In the east channel, which is immediately above the bar, the course is due west, for the space of three miles, and it is much of the same depth with the other. On taking the large channel first over the bar, the country is north-west, and there is always forty feet depth of water. The course lies afterwards west, in a sort of bay, at the end of which are three channels more. This bay is but ten fathoms in depth, and twenty over, yet there is but little water. A little further, there is another bay, twenty fathoms over, and about fifty in depth. This has two channels, through which canoes can pass, though sometimes with considerable difficulty.

April 26. We went on board, but after attempting to sail to the southward, the wind turning contrary, we were obliged to come to an anchor, where we remained the two following days.

On the twenty-ninth, we weighed early in the morning, but there was so little wind, that we got only about forty miles; which was not above one half of what we intended.

On the thirtieth, the wind was neither more favourable, nor the sea more calm than before, till towards four in the afternoon, when a shower of rain cleared the sky, which had been foggy for some time, and allayed the violence of the sea. However, within two hours after the fog returned, and became so thick, that, not being able to see our course, we thought it best to come again to an anchor.

The land to the northward is called Biloxi, from the name of an Indian nation settled on it, or rather the original inhabitants. A worse place could not have been chosen than this, for the general quarters of the colony: for it can receive no assistance from shipping, nor afford them any. Besides, the road has two defects; the anchorage is not good, and is full of worms, which make sad havock among the shipping. The only advantage therefore that can be

drawn from it, is its serving for a shelter for the shipping in a hard gale of wind; because the seamen are able to discover the mouth of the Mississippi, which being low, would be dangerous to approach in bad weather without having first seen it. Biloxi is not of more value by land than by sea, for the soil is sandy, producing little besides pines and cedars. But there are several physical herbs grow here, which, although little regarded by the inhabitants, are much esteemed in Europe, and make a valuable article of commerce; vast fortunes having been acquired by the sale of them to our druggists.

Having spent a month at Biloxi, where several of our company were taken ill of the jaundice, we embarked on the river, and set sail to view the interior parts of the country; taking again the route of New Orleans. This was a most disagreeable voyage; the winds being so violent, that we were obliged to go on shore and pitch our tents, in order to get a little rest. But we had scarce pitched our tents, when a dreadful shower of rain, accompanied with thunder, laid us all under water. Two small vessels, which set out at the same time with us, took advantage of the wind; and we began to wish that we had done the same; but we soon perceived that their fate was rather to be pitied than envied. The first was in continual danger of being shipwrecked; and the people on board arrived at New Orleans rather like dead men than living creatures. The second sailed half way, and five of the passengers going on shore were drowned in a swamp which had been formed by the overflowing of the river. The wind continued the whole night with the same violence, and the rain did not cease till the next day at noon. It began again in the evening, and lasted till day light, accompanied with thunder.

On the twenty-sixth, it rained the whole day; and although the water was calm, we made but little progress.

On the twenty-seventh, we advanced farther; but on the following evening lost our course, near the Island of Pearls. The next day we encamped at the entrance of Lake Portcherhain, having a little before left upon our right the River of Pearls, which has three mouths. These three branches separate about four leagues from the sea, a little above Biloxi.

In the afternoon we passed Lake Poutchetrain, which is about twenty miles over, and at midnight entered the Bay of St. John. Those who sailed first upon this lake, found it so full of alligators, that they could hardly make a stroke with an oar without touching one of them; but they are now become scarce; and we only saw some nests of them at the place where we encamped: for these amphibious animals lay their eggs on shore, in the same manner as the crocodiles do in Egypt. Having refreshed ourselves, we pursued our journey by land, and arrived at New Orleans about sun-rising.

The inundation was now at its height, and consequently the river was so much swelled, and more rapid than ever we had seen it before; and here, when we embarked, we found our mariners were so little acquainted with the navigation, that it was next to a miracle we escaped being drowned. It was still worse with us when we got the length of the channels; for the currents drove us against the shore with great violence. We had but two anchors, and that circumstance discouraged us so much, that we began to consider our condition as rather serious; but we had still greater difficulties to engage with. The captain who had hitherto conducted us was taken sick, and the seamen were so ignorant of the nature of the coast, that we expected every moment to go to the bottom. Providence, however, came to our aid, in sending a seaman on board, who appeared to us the most experienced we had ever seen.

On the twelfth, at noon, having suffered much from extreme heats for several days, we came within sight of the north shore of the island of Cuba, where the land was very high. At sun-set we were east of it, but kept all night near the shore. At day-break we found

found ourselves near the Havannah, the capital of this vast island. Two leagues beyond the Havannah there is a small fort, but of considerable strength, built by the Spaniards; and as it is situated on an entrance in the form of a sugar-loaf, they have given it the name of Matanzas. This serves to distinguish the bay, which is fourteen leagues from the Havannah. The heat was excessive, for we were now on the borders of the torrid zone; and besides that, we had scarce a single breeze of wind, so that we advanced slowly by the current, which carried us to the eastward.

We continued sailing till seven o'clock in the evening along the coast, and we found six fathoms of water; and we should have cast anchor immediately, but we had not one in readiness. It was proposed to wear the ship, and perhaps it was still time, had expedition been used; but the seamen amused themselves with founding again, when no more than five fathoms were found. The lead was cast a third time, and then there were only three. Immediately a confused noise was heard, every one crying out with all his might, so that the officers could not make themselves to be heard, and two or three minutes after the vessel struck.

That instant a storm arose, followed by rain, which calmed the wind; but it soon sprung up again at south, and blew more violent than before. The vessel immediately began to stick fast by the rudder, and there was great reason to fear the main-mast, which at every stroke sprung up to a great height, should beat out a hole in her bottom; therefore it was immediately condemned in form, and cut away, the captain, according to custom, giving it the first stroke with a hatchet.

The lieutenant on this went on board a shallop, to discover, if possible, in what place we were, and what condition the ship was in. He found that there was only four feet water ahead; that the bank on which we had struck was so small, that there was just a place for the vessel, and all around it she would have been afloat. But had we escaped this bank, we must have fallen upon another, for it was surrounded by them, and therefore we could not have met with one that was more convenient.

The wind still blew with violence, and the vessel continued to strike; and at every stroke we expected she would have gone to pieces. All the effects of terror were painted on every face; and after the first tumult, formed by the cries of the sailors who were working, and the groans of the passengers, who laid their account with perishing every moment, was over, a dead and profound silence reigned throughout the whole vessel.

We then examined if there was any probability of getting the vessel afloat again; and as it was prudent to have more resources than one, we began to consider of the most proper means to extricate ourselves out of our difficulties. We then called to mind that we had a flat-bottomed boat on board, which was intended to be made use of in loading the sugars at St. Domingo. This was a very wise precaution taken by the captain, who had been informed that vessels were frequently detained longer in the road on that account than was consistent with the interest of the owner, or the health of the crews; but Providence had, without doubt, another view, when it inspired him with this thought, for this boat was, under God, the instrument of our safety. The whole of this day was passed in a state of inactivity, for no attempt was made to bring off the vessel, and we had no hopes, for some time, but of travelling by land, which in this part of America is almost impracticable.

It was not however thought proper to abandon the ship at present, but the passengers went on board the shallop. At the distance of a cannon-shot from the vessel, we found the sea run high, and the provisions we carried along with us were damaged by the water. In this shallop, we made all possible haste to get on shore, that we might give all the assistance in our power to the rest; but just as we were ready to land, we perceived a large company of Indians, armed with bows and arrows coming down to the sea-side. This made

us reflect that we had no arms, and we stopped some time, not daring to advance. We began to imagine that it would be imprudent to go any farther, and the Indians perceiving our embarrassment, certainly understood the cause. They drew near us, calling out in Spanish that they were friends. But seeing that this did not encourage us, they laid down their arms, and came forwards to us, having the water up to their middle.

We were soon surrounded by them, and as we were encumbered with baggage, it would have been easy for them to have destroyed us. They asked us if we were their friends, and we answered them in the affirmative. They testified a great deal of joy, inviting us to come on shore on that island, and assuring us that we should be as safe there as on board our own vessel. Distrust, on some occasions, gives rise to weakness, and shews a kind of dangerous suspicion; we therefore thought we ought to accept the invitation of these barbarians, and so we followed them to their island, which we found to be better cultivated than we expected.

We were no sooner landed on the island, than forgetting our fears of the Indians, we began to entertain some distrust of our own officers. Our captain had attended us thus far; but as soon as he had set us on shore, he took leave of us, saying, that he was obliged to return on board, where he had still a great many things to do, and that he would send us whatever we stood in need of, especially arms and warlike stores. There was nothing in this but what was reasonable, and we naturally concluded, that his presence might be necessary on board his vessel; but we reflected, that he had only taken the passengers out of her, and that upon his return the whole crew would be on board, so that they might set sail, and leave us among the barbarians.

All these circumstances joined together, made us suspect that they had only put us on shore as an incumbrance to them, in order to be able to make use of the canoe and shallop, in order to transport themselves to the Havannah, or St. Augustin in Florida. These suspicions were heightened in every one of us, when we considered, and also began to imagine, that we were destined for destruction. We therefore resolved to return to the vessel; but one of us was first sent as a deputy, in the name of the rest. Accordingly our deputy waited on the captain, and told him, that as he had left his chaplain along with us on the island, it would be inconsistent with natural justice for him to leave us in such a forlorn condition. The captain seemed to be surpris'd at what was said, but he consented to take us on board, yet still we had many difficulties to engage with. As soon as we got on board, we tried to get the sails in proper order so as to get off, but a great many other things were to be done for that purpose, which however they did not think proper to attempt.

Half an hour afterwards the wind turned towards the east, and blew very hard, which obliged us to furl our sails, but this gale was of great service to us. The waves drove the raft backwards to us, and as soon as we perceived her, the captain sent the shallop, which took her in tow, and brought her along side of us. These unhappy men are, for the most part, poor passengers, who looked for nothing but death, and we, on our side, began to despair to be able to save them, when Providence raised this little tempest, in order to preserve them from shipwreck.

Our sailors, during the captain's absence, had thought proper to drown all their cares in an inordinate use of spirituous liquors, notwithstanding every remonstrance to the contrary. Indeed we perceived in the ship's crew some seeds of dissention, and we did not know to what height they might have been carried.

To increase our perplexity, a great number of the Indians had followed close after us, and we soon perceived, that although we should have nothing to fear from any violence offered by them, yet it would not

be an easy matter to get quit of their importunities, especially as it behoved us to be upon our guard, lest they should have stolen any part of our baggage. He that called himself the principal man, was named Don Antonio, and he spoke tolerable good Spanish. He had also been very successful in imitating the manners of the Spaniards, for he had a gravity upon him peculiar to that nation. Whenever he saw any one tolerably dressed, he asked if he was a cavellero, having before told us, that he was one himself, and one of the greatest distinction in his nation. This behaviour, however, shewed not much of the gentleman, for every thing that he saw he coveted; and if he had not been prevented, he and his people would have left us nothing they could have carried away. He even asked us for our girdles; and when we told him we could not part with them, he seemed displeased, or rather angry.

We learned from this man, that almost all the Indians of the village had been baptized at the Havana, to which they made a voyage every year. This city is above one hundred miles distant from them, and these people make the voyage in small boats, with which the Europeans would be afraid to cross a river. The Indian chief told us further, that they had a king named Don Diego, whom we should see the next day. He afterwards asked us what route we were resolved to take, and offered to conduct us to St. Augustine. We thanked him for his offer, treated him and all his company handsomely, who returned to all appearance very well satisfied with their reception.

These Indians are more red in their colour than those in Louisiana; and although they are naturally thieves, yet we could not find that to be true which has been said of them, that they feast on human bodies. It is certain, however, that they are a fierce body of people; and many of the Europeans have been, in cold blood, murdered by them, without any sort of provocation. Above all, we found that they were most inveterate enemies to the English, although we did not know the reason, any further than that we were told some depredations had been committed by the latter, in cutting down their logwood, and carry it away without their consent, which has created many disputes, and been the occasion of many brave men losing their lives.

On the sixteenth we went on shore to visit those who had been left on the island, and fulfilled the promise we had made them the evening before. We spent almost the whole day with them, but in the evening, on our return, we found our vessel in the utmost state of confusion. The authors of this disorder were the marine officers, and all the best sailors in the ship had taken part with them. Their quarrel was with the lieutenant, who, they said, had hitherto treated them with a great deal of haughtiness and severity. The wine, which they had at discretion, had inflamed their passions in such a manner, that it was scarce possible to make them hearken to reason.

The captain shewed, on this occasion, a wisdom, firmness, and moderation, which could not well have been expected from one of his age, little experience, and past conduct. He made it appear, that he knew how to make himself loved and feared by people who seemed to be guided by nothing but fury and caprice. The lieutenant, on his part, confounded the most mutinous by his intrepidity; and having found means to separate and employ them, in the end made himself obeyed. They had at last drawn from the bottom of the hold the boat that had been so long promised, and carried it to the island. This required a great deal of trouble, but we surmounted the difficulties with success.

On the twenty-seventh there appeared a sail within a league of us, and we hung out the signal of distress, and soon after we found that the captain had veered his ship to, to afford us what succour was in his power. Our lieutenant immediately embarked on board a canoe, and went to see whether the captain would receive us all into his ship. But this ship was only a

brigantine of one hundred tons, that had been plundered by pirates, and which, for three days past, had attempted to get out of the bay, into which the currents, stronger this year than they had ever been known, had carried them, in spite of all their efforts, though the wind was favourable.

The brigantine was an English ship, and the captain promised to take twenty of our people on board, provided he was supplied with water and provisions; of which he was then in great want. The condition was accepted, and he accordingly drew near to cast anchor as close to us as possible. But a strong south-west wind arising, he was obliged to continue his course, lest by endeavouring to assist us, he would have exposed himself to be shipwrecked, an accident that frequently happens on these coasts.

On the twenty-ninth we had sight of three vessels more, and sent to make them the same proposals we had formerly done, but without effect. They also were English, and complained they had been plundered by pirates. This day, as there remained nothing on board that we could carry away with us, we took our last farewell of our vessel, and got all safely on shore. Here we found tents made of the sail-cloth, with a strong grand room, where centinels were placed every night.

This island was in appearance about twelve miles in circumference, and round it were several others of a smaller extent. That on which the Indians had their tents was the smallest of all, and lay nearest to ours. Here we found the Indians lived in a manner solely by fishing, for the water made up those deficiencies which were occasioned by the barrenness of the earth. The dress of these savages was either the skins of wild beasts, or the leaves of trees, which they made use of to cover those parts which nature teaches us to conceal.

The soil of all these islands is a sort of very fine sand, interspersed with white coral, which is easily broken; and as for wood, we seldom saw any trees, shrubs, and bushes. The coasts of the sea, or rather the fresh water, are covered with a pretty sort of shells; and some sponges are frequently found, which seem to have been cast on shore in stormy weather. It was told us that the Indians will not leave this place, on account of the vast booty they get from so many ships being wrecked on the shore. There is not so much as a four-footed beast in those islands, nor have they any fowls.

On the twentieth, Don Diego, whom they called their king, condescended to pay us a visit. We found him a young man, rather below the middle size, without any thing graceful in his appearance. He was almost as naked as his subjects, and the few rags on his back were hardly worth the picking up at one's feet. He wore on his head a sort of fillet, made of a sort of stuff, which we did not understand the nature of, and which some travellers would have been vain enough to call a diadem. He was without attendants, or any mark of respect, distinction, or, in short, any thing to shew what person he was. A pretty, young, handsome woman, decently clothed for an Indian, accompanied him; and, as we learned from the people, this was the queen his wife, for these savages have their consorts.

We received their majesties with a great deal of formality, and they seemed very well pleased with us, but we found them extremely poor. We desired this prince to give us some sort of assistance, by which we might be conveyed to St. Augustine, and he gave us reason to hope for every thing that lay in his power. In order to induce him to keep his promise, we made him several presents, which he received very thankfully; but there is hardly any such thing as satisfying the avarice of these Indians. Among our presents to him was a shirt; and next day he visited us in it, wrapped over his ragged tatters, with the skirts trailing on the ground. He let us know that he was not the absolute sovereign of the country, but that he was subject to another, who lived at a considerable distance. But, notwithstanding this declaration, we found that he

exercised an unlimited power, of which we met with several instances.

Don Antonio, who acted as his deputy, who was at least double his age, and who could have beaten one of double his strength, came to visit us a short while after, and told us, that Don Diego had twice drubbed him very heartily for getting drunk on board our ship, where probably some remains of spirituous liquors had been left. Indeed the prince loved spirituous liquors as well as his deputy, and was only sorry that he should engross the prize to himself.

On the twenty-second Don Diego came again to visit us, clothed in the same manner as before. He seemed delighted with his dress, which gave him, however, a very ridiculous air, and which, joined to his physiognomy, made him appear like a wretch who is going to suffer death. We could not prevail upon him to eat any flesh-meat, but he ate fish without any reluctance. After the repast was over, we received our proposal, and put him in mind of the promise he had made of conducting us safely to St. Augustine; but he told us that there were several nations by the way with whom he was at war, so that he could not spare any of his people. This was a shocking answer, especially as we found that our ship had been totally destroyed by the Indians.

On the twenty-third we furnished a boat, and began in good earnest to think of coming to some final resolution. Some proposed our sailing to the Havannah, while others were equally eager that we should direct our course to St. Augustine's. The last seemed to be the safest, although the first was the shortest.

In the midst of such confusion, not knowing what resolution to follow, we set sail on the twenty-fifth, about noon; and towards sun-set found ourselves near that channel, which must be crossed before one comes into the Havannah. We were forty in number, and landed on a small island, where we met with a body of Indians, so that we were obliged to keep on our guard all night. The weather was delightful, and the sea calm; but nothing could prevent our people from murmuring. We set out early next morning, and took the course of the channel; but five hours after the wind began to blow fresh, and we dreaded an approaching storm. All on board agreed that it would be a dangerous thing to hazard so long a passage in such a vessel as ours, nothing being weaker than our boat, which let in water every where. But as in order to go to St. Augustine, we should have been obliged to sail back again the whole way we had hitherto come, we came to an unanimous resolution to return by the way of Biloxi.

We therefore set sail westward, but could make no great way that day, and were obliged to pass the whole night in the boat, where there was far from room sufficient for all of us to lay at our whole length.

On the twenty-seventh, we encamped on an island, where we found the cabins abandoned, the roads beaten, and the traces of Spanish shoes. This island is the first of those called the Tortues, and the soil is the same with that of the Isles of the Martyrs. We could not conceive what men could have to do in such wretched places, and so remote from all manner of habitations. However, we continued to sail westward, and advanced with a rapidity which could only come from the current.

On the twenty-eighth, we advanced considerably; and at noon, the weather being calm, we took a view of the country. It appeared to us, that there were but few Indians in this country, for we could never discover above five or six together. This coast may be properly called the dominion of oysters, as the great bank of Newfoundland is the nursery for cod-fish.

Having spent fourteen days in viewing the islands on this coast, we met on the morning of the fifteenth a Spanish shallop, in which were about fifteen persons. These were part of a ship's crew that had been cast away near the river St. Martin. This misfortune

had befallen them about five and twenty days before, and they had but a very small shallop to contain forty-four persons, so that they were obliged to use it by turns, and, consequently, to make very short journies. This rencounter was to us a visible interposition of Providence; for had it not been for the instructions which the Spanish captain gave us, we had never found the right course to steer; and the uncertainty of what might become of us, might have prompted our unruly crew to conspire some act of violence, or perhaps, even of despair.

The night following we were exposed to very great danger. Being on a small island, we were all asleep, except three or four persons, who guided the boat. One of them had lighted his pipe, and imprudently laid the match on the edge of the boat, just where the arms, powder, and ammunition were kept in a chest. He fell asleep afterwards, and whilst he was in that condition, the covering of the chest, which was only a piece of sail-cloth, took fire. The flames awakened him, as well as his other companions; and had they continued asleep a moment longer, the boat must have been either blown up, or shattered in pieces. Dreadful then must our condition have been, as we should have been without any thing but a canoe, which could not have contained above one-sixth part of our company; and without provisions, arms, or ammunition, in a sandy desert, on which nothing grew besides a few blades of wild grass.

On the sixteenth, the canoe left us, and joined the Spaniards; and we had the wind contrary, so that we could not advance, the coast being so flat, and every where covered with flints, so that our boat, which drew no more than six feet water, was in continual danger of striking her bottom against the rock. We were still under the same apprehension the two following days; and on the twentieth we encamped on an island, which joins the eastern part of a bay. All night we perceived fires on the continent, which we were very near; and we had observed the same for some nights before.

The twenty-first, we set out in a very thick fog, which being soon dispersed, we perceived the sea-marks the Spaniards had directed us to follow. We did this by steering north, and we saw that had it not been for their assistance, it would have been impossible for us to have shunned the sand-banks with which the whole coast was covered, and which was full of oysters. About ten o'clock we perceived a small stone fort, of a square form, with regular bastions, and saw immediately hung out the white flag; but were told, in French, to proceed no further.

We stopped, and immediately saw a small vessel coming towards us, in which were only three people. One of them was a native of Bayonne, and had been a gunner in Louisiana and at St. Mark's.

After the common ceremonies were over, the gunner told us that only our captain and some more of our company could be permitted to wait on the governor. We went according to his directions, and were well received: the governor was only in rank a lieutenant, but a man of good sense. He had no objection, as soon as he knew who we were, of bringing our boat opposite the fort, and he invited our principal officers to dine with him. In the mean time, he ordered all our arms and ammunition to be taken into the common magazine, pledging his word of honour that they should be delivered to us as soon as we set sail.

We had here an opportunity of viewing the country, and we found vast numbers of buffaloes in the fields, with horses, which the Spaniards suffer to run about wild; so that when they want any, they send out Indians to catch them. Two leagues higher, stands a village inhabited by a tribe of Indians called the Apalachés, who have considerable territories adjoining. The inhabitants of this nation were formerly very numerous, but they are now much reduced, so that they are become mean and contemptible. They have long since embraced the Christian religion,

religion, and yet the papists put but little confidence in them; and in doing so they act wisely: for these savages, although they have, for their own interest, assumed the characters of Christians, yet they are most notorious thieves, and pay no regard to moral obligation.

The country is, in general, well wooded and watered; and the farther we advanced upwards into it, we found it the more fertile.

On the twenty-third, we set out in the morning, and continued sailing till the twenty-fifth, when our guides made us undertake a traverse of three leagues, to get into a channel, formed by the continent on one side, and on the other by a chain of islands of different extent. Had it not been for them we durst never have ventured to engage in it, and consequently we should have missed the bay of St. Joseph. However, we were out of provisions, and our scarcity of water increased every day. One evening we dug ten paces from the sea, on a rising ground, but could find nothing but brackish water, which we could not drink. We then bethought ourselves of making a hole, of a small depth, on the very borders of the sea, and in the sand. It was presently filled with water, as sweet as if it had been drawn from the most limpid stream, but after we had drawn up a few quarts of it the spring dried up entirely, from which circumstance we concluded that it was rain-water.

After we had got ahead of the island, we advanced under sail till ten o'clock, and then the wind fell, but the tide, which began to ebb, supplied its place; so that we continued our course all the night. This was the first time we observed any regular tides in the gulph of Mexico; and our two Spaniards told us, that from this place to Pensacola the flux is twelve hours, and the reflux the same.

On the twenty-fifth, the wind kept us upon an island indifferently well wooded, about thirty miles in length, and where we killed as many larks and woodcocks as we could desire: we also saw a great number of rattlesnakes, but these we did not chuse to have any connection with. Our guides called this place the Island of Dogs, but for what reason we could not discover.

On the twenty-seventh, we struck upon a bank of oysters, and it was above an hour before we could get clear of them. We went to pass the rest of the night in the country house of a captain belonging to the garrison of Fort St. Joseph, where, upon our arrival, we were told strange news indeed. He assured us, that all Louisiana was evacuated by the French, and that the Indians had taken possession of it. Most of our people were much disconcerted at this news, though it did not originate from public authority.

But still our crew having plenty of provisions, like most seamen in general, were rather easy, and contented themselves with eating and drinking. Don Diego's servants were still with us, and our seamen plied them with spirituous liquors; but next morning they took their leave and went away. Indeed we had no farther occasion for them, for instead of losing our way, we here met with a French soldier, who had enlisted into the Spanish service, where he was in a manner dying of hunger; we had no great difficulty to prevail on him to accompany us to St. Joseph's, and from thence to Louisiana, provided we could procure his discharge.

We arrived, about five in the evening, at the port of St. Joseph, where we were well received by the governor. Here we met with two large shallops from Biloxi, with four French officers, who had come to claim some deserters, but could not find them. We had seen them some days before, but we took no notice of them. They endeavoured to conceal their real characters; and we knowing the severity of the martial law, looked upon them as objects of compassion. So far as we could form any proper notion, they had gone among the Spaniards, which was only going from one state of miserable servitude to another; for of all lives that of a soldier is the most wretched.

The fort is not situated in the bay, but in a crooked point, in which there is an island. This fort is built only of earth, but it is well secured with pallisadoes, and defended with several pieces of cannon: there is also a pretty strong garrison, and most of the officers wives reside along with them. Their houses are neat and commodious, indifferently well furnished; but the streets are so much neglected, that one is obliged to walk sometimes up to the knees in sand. The ladies never come abroad but when they go to church, and then always with a train, and a gravity becoming the manners of the Spanish nation.

On the twenty-ninth, we were invited to a grand dinner at the major's, an officer whom we had seen formerly in Louisiana, and who had treated us with every mark of respect. Here he became more intimate with us than before; probably, because we had along with us one Mr. Hubert, who was a kind of superior, or what the Romans called a quaestor. We heard that a daughter of this Mr. Hubert had only been sprinkled, and therefore were prevailed on to baptize her. This was performed with great ceremony, and under a discharge of the cannon of the fort. The godmother was a niece of the governor's, who gave us an elegant supper in the evening, and treated us with more politeness than we could have reasonably expected from strangers; especially such as were natives of Spain.

On the thirtieth, we set out on board two shallops, and were saluted by the fort with two pieces of cannon. That day we advanced seven leagues, and came to an anchor at the mouth of a river, joining with a bay a little more to the southward. At eleven at night, the wind proving favourable, we took the advantage, and sailed south west, as far as the island called the Holy Rose, which was full sixty miles. Here we found the coast so extremely dangerous, that we could not come to an anchor.

On the thirty-first, at four in the afternoon, we came to an anchor behind the island, which incloses the great bay of St. Rose; the entry of which is dangerous when the sea is high. Had we been but a few minutes later, we must have inevitably perished, because the wind continued changing so frequently, and the sea rose so high, that we were in danger of being swallowed up.

June 8. About three in the morning, the tide beginning to flow, we re-embarked, and after advancing about three miles, entered the channel of St. Rose, which is above forty miles in length. It is formed by the island of St. Rose, which is of this length, but at the same time extremely narrow. This island has a considerable quantity of wood on it; and taking it all together, it is far from being disagreeable.

The continent is very high, and bears trees of all sorts, but the soil is extremely sandy. However, on digging a little way into the ground, we found plenty of fresh water. The wood here is very hard, but easily rots, so that it is not of any great service. The whole coast swarms with game, and the sea, or rather the river, with fish. The channel is narrow at the mouth, but grows broader afterwards, and has a strong current as far as the bay of Pensacola.

The bay of Pensacola would be a very good port, were it not for the worms that eat through the bottom of the ships; and if its entry had a little more depth of water, then it would be more safe. It is so narrow, that only one ship can pass at a time, but within the bay the anchorage is good.

The first news we heard, upon our arrival at Biloxi for the second time, was, that a peace had been concluded with Spain, and a durable alliance between the two crowns. One article of the peace was the restitution of Pensacola, the news of which was brought to Louisiana by Alexander Wallop, an Irishman, and captain of a vessel belonging to New Spain. He had embarked at La Vera Cruz, on board a brigantine, commanded by Augusta Spinola, carrying one hundred and fifty men, and mounting fourteen pieces of cannon.

We found this Spinola to be a young man, full
of

of fire, but of a very amiable character. His sentiments and behaviour shewed him to be above the common rank, and in all things he was extremely agreeable. He was a good deal chagrined at being informed that an English officer, whose name was Marshall, had just left the road of Biloxi, where he had been carrying on a considerable trade with the French, contrary to the faith of treaties. This practice, however, was so common, that we did not think proper to take any notice of it.

June 18. We discovered that a conspiracy had been formed to carry off the Spanish ship, and about seven in the evening we got several informations of it. Nay, we were afraid that before nine that evening, it would be put in execution; the captain not being used to go on board before that time. The conspirators were in number at least one hundred and fifty; and their intention was, if they succeeded in their enterprize, to turn pirates. We immediately sent to give notice of it to Mr. Benvilo, who was then at table with Spinola; and this gentleman rose up that minute and went on board, in order to make a proper enquiry. The conspirators soon began to perceive that they had been detected, for guilt always creates fear, and this leads to the detection of crimes, when the criminals do not think of it.

On the twenty-second, we embarked on board the Bellona, which set sail on the thirtieth. On the second of July, we reckoned ourselves very near Pensacola, from whence we thought it best to depart, because we were afraid of storms arising. We had then the sun directly above our heads, and in our voyage had suffered much from the incessant heats: nor could we screen ourselves from the heats any more than we could from the dew that fell by night, and was accompanied with a prodigious cold.

On the twentieth, we discovered the island of Cuba, which we had seen three months before, and this delay of arriving at it was occasioned by the following accidents. The first was, the not having a proper knowledge of navigation; a science we were well acquainted with, but we imagined our seamen were not able to reduce it into practice: for speculation, without practice, is like a body without a soul. The second difficulty we had to encounter was, the capricious humour of our captain: this gentleman, though in many respects a man of good sense, yet considered his own ease more than he did our interest.

He therefore formed a resolution of going into the harbour of the Havannah, but he had nearly gone past it, without so much as knowing where he was. All this night we were in the utmost state of confusion, and we imagined every moment that we should go to the bottom. Early in the morning we discovered land, and it appeared to us to be the Cape de Sed. The officers laughed at us, and told us we were mistaken. We got upon deck, and from our knowledge of the country, believed that what we had asserted was true; but all to no purpose, for we were browbeaten in every part of our argument. In the mean time we had a contrary wind, which obliged us to tack several times, and in that manner we continued not only all the day, but even the whole of the succeeding night.

On the morrow, about mid-day, we were still in the sight of the two lands which were the subject of our dispute, when drawing nearer the shore, we perceived the Havannah before us, which gave great joy to the captain, he having a large private adventure, which he expected to dispose of to advantage among the Spaniards. His interest did not concern us; but if we had been farther out at sea, and had there not been contrary winds during the night, the rashness and obstinacy of our pilots had cost us dear.

The wind, however, was fair, and about five in the evening we were no more than a league from the Havannah, where we fired two guns, to give them notice of our approach. We did not, however, receive any answer, and therefore we sent our canoe into the harbour, desiring permission to come on shore;

but it was so late, that we could not receive an answer.

On the twenty-third, an officer of the Bellona went on shore, in order to ask the governor's permission to take water and provisions on board, because we had not been able to lay in a sufficient quantity before at the place where we last stopped. On our landing, we met with several sailors whom we knew, and who had formerly belonged to our ship. The first of these informed us, that they had been five days in making this port, from the place where they had been cast away, having been almost the whole time in the most imminent danger of perishing. We had no time to inquire in what manner they had got there, but the surgeon who went on board furnished us with some particulars.

He told us, that the seamen had actually turned pirates, and that they had committed some deeds of a very malignant nature. That they were become desperate, in consequence of their being considered as the outcasts of human society, and that had induced them to trample on every moral obligation.

The governor received us coldly; and after having heard us, said, that he should have been very glad to have granted our request, but that the king, his master, had tied his hands in particulars, expressly forbidding him to receive into the harbour any ship whatever that came from Louisiana. He added, that there were several other places on the same coast where we might stop without any danger, and furnish ourselves with all sorts of necessaries. We were obliged to rest contented with this answer, and after having paid a visit to the rector of the French college, we returned on board, disappointed in our expectations, but still considered, that it is the fate of travellers to meet with many difficulties, which the vulgar take no notice of.

Next day, being the twenty-fourth, we were north of the Pan of Matanzas, and at half an hour after eleven opposite to the Rio de Ciroca, where there is a Spanish settlement. But as our captain was determined to try if he could succeed better at Matanzas than he had done at the Havannah, he turned to and fro during the whole night; and on the twenty-fifth, at break of day, we found ourselves at the entrance of the bay, which is two leagues over.

Before we could get in, we were obliged to double a point, which does not advance very far into the sea, and then sail westward three miles. We then came to another point, behind which is the fort. About ten o'clock an officer was sent to the fort in a canoe, who did not find the commandant at home. He informed the lieutenant of the necessity we told him we were in; but this officer said, he could not take it upon himself to grant him the permission he wanted; and that all he could do, was, to send a messenger to the Havannah, to hear the pleasure of the governor of that city, who was his general; and if this suited us, we might lay at anchor on the other side, where we would be more in safety.

This answer was so mortifying to our captain, that he resolved to continue his course, with all his goods on board, for the sake of which he had made us lose fifteen days of our most precious time. Such are the common practices of those little captains of trading vessels in America, who, if they can promote their own interest, never pay any the least regard to what may happen to passengers.

On the twenty-seventh we discovered the land of Florida, about five o'clock in the morning, and then we steered to the northward, and soon came within sight of what remained of our ship that had been lost.

On the twenty-eighth, at mid-day, the pilot reckoned himself at the entrance of the gulph; but discovering his mistake, he steered about more to the left. As we were now in danger of being dashed to pieces against the rocks, some of our company proposed that we should steer before the wind to Carolina, where we could have got plenty of provisions; but this was rejected, and another followed, which seemed to be the effect

Engraved for Messrs. Van Nostrand's Collection of Voyages & Travels

THE KING OF FLORIDA consulting his MAGICIAN previous to his going to Battle

effect of despair, and this was, to coast along till we came to the Bahama Islands. This is the passage for all the vessels that return from St. Domingo to France; but then they have nothing to fear, because they can take their own time.

About two o'clock in the afternoon we found ourselves in great danger of being dashed against a small island, called Caicos; and perhaps we were the first who had ever ventured so near it, but then we were in a state of despair. Here, however, we went on shore, and took a view of this island, which is far from being such a wretched place as it has been represented by some geographers. In some places, indeed, the soil is barren, but in others extremely fertile, and, if properly cultivated, would produce a considerable crop.

We coasted along the island of Caicos till four o'clock in the evening, having both wind and current in our favour. Then sending a man up to the mast-head to observe what was before us, he soon came down, telling us, that he had seen the extremity of the island; but that beyond it he could discover nothing but low lands, and small channels, the waters of which were white. Upon hearing this, we looked to the westward, and about mid-day it seemed as if the wind would be very favourable to us. We had all this day a great number of currents to pass through, but we got through them in safety.

The moment now approached that was to determine our fate; and what gave us great hopes was, that the wind by degrees veered about to the north-east. At eleven o'clock we lay south-east, but the currents made us fall so much to the leeward, that we soon made a fourth course. At last we made Cape François, and from thence returned to Old France.

Such is the narrative written by father Charlevoix; and thus much is certain, that comparing it with all the other accounts we have ever yet read, it far exceeds them. The worthy author pays no regard to what has been related by the most celebrated writers, any farther than they have adhered to the truth. He has treated with a just severity the gay La Fontaine, his own countryman, whose account of America is a well written romance. If travellers have no regard for the truth, they might at least have some for their own honour.

We come next to the accounts given of America by the celebrated professor Kalm, who visited that country in 1749 and 1750. This gentleman was professor of œconomy in the university of Abo, in Swedish Finland. He was a member of the Royal Swedish society, and, at the expence of its members, was sent to take a survey of the more interior parts of America. He confined himself more to the British settlements than to any other parts of that vast continent; and, so far as we know, no part of his account has ever yet been censured. This celebrated author proceeds in the following manner with his account of Philadelphia: This morning (April 12,) I went to Philadelphia; but the roads were extremely bad, and the soil being clayey, it was very different to get along.

In general the land is very swampy, and therefore there is a necessity of building their houses in a particular manner. The white cedar is one of the trees which resist putrefaction, and when it is put above the ground, it will last longer than under ground. It is therefore employed for many purposes; it makes good fences, and posts to be put into the ground; but in this point the red cedar is still preferable to the white; and it likewise makes good canoes. The young trees are employed for hoops round barrels, because they are thin and pliable. The thick and tall trees afford timber for coopers work. The houses that are built of it surpass in duration those that are built of American oak.

The white cedar shingles are preferred to all others for several reasons. First, they are more durable than any others made of American wood, except the red cedar shingles; and, secondly, they are very light, so that no strong beams are requisite to support the roof.

For the same reason it is necessary to build thick walls, because they are not pressed with heavy roofs. When fires break out, it is less dangerous to go under, or along the roofs; because the shingles being very light, can do little hurt by falling. They suck the water, being somewhat spongy; so that the roofs can be easily wetted in case of a fire. When they burn, and are carried about by the wind, they have commonly what is called a dead coal, which does not easily set fire where it alights.

The roofs made of these shingles can be easily cut through; because they are thin, and not very hard; and this is one of the reasons why the people in general are so earnest to have their roofs made of them. All their churches, and the houses of their gentry, are covered with these shingles; and in many parts of the province of New York, where the white cedar does not grow, the people are so fond of it, that they have it brought from other parts.

Vast quantities of this white cedar wood is now sent annually to the West Indies, and is considered as a very lucrative branch of trade. By this means many swamps, in which cedars grew formerly, are now almost cleared, and will be all so in time, if the trade is carried on with the same spirit as hitherto.

The best canoes, consisting of a single piece of wood, are made of red cedar; for they last longer than any others, and are very light. Several yachts which go from New York to Albany, and up Hudson's River, are built in a different manner: the lower part, that is continually in the water, is made of black oak; but the upper part is built of red cedar, because it is sometimes above, and sometimes in the water.

In Philadelphia, they cannot make any yachts, or other boats, of red cedar; because the scarcity and size of the trees will not admit of it: for the same reason they do not roof their houses with red cedar shingles, but in such places where it is plentiful. The heart of this cedar is of a fine red colour, and whatever is made of it looks extremely beautiful: the smell is both wholesome and agreeable, but the colour soon fades, otherwise it would be very good for cabinet work.

In the house of one Mr. Norris, we saw a room wainscoted with boards of red cedar; and Mr. Norris assured us, that although it was then faded in its colour, yet at first it looked extremely fine. We were told that this wood will keep its colour, if a thin varnish is laid over it whilst it is fresh, and just after it has been planed; but care must be taken that the wood is not afterwards rubbed or hurt. At least it makes the wood keep its colour a considerable time.

As it has a very pleasant smell when fresh, some people put the shavings and chips of it among their linen, to secure it from being worm eaten. Some, likewise, get bureaus made of red cedar, for the same purpose; but then it is only useful while it continues fresh; for it soon loses its smell, and has then no power to prevent insects from breeding. In many parts round Philadelphia, in the seats of the gentry, we generally found an avenue, with a row of these cedars planted on both sides, leading from the high road to the house: the lower branches were cut, having only a small crown on the top, which made the whole appear extremely agreeable and beautiful.

We found the trees here infested with vast numbers of caterpillars; one kind especially was worse than all the rest. These species formed great white webs behind the branches of the trees, so that they were perceptible at a considerable distance. In each of these webs were thousands of caterpillars, which crept out of them afterwards: they bred chiefly on apple-trees: they covered the leaves, and often left not one on a whole branch. We were told that some years ago they did so much damage, that the apple-trees and peach-trees hardly bore any fruit at all, because they consumed all the leaves, and exposed the naked trees to the intense heat of the sun, by which means several of the trees died.

As the evil was great, it was necessary that the people should

should take some method to extirpate these pestilential vermin. They fixed some flax on a grate, set it on fire, and placed it under the nests; by which one part was burnt, and the other fell to the ground. However, vast numbers of the caterpillars crept up the trees again; which could have been prevented, had they been trod upon, or killed any other way. We called chickens to the places where these caterpillars crept on the ground, but they would not eat them: nor did the wild birds like them; for the trees were full of these webs, though whole flights of little birds had their nests in the gardens and orchards.

Though it was now pretty late in May, yet the nights were so dark, that, at an hour after sun-set, it was impossible to read in a book of the largest print. About ten o'clock, on a clear night, the darkness was so much increased, that it looked like a winter night in Sweden. It likewise appeared to us, that the stars did not give such a fine light as they do in Sweden; so that they appeared to us dark and cloudy. It was, therefore, at this time of the year, very difficult to travel in the nights; for neither man nor horse can find their way. The nights, in general, were very disagreeable to us, in comparison of the light and glorious nights of Sweden. Ignorance, sometimes, makes us speak slightly of our country; but if other countries have their advantages, ours has an equal number. The winters here bring no snow to make the nights clear, and to make travelling more safe and easy. The cold, however, is frequently as intense as in Sweden; and the little snow that falls lies only a few days, and always goes off with a great deal of wet; which renders it almost impossible to travel, even along the best roads.

The rattle-snakes, horned-snakes, red-bellied, green and other poisonous snakes, against whose bites there is frequently no remedy, are in great plenty here. To these we may add the wood-lice, with which the forests are so pestered, that it is impossible to pass through a bush without having a whole regiment of them on one's cloaths; or to sit down, though the place has ever so agreeable an appearance. The weather is so inconstant here, that sometimes when one day is intensely hot, another, next following it, is equally cold: nay, this sudden change sometimes happens in one day, which injures the health of the people considerably. The heat in summer is excessive, and the cold in winter sharp and piercing.

It has frequently happened, that when people walked into the fields, they dropped down dead with the heat, and, in general, intermitting fevers are frequent here; so that the climate is far from being so agreeable as it has been represented. Pease cannot be sown, on account of the vast numbers of insects that consume them; and there are several in the grains of rye, and in the cherry-trees. The caterpillars frequently eat all the leaves from the trees, so that they cannot bear fruit that year; and numbers die every year, both of fruit trees and forest trees. The grass in the meadows is likewise consumed by a kind of worms, which destroy the fruit.

The oak here is not so hard, nor so good, as in Europe, so that their houses do not stand long. The meadows are poor, and what grass they have is bad. The pasture for cattle in the forests consists of such plants as they do not like, and which they are compelled to eat by necessity, for it is difficult to find good grass in great forests, where the trees stand far asunder, notwithstanding the soil is excellent: for this reason the cattle are forced, during the whole winter, and part of the summer, to live upon the young shoots and branches of trees, which sometimes have no leaves: therefore the cows give very little milk, and continue to decrease in their size every generation. The houses are extremely unfit for winter habitations, because there are so many hurricanes, that they are constantly in danger of being driven down. Some of these inconveniences might be remedied by art, but others will either admit of no other alterations, or they will, at best, cost a vast deal of

trouble. Thus we find, that every country has its disadvantages as well as its advantages, and happy is he who can live in a state of contentment.

The rice grows very ill in most of the fields, which is owing to their want of knowledge in agriculture, particularly in their neglecting to manure their fields in a proper manner. Birds of prey, which pursue the poultry, are found in abundance here, and more so than in Europe. The reason is obvious: they enjoy great liberty, have vast forests to reside in, from whence they can come unawares upon chickens and ducks. To the birds of prey it is quite indifferent whether the woods consist of good or bad trees, provided they have but a shade. At night the owls, which are very numerous, endanger the safety of the tame fowls: they live chiefly in marshes, and give a most hideous shriek at night. They attack the chickens, who commonly roost at night in the apple-trees, and commit dreadful depredations among them.

The thick forests in this country contain vast numbers of stags, and they seem not different from those we have in Europe. We met with an Englishman, who was possessed of a tame hind; and it is worthy of observation, that although these creatures are very shy, when wild in the woods and cedar-swamps, which are very much frequented by them, yet they can be tamed to such a degree, if taken young, that they will come of their own accord to look for food. This hind, which the Englishman had, was caught when very young: the colour of the body was of a reddish-brown, except the belly and the under side of the tail, which were white; the ears were grey; the head, towards the snout, was very narrow; but, upon the whole, the creature looked very fine. The hair lay close together, and was very short; the tail reached almost to the bend of the knee, near which, on the inside of each hind-foot, was a knob. The proprietor of this hind told us, that he had tamed several stags by catching them whilst they were young. It was now big with young ones, and had a little bell hung round its neck, so that by walking in the woods the people might know it was tame, and take care not to shoot it. It was at liberty to go where it pleased; and to keep it confined would have been a pretty hard task, as it could leap over the highest inclosure. Sometimes it went far into the woods, and frequently staid away a night or two, but afterwards returned home like other cattle. When it went into the woods, it was often accompanied by wild stags, and decoyed them even into the very houses, especially in rutting time, giving its master many opportunities of shooting the wild stags almost at his door.

Its scent was excellent, and when it was situated towards the wind, we often saw it raising its head, and looking towards that part, though we did not see any people on the road; but they commonly appeared within an hour afterwards. As soon as the wild stags have the scent of a man, they make off, and shift for themselves in the woods. In winter the men fed the tame hind, belonging to the English gentleman, with corn and hay; but in summer it went out into the woods and meadows, seeking its own food, eating both grass and plants. It was, while we were there, kept in a meadow, and subsisted chiefly on clover. Sometimes it eat common pasture, leaves, and such other things as came in its way. The proprietor of this hind sold stags to people in Philadelphia, who sent them, as curiosities, to other parts of the continent. He generally got about forty shillings apiece for them; but that was only the currency of the country.

In the long and severe winter, which commenced here on the tenth of December, 1740, and continued till the thirteenth of March following, such vast quantities of snow fell, that many stags were found dead. No body could say whether their death was occasioned by the snow, or whether the frost had been too severe, and of too long duration. Numbers of
birds

birds were likewise found dead at the same time, which was, in all probability, owing to the want of food, more than the severity of the weather. In that winter a stag came to the stables in Matsong, and eat hay together with the cattle. It was so pinched by hunger, that it grew tame immediately, and did not run away from people; and it afterwards continued in the house as another tame creature. All aged persons asserted, that this country abounded formerly with more stags than it does at present; for it was frequent, in former times, to see thirty or forty of them in a flock together. The reason of their decrease is chiefly owing to the increase of population, the destruction of the woods, and the numbers of people who every day either kill them, or frighten them away. Among their enemies is the lynx, which is the same with those found in Sweden. These creatures climb up the trees, and when the stags pass by, they descend down upon them, get fast hold, bite and suck the blood, and never give over till they have either killed them, or left them almost dead.

We saw several holes in the ground, both on hills, and in fields. They were round, and, for the most part, about an inch wide: they went almost perpendicularly into the earth, and were made by dung-beetles, or by great worms, which are made use of for angling. The dung-beetles had dug very deep into the ground through horse-dung, though it lay very hard on the ground, so that a great heap of earth lay near it. These holes were afterwards occupied by several other insects, especially grasshoppers; for in digging them, we usually found several young ones, who had not come to a full size.

May 19. We left a place called Ranvion, chiefly inhabited by Indians, in order to pursue our journey to the northward. On the first day of our journey, we saw a black snake, which we killed, and found it to be just five feet long. These snakes are commonly of this length, but they are very small and slender. The largest we saw was not above three inches thick in the broadest part: the back is black, shining, and smooth; the under jaw white and smooth; the belly of a light blue colour; but some of these differ in their common appearances.

This country abounds with these black snakes, and they are among the first that make their appearance in the spring. They often appear very lively if the weather is warm; but if after it grows cold again, they are quite frozen, and lie stiff on the ground or the ice. When taken in this state, and put before a fire, they generally revive in less than an hour.

This is the swiftest of all the snakes which are to be found here, for it moves so quick, that a dog can hardly catch it. It is, therefore, almost impossible for a man to escape it if he is pursued; but happily its bite is neither poisonous nor any way dangerous. Many people have been bit by it in the woods, and have scarce felt any more inconveniency than if they had been wounded by a knife; the wounded place only remaining painful for some time. These black snakes seldom do any harm except in spring, when they copulate, at which time they will attack the person who disturbs them. We met with several people who, on such occasions, had run themselves almost out of breath to escape their fury, and ran almost as swift as an arrow. If a person, thus pursued, can muster up courage enough to oppose the snake with a stick, or any thing else, when it is either passing by him, or when he steps aside to avoid it, it will turn back again and seek refuge in its swiftness.

We were assured by several persons, that when it overtakes one who has tried to escape it, and who has not courage enough to oppose it, it winds round his feet so as to make him fall down; it then bites him several times in the leg, or whatever part it can get hold of, and goes off again. In support of what is here said, we shall mention only two instances, though we might relate many more.

While we were at New York, Dr. Cobden told us, that in the spring of 1748, he had several men at work

at his country seat, and among them one lately arrived from Europe, who of course knew very little of the black snakes. The other workmen seeing a great black snake copulating with its female companion, desired the new comer to go and kill it, which he intended to with a little stick: but on approaching the place where the snakes lay, the male in great wrath forgot his pleasure, and pursued the stranger with the most amazing swiftness till it overtook him, and twining several times round his feet, threw him down, and frightened him almost out of his senses; nor could he get rid of it, till he pulled out a knife and cut it into two or three pieces.

Many people at Albany told me of an accident that happened to a young lady, who went out of town in summer, together with many other girls, attended by her negro. She sat down in the wood, in a place where the others were running about, and before she was aware, a black snake, being disturbed in its amours, ran under her petticoats, and twisted round her waist, so that she fell backwards in a swoon, occasioned by the fright, or by the compression which the snake caused. The negro came up to her, and suspecting that a black snake might have hurt her, on making use of a particular remedy to bring his lady to herself again, he lifted up her cloaths, and found the snake wound about her body as close as possible. The negro was not able to tear it away, and therefore cut it, and the girl came to herself again; but she conceived so great an aversion to the negro, that she could not bear the sight of him afterwards, and died of a consumption. At other times of the year this snake is so much afraid, that it runs away when any human creatures make their appearance; so that we find it is only the violence of their passions, on particular occasions; that induces them to injure the human race: but still travellers ought to be on their guard against them.

Most of the people in this country believe that these black snakes have the power of fascinating birds, squirrels, and such like creatures; but of this we could not procure any certain accounts, any farther than we were told by the people.

They tell us, that when the snake lies under a tree, and has fixed his eyes on a bird or a squirrel above, it obliges them to come down and go quietly into their mouths. We never saw this done, and yet it is confidently asserted as matter of fact by many reputable people. It is added farther, that the bird or squirrel, runs up and down along the tree, continuing its plaintive song, and always comes nearer the snake, whose eyes are unalterably fixed upon it. It should seem as if these poor creatures endeavoured to escape the snake by hopping or running up the tree, but then there appears to be a power that with-holds them; for they are forced downwards, and each time that they turn back, they approach nearer their enemy, till they are at last forced to leap into its mouth, which stands wide open for that purpose.

Numbers of squirrels and birds are continually running and hopping fearless in the woods, on the ground, where the snakes lay in wait for them, and can easily give these poor creatures a mortal bite. Therefore, it seems that this fascination might be thus interpreted, that the creature has first got a mortal wound from the snake, who is sure of her bite, or at least feels pain from the violence of it: the snake lies quiet, being assured that the wounded creature has been poisoned, and that at last it will be obliged to come down into its mouth. The plaintive note is, perhaps, occasioned by the acuteness of the pain which the wound gives the creature. But to this it may be objected, that the bite of the black snake is not poisonous; and it may be farther objected, that if the snake could come near enough to a bird or squirrel, to give it a mortal bite, it might as easily keep hold of it; or, as it sometimes does with poultry, twist it round, or strangle and stifle it.

But the chief objection which lies against this interpretation, is the following account, which we received

received from the most credible people at that time in the country.

The squirrel being upon the point of running into the snake's mouth, the spectators have taken care not to let it come so far, but killed the snake, and as soon as it had received a mortal blow, the squirrel or bird, destined for destruction, flew away, and left off the mournful note. Some say, that if they only touched the snake, so as to draw off its attention from the squirrel, then it went off quickly, not stopping till it had got to a great distance.

Why do the squirrels and birds go away so suddenly? and why no sooner? If they had been poisoned or bitten by the snake before, so as not to be able to get from the tree, and be forced to approach the snake more and more, they could not, however, get new strength by the snake's being either killed or diverted. Therefore, it would seem that they are only enchanted while the snake's eyes are fixed on them. However, this looks odd and unaccountable, though many of the most worthy people in the country asserted it to us as matter of fact; and had we objected to it, we should have been exposed to public scorn and laughter.

The black snakes kill the frogs and eat them; and if they get at the eggs of the poultry, they break them and suck out the contents: when the hens are sitting on their eggs, they creep into the nests, wind round the birds, stifle them, and then suck their blood. Here, snakes are very greedy of milk, and it is very difficult to keep them from going into the cellars where it is contained. Some of them have been seen eating milk out of the same dish with children, without biting them; though they often gave it blows with their spoons, upon its head, when it seemed to be over greedy. These sort of snakes can raise one half of their bodies from the ground, in order to look about them; they have new skins every year, which are considered as a sovereign remedy against the cramp.

May 26. We met with a most dreadful storm, which began about ten o'clock in the evening, when the sky was quite clear, then a thick cloud appeared rising from the south west, with a very high wind; the air was quite calm, and we could not feel any breeze: but the approach of this cloud was perceived from the strong rushing noise in the woods to the south west, and which increased in proportion as the cloud came nearer. As soon as it was come up to us, it was attended by a violent gust of wind, which, in its course, threw down the weaker inclosures, carried them a good way along with it, and broke down several trees: it was then followed by a hard shower of rain, which put an end to the storm, and every thing was calm as before. These showers are frequent in summer, and have the quality of cooling the air; but still they frequently do a great deal of damage: they are commonly attended by thunder and lightning, and as soon as these are passed over, the sky is as serene as before.

May 30. We met with a great number of Moravian brethren, who had come from Europe, and brought two converted grandees along with them. The Moravians, who were already settled in America, sent some of their people to wait on them, and to welcome them to that country. Among these deputies were two North American Indians, who had been converted to their doctrine; and likewise two South Americans, from the island of Surinam, which for a considerable number of years belonged to the Dutch.

These three sorts of converted savages met at New York, where we had an opportunity of conversing with them; but we could make but little of them. The sensibility of their feelings induced us to believe that there had been, or still is, a connection between the north of Europe and America; but this we leave for the learned to decide; it being a subject far beyond our comprehension.

May 31. We embarked on the River Delaware, and for some time sailed with a fair wind. Here we saw a vast number of sturgeons, who frequently leaped

above a fathom into the air: we saw them continuing this exercise all day, till we came to fathom. The banks on the Pennsylvania side were low, and those on the New Jersey side steep and sandy, but not very high, and on both sides were fine forests of trees.

During the course of this month, the forenoon was always calm; but immediately after noon it began to blow gently, and sometimes pretty hard: the mornings were likewise fair, but still there was nothing to be met with but changes. We saw some small houses near the shore, in the woods, and now and then a good house built of stone. The river now decreased visibly in breadth, and about three o'clock in the afternoon we passed Burlington.

Burlington is the chief town in New Jersey, and the residence of the governor. It is but a small place, and is situated about twenty miles from Philadelphia, on the eastern side of the Delaware. The houses are chiefly built of stone, but they stand at a considerable distance from each other. The town has a good situation, for shipping of a considerable burthen can sail up to it; but Philadelphia carries on the greatest part of the trade, for the proprietors of that place have granted it many privileges, by which it so increased as to swallow up all the trade of the towns around it.

The house of the governor at Burlington is but a small one, built of stone, stands close by the river side, and is the first building in the town in coming from Philadelphia.

The banks of the river were now chiefly high and steep on the side towards Jersey, consisting of a brick coloured soil. On the Pennsylvania side they were gently sloping, and consisted of a rich blackish mould, which appeared very fit for all sorts of grains.

Towards night, after the tide had begun to subside, we could not proceed, but dropped our anchor about seven miles off Trenton, and passed the night there.

June 1. We continued sailing up the river, as soon as the heavy rains had subsided; and here we found the river very narrow; the banks the same as we found them the day before, after we had passed Burlington. About eight in the morning we arrived at Trenton.

June 2. This morning we left Trenton, and proceeded towards New York: we found the fields were sown with wheat, rye, oats, maize, hemp and flax. Here we saw abundance of chestnut-trees in the woods, and we took notice that they were always growing in poor ground. The tulip-tree did not appear on the sides of the roads, but we were informed there were many of them in the woods. The beaver-tree grows in the swamps; it was now in flower, and the fragrance of its blossoms had so perfumed the air, that we smelt it long before we came in sight of it. The houses we passed were most of them built of wood; and, in one place, we saw the people building a house of mere clay, just as if it had been an oven for a baker; for all ovens here are built of these materials. Buck-wheat was already coming up in several places, and we saw single plants of it all day in the woods, and in the fields, but always near the side of the road; from which circumstance it may be concluded, that they spring up from lost or scattered seed. Late this evening we arrived at New Brunswick.

June 3. At noon we went on board a yacht bound for New York, and sailed down the river, which had, at first, pretty high and steep banks of red sandy stone on each side. Now and then there was a farm house on the high shore, and these, at a distance, had a romantic appearance. As we came lower down, we saw, on both sides, great fields and meadows close up to the water; but we could not sail at random with the yacht; for the river was often shallow in some places, and sometimes in the very middle. For that reason, the course we were to take was marked out by branches with leaves on them. At last we got into the sea, which bounded our prospect on the south, but on the other side we were continually in sight of land, at a short distance. On coming to the mouth of the river, we had a choice of two roads to New York, viz. either within Staten Island, or without it. The inhabitants

T. Conder Sculp.

inhabitants are determined in their choice by the weather; for when it is stormy and cloudy, or dark, they do not venture to sail without, where the sea itself communicates. We took that course now, it being very pleasant weather; and though we struck on the sands once or twice, yet we got safe off again, and arrived at New York about nine o'clock.

June 4. This day we found vines in several gardens; and these vines, notwithstanding the coldness of the climate, bear excellent grapes. When the winters are very severe, they are killed by the frost, and die quite to the ground; but the next spring new ones shoot up from the roots. Strawberries were now sold about the town every day; and an Englishman from Jamaica asserted there were strawberries in that island. The snakes are very fond of strawberries: those we found here were as good as any we had seen in Europe. Red clover was sown on several of the hills without the town, and the country people were employed in mowing the meadows; some of the clover was already cut down; and the dry clover was put under cover, in order to be carried away the first opportunity.

Cherry-trees were planted, in great quantities, before the doors of the farm houses, and along the high roads, all the way from Philadelphia to New Brunswick; but behind the latter place they begin to grow scarce. On coming to Staten Island, in the province of New York, we found cherries very common again, especially near the gardens; but there were not such varieties of them as in Pennsylvania. We seldom saw any of those called black heart cherries, but frequently the four sorts of red ones. All travellers are allowed to pluck ripe fruit as they go along, which is of considerable service to them in those countries. Between New Brunswick and Staten Island are a few cherry-gardens, but more orchards with apple-trees.

June 6. We dined with several merchants far advanced in years; and they asserted, that, during their lives, they had found several species of fish to decrease in their numbers every year; and that they could not get so many of them as formerly. Rum is used here in great quantities, but it is not reckoned so good as that they bring from the West Indies. That rum is less noxious than other spirituous liquors, is owing to the balsamic qualities it gets from the sugar, which prevents it from being of a preying nature. The older the rum is, and the longer it has been kept in the cask, the more it is purified, and the better for use.

Long Island is situated opposite New York, in the sea; and what is more remarkable, the northern part is more fertile than the southern. Formerly there lived a number of Indians on this island; and there are yet some, but they gradually decrease in number. The soil of the southern part of the island is very poor, but this deficiency is made up by a vast quantity of oysters, lobsters, crabs, and many other sorts of shell fish. Therefore the Indians formerly chose to live in the southern parts of the island, because they subsisted chiefly on oysters, and other productions of the sea. When the tide is out, it is very easy to fill a cart with oysters, which have been driven on shore by the flood. The island is strewed with oyster-shells, and these serve for good manure to the fields; but all the southern parts are used as meadow land for their cattle.

June 10. At noon we left New York, and sailed up Hudson's River in a yacht bound for Albany. All this afternoon we saw a fleet of little boats returning from New York, where they had bought provisions and other things for sale; which, on account of the extensive commerce of this town, and the great number of its inhabitants, go off very well. The River Hudson runs from north to south here, except where the land running in, alters its direction, which is generally the case. Its breadth at the mouth is more than a mile; and here we saw a vast number of porpoises. The eastern shore, next to New York, is very high, but the western is sloping, and covered with weeds. On each side, we saw several farm houses sur-

rounded with corn fields, and the ground of which the steep sides consisted was of a bright colour; sometimes we saw small rocks.

About ten or twelve miles from New York, the north west shore appears very different from what it was before; for it consists of steep mountains, with perpendicular sides towards the river. Sometimes a rock projects like the angle of a bastion; and the tops of these mountains are covered with oaks, and other wood. Stones of all sorts lay along the shore, which have fallen from the neighbouring mountains and rocks.

These high mountains continue several miles in length on the western shore; but on the eastern side the land is diversified with hills and valleys, which are commonly covered with delicious trees, in the middle of which are several pretty farm houses: the hills are covered in some places with stones; and about two miles from New York we saw sturgeons leaping out of the water; and in the whole passage we met with porpoises in the river. As we proceeded, we found the eastern banks of the river very well cultivated; and a number of pretty farms surrounded with orchards and fine corn fields. About twenty-two miles from New York, the face of the country was quite different, especially on the western shore of the river; for, from mountainous, it became interrupted with little vallies and round hillocks, which were scarcely inhabited at all; but the eastern shore afforded us a most delightful prospect. After sailing a little while in the night, we cast anchor, and lay here till the morning; especially as the tide was ebbing with great force.

June 11. This morning we continued our voyage up the river with the tide and a faint breeze. We now passed the highland mountains, which were to the east of us; they consisted of grey stony rocks: the tops of these eastern mountains, on the opposite shore, were cut off from our sight by a thick fog which surrounded them. The country appeared unfit for cultivation, being so full of rocks that we could not see any farms.

A thick fog now rises up from the mountains, and for the space of some English miles, we had hills and rocks on the western banks of the river, and a change of season; likewise greater and lesser mountains and valleys, covered with young firs.

The hills close to the river are commonly low, but their height increases as they approach nearer the river. Afterwards we saw for some time, and indeed for miles together, nothing but high round mountains, and beautiful vallies, both covered with woods. The vallies are, in general, well cultivated; and in them are several beautiful farms. The breadth of the river is, sometimes, two or three musket shot, but commonly not above one. Every now-and-then we saw several fish leaping out of the water; and about nine o'clock the wind intirely fell, and forced us to get forwards with our oars; the tide being almost spent.

The water of this river begins here to lose its brackish taste; and yet we were told, that the tide, when the winds are strong to the south, sometimes carries the salt water much higher: the colour of the water was higher, and appeared more black than before. To account for the origin of rivers, is extremely difficult, if not wholly impossible. Some rivers may have flowed from a great reservoir of water, which being considerably increased by heavy falls of rain, or other circumstances, passed its old bounds, and flowed down into the lower countries; or through other places, where it met with the least opposition. This is, perhaps, the reason why so many rivers run in a variety of bendings; equally where rocks resist their passages, as where the opening ground makes way for them.

However, it seems that some rivers receive their first origin from the creation itself, and that Providence then pointed out their course; for their existence, in all probability, cannot be owing to the accidental irruption of water alone. Among such rivers we may rank that of Hudson's; and we were surpris'd at seeing its course, and the variety of its shoals.

It takes its rise a great way above Albany, and descends to New York in a direct circle from north to south; which is a distance of one hundred and sixty miles.

In many places, between New York and Albany, are ridges of high mountains, running from west to east. But it is remarkable, that they go on undisturbed till they come to the River Hudson, which stands perpendicular towards the river. There is an opening left in the chain of mountains as broad as on the other side, in the same direction. It is likewise remarkable, that the river, in places where it passes through the mountains, is as deep, and often deeper than in other places. The perpendicular rocks, on the sides of the river, are surprising; and it appears as if no passages had been opened by Providence for the river to pass through, as all the country would have been over-run with water.

We now perceived excessive high and steep mountains on both sides of the river, which echoed back each sound we uttered; but notwithstanding they were so steep and high, they were beautifully covered with small trees. The blue mountains, that reared their heads above all the others, were now seen before us, towards the north, but at a great distance. The country now began to look more cultivated; and we saw vast numbers of farm houses scattered up and down, from place to place. In passing by the hills, we had the wind in our faces, so that we were obliged to come to an anchor; and at the same time the tide was against us.

While we waited for the return of the tide, and the change of the wind, we went on shore, to take a view of the curious sassafras-tree, which grows here in vast numbers. We likewise found a great variety of tulip-trees in full blossom, which made the country appear extremely beautiful.

In the afternoon, the wind arose from south west, which being a fair wind, we weighed anchor, and continued our voyage. The place where we lay at anchor, was at the end of those steep mountains already mentioned: their height was amazing, beyond description, and they consist of grey rock stone; which frequently breaking in pieces, falls down upon the shore. As soon as we had passed these mountains, the country appeared more beautiful, and the river increased in breadth, so as to be almost an English mile. After sailing some time, we found no more mountains on the sides of the river; only that a considerable distance to the east was a chain of them rearing their heads. These mountains, for about half way in, were covered with wood; but the summits exhibited nothing but barren rocks.

The eastern side of the river is much better cultivated than the western, where we seldom saw a house; the land being covered with woods, except where there are some new farms dispersed here and there. The high mountains, which we left in the afternoon, now appeared above the woods and the country. These mountains, which were called the Highlands, did not project more to the north than the others, in the place where we anchored. They have all of them sloping sides, so that we climbed up some of them; but with no small difficulty. On some of the high grounds, near the river, we found the people burning lime; and the master of the yacht told us, that they broke a fine blueish grey lime-stone in the high grounds, along both sides of the river, for the space of some English miles, and burnt heaps of it. But at some miles distance, there is no more lime-stone on the banks of the river till they come to Albany. This day we passed by a little neck of land, which projected on the western side in the river, and was called Zeinore. This name is said to be derived from a festival which the Dutch celebrated here in former times, and at which they danced and diverted themselves; but at one time came a party of Indians and killed them all. Here we cast anchor, late at night, and found the depth of the water twelve fathoms. The fire-flies passed the river in great numbers at

night, and sometimes settled upon the rigging of our vessel.

June 12. This morning we proceeded with the tide, but against the wind, and found the river about a musket shot in breadth. This country, in general, is low on both sides, consisting of stony fields; which are, however, covered with woods. It is so stony, rocky, and poor, that few can settle in it; for it will not yield corn except in a few places.

The country continued to have the same appearance for some miles; and yet we did not perceive one settlement. At eleven o'clock this morning we came to a little island, which lies in the middle of the river, and is considered to be half way between New York and Albany. The shore was still rocky and stony as before; but at a greater distance, we saw high mountains covered with woods, and these were chiefly on the western shore; but still the blue mountains appeared above them. Towards noon it was quite calm, and we went on very slowly; but here we found that the land began to have a more agreeable appearance, for in several places it was well cultivated, although the soil was rather sandy. Several villages appeared on the east side of the river, and one of these, called Strasburgh, was inhabited by Germans.

The Blue Mountains are very plainly to be seen here through the clouds, and tower above all other mountains. There is another village at a small distance from Strasburgh, called Rhimbeck; which, like the other, is inhabited by Germans; for these people take along with them, into foreign countries, the names of the places where they were born. Had the antients transmitted to us the particular spots from whence new colonies were supplied with inhabitants, we might have been able to discover the etymology of all the towns in the known world.

At two in the afternoon, it began again to blow from the south, which enabled us to proceed. The country, on the east side, is high, and consists of a well cultivated soil, there being plenty of corn growing, and farm houses, with orchards adjoining to them.

June 13. The wind favoured our voyage during the whole night, so that we had no opportunity of observing the nature of the country. This morning, at five o'clock, we found ourselves within nine miles of Albany; the country on both sides of the river was low, and covered with wood, excepting a few scattered settlements. Under the higher shore of the river, are wet meadows, covered with sword grass; and these meadows are formed into little islands. We saw no mountains here; but hastened towards Albany, where, as we approached the place, we gradually found the ground better cultivated, and in some places finely inclosed.

At eight o'clock in the morning we arrived at Albany, and found that the river was not above a musket shot in breadth. All the yachts that sail between New York and Albany belong to the latter: they go up and down the river as long as it is free from ice, and they bring from Albany boards or planks, with other sorts of timber, flour, pease, and firs, which they get from the Indians, or, which are smuggled from the French. They come home almost empty, seldom bringing with them any thing besides rum. This the inhabitants of Albany cheat the Indians with, for they first make these poor people drunk, and then buy their firs of them at whatever price they please.

The yachts are large, and each has a cabin, in which the passengers are conveniently lodged. They are commodiously built, either of red or white oak: sometimes the bottom is of oak, and the sides of red cedar, because the latter withstands putrefaction much longer than the former. The red cedar is likewise apt to split when it is struck against any thing; and the river Hudson is, in many places, full of sands and rocks; against which the keel of the yacht sometimes hits. Therefore, they chuse white oak for the bottoms, being the softer wood, and not splitting so easily; the bottom being continually under water.

is not so much exposed to putrefaction, but holds out longer.

The canoes which the yachts have along with them are made of a single piece of wood hollowed out, frequently three or four fathoms long, and shaped at both ends, being always as broad as the wood will allow. The people cannot row sitting, but commonly a person stands at each end with a stout oar in his hand, with which he governs and brings the canoe forwards. Those which are made at Albany are commonly of the white pine, but they are for the most part not much esteemed. At New York they are made of the julip tree; but these trees are so small in Albany, that they are unfit for canoes, as they would be liable to overset.

Battoes are another kind of boats mentioned in Albany; they are made of boards of white pine, with flat bottoms, that they may row the better in shallow water; they are shaped at both ends, and somewhat higher towards the ends than in the middle; they have seats in them, and are round as common boats, but they are not all of a size, some being three, and some four feet long; the height from the bottom to the top of the board is about two feet, and the breadth in the middle about a yard and six inches. They are chiefly made use of for carrying goods up the rivers to sell to the Indians, that is, when their rivers are open enough for the battoes to pass through; and when they cannot, they are carried by land a great way. The boats made of the bark of trees crack easily, by knocking against a stone; and the canoes cannot carry a heavy loading, so that the battoes are considered as preferable. We saw no boats here like those commonly made in Europe, and we were of opinion that the Indians knew the art of making these vessels many years ago, though it is probable enough that our people may have made them first.

In Albany the frost frequently does a great deal of damage, for there is hardly a month even in summer in which a frost does not happen; the spring is commonly late, and in April and May are many cold nights, which frequently kill the blossoms of trees, and destroy the vegetables. It was found, while we were there, that the blossoms of the apple trees had been so severely damaged by the frosts during the month of May, that next autumn there would be but very few apples; the oak blossoms are very often killed by the frosts in the woods; and the autumn is of a long continuance, with warm days and nights; however the cold nights frequently begin at the latter end of September, and are extremely severe in October.

During summer the wind blows commonly from the south, and brings along with it a great draught, sometimes it rains a little; and as soon as the rain is over the wind shifts about to the north-west, blowing for several days from that point, and then returning again to the south. These changes of the wind in such an exact, and yet surprising manner, we took particular notice of during the time we were there, but they are not much minded by the inhabitants, for custom wears off the edge of curiosity, and makes entertainment insipid.

June 15. We went to view the inclosures round the neighbourhood, and found that most of them were made of boards of fir wood, of which there is always abundance here, and many saw mills to cut it. The several sorts of apple trees grow very well here, and bear as much fruit as in any other parts of North America, each farm having a large orchard. They have some apples here extremely large, and very palatable, which are sent to New York, and other places as a great rarity. Vast quantities of cyder are made here, and throughout the whole country of Albany; but they do not take proper care in the management of it.

Beach trees have often been planted, but never arrived to any great degree of perfection; this was attributed to a worm that lives in the ground, and eats

through the root, so that the tree dies: perhaps the severity of the winter contributes much to it. Except what we have mentioned, we could not learn that they planted any other sorts in the neighbourhood of the town of Albany; but they sow a vast quantity of hemp, most of which is used in home consumption.

They sow maize in great abundance, and a loose soil is reckoned the best for that purpose, for it will not grow in clay. This practice succeeds so well, that in any ordinary season one bushel will produce a hundred. They reckon maize a very good kind of corn, because the shoots recover after having been hurt by the frost. They have examples here of the shoots dying twice in spring to the very ground, and yet they came up again afterwards, and afforded an excellent crop. Maize has likewise the advantage of standing much longer against a drought than wheat: the larger sort of maize, which is corn, mostly sown here, ripens in September, and is immediately cut down; which is the more necessary, that it may be kept from the frost.

They sow wheat in the neighbourhood of Albany to great advantage, one bushel producing twelve; and when the soil is good, they get twenty. If the crop is only ten bushels to one, they think it but an indifferent season. The greatest number of the inhabitants here are Germans and Low Dutch. The Germans live in several large villages, and sow great quantities of wheat, which is brought to Albany, and from thence sent to New York. The wheat flour from Albany is reckoned the best in North America, except that from Sopus or King's Town, a place between Albany and New York. All the bread in Albany is made of wheat flour, and at New York this flour is sold at a great price.

They neither sow much barley nor rye, because the profits arising from it are not great. Wheat is so plentiful, that they make malt of it. Indeed, in the neighbourhood of New York we saw a great many fields of barley; but that being a flourishing city, any quantity of grain is easily disposed of.

Both Dutch and Germans sow great quantities of pease, which succeed very well, and are carried annually to New York. For some years they had but few insects, but that summer we were there they were infested with beetles, which made vast havock among their fields of grain; this was a great loss to the farmers, and also to the sailors, who use considerable quantities. Experience has convinced the people of New York, that when they sow pease which come from Albany, they thrive very well for one year, but the next they are generally eaten away by the worms.

The shingles with which the houses are covered are made of the white pine, which is reckoned as good and as durable, and sometimes better, than the white cedar. The white pine is found in abundance here, in such places where common pines grow in Europe. We saw vast quantities of deal from the white pines, on this side of Albany, which are brought down to New York, and from thence exported to other places.

The woods abound with vines, which likewise grow on the steep banks of the river in surprising quantities. We climbed to the tops of trees on the banks, and bent them by our weight. The grapes are eaten after the frost has attacked them, for before that they are too sour. The vast woods near Albany contain immense swarms of gnats, which annoy travellers. To be in some manner secured against these insects, the people besmear their houses with butter or grease, for the gnats do not like to settle in greasy places. The violent heats make boots very uneasy, but to prevent the gnats from stinging the legs, they wrap some paper round them, under the stockings; some travellers will cover the whole face, and have a piece of gauze before their eyes. At night they lie in tents, if they can carry any along with them, and make a great fire at the entrance, by the smoke of which the gnats are driven away.

The porpoises seldom go higher up the river Hudson

Hudson than the salt water does, and after that sturgeons come in their room. It has, however, frequently happened that sturgeons have gone up as far as Albany. The fire-flies are here seen in great abundance every night in summer, and they fly up and down the streets of the town: they come into the houses, if the doors and windows are open.

This afternoon, we went to visit an island which lies in the middle of the river, about a mile below the town. It is about an English mile in length, but not above a quarter broad. It is almost intirely turned into corn-fields, and is inhabited by a single planter, who, besides possessing this island, is the owner of two more. Here we saw no woods, except a few trees, which were left round the island on the shore, and formed, as it were, a tall hedge. The red maple grows here in great plenty, in several places. Its leaves are white under the edges, and when agitated by the wind, they make the trees appear as if it was full of white flowers. The water-beach grows to a great height, and is one of the most shadowy trees here; but the water-poplar is the most common tree, and grows exceedingly well on the banks of the river: it is tall, and in summer affords a most excellent shade for men and cattle, against the scorching heat of the sun. On the banks, rivers and lakes, it is one of the most useful trees; because it holds the soil, by its extensive branching roots, and prevents the water from washing it away. The water-beach and the elm-tree, serve the same purpose. The wild prune-trees were plentiful here, and were full of unripe fruit, but the wood is not made any use of. Here are vast numbers of wild vine-trees, but they ripen so late that they are seldom good for much.

The soil of this island is a rich mould mixed with sand, which is chiefly employed in maize plantations; here we saw large fields of potatoes. The whole island was let on lease for one hundred pounds of New York currency, and the person who first had it, let it in small lots to the people of Albany, for the purposes of making kitchen gardens; and by that means reimbursed himself. There are a vast number of curious plants here, which are not to be found in Europe; and these might be of great service in the medical world if they were properly cultivated.

The tide in the river Hudson goes about eight or ten miles above Albany, and consequently runs one hundred and fifty-six English miles from the sea. In spring, when the snow melts, there is hardly any flowing near this town, for the great quantities of water that come from the mountains, during that season, occasion a continual ebbing, and this likewise happens after heavy rains.

The cold is always very severe here, and the ice in Hudson's River is seldom less than four feet thick. It is so strong, that so late as the third of April some of the inhabitants crossed the river with six pair of horses. When the ice begins to dissolve, the streams are so violent, that they often carry houses along with them. The water is very high, at that time, in the river; because the ice stops sometimes, and sticks in places where the river is narrow, so as to obstruct the streams. The water has been frequently found to rise three fathoms higher than it was in summer; and the ground is generally frozen five or six feet deep. About the middle of November the yachts are put up, and about the beginning of May are in motion again.

We found the water in the wells, in this town, extremely cold during the heat of summer, and the taste had something like acid in it, not very agreeable. On a closer examination, we found a vast number of insects in it, but we could not properly distinguish what they were. Their length was different, some being long, and others being short. They were very narrow, and of a pale colour: the head was blacker and thicker than the other parts of the body, and about the size of a pin's head: the tail was divided into two branches, and each branch terminated in a little black globe. When these insects swarm, they proceed in little crooked lines, almost like the tadpoles.

We were frequently obliged to drink water here, in which we saw the vermin swimming, and next day we generally felt something like a pea sticking in our throats, or as if there had been a swelling, which continued upwards of a week. However we endeavoured, as often as possible, to mix rum with the water, and then we did not feel any pain at all. Perhaps many of our diseases in Europe arise from waters of this nature, which we do not sufficiently examine. We frequently saw vast numbers of insects in water, which otherwise seemed to be clear; so that it appeared no easy matter for us to discover where the malady lay. Almost every house in Albany has its well, the water of which is applied to common use; but for tea, cleaning, and washing, they commonly take the water of the river Hudson, which flows close up to the town.

This water is, generally, quite muddy in summer, as well as very warm; and on that account it is kept in cellars, in order that the slime may subside, and that the water may cool a little. We lodged here with a gunsmith, who told us, that the best charcoal for the forges was made of the black pine; and the next in goodness, in his opinion, was made of the birch-tree. The best and dearest stocks for his muskets were made of the wood of the wild cherry-tree, and next to that he valued the use of the red maple; for they seldom make use of any other wood for this purpose. The black walnut-tree affords excellent wood for stocks, but there is little of it to be found in the neighbourhood of Albany.

June 21. Next to the town of New York, Albany is the most wealthy in this province. It is situated on the declivity of a hill, close to the western shore of the river Hudson, about one hundred and forty-six miles from New York. The town extends along that side of the river, and the mountains on the next bound the prospect. There are two churches in Albany, an English and a Dutch one. The Dutch church stands at some distance from the river, on the east side of the market, and is built of stone, having a small steeple and a bell: but it has only one minister, who preaches every Sunday.

The English church is situated on the hill, at the west end of the market, directly under the fort, and is likewise built of stone, but has no steeple. There was no service in this church while we were there, because they had no minister; but most of the people understood Dutch, except the soldiers in the garrison. The minister of this church has a settled salary of one hundred pounds a year, which is remitted to him from England; but we found that he seldom attended his duty.

The town hall lays to the south of the Dutch church, close by the river side, and is a fine stone building, three stories high. It has a small tower, with a gilt ball, or vane, at the top of it. The houses in this town are very neat, and partly built with stones, covered with shingles of the white pine. Some are slated with tiles sent over from Europe, because the clay of this country does not answer that purpose. Most of the houses are built in the old way, with the gable end towards the street; only that some new ones have been erected on a more fashionable plan. The reason why they are so very awkward in building their houses here is, that most of the first settlers were Dutchmen, who, knowing nothing of the beauties of architecture, sought to imitate the fashion of their own country.

The outsides of the houses are never covered with lime or mortar, and yet the walls do not seem to have been endangered by the air: but it is extremely disagreeable in rainy weather, on account of the water falling from the gutters into the very middle of the streets. The street doors are generally in the middle of the houses, and on both sides are seats, on which, during fine weather, the people spend almost the whole of the day, especially as there are here trees to form a kind of a shade. In the evenings, these seats are covered with people of both sexes; but this is rather trouble-

Engraved for *Moor's Voyages & Travels*

Habits of **ESKIMAUX INDIANS**, *natives of Hudson's Bay.*

troublesome, as those who pass by are obliged to speak to every one; for were they to neglect that, they would be looked upon as extremely rude. The streets are broad, and some of them are paved, being lined in some parts with trees; and the long streets intersect each other at right angles. The street that runs between the two churches, is five times broader than the others, and serves as a market place. But, upon the whole, the streets are very dirty, because the people suffer their cattle to stand in them during the summer nights. There are two market places in the town, which the country people resort to with all sorts of provisions, but they have nothing in them remarkable.

The fort is built on a steep hill, on the west side of the town, and is built entirely of stone, surrounded with high and thick walls; but the situation is bad, as it can only serve to keep off plundering parties, without being able to sustain a siege. There are numerous high hills to the west of the fort, which commands it, and from whence one may see all that is done within it. There is a spring of water in this fort, and here several companies of soldiers are always quartered.

The situation of Albany is very advantageous for trade; for the river Hudson, which flows close by it, is from twelve to twenty feet deep. No quay has yet been made, because the people were afraid that the shoals of ice would have driven it away: but this was a ridiculous notion, because any ingenious artist, who was acquainted with the rules of architecture, could have constructed one that would have opposed, with a sufficient force, every thing of that nature. The river naturally leads the inhabitants of this town to trade with the people of New York, and their exports consist chiefly in firs, boards, wheat, flour, rum, and several kinds of timber. Indeed there is not a place in the whole of the British dominions in America, except Hudson's Bay, and the territories belonging to it, where such vast quantities of firs can be found. Most of the merchants in this town send a clerk to Oswego, a factory belonging to the English; and to which the Indians resort with their firs; but of this we shall speak more at large afterwards.

The merchants from Albany spend the whole summer at Oswego, and trade with many tribes of Indians, who come to them with their goods. Many people assured us, that the Indians are frequently cheated in disposing of their goods, especially when they are in liquor; and that sometimes they do not recover one half of their value. We were witnesses to some transactions of that nature, and looked upon them with regret; for how can we expect to civilize savages, while we set a thievish example before them?

The merchants of Albany glory in these tricks, and are much pleased, when they have given a poor Indian a greater quantity of brandy than he can bear to drink; after which, having reduced him to a state of intoxication, they take their goods from him at what price they please. The Indians often find, when they have returned to a state of sobriety, that they have been cheated; and they grumble, but are soon satisfied, when they reflect that they have, for once, drunk as much as they were able of a liquor which they valued beyond any thing else in the known world; and they are again insensible of this loss, if they get a fresh draught of this nectar.

Besides this trade at Oswego, a number of Indians come to Albany from several parts, especially from Canada; but from this latter place they hardly bring any thing but beaver skins. The inhabitants in Albany have, in general, very considerable estates in the country, most of which consist of wood. If there is a little brook on their estates, they are sure to erect a saw-mill upon it, for sawing boards and planks; with which many yachts commonly go, during the whole summer, to New York; having scarcely any other loading besides boards. The extensive trade which the inhabitants of Albany carry on, and their penurious way of living in the Dutch manner, contributes to-

wards procuring them many of these estates which they enjoy. Indeed frugality will, at all times, lay the foundations of an opulent estate; and it is more honourable for a man to say that he has saved a pound, than to brag that he has spent a hundred.

The greatest number of the inhabitants in and about Albany being Dutchmen, so they speak their own language, and have their own preachers. Divine service is performed in that language; and in their manners they are like the Dutch, though they dress like the English. It is well known the first Europeans who settled in the province of New York were Dutchmen; and, during the time they had this province, they subdued New Jersey, and some parts of Pennsylvania. However, they did not enjoy their conquests long, for in 1664, Sir Robert Carr, by order of King Charles II. of England, went to New Amsterdam, and took it, and gave it the Name of New York. Soon after this, Colonel Nichols went to Albany, which then went by the Name of Fort Orange, and, upon taking it, gave it the name of Albany, in honour of the Duke of York's Scotch title.

The Dutch inhabitants were allowed either to continue where they were, and under the protection of the English, to enjoy all their former privileges; or they were to remove to whatever country they pleased. The greater part of them chose to stay, and from them the Dutchmen are descended, who now live in the province of New York, and possess the greatest and best estates there. The avarice and selfishness of the inhabitants of Albany are well known throughout every part of North America, where the English have any trade. When a Jew settles amongst them, and begins to prosper by trade, they leave nothing untried to complete his ruin. For this reason, nobody comes to this place without the most pressing necessity; and, therefore, we were asked in several places, what induced us to go it? we likewise found that the judgment formed of these people was not without reason.

Thus it frequently happened that we were obliged to pay twice for what provisions we called for, although the single price was dearer than in any other part of America. If we wanted their assistance in any thing, we were obliged to pay very dear for it; for they either exacted exorbitant prices for their labour, or were very backward to assist us. Such, in general, is the character of this people; but still they are not all of the same stamp, for many of them treated us with a politeness that would have done honour to the most polished nations in Europe: and this leads us naturally to consider in what manner this province was first peopled by the Dutch.

Whilst the Dutch were in possession of this province, they sent to Europe for a great number of vagabonds, who had been guilty of the most enormous crimes; and these naturally brought their vices along with them, and even transmitted them to their children, who seem to inherit them even so late as the present times.

The inhabitants of Albany are much more sparing than the English; for the meat which is served, being often insufficient to satisfy the stomach and bowels, does not circulate so freely as in Europe. The women are perfectly well acquainted with economy; for they rise early, go to sleep very late, and are almost over nice and cleanly with regard to their floors, which are frequently scoured several times in the week. The servants are for the most part negroes, or convicts transported from England. Some of the inhabitants wear their own hair, but it is always very short, without a bag, because they have a strong aversion to any thing that has the appearance of French fashions. To such an height do they carry this prejudice, that when we went into the town, because we had bag wigs, the children flocked round us, and called us beggarly Frenchmen.

Their manner of dressing victuals is very different from that of the French or English, for their breakfast is commonly tea without milk. They never put sugar into the cup, but put a small bit of it into their

mouths

mouths while they drink, which is exactly the practice in Holland. They generally breakfast about seven; and their dinner is butter-milk with bread, to which they sometimes add a little sugar. Sometimes they have fresh milk and bread, and at other times broiled fish. To each dinner they have a salad prepared, with abundance of vinegar, but very little oil. They frequently eat butter-milk, bread and salad, one mouthful after another. Their suppers are generally bread and butter, or bread and milk. They sometimes eat cheese at breakfast and at dinner, but it is not cut into slices: they scrape and rasp it, so as to make it resemble coarse flour; which they believe gives it a fine flavour. Their drink is either very bad small beer, or pure water.

June 21. About five o'clock in the afternoon we left Albany, and proceeded towards Canada. We had two men with us, who were to accompany us to the first French place, which was called Fort St. Frederick; but the English now call it Crown Point. For this service each of them was to receive five pounds of New York currency, besides which, we were to provide them with victuals. This is the common price here; and he that does not chuse to conform to it, must travel alone.

We were forced to take up with a canoe, as we could neither get battoes nor boats of bark; and as there was a good road along the west side of Hudson's River, we left the men to row forwards in the canoe, and we went along the shore, that we might examine its countries with the greater accuracy. It is very inconvenient to row in these canoes; for one stands at each end, and pushes the boat forwards. They commonly kept close to the shore, that, in case of any accident, they might get to the land with the greater ease; and then the rowers are obliged to stand upright whilst the canoe is sailing along, otherwise they would be in danger of being drowned every moment.

We kept along the shore all the evening, but were obliged to climb up several hills, and walk through thick woods of trees. Here we found the eastern shore of the river woody, and in many parts uncultivated; but the western was flat, and made a most beautiful appearance. There were many fine farm houses upon it, and near them were beautiful corn-fields. It appeared very plainly that the river had been once broader here; for there was a sloping bank, at about thirty yards distance, with which it run parallel. From this it appeared to us, that the rising ground was formerly the shore of the river, but we were not able to account how this change had taken place.

All the grounds were plowed, and most of them sown with wheat; and we frequently saw fields of flax, just then in blossom. In some parts flax grows very well, but in others it is but indifferent. The excessive drought, which continued during this season, had parched up the grass and plants on the hills; but it was not so in the lower grounds.

We passed the night in a cottage, about six miles from Albany, and saw on the west side of the river several houses, inhabited by the descendents of the first Dutch settlers, who lived by cultivating their grounds.

The barns were generally built in the Dutch fashion, as has been already described. In the middle above is a place for straw, and on each side stables for horses, cows, and other animals. Sometimes these barns are large; but in the court-yard the house consists generally of no more than one room, with a garret above it.

June 22. This morning we followed one of our guides to the water-falls near Cohas, in the river Mohawk, before it falls into the river Hudson. This fall is about three English miles from the place where we passed the night. The country around is in general plain, but near the fall it is hilly. The wood is cleared in most places, and the ground cultivated, being interspersed with farm-houses.

The fall at Cohas is very remarkable, for both above and below are solid rocks, and the river is three hundred yards broad. At the fall there is a rock

cross-ways in the river, running every where equally high, and crossing in a straight line with the side which forms the fall. It represents, as it were, a wall towards the corner side, which is not quite perpendicular, wanting about four yards. The height of this wall, over which the water rolls, appeared to be about twenty or twenty-four yards. At this time there was but little water in the river, and it only ran over the fall in a few places. In such places where the water had rolled down before, it had cut deep holes in the rock, sometimes to the depth of two or three fathom.

The bed of the river below the fall was of solid rock, and almost dry; there being only a channel in the middle fourteen feet broad, and a fathom, or somewhat more in depth; through which the water passed, that came over the fall. We saw a number of holes in the rock, below the fall, which bore a perfect resemblance to those in the northern parts of Sweden. We had clear uninterrupted sunshine, not a cloud above the horizon, and no wind at all. However, close to this fall, where the water was in such a small quantity, there was a continual drizzling rain; occasioned by the vapours which rose from the water during its fall, and were carried about by the wind. Therefore, in coming within a musket shot of the fall, and against the wind, our cloaths were wetted as though there had been a shower of rain.

The whirlpools, which were in the water below the fall, contained several sorts of fish, and they were caught by some people who amused themselves with angling. The rocks consist of the same black stones which form the hills about Albany; and when exposed to the air, it is apt to split into many different pieces, in the same manner as slate.

At noon, we continued our journey to Canada in the canoe, which was pretty long, and made out of a white pine. Somewhat below the farm house where we lay at night, the river became so shallow that the men could reach the ground every where with their oars; it being, in some parts, not above two feet, and sometimes but one foot deep. The shore and bed of the river consisted of sand and pebbles; and sometimes the stream was so rapid, that our rowers found great difficulty in getting forward. The hills, along the shore, consisted merely of soil, and were very high and steep in some parts; and the breadth was in general about a musket shot.

Here we saw vast numbers of sturgeons for several days together, leaping up above the water, especially towards the evening. Our guards, and the people that lived hereabouts, asserted that they had never seen any sturgeons in the winter season; because, in autumn, these fish leave the river and go into the sea, but come again in the spring, and spend the whole summer in the river. They are said to prefer the shallowest places in the river, which agreed pretty well with our observations; for we never saw them leap out of the water but in shallows. The Dutch who are settled here, as well as the Indians, fish for sturgeons; and every night of our voyage we observed several boats with people, who struck them with harpoons. The torches they made use of, were of that kind of wood which they call the black pine-tree, and it has an agreeable smell.

The nights were exceeding dark, but they were now at the shortest: we found many of the banks of the river covered with living sturgeons, which had been wounded by the harpoons, but escaped and died afterwards. Their corrupted carcases caused a most insupportable stench during the excessive heat of the weather.

As we went further up the river, we saw an Indian woman and her boy sitting in a boat of bark, and an Indian man wading through the river, with a great cap of bark upon his head. Near them was an island, on which were a considerable number of Indians fishing for sturgeons. We went to their huts, to try if we could get one of them to accompany us to Fort St. Frederick; but on our arrival, we found that all the men

men were gone into the woods a hunting, so that we were under the necessity of sending some of their boys to look for them. They asked for some bread, and we gave them twenty little round loaves:

This island belonged to the Dutch; but after they had cultivated it so as to produce corn, they let leases of it to the Indians, who planted their maize, and several sorts of melons on it. These Indians build their huts on a very simple plan, in this island. They put four posts into the ground perpendicularly, over which they place poles, and make a roof of bark upon them: the walls consisted of branches of trees with leaves, which were fixed to the poles: their beds were of deer-skins, spread on the ground; and the kitchen furniture, a couple of small kettles, two ladles, and a bucket or two of bark, made so close as to hold water.

The sturgeons were cut into long slices, and hung up in the sun-shine to dry, and to be ready against winter. The Indian women were sitting at their work on the hill, on deer-skins. They never make use of chairs, but sit on the ground with these skins under them. However, they do not sit cross-legged, like the Turks, but keep their feet straight forward. The women have black hair, but wear no head-dress: they have a short blue petticoat, which reaches to their knees, and the brim of it is bordered with red or other ribbons: they wear their shifts over their petticoats, and they have large ear-rings, with their hair tied behind and wrapped up. Their pearls, and their money which is made of shells, are tied round their necks, and hang down on the breast. This is the whole of their dress, and we found them employed in making different garments of skins.

Towards evening, we went to a farm close to the river, where we found only one man, looking after the maize and the fields; the rest of the men not being yet returned from the woods. The little brooks here contain craw-fish, which are exactly the same with ours, only that they are somewhat less; but the Dutch inhabitants will not eat them.

June 23. We waited a good while for the Indians, who had promised to come home, in order to shew us the way to Fort St. Anne, and to assist us in making a boat of bark to continue our voyage. About eight o'clock three of the men arrived: their hair was black, and cut short, and they wore rough pieces of woollen cloth, of a bright green colour, on their shoulders; a shirt which covers their thighs, and pieces of cloth or skins, which they wrap round their bodies; but they had neither hats, caps, nor breeches. Two of them had painted their faces with vermilion; and round their necks were ribbons, from which hangs a bag down to the breast containing their knives. They promised to accompany us for thirty shillings; but soon after changed their minds, and went along with an Englishman, who promised them more. Thus we were obliged to undertake this journey without these guides, who were, however, honest enough to return us fifteen shillings, which we had paid them beforehand.

All this day, we had one violent current after another to pass, full of stones, which was a great hindrance to us in getting forward. The water in the river was very clear, and generally shallow, being for the most part not above four feet deep, but very rapid. The shores were covered with pebbles, and the hills were high, though covered with verdure. In some places the lands were cultivated, but in others they were covered with wood. The hills near the river abounded with red clover, and we found much of the same in the woods.

The farm houses were built either close to the river or on the hills, and each house had a little kitchen garden, and a still lesser orchard: some, however, had large gardens. The kitchen garden afforded several kinds of gourds, water melons, and kidney beans. In general, their orchards are full of apples, but this year the fruit was very scarce, on account of the frosty nights which had happened in May, and the drought which had continued throughout this summer.

The houses here are generally built of beams of wood, and unburnt bricks, dried by the sun and the air. The beams are first erected, and upon them a gable with two walls, and then spars, the wall on the gable being made of boards: the roof is covered with shingles, the walls are made of the unburnt bricks, placed between the beams, to keep the rooms warmer; and that they may not easily be destroyed by rain or air, they are covered with boards on the outside. This night we lodged with a farmer, who had returned home after the war was all over; and all his buildings, except the barn, were burnt down.

June 24. The farm where we passed the night, was the last in the province of New York, towards Canada, which had been left standing, and was now inhabited. Further on, we met still with inhabitants; but they had no houses, being obliged to reside in huts made of boards; their former houses having been burnt down during the war.

As we proceeded on our journey we observed the country, on both sides of the river, to be generally flat, but sometimes hilly; large tracts of it being covered with trees: frequently we found corn-fields, and sometimes fine meadows, but they seemed to be much neglected. From the time we left Albany, almost half way to Saratoga, we found the river very rapid, and it cost us a deal of trouble to get upwards; but afterwards we found it deep for several miles, and the water moved very slowly. Here the shores are deep, but not high, and the river is about two musket shot broad. In the afternoon it changed its direction, and for miles afterwards we found it very crooked.

Saratoga is a fort of wood, built by the English, to stop the attacks of the French Indians upon their settlements, and to serve as a rampart to Albany. It is situated on a hill, on the east side of the river Hudson, and is built of thick posts driven into the ground, close to each other, in the manner of pallisadoes, forming a square of a musket shot in breadth. At each corner are the houses of the officers; and within the pallisadoes are the barracks for the soldiers, all built of wood, so that it can never be able to make any great stand against an enemy.

This fort has been kept in order, and was garrisoned till 1747, when the English were obliged to set fire to it, and abandon it, on account of the Indians lying continually in wait, and killing such parties as went out to forage. These Indians are, perhaps, the most artful people in the world, as will appear from the following anecdote.

A party of Indians concealed themselves one night in a thicket near the fort, and in the morning some of them went near to view it: the English fired upon them as soon as they saw them at a distance, and the Indians pretending to be wounded, fell down, got up again, ran a little way, and dropped again. Above half the garrison rushed out to take them prisoners; but as soon as they were come up with them, the Indians came out of the bushes betwixt the fortress and the English, surrounded them, and took them prisoners. Those who remained in the fort had hardly time to shut the gates, nor could they fire upon the enemy, because they equally exposed their countrymen to danger; and they were vexed to see their enemies take and carry them off in their fight, and even under their cannon.

The country on each side of the river, near Saratoga, is flat, but the soil is good, and when we were there most of the wood was cut down. We saw some hills on the north, beyond the distant forest, where there are some Dutch settlements, who live on bad terms with the English. We laid all night in a little hut made of boards, erected by the people who were come to live here.

June 25. This morning we proceeded up the river, but after we had advanced about an English mile, we fell in with a water fall, which cost us a deal of pains before we could get our canoe over it: the water was very deep just below the fall, owing to its hollowing out the rock. In every place where we met

with

with rocks in the river, we found the water very deep, from two to four fathoms, and upwards; because by finding a resistance, it had worked a deeper channel into the ground. Above the channel the river is very deep again, the water slides along silently, and increases suddenly near the shores. On both sides are vast numbers of tall trees, and soon after we passed another water-fall more dangerous than the other.

We intended to have gone up as far as the fort called Nicholson in our canoe, which would have been a great convenience to us; but we found it impossible to get over the upper fall, the canoe being heavy, and scarce any water in the river. Sometimes we had no other way of crossing deep rivers than by cutting down tall trees, which stood on their banks, and throwing them across the water. All the land we passed over this afternoon was level, without hills and stones, and entirely covered with a tall and thick forest, in which we continually met with trees that had been blown down, because no one made the least use of the wood. We passed the next night in the midst of the forest, plagued with gnats and wood-lice, and continually in fear of snakes, there being vast numbers of these reptiles to be met with at all times here.

June 26, Early this morning we continued our journey along the river Hudson; and there was an old path, but it was so overgrown with grass, that we could hardly distinguish it from the rest of the fields. Here we found vast numbers of raspberries growing, and in general the face of the country had a delightful appearance.

Fort Nicholson is situated on the eastern shore of the river Hudson, and in it a garrison was formerly kept. We arrived here a little before noon, and rested ourselves some time. The fort was situated on a plain, but at present the place is no better than a thicket. It was built in 1709, and named after the brave English general Nicholson. The soil near it is good, but there are few inhabitants in the country.

In the afternoon we changed our course, and kept to the other side of the river, where we found the ground flat and low. Sometimes we saw a little hill, but neither mountains nor stones, and the country was every where covered with tall and thick forests. The trees stood close to each other, and afforded a fine shade; but the pleasure we enjoyed from it was lessened by the incredible quantity of gnats that filled the woods. In some places we found the ground overgrown with great quantities of moss; but the soil was generally very good, consisting of a deep mould, in which the plants thrive very well. We lodged this night near a brook, in order to be sufficiently supplied with water, which was not to be had every where during this season: but our fear of snakes and of the Indians prevented us from having much rest during the whole of the night. We heard several great trees fall of themselves in the night, though it was so calm that not a leaf stirred, and yet they made a dreadful cracking.

June 27. We continued our journey in the morning, and found the country much like that we had passed through the day before; only that we frequently met with a few hills. In every part of the former we found trees thrown down either by age or stones, but none were cut down, there being no inhabitants: and though the wood is very fine, yet no one makes any use of it. We found it very difficult to get over these trees, because they had stopped up almost all the passages, and close to them were vast numbers of rattlesnakes, during the heat of the season.

About two o'clock this afternoon, we arrived at fort Anne, situated upon the river Woodcrack, which is here little bigger than a brook. We stayed here all this day, and on the next attempted to make a new bank, because there was hardly a possibility of going to fort Haddock without it. We arrived in time, for one of our guides fell ill, and could go no further with us. If he had been worse, we should have been obliged to stop on his account, which would have

put us under great difficulties, as our provisions would soon have been exhausted; and from the desert place where we were, we could not have arrived at any inhabited place in less than three or four days. Happily we reached the wished-for place, and the sick man had time to rest and recover.

June 28. The making the boat took up half yesterday, and all this day. To make such a boat, they choose out a thick tall elm, with a smooth bark, and with as few branches as possible. This tree is cut down, and great care is taken to prevent the bark from being hurt by falling against other trees, or against the ground: with this view some people do not fell the trees, but climb to the top of them, split the bark, and strip it off, which was the method used by our carpenter.

The bark is split on one side, in a straight line along the tree, to the length the boat is intended to be; and at the same time the bark is carefully cut from the stem, a little way on both sides of the slit, that it may more easily separate. The bark is then peeled off very carefully, and they guard against making holes in it. This is easy, when the sap is in the tree, and at other times it is heated by the fire for that purpose. The bark thus stripped off, is spread on the ground, in a smooth place, having the inside downwards, and the rough outside upwards, and to straighten it the better, some logs of wood, or stones, are carefully put on it, which press it down: then the sides of the bark are gently bent upwards, in order to form the sides of the boat.

Some stakes are then fixed into the ground, at the distance of three or four feet from each other. The sides of the bark are then beat into the form which the boat is to have, and according to that the sticks are either put nearer, or further off. The ribs of the boat are made of thick branches of succory, they being tough and pliable: they are cut into several flat pieces, about an inch thick, and bent into the form which the ribs require, according to their places in the broader or narrower part of the boat: bent in this manner, they are put across the boat, about a span or ten inches from each other. The upper edge on each side of the boat is made of two thin poles of the length of the boat, and being flat, they are to be joined together.

All possible precaution must be used in rowing in boats on these rivers, for as there are vast numbers of broken trees, so it frequently becomes dangerous; for the boat may easily run against them, and then, if the water is deep, passengers are in danger of being drowned. Now sometimes these branches will tear one half of the boat away, and then all that were in it must fall into the water.

Fort Anne derives its name from queen Anne, for in her time it served as a fortification against the French. It lies on the western side of the river Woodcrack, which is here very small, and any person may walk across it in summer. The fort is built in the common manner, namely, with pallisadoes, within which are barracks for the soldiers, and the lodgings for the officers are at the corners. The whole consists of wood, and is built on a rising ground, very near the banks of the river, from whence there is an extensive prospect over the neighbouring country.

June 29. Having completed our boat, after a great deal of trouble, we continued our journey this morning. Our provisions, which were much diminished, obliged us to make great haste; for as we had been under the necessity of carrying things on our backs, so sometimes we could not take a great quantity of provisions with us, having several other very necessary things to carry, and we always ate very heartily. As there was very little water in the river, and several trees had fallen across it, which frequently stopped our boat, we went on shore, and walked over land.

The ground on both sides of the river was very low; and the shores were covered with several sorts of trees, which stood at moderate distance from each other, and a great deal of grass between them. The trees

trees afforded a fine shade, very agreeable in the summer season; but the pleasure it gave was considerably lessened by the vast numbers of gnats with which we were continually pestered. Here we found the soil rich, and in different places were rich and beautiful plantations of corn.

As we came lower down the river, the dikes which the beavers had made in it, produced new difficulties. These laborious animals had carried together all sorts of boughs and branches, and placed them across the river, putting mud and clay in between them, to stop the current. They had cut off the ends of the branches as naturally as if they had been chopped off with an hatchet. The grass about these places had been trod down by them, and in the neighbourhood of the dikes we sometimes met with places where the beavers had carried trees along. We found a row of dikes before us, which stopped us a considerable while, as we could not get forward with the boat till we had cut through them.

As soon as the river was more open, we got into the boat again, and proceeded on our journey. The breadth of the river at this place did not exceed eight or nine yards, and frequently it was not above three or four yards broad, and generally so shallow that it was with difficulty we could get on. Sometimes again it was so deep, that we could not reach the bottom with sticks seven feet long; and the stream was irregular, being rough in some places, and smooth in others. The water in the river was very clear and transparent, and we saw several little paths leading to it from the woods, said to have been made by bears, and other animals who come here for water. Frequently we met with several trees laying across the water, and we were obliged to remove them before we could pass, otherwise our course would have been stopped.

Towards night we met with a French serjeant, and six French soldiers, who were sent by the commander of fort St. Frederick, to accompany three Englishmen to Saratoga, and to defend them, in case of necessity, against six Indians, who had gone out to be revenged on the English for killing the brother of one of them in the last war. The peace was already concluded, but it had not yet been proclaimed in Canada, so that the Indians thought they might act as they pleased.

We had here occasion to admire the care of divine Providence in escaping these barbarians. We found the grass trod upon all the day long, but had no thoughts of danger, as we believed every thing to be quiet and peaceable. We were afterwards informed, that these Indians had trod the grass down, and passed the place, where we found burning brands in the morning. The usual road they were to take was by fort Anne; but to shorten their journey, they had gone an unfrequented road. If they had gone towards fort Anne, they must have met us, and looking upon us all as Englishmen, for whose blood they were gone out, they could easily have surprised and shot us all, and by that means have been rid of the trouble of going any further to satiate their cruelty. We were greatly struck when the Frenchmen told us how near death we had been. We passed the night here, and though the French repeatedly desired and advised us not to venture any further, but to go to the first English settlement, and then back to fort St. Frederick; yet we resolved, with the protection of the Almighty, to continue our journey the next day.

We saw immense numbers of those wild pigeons flying in the woods, which sometimes come in incredible numbers to the southern English colonies; most of the inhabitants not knowing where they came from. They have their nests in the trees there, and almost all the night make a great noise and cooing in the trees where they roost. The Frenchmen shot a great number of them, and gave us some, in which we found the seeds of the elm, which evidently demonstrated the care of Providence in supplying them with food; for in May the seeds of the red maple,

which abounds here, are ripe, and drop from the trees, and are eaten by the pigeons during that time. Afterwards the seeds of the elm ripen, which then becomes their food, till other seeds ripen for them. Their flesh is, perhaps, the most palatable of any birds in the world.

June 30. This morning we left our boat to the Frenchmen, who made use of it to carry their provisions; for it was not of any service to us, on account of the number of trees that had been thrown across the river. The Frenchmen gave us leave to make use of one of their boats, which they had left behind them, about six miles from the place where we passed the last night. Thus we continued our journey on foot along the river, and found the country flat, with some little vales here and there. It was every where covered with tall trees, at a small distance from each other, which made it appear extremely agreeable.

After we had walked about six English miles, we came to the place where the Frenchmen had left their boats, one of which we took and rowed down the river, which was now near one hundred yards broad. The ground on both sides was very smooth, and not very high. On our left we saw an old fortification of stones laid above one another; but no person could tell us whether it had been erected by the Indians or the Europeans.

We had rowed very fast all the afternoon, in order to get forward, and we thought that we were upon the true road, but found ourselves greatly mistaken; for towards night we observed that the reeds in the river bent towards us, which pointed out that the water flowed towards us; whereas had we been on the true river, it would have gone from us. We likewise observed from the trees that lay across the river, that nobody had lately passed that way. At last we saw plainly that the river flowed against us, and we were convinced that we had gone twelve English miles and upwards upon a wrong river, which obliged us to return, and to row till very late at night. We were sometimes afraid that some parties of Indians would meet with us, and murder us; and although we rowed hard all day, yet we got but a little way forward.

July 1. At day break we got up, and rowed a good while before we got to the place where we had mistaken our way. The country we passed was the poorest and most disagreeable that could be imagined; we saw nothing but an amazing ridge of high mountains, covered with woods, so that we found it difficult to get a place where we could dress our dinners. In many places where the ground was smooth, it was at the same time overflowed with water, and the wind blew north all day, which rendered it very difficult for us to get forward, though we rowed very hard, which was the more necessary, as all our provisions were eaten up. About six o'clock in the evening we arrived at a point of land, about twelve English miles from fort St. Frederick. Behind this point the river is converted into a spacious bay; and as the wind still kept blowing hard from the north, it was impossible for us to get forward, because we were extremely weak. We were therefore obliged to pass the night here, notwithstanding our being almost famished for want of provisions.

It is to be attributed to the good providence of God that we met with the Frenchmen on our journey, and that they gave us leave to use one of their boats. It seldom happens that the French go this road to Albany oftener than once in three years, for they commonly pass over the lake George, which is the nearer and better road; therefore every body wondered how they came to take this road. If we had not got their large strong boat, but been obliged to keep that which we had made, we should, in all probability, have been in a very bad situation; for to have ventured upon the great bay, during the wind, in such a wretched vessel, would have been a very great piece of temerity, and we should have been in danger

of being starved, had we been detained by a calm. For being without fire arms, and there being no game to be found, we must have been obliged to subsist on frogs and snakes, neither of which would have been very agreeable. It is impossible to reflect on this goodness without reverently acknowledging the peculiar care and providence of the merciful Creator.

July 2. Early this morning we set out on our journey again, it being moon-shine and calm, and we feared lest the wind should change, and become unfavourable, if we stopped any longer. We all rowed as hard as possible; and happily arrived, about eight in the morning, at fort St. Frederick, now called Crown Point. The governor received us with great politeness, and treated us consistent with the character we had heard of him. He was a little above fifty years of age, well acquainted with polite literature, and had made several journies into this country, by which he had acquired a perfect knowledge of several things relative to its state.

We were informed, that during the whole of the summer there had been a continual drought here, and that they had not had any rain since last spring. The excessive heat had retarded the growth of the plants, and on all dry hills the grass, and a vast number of plants, were quite parched. The small trees which grew near rocks, scorched by the sun, had withered leaves; and the corn in the fields bore a very wretched aspect. The wheat had not yet eared, nor were the pease in blossom. The ground was full of wide and deep cracks, into which the little snakes retired; and hid themselves, when pursued by us, in an impregnable asylum.

July 5. Whilst we were at dinner, we several times heard a disagreeable noise, at some little distance from the fortrefs, in the river Woodcrack. The governor told us this cry was no good omen, because he could conclude from it, that the Indians, whom we had escaped near fort Anne, had compleated their design of revenging the death of one of their brethren upon the English, and that their shouts shewed that they had killed an Englishman. As soon as we came to the window, we saw their boat, with a long pole at one end, on the extremity of which they had put a bloody skull. When they landed, we heard that they, being six in number, had continued their journey from the place where we had seen the marks of their feet, till they got within the boundaries of the English province, where they found a man and his son employed in mowing the corn. They crept on towards this man, and shot him dead on the spot. This happened near the village where the English some time before had killed one of the Indians. According to their barbarous custom, they cut off the skull of the dead man, and took it with them, together with his cloaths and his son, who was only about nine years old. As soon as they came within a mile of fort St. Frederick, they put the skull upon a pole, in the fore part of the boat, and shouted as a sign of success.

They were dressed in shirts, as usual, but some of them had put on the dead man's cloaths; one his coat, another his breeches, a third his hat, &c. Their faces were painted with vermillion, with which their shirts were painted across the shoulders. Most of them had large rings in their ears, which seemed to be a great inconvenience to them, as they were obliged to hold them when they leaped, or did any thing which required a violent motion. Some of them had girdles of the skins of rattle-snakes, with the rattles on them; and the son of the murdered man had his shoulders marked with red. When they got on shore, they took the pole on which the skull was fixed, and danced round it with all the demonstrations of joy, and sung at the same time in their own manner.

Their view in taking the boy was to carry him to their habitations, to educate him instead of their deceased brother, and afterwards to marry him to one of their relations. Notwithstanding they had per-

petrated this act of violence, contrary to the faith of treaties, and in direct opposition to the orders of the governor of Canada, yet the governor of fort St. Frederick could not refuse them provisions, because he did not think it prudent to exasperate them. But when they came to Mount Real, the governor called them to account for this action, and took the boy from them, whom he afterwards sent to his relations. Mr. Lufignan, the governor of fort St. Frederick, asked them what they would have done, had they met with us in the desert through which we passed? They answered, that as it was their chief intention to take revenge on the English, who had murdered their brother, they would have let us alone; but it depended on the humour they were in when they first came in sight of us.

Some years ago the skeleton of an amazing great animal had been found in that part of Canada where the Illinois live, and one of the officers in the fort assured me he had seen it. The Indians who were there had found it in a swamp, and they were surprised at the sight, having never seen any thing like it before. Being asked what skeleton it was, they answered, that they believed it must have been the father of all the beavers. It was of a prodigious bulk, and had thick white teeth, about ten inches long. Some thought it was the skeleton of an elephant; but no care had been taken to preserve it, so that we were disappointed in making a proper inquiry.

Here are vast numbers of bears, and they kept a young one, about three months old, at the fort. He had the same shape and qualities as our bears in Europe, except the ears, which seemed to be longer in proportion, and the hair was stiffer: his colour was a deep brown, almost black. He played and wrestled every day with one of the dogs, and what was remarkable, they never quarrelled. The Indians prepare an oil from bear's grease, with which they daub their faces, hands, and all naked parts of their bodies. They believe it softens the skin, and makes the whole body pliable.

July 6. The soldiers that had been paid off after the war, had built houses round the fort, on the ground allotted to them; but most of these habitations were wretched cottages, little better than common huts. These huts consisted only of a few boards, standing perpendicularly close to each other, and the roofs were likewise of wood. The crevices were stopped up with clay, to keep the rooms warm, and the floors were either of clay, or a black lime-stone, which is in great plenty here. They build their hearths of the same stone, except the place where the fire lays, which is made of grey hard stones. They have skins of sheep, instead of glass, in their windows; and what we admired most was, that although their huts are formed of combustibles, yet no fires happened.

July 8. The French women are excellent in the art of dying, and good judges of the materials proper for that purpose. The horses are left out of doors during the winter, and find their food in the woods, living upon nothing but dry plants, which are very abundant; and although this sort of food may seem poor, yet the horses always look well and plump.

July 9. This day we found the skeleton of a whale, about one mile from the river St. Laurence, in a place where no water comes. This skeleton had been very large, and the governor told us that he had seen it alive; but it was so much mangled that we could not measure it.

July 10. This day we had an opportunity of taking notice of three sorts of boats, which the people were making. The first were of bark, and the ribs of wood; and these are very common in the shallow waters. The second were canoes, consisting of a single piece of wood, hollowed out, which we have already described. They are not brought forward by rowing, but by paddling, by which method not half the strength can be applied which is made use of in rowing, and a single man might row as fast as two of them could paddle. The third kind of boats are the battoes,

battoes, which in this part of America are different from those we have already described. They are used for large cargoes, and the bottom is made of either red or white oak. The sides are made of the white fir, because oak would make the battoes too heavy. Here they make large quantities of tar and pitch; which is sold to the Europeans at a considerable advantage.

The soldiers here enjoy greater privileges than in any other part of the world. Those who formed the garrison of this place, had a plentiful allowance from the government; they get every day a pound and a half of wheat bread, with pease, bacon, and plenty of salt meat: sometimes they kill oxen and other cattle, the flesh of which is distributed among the soldiers. All the officers keep cows at the expence of the king, and the milk they gave was more than sufficient to supply them. Each of the soldiers had small gardens without the fort, which they were allowed to attend, and plant in it whatever they liked; and some of them had built summer houses, near which were all sorts of useful pot herbs, with all other kitchen vegetables growing.

The governor told us, that it was a general custom here, to allow the soldiers a little piece of garden ground at such of the forts as were not near great towns, from whence they could have been supplied with greens. In times of peace, the soldiers have very little trouble with being upon guard at the fort; and as the lake by it is full of fish, besides the birds and animals in the woods, those among them who choose to be industrious, may live extremely well; and indeed voluptuously, with regard to food. Each soldier has a new coat once in two years; but annually, a waistcoat, cap, hat, breeches, cravat, two pair of stockings, two pair of shoes, and as much wood as they have occasion for in winter. They had also about two pence halfpenny per day, and, when employed in any of the public works, they were allowed fifteen pence per day; so that there is no wonder that they should look so fresh and well.

When a soldier falls sick, he is immediately sent to the hospital, at the expence of government, where he has a bed found, and nurses to attend him. When any of them has had leave to go abroad for a day or two, it was granted them on condition of the surgeon's approving of it. The governor and officers were duly honoured by the soldiers; and so little ceremony was used by them, that they lived together in a state of innocent freedom. The soldiers who are sent here from France, commonly serve till they are about fifty years of age, after which they are dismissed, and a piece of ground is allowed them to cultivate: but if they have agreed to serve for only a certain number of years, they are dismissed at the expiration of their term. Those who are sent here commonly agree to serve the crown six years, and then they set up as farmers in the country. Great emoluments are bestowed upon those soldiers who have served faithfully; and this being an encouragement to young men, it stimulates them on to perform all those obligations binding upon them as good soldiers. This is, perhaps, one of the best plans that ever could have been laid down for the cultivation and civilization of a new colony. It encourages people to come from Europe, and it inspires them with sentiments of courage to defend their property against all sorts of depredations that may be made on them by their enemies.

July 11. We had this day an opportunity of taking notice of several things used by the people in husbandry. The harrows they make use of are made entirely of wood, and of a triangular form. The ploughs, however, are not convenient; and the wheels upon which the plough beams are fixed are as thick as the wheels of a cart, and all the wood work is so clumsily made, that it requires at least one horse to draw the plough along a plain field.

July 16. This morning we crossed Lake Champlain to the high mountains on its western side, in or-

der to examine the plants and other curiosities there. From the top of the rocks, at a little distance from Fort St. Frederick, a row of very high mountains appear on the western shore of Lake Champlain, extending from south to north; and on the eastern side of this lake is another chain of high mountains, rising in the same direction. Those on the western side are about ten or twelve miles from the lake; and the country between it and them is low and flat, being covered with woods, which likewise cloath the mountains, except in such places where the fires are lighted to destroy the insects.

These mountains have generally steep sides, but sometimes they are found gradually sloping. We crossed the lake in a canoe, which could only contain three persons; and as soon as we landed, we walked from the shore to the top of the mountains. Their sides are very steep, and covered with a mould, and some great rock stones lie on them. All these mountains were formerly covered with trees, but in some places the forests had been destroyed by fire. After a great deal of trouble, we reached the top of one of the mountains, which was covered with a dirty mould. It was none of the highest, for some of those which were at a greater distance were much higher.

When we returned to the shore, we found the wind risen to such a height, that we did not venture to cross the lake in our boat, and therefore we left the boatman to take care of it, while we walked round the bay. As there was no road, we kept close to the shore, where we passed over mountains and sharp stones, through thick forests and deep marshes, all which were inhabited by vast numbers of rattle-snakes, but we had the good fortune not to see any of them. The shore is covered with stones, and now and then we met with some spots covered with grey sand. Sometimes these mountains, with the trees over them, stood perpendicular with the water side, but in other places the shore was marshy.

The mountains near the shore are amazingly high and large, consisting of a compact grey rock stone. This stone reaches all the way down to the water, in places where the mountains stood close to the shore, but where they were at some distance, then the shores were covered with wood.

July 17. This day we had an opportunity of inquiring into the nature of those disorders with which the Indians are generally affected; and these we found to be the rheumatism, and pleurisy; which arose from their being obliged frequently to lie in the woods all the night, where the ground is damp. To this may be added, that in the mornings, when they awake, they frequently indulge themselves in the use of strong liquors, which co-operating with the situation of the ground in such places, brings on the disorders already mentioned.

There are several other disorders to which the Indians are subject, and amongst these is the venereal disease; which seems to have been brought first into the country from South America, by the Spaniards.

July 19. This day we took a more particular view of Fort St. Frederick than we had yet done. It is situated on the extremity of Lake Champlain, and on a neck of land between that lake and the river which arises from the union of the river Woodcrack and the lake of St. Sacrament. The breadth of the river is here about a musket shot, and the English have given the fort the name of Crown Point.

The soil about this fort is very fertile, on both sides of the river, and before the last war a great many families, mostly French, and especially old soldiers, settled here; but the war breaking out, they were obliged to return to Canada, or to lie in the garrison at night. A great number of these returned at this time, and it was thought that about forty or fifty families would settle here this season. Within one or two musket shot, to the east of the fort, is a windmill built of stone, with very thick walls; and most of the flour wanted for the use of the garrison is ground here. This windmill is so contrived, as to serve the purpose

purpose of a redoubt, and at the top of it are several pieces of cannon.

During the last war, there was a vast number of soldiers quartered in this mill, because they could from thence look a great way up the river, and observe when any of the enemy approached; which could not be done from the fort itself; and that was a matter of considerable consequence. For this reason the fort ought to have been built on the place where the wind-mill stands; for all those who come to see it, are struck with the absurdity of the situation. If it had been erected in the place where the mill stands, it would have commanded the river, and prevented the approach of an enemy; and a small ditch cut through to the lake Champlain, would have served the fort with flowing water, because it would have been situated on the neck of land. In that case the fort would always have been supplied with fresh water at a distance from the high rocks, which succeed it in its present situation.

This day we proposed to leave the place, having waited some time for the arrival of the yacht, which plies continually all summer, between the forts St. John and St. Frederick. During our stay here, we received many favours. Mr. Lusignan, the governor, a man of learning and great politeness, heaped obligations upon us, and treated us with as much civility as though we had been his own relations. We had the honour of eating at his table during our stay, and our servants were treated in the same hospitable manner. We had rooms for ourselves; and at our departure, the governor supplied us with all sorts of provisions for our journey to Fort St. John. In short, he did more for us than we could have expected even from our own countrymen; and the other officers were very obliging to us.

About eleven in the forenoon, we set out with a fair wind, and saw vast high mountains on both sides of the lake. These mountains, on the eastern shore, are considered as the boundary between the English and French colonies. The country is inhabited within a mile of the fort, but at a short distance begins a large uncultivated forest. At about ten miles from Fort St. Frederick, the lake is four miles broad, and we saw several small islands in it. The master of the yacht said, that there were about sixty islands in the lake, of which some were of a considerable size. He assured us, that the lake was, in some places, so deep, that a line of two hundred yards could not fathom it; and close at the shore, where a chain of mountains generally ran across the country, it frequently has a depth of eighty fathoms.

This day the sky was cloudy, and the clouds, which were very low, seemed to surround several high mountains near the lake with a fog; and from some of the mountains, the fog rose up as smoke from a kiln. We frequently saw little rivers falling into the lake; for vast numbers of these rise in the neighbouring forests. The shores are sometimes rocky and sometimes sandy here, and indeed there are on the banks all sorts of soils. Towards night, the mountains decreased gradually; the lake was very clear, and we observed neither rocks nor shallows in it. Late at night the wind abated, and we anchored close to the shore, where we spent the night.

July 20. This morning we proceeded with a fair wind. The place where we passed the night, was about half way to Fort St. John; for the distance of that place, from Fort St. Frederick across Lake Champlain, is computed to be forty-one French miles. The lake is here about six miles in breadth. The mountains were now out of sight, and the country low, plain, and covered with trees. The vast number of islands made the lake appear much narrower than it really was.

We frequently saw Indians in bark boats, near the shore, which, however, was not inhabited; for the Indians came here only to catch sturgeons, with which the lake abounds, and which we often saw leaping up into the air. These Indians led the most singular life that can be imagined. At one time of the year,

they live upon the small store of maize beans, and melons, which they have planted; at another period of the year, their food is fish, without bread or any kind of sauce; and again, in a hard season, they feast on the flesh of stags, roes, and beavers. They enjoy, however, good health and long life, and are more able to sustain hardiness than other people. They sing and dance, are joyful, and always content; and would not, for a great deal, exchange their manner of life for that which the Europeans so much esteem.

When we were got ten miles from Fort St. John, we saw several houses on the western side of the lake, in which the French had lived before the war, and which they then abandoned, as it was not safe to remain in them, but now they were returned to them again. These were the first houses and settlements we saw, after we left Fort St. Frederick to sail across the lake.

There was formerly a fort, or rather a redoubt here, on the eastern side of the lake, near the water-side; and we were shewn the place where it stood, but it was then overgrown with trees. The French built it to prevent the incursions of the English and the Indians across the lake; and we were assured that many Frenchmen had been killed in these places. At the same time they told us, that they reckon four women to one man in Canada, because annually several Frenchmen are killed on their expeditions, which they undertake for the sake of trading with the Indians.

A wind-mill, built of stone, stands on the east side of the lake, on a projecting piece of ground, from whence there is an extensive prospect. Some Frenchmen have lived near it, but they left it when the war broke out, and they were not then returned to it. From this mill to Fort St. John is about eight miles; many of the cottages had been burnt down by the Indians.

The yacht that we went in to St. John's, was the first that had been built here, for the use of sailing across Lake Champlain; for, in former times, they made use of battoes to send provisions across the lake. The captain of the yacht was a Frenchman, born in this country. When he built it, he took the soundings of the lake, in order to discover the true road between Fort St. Frederick and Fort St. John. Opposite the wind-mill, the lake is about three fathoms deep, but it becomes more shallow the nearer you approach Fort St. John.

We now began to perceive houses on the shore again. The master had his cabin filled with the skins of otters, much of the size and colour as those found in Europe. These skins, as well as those of seals, are here made use of to cover trunks, and sometimes they are made into portmanteaus. The seals are just the same as in Europe, and are in great plenty towards the mouth of the river St. Laurence.

The French, in their colonies, spend much more time in external worship, than either the English or Dutch settlers in the British colonies. The latter have neither morning nor evening prayer in the ships or yachts, and no difference is made between Sunday and other days. They never, or at least very seldom, say grace at dinner, or at any other of their meals. On the contrary, the French have prayers every morning and evening on board their shipping, and on Sunday they have additional services: they regularly, in their own way, say grace at their meals, and every one of them pray in private as soon as he gets up. At Fort St. Frederick, all the soldiers assembled together for morning and evening prayers: but still there could be but little devotion in all this, seeing these prayers were read in Latin, which the soldiers did not understand. Here the lake becomes so narrow, that it is rather like a river, and the country on both sides is flat, and covered with wood. We saw, at first, a few scattered cottages along the shore; but a little further, the country is not only well inhabited, but it is also finely cultivated.

The

The lake was now so shallow in several places, that we were obliged to trace the way for the yacht, by founding the depth with branches of trees. In some other places, it was two fathom deep. In the evening, about sun-set, we arrived at the fort of St. John; having had a continual change of rain, sun-shine, wind, and calm, all the afternoon.

July 21. St. John's is a wooden fort, which the French built in 1748, on the western shore of the mouth of the lake Champlain, close to the water side. It was intended to cover the country round about, which they were then going to people; and to serve as a magazine for provisions and ammunition, which were usually sent from Montreal to Fort St. Frederiek, because they may go in yachts from hence to the last mentioned place, which is impossible lower-down, the water being so extremely shallow.

The situation is low, and it lies in a very sandy soil; the country round about being covered with wood. The fort here is called Chamblan, built in a quadrangular form, and stands on a considerable space of ground. In each of the two corners, that look towards the river or lake, is a wooden building, four stories high; but the lower part is of stone, to the height of about a fathom and a half. In the building is holes for cannon and other small arms; and in each of the other two corners, towards the country, are only wooden houses, two stories high. These buildings were intended for the habitations of the soldiers, and for the better defence of the place, for there are poles two fathom and a half high between them: they are made of a tree called thuja, which is reckoned the best wood for keeping from putrefaction; and in that respect is much preferable to fir.

Lower down, the pallisadoes were double, one row being within the other. For the conveniency of the soldiers, a broad elevated pavement of stone, more than two yards in height, was made in the inside of the fort, all along the pallisadoes, with a sort of balustrade. On this pavement the soldiers stand, and fire through holes upon the enemy, without being exposed to their fire. In the year 1748, two hundred men were in garrison here; but while we were here, there were only a governor, a commissary, a baker, and six soldiers, to take care of the fort, and to superintend all the public works which were then carrying on. The ground round the fort is extremely fertile; the soil is rich, and yet it is without inhabitants, except a few cottagers. Here are constantly, in summer, vast swarms of gnats, and these insects are in such prodigious numbers in the woods round Fort St. John, that it is almost impossible to bear with them. The marshes and low countries contribute towards their increasing in such numbers; but there is reason to believe, that when the woods are cut down, they will decrease.

The rattle-snake is never seen in this neighbourhood, nor any way farther to the north. Of all the snakes found in this country, none are so pernicious as this species, and yet they never hurt any person, unless they are first injured.

July 22. This evening some people arrived with horses, from Prairie, in order to fetch us. The governor had sent for them at our desire, because there were not yet any horses near Fort St. John, there being but few people settled near it. Those who had the command of the horses, brought letters to the governor general of Canada, intimating, that we had been strongly recommended by the French court, and that we were to be supplied with every thing we wanted on our journey. At the same time two casks of wine were sent as a present to us, to be of service to us on our journey. At night we drank the kings of France and Sweden's healths, under a salute from the cannon of the fort, and to these we joined that of the governor.

July 23. This morning we set out on our journey to Prairie, from whence we intended to proceed to Montreal, by the way of the river St. Laurence. At first we kept along the shore, so that we had on our

right hand the river St. John. This is the name of the mouth of Lake Champlain, which falls into the river St. Laurence, and is sometimes called Champlain River. After we had travelled about a mile, we turned to the left from the shore. The country was always low, woody, and pretty wet, though it was in the midst of summer, so that we found it difficult to get forward. But it is to be observed, that Fort St. John was only built the summer before we went there, so that it could not be supposed that the road could be in good order. Two hundred and sixty men were three months at work, in making this road, for which they were supported at the expence of government, and each received about a shilling a day.

The country here is low and woody, and of course the residence of millions of gnats and flies, which were very troublesome to us. After we had travelled about three miles, we came out of the woods, and the ground seemed to have been formerly a marsh, which was now dried up. From hence we had a very good prospect on all sides: on our right hand, at a great distance, we saw two very high mountains rising remarkably above the rest, and they were not far from Fort Champlain. We could likewise, from hence, see the high mountains that stands near Montreal, and our road went on nearly in a straight line. Soon after; we got again upon wet and low grounds, and after that into a wood that consisted chiefly of that sort of fir which has argent or silver leaves.

We found the soil, which we passed over this day, very rich and fertile, for there were few stones or rocks. About four miles from Fort St. John, the country has a very different appearance. It is all cultivated; and a continual variety of fields, with excellent wheat, pease, and oats, presented themselves to our view; but we saw no other sorts of grain. The farms stood scattered, and each was surrounded by its own corn-fields and meadows; the houses are built of wood, and very small. Instead of moss, which cannot be had here, they make use of clay to stop up the crevices in the walls: the roofs of the houses are very sloping, and covered with straw. The soil is good, being flat, and divided by several rivulets, only that in a few places there are some little hills. The prospect is very fine from this part of the road, and, as far as we could see, the country was well cultivated. All the fields were covered with corn, and they generally use summer wheat. Here the ground is very fertile, so that there is no occasion for leaving it to lay fallow. The forests are pretty much cleared, and it is to be feared that there will be a time when wood will become scarce.

About dinner time we stopt at Prairie, situated on a rising ground, near the river St. Laurence. We staid here this day, because we intended to visit every curiosity in the neighbourhood.

Prairie is a small village, on the eastern banks of the river St. Laurence, about four miles from Montreal, having that city north-west of it. All the country round is quite flat, and has hardly any rising grounds. On all sides are large corn-fields, meadows, and pastures. On the western side, the river St. Laurence passes by, and has here a breadth of above a mile. Most of the houses are built of timber, with sloping wooden roofs, and the crevices in the walls are stopt up with clay. There are some little buildings of stone, or of pieces of rock stone; but these latter are generally used for the ornamental entablatures. In the midst of the village is a pretty church of stone, with a steeple at the west end of it, furnished with bells. Before the door is a cross, together with a great deal more popish trumpery, to repeat all the sufferings of our Saviour.

The village is surrounded with pallisadoes, from four yards to five in height, put up formerly as a barrier against the Indians: without these pallisadoes are several little kitchen and pleasure gardens, but they had few fruit-trees in them. The rising grounds along the river are very inconsiderable here, so that little can be said of them. In this place there was a priest who

acted as chaplain, and a captain who assumed the name of governor. The corn-fields round the place are extensive, and sown with summer wheat; but rye, barley and maize are never seen.

To the south-east of this place is a great fall of the river St. Laurence, and it makes such a noise, that it is heard at a considerable distance. When the water, in spring, increases in the river, on account of the ice, which then begins to dissolve, it sometimes rises so high as to overflow a great part of the fields; and instead of fertilizing them, as the Nile does the lands in Egypt, by its inundations, it does them much damage, by carrying away a vast number of seeds and roots. Those inundations oblige the people to take their cattle a great way off, because the water covers a great tract of land; but happily, it never stays on it above two or three days. The cause of these inundations is generally owing to the stopping of the current of the river, on account of the vast quantities of ice that are half dissolved in it.

July 24. This morning we went in battoes to Montreal, upon the river St. Laurence; where we found the stream very rapid, but not deep: on our arrival there, we found a crowd of people at the gate of the town where we were to pass through. They were very desirous of seeing us, because they were informed that some Swedes were come to town; people of whom they had heard something, but whom they had never seen; and we were assured by every body, that we were the first Swedes that had ever been at Montreal. As soon as we were landed, the governor of the town sent a captain to us, who desired we would follow him to the governor's house, where we would be kindly received.

July 27. All this day we were pestered with the house flies, and yet we were told that they were not common in the country, at least that they had not been so for many years. The Indians are all of opinion, that these flies came first over from Europe; but this seems altogether improbable. They maintain, that all sorts of flies, which are only insects, are produced either from seeds or eggs, which is the same as the physicians call either sperma, or semina vitæ: and what reason can be assigned why that sperma should not be found in America as well as England?

Wild cattle are in great plenty in the southern provinces of Canada, and have been there from time immemorial. They are in great plenty towards the south; but when we advanced more towards the north, we saw none of them, except on some extraordinary occasions, which we could only conceive as accidental; there being no fixed time here for taking of them.

This day we saw the skin of a wild fox, which was as big as any in Europe, but the hair on the skin was thinner. The hair is dark brown, like that of a beaver; and that which is close to the skin, is as soft as wool. His hide was not very thick; and, in general, they do not reckon them so valuable as the skins of bears. In winter, they are spread on the floors to keep the feet warm; and some of these wild cattle have a fine wool as good as that of sheep. They make stockings, cloth, gloves, and other pieces of worsted work of it; which looks as well as if they were made of the best sheep's wool: and the Indians employ it for several uses. These wild cattle are, in general, stronger than the European ones; but their horns are short, and close to their head. These, and several other qualities, which they have in common with, and in greater perfection than the tame cattle, have induced some to endeavour to tame them; by which means they would have received the advantages arising from their hair, and, on account of their superior strength, be enabled to employ them in agriculture.

With this view, some have got young wild calves, and brought them up in Canada, and in several other places of North America, but they commonly died in three or four years; and although they were seen by people every day, yet they retained their native ferocity, and were as ravenous as ever; they have constantly been very shy, pricked up their ears at the sight

of a man, and trembled or run about; so that the art of taming them has not hitherto been found out. Some have been of opinion, that these cattle cannot well bear the cold, as they never go north of the place, though the summers are very hot even in those climates. They think, that when this country is better peopled, it will be more easy to tame these cattle, and that afterwards they will become quite familiar to them.

July 28. This morning we went, in consequence of an invitation we had received from the governor to visit a small island, called Magdalene. It lies in the river St. Laurence, directly opposite to the town, on the eastern side. The governor had here a very neat house, though it was not large; but there was a fine garden, and a court yard. The river passes between the town and this island, and is very rapid. Near the town, it is deep enough for yachts; but towards the island, it grows more shallow; so that they are obliged to push the boats forwards with poles. There was a mill on the island, turned by the mere force of the stream, without an additional mill-dam.

About half an hour after seven, we left this pleasant place, and within two hours after we returned to the governor's house. We received such agreeable news as are always pleasing to persons endued with virtuous friendship, especially such as are traveling through the world. The first news we received, was that the governor's son, who had been five years in France, was safely returned to Canada; and the second, that he had brought with him the royal patent, which appointed his father governor of Montreal, as well as the country belonging to it.

July 30. This day we passed through many groves of plumb-trees, which grew in abundance on the hills, and very near to the rivulets which flowed from the mountains. They were so loaded with fruit, that the boughs were bent down with the weight. The fruit was not yet ripe, but when it comes to that state of perfection, it has a red colour and a fine taste. It frequently happens that preserves are made of it; but these are little regarded, because they have but few opportunities of exporting them. There are a vast number of other things growing here, all of which are extremely useful; but many of them are lost for want of cultivation. Pompions grow in great abundance on the rising banks of the river, along the corn-fields, and in other places.

April 1. We were now advanced into the province of Canada, and we found that the governor-general frequently goes from Quebec to Montreal, and generally spent the winter there. In summer, the governor chiefly resides at Quebec, on account of the vessels that arrive there during that season, and bring him letters which he must answer; besides other business which comes in about that time. During his residence in Montreal he lives in the castle, as it is called, which is a large house, built of stone, but it has nothing at all elegant in it. All the houses in Canada stand separate from each other, and, according to the Roman Catholic custom, they have crosses fixed for their boundaries. Most of the crosses are fixed up by the road side, and they are generally made of wood, being about five or six yards high; and they are designed to excite some sort of devotion in the people. Most of these crosses convey ideas of a superstitious nature, but we shall not insist on that at present.

All this day the country exhibited a most agreeable appearance, and the fine state of its cultivation added to the beauty of the scene. Although the distance from Montreal to Quebec is near two hundred miles, yet the whole looks like one continued village; for the farm houses are so nearly situated to each other, that their inclosures join together; and this enables them to assemble with more ease when an enemy approaches to disturb them. The prospect is extremely beautiful, when the river goes on in a straight line for two or three miles together, because it presents the traveller with a view of all the villages as he sails along.

All the women in the country, without exception, wear caps of one sort or other. Their jackets are short, and so are their petticoats, which scarce reach down to the middle of their legs, and they have crosses hanging on their breasts. In general, they are very laborious; but still we found some of them as much addicted to the vanity of gossiping as the Europeans. When the girls are employed within doors, they are continually singing love-songs; but in this there is nothing extraordinary, because the same takes place in all other nations.

In the country, when the husband receives a visit from a parson of the parish, his wife stands behind the chair, to do the honours of the table; but in the towns the ladies are more distinguished, and would willingly assume an equal, if not a superior power to their husbands. When they go abroad, they wear long cloaks, which cover all their other cloaths, and are either grey, brown, or blue. The men sometimes make use of them, when they go out in the rain; and the women have the advantage of concealing their *deshabille* under their cloaks.

We sometimes saw wind-mills near the farmers, and they were generally built of stone, with a roof of boards, which, together with its fliers, could be turned to the wind occasionally. The breadth of the river was not always equal, for sometimes it was two miles, and in other places not above a quarter of a mile. The shore was sometimes high and steep, and sometimes low or sloping.

At three o'clock this afternoon we passed by the river, which comes from lake Champlain, and falls into the river St. Laurence, and towards the middle of it is an island. The yachts which go between Montreal and Quebec sail past the south-east side of the island, because it is deeper there; but some of them pass the north-west side, because it is nearer. Besides this island, there are several others here, and all of them are inhabited. Somewhat further, on both sides of the river, the country is uninhabited, because it is so low as to be overflowed at different seasons in the year.

Lake St. Pierre is a part of the river St. Laurence, which was here so broad, that we could hardly see any thing but sky and water before us. From the middle of the lake, as it is called, we saw some high mountains towards the west, which appeared above the woods. Here were no houses within sight of the lake on either side, because the land is rather too low; and in the spring season the water rises so high, that they may go by water within the inclosures. However, at some small distance from the shore, where the grounds are higher, the farms are close together. We saw no islands in the lake this afternoon, but next morning we met with several. Late in the evening we left lake St. Pierre, and rowed up a little river, in order to go to a house where we could lodge. Having rowed about an English mile, we found the river inhabited on both sides, and we passed the night in a farm-house.

August 3. At five o'clock in the morning we set out again, and first rowed down the little river, till we came again into the lake St. Pierre, which we went downwards. After we had gone a good way, we perceived a high chain of mountains towards the north-west, which were very much elevated above the low flat country. The north-west shore of the lake was now very closely inhabited, but on the south-east side we saw no houses, and only a country covered with woods, which is sometimes said to be under water; but behind it are a great number of farms. Towards the end of the lake, the river went into its proper bounds again, being not above a mile and a half broad, and afterwards we found it growing still narrower.

August 4. As soon as it was day-light, we set out for Quebec, and found the country well inhabited along the banks of the river; but in many places the woods prevented us from seeing the houses. As we proceeded along, we saw several churches built of stone,

and some of them were erected in a very neat manner. All the small streams, or rivulets, running into the river St. Laurence, were on both sides well inhabited, and the islands in the river were in the same condition.

They have a very peculiar method of catching fish here, which we believe is not practised in any other part of the world. They place hedges along the shore, made of twisted osiers, so close that no fish can get through them. For this purpose they choose such places where the water runs off during the ebb, and leaves the hedges quite dry. Within this inclosure they place several wheels, or fish-traps, in the form of cylinders, but broader below. They are placed upright, and are about a yard high, and two feet and a half wide. On one side, near the bottom, is an entrance for the fishes, made of twigs, and sometimes of yarn, in the form of a net. Opposite to this entrance, on the other side of the wheel, looking towards the lower part of the river, is another entrance like the first, and leading to a box made of boards, of about four feet long, two deep, and two broad. Near each of the wheels is a hedge leading to the long hedge, and making an angle with it. This latter hedge is made in order to lead the fish into the traps, and it is placed on that end of the long hedge which looks towards the upper part of the river. When the fish, particularly the eels, come up the river, and the water begins to ebb, they always go down again, and meeting with the hedges, they swim along them till they come through the wheels into the boxes of boards, at the top of which there is a hole with a cover, through which the fish can be taken out.

August 5. This morning we continued our journey by rowing, the contrary winds hindering us from sailing. The appearance of the shore was the same as yesterday, being in some places steep, and in others almost perpendicular. These shores were covered with a sort of black slate, which is much used in this country.

The shores of the river grow more sloping the nearer we came to Quebec, and to the northward the high mountains appeared. About two miles from Quebec the river becomes very narrow, the shores being within a musket-shot of each other. The country on both sides was sloping, covered with trees, and had many small rocks adjoining to the shore. About four o'clock in the afternoon we arrived at Quebec, much fatigued, and in great want of rest. The city does not appear till one is close to it, the prospect being intercepted by a high mountain to the south. However, a part of the fortifications appear at a considerable distance, being situated on the same mountain.

As soon as the soldiers who were with us saw Quebec, they called out, that all those who had never been there before should be ducked, if they did not pay something to release themselves. This custom even the governor general of Canada is obliged to submit to on his first journey to Montreal.

We did not desire, when we came in sight of this town, to be exempted from complying with the customs, which is very advantageous to the rowers, as it enables them to spend a merry evening on their arrival at Quebec, after their troublesome labour.

Immediately after our arrival, the officer, who had accompanied us from Montreal, conducted us to the lodgings of the deputy governor, the marquis La Galissonniere, a nobleman of eminent qualities, who behaved towards us with extraordinary goodness, during the time we staid in the country. He had already ordered some apartments to be got ready for us, and took care to provide us with every thing we wanted, besides honouring us so far as to invite us every day to his table. This good-nature, and unmerited generosity was continued to us all the time we remained in that place.

August 6. Quebec lies on the western shore of the river St. Laurence, close to the water's edge, on a rock, and bounded on the east by another branch of
that

that river, called St. Charles. The salt water never comes up to the town, and therefore the inhabitants can make use of the water of the river for their kitchens. All accounts agree, that notwithstanding the rapidity of this river, yet it continues frozen over during the winter; and so strong, that carriages can go over it. It has happened frequently, that when the river has been open in May, there are such cold nights that it freezes again, and will bear walking over. This is a clear proof of the intenseness of the frost here, which continues six months in the year.

August 7. Ginseng, a plant brought originally from China, flourishes in many parts of Canada. It flowers in May, and has berries ripe in August. The natives use these berries for the cure of asthmas, and they believe that the root promotes fertility in women. They have no traces of letters in this country, nor any remains of books, by which we might be enabled to learn some particulars concerning their history; and this may serve to shew, that there is no trusting to any accounts of nations, handed down by tradition, before the use of letters were known.

Some few years before we came to Canada, the French governor gave Mr. Verandier an order to go from Canada, with a number of people, across North America to the South Sea, to examine how far those two places are distant from each other; and find out what advantages might arise to Canada, or Louisiana, by a communication with that ocean. They set out on horseback from Montreal, and went as much due west as they could, on account of the lakes, rivers, and mountains, which fell in their way. As they came far into the country, beyond many nations, they sometimes met with large tracks of land, free from wood, but covered with a kind of tall grass. Many of these fields were every where covered with furrows, as if they had been ploughed formerly.

It is to be observed, that the natives which now inhabit North America, could not cultivate the land in this manner, because they never made use of horses, oxen, ploughs, or any instruments of husbandry; nor had they ever seen a plough before the Europeans came to them. In two or three places, at a considerable distance from each other, our travellers met with the impression of the feet of grown people and children in a rock; but these seemed to be natural when they came far to the west, where they believed no Europeans had ever been. They found in one place in the woods, and again on a large plain, great pillars of stone, leaning against each other. These pillars consisted of one single stone each, and the Frenchmen believed that they had been erected by men. At last they found a very large stone, like a pillar, and in it a smaller stone was fixed, which was covered on both sides with unknown characters. This stone they took off from the large one, and carried it to Canada along with them, from whence it was sent over to France, but what became of it afterwards does not appear. Several jesuits, who have seen and handled the stone in Canada, unanimously affirm, that the letters on it are the same with what are used by the Tartars. Notwithstanding the questions the French people asked the inhabitants on the South Sea coast concerning the time when, and the persons by whom the pillars had been erected? what their traditions and sentiments were concerning them? who had wrote the characters? what was meant by them? what kind of letters they were? in what language they were written? and other enquiries; yet they could never get the least explication, the Indians being as ignorant of those things as the French themselves: all that they could say was, that these stones had been there time immemorial.

The places where the pillars stood were above one thousand miles west of Montreal. The chief intention of this journey was not attained on this occasion, for the Indians were at war among themselves. Among the best and most westerly Indians they met with, they heard that the South Sea was but a few days journey off; that the Indians often traded with the

Spaniards on that coast, and sometimes with the English at Hudson's-Bay. Some of these Indians had houses made of earth: some of them were dressed in the skins of wild beasts, but the greater part were naked.

All those who had made long journies in Canada to the south, but chiefly westward, agreed, that there were many great plains destitute of trees, where the land was furrowed as if it had been ploughed. In what manner this happened, no one knows; for the corn fields of a great village, or town of the Indians, are only a few acres in extent; whereas those furrowed plains are frequently two or three days journey in length, except now-and-then a small smooth spot, and here and there some rising grounds.

August 8. This morning we visited the largest nunnery in Quebec. Men are prohibited from visiting it under very severe penalties, except in some rooms divided by iron rails, where the men and women that do not belong to the convent stand without, and the nuns within the rails, and converse with each other. However, the governor procured leave from the bishop for us to visit the inside, to view the construction of the building. The bishop alone has the power of granting this privilege, and it is very sparingly complied with. The royal physician and surgeon are, however, at liberty to go in as often as they please. We first saw the hospital, and then entered the convent, which forms a part of it.

It is a large building of stone, three stories high, divided in the inside into long galleries, on both sides of which are cells, halls, and rooms. The cells of the nuns are in the highest story, on both sides of the gallery; but they are small, not painted in the inside, but hung with paper pictures of saints, and our Saviour on the cross, coarsely daubed over.

A bed, with curtains and good bed cloaths, a little narrow desk, and a chair or two, is the whole furniture of a cell. They have no fires in winter, so that the nuns are obliged to lay in the cold cells. On the gallery is a stove, which is heated in winter, and as all the rooms are left open, some warmth can, by this means, come into them. In the middle story are rooms, where they pass the day together. One of these is the room where they work, which is large, finely painted, and adorned with an iron stove. Here we found them at their needle-work, embroidering, gilding, and making flowers of silk, which bore a great similarity to the natural ones. In a word, they were all employed in such works as were suitable to ladies of their rank in life. As we were protestants, we lamented to see so many young ladies confined up as prisoners, merely from motives of gross superstition, and deprived of those comforts which give life and pleasure to society.

In another hall, they assembled to hold their meetings for conversation together, but such as were indisposed had rooms for themselves. The novices are instructed in another apartment; and they have a dining-room, with tables on both sides. When they dine, all are silent, except one of the oldest, who goes into a reading-desk, and reads some passages out of a book, containing anecdotes relating to the saints. During dinner, as well as at their other meals, they sit on that side of the table which is next the wall; and almost in every large room is a gilt table, on which are placed candles, with the picture of our Saviour on the cross.

On one side of the convent is the church, and near it a large gallery, divided by rails, so that the nuns can only look into it. In this gallery they remain during divine service; and the priest is in a part of the church, where the nuns receive his sacerdotal robes through a hole, for they are not allowed to go into the vestry, nor to be in the same room with the priest. There are still several other rooms and halls here for different uses, and the ground floor is for the kitchen. In the garrets they keep their corn, and dry their linen. In the middle story is a bakery

on the outside, almost round the whole building, where the nuns are allowed to take the air. The prospect from the convent is very fine on every side: the rivers, the fields, and the meadows out of town appear to great advantage, and heighten the beauty of the scene even beyond description. On one side of the convent is a large garden, in which the nuns are at liberty to walk about, and it is surrounded with a high wall. There is plenty of fruit in it, the whole being the property of the convent. This convent contained about fifty nuns, some of them young, but the greater part were such as had been advanced in years, several of whom were the widows of such officers who had been killed.

They are not allowed to take the veil till they have served a noviciate of two or three years, in order to try whether they will be constant. During the whole of that time it is in their power to leave the convent if they please, or if the monastic life does not agree with their inclinations. But as soon as they are received among the nuns, and have made their vows, they are obliged to continue in the convent for life; and if at any time they should discover an intention to make an elopement, they are locked up in a dungeon. This is horrid barbarity; but what will superstition not do? it rides triumphant over the natural rights of all the children of Adam; it keeps thousands off from intellectual knowledge, and drives them to things that are dishonourable to them as human beings, and unbecoming their characters as Christians.

The nuns of this convent never go further from it than to the hospital, which is just beside it, and even makes a part of it. They go there to attend the sick, and take care of them. We were told here, that few of the nuns take the veil till they had lost all hopes of getting husbands; but we answered, that ladies would take their passions along with them. Nor is it possible for them to divest themselves of those passions: and although they may put on a very chearful countenance within the walls of a convent, yet their minds may be uneasy and distressed.

How oft the smiling brow of joy
A sick'ning heart conceals!
And through the cloyster's dark recess
Invading sorrow steals.

August 10. This day we dined with the jesuits, many of whom we found to be men of considerable attainments in the literary world. We waited on them in consequence of an invitation sent us by their president. We found their convent built in a very regular form, and had more the appearance of a palace than of a house for priests to reside in. It consists of stone; is three stories high, exclusive of the garret, covered with slates, and built in a square form, with a large court. Its size is such, that three hundred families can reside in it, though there were not above twenty jesuits there at that time. Sometimes there is a much greater number of them, especially when those return who have been sent as missionaries into the country. There are walls along the sides of the square in every story, on both sides of which are either cells, halls, or other apartments, for the priests. Every thing is very well regulated, and the jesuits are accommodated in a very handsome manner. On the outside is their college, which is on two sides surrounded with large orchards, and kitchen gardens, in which they have fine walks, part of the trees being the remains of the forest which stood here before the French occupied it.

They have besides planted a vast number of fruit-trees, and the garden is stocked with all sorts of plants for the use of the kitchen. The jesuits dine together in a great hall, and tables are placed along the walls, with seats between them. Near one of the walls is a pulpit, where one of the fathers reads a religious book, while the others are at their meals: but while we were there, this ceremony was omitted, the time being allotted for conversation. They live very well,

VOL. II. No. 74.

and their dishes are as elegant as at the most splendid feasts. In this spacious building we did not see a single woman, for all are fathers or brothers; the latter of which are young men, who are to be brought up jesuits. Three young gentlemen serve at table, for no common servants are admitted.

August 11. This morning we took a walk out of town, in order to see a nunnery, at a small distance from Quebec. This convent, which is built most magnificently of stone, lies in a pleasant spot, surrounded with corn-fields, meadows, and woods; from whence Quebec, and the river St. Laurence, may be seen. The bishop, at the desire of the governor, permitted us to visit this convent, which is a favour seldom granted. The abbess led us through all the apartments, accompanied by several of the nuns. Most of the nuns here are of noble families, and one was the daughter of a governor. Many of them were old, but we likewise saw some young ones, who had a very fine appearance. They seemed to be more polite than those in the other nunnery we had visited, but their cells, or rooms, were the same, only that they had some additional furniture, the beds being all hung with blue curtains.

There are, however, no stoves in any of their cells, but the public halls, in which they must have stoves. Here is a school as well as a nunnery, and the people of fashion send their children to be educated in it. The convent at a distance looks like a palace; and we were told that it was founded by a bishop, who lies buried in the church.

We dined with a venerable old father, who officiated here as priest. The dishes were all prepared by the nuns, and they were as numerous and various as on the tables of great men. There were likewise several sorts of wine, together with every thing that could make the dinner a source of entertainment. The revenues of this convent are said to be considerable, which is not to be wondered at, when we consider the superstition of the people. At the top of the building is a small steeple, with a bell, to call the nuns together to prayer; and upon the whole, the situation is the most agreeable that can be imagined. From this place to Quebec there is a fine walk, surrounded with tall trees, which, forming villas in different places, present the travellers with a variety of objects, equally agreeable, chearful, variegated, and delightful.

August 12. This day, in the afternoon, we went into the country, to spend two days in collecting plants, and to take an attentive view of every thing we saw. In order to proceed the better, the governor-general sent a sort of Indian to attend us. This Indian was the son of an Englishman, but had been taken prisoner by the savages thirty years before, when he was only a boy, and adopted by them, according to their custom, in room of one of their relations, killed by the enemies. From that time he had constantly staid with them, had become a Roman catholic, and married an Indian woman. He dressed like an Indian, and, besides their language, he spoke both English and French.

In the wars between the English and French in this country, the Indians made many prisoners of both sexes, whom they adopted and married to some of their own people. Thus the Indians in Canada are in blood much mixed with the Europeans, which is the reason why they live on such friendly terms together. It is likewise remarkable, that a great part of the prisoners whom they had taken, during the war, and incorporated with their nation, especially the young people, did not choose to return to their native country, though their parents and nearest relations came to them, and endeavoured to persuade them to do it. The licentious life lived by the Indians pleased them better than the austerity of the European nations; for they dressed like them, and in their manners and customs conformed to all the practices of the country. It was therefore difficult for us to distinguish them, except by their colour, which

is somewhat whiter than that of the Indians. There is, on the contrary, scarce an example of an Indian's adopting the European customs, except such as have been taken prisoners in the wars while they were young.

The lands which we passed over, were every where laid out in corn-fields, meadows, or pastures. Almost all around us, the prospect presented to our view farms and farm-houses, with fine cultivated fields. A little from the town, the land rises higher and higher, consisting as it were of terraces one above another. The rising grounds are, however, pretty smooth, chiefly without stone, and covered with rich mould; under that is the black lime stone which is so common hereabouts, and is much esteemed. All the hills are cultivated, and some are adorned with fine churches, houses, and corn-fields. The meadows are commonly in the vallies, though we frequently found some on eminences. From one of these hills we had a most delightful prospect; Quebec appeared very plain to the eastward, and the river St. Laurence could likewise be seen. On the south-east side of the river appears a large chain of mountains, running, generally, parallel to it, though many miles distant from it.

To the west again, at some distance from the rising grounds where we were, the hills changed into a very long chain of high mountains, lying very close to each other, and running parallel to the river, that is nearly from south to north. These high mountains consist of a grey rock stone, very nearly resembling that of the slates. The houses in the country are built promiscuously of wood or stone; for we did not find that they had many bricks: the houses are seldom above one story high, and in every room is either a chimney or stove, and sometimes both. The smoke from the stoves is conveyed up the chimney by an iron pipe, but in summer they are removed.

This evening we arrived at Lorette, where we lodged with the Jesuits.

August 13. In the morning, we continued our journey through the woods to the high mountains, in order to discover some scarce plants, with other curiosities; but we could not find any except what were common in Europe. At night we returned to Lorette, but brought nothing with us of any importance.

August 14. Lorette is a village three miles to the westward of Quebec, inhabited, chiefly, by Indians of the Huron nation, converted to the Roman Catholic religion. The village lies near a little river, which falls over a rock, making a prodigious noise, and turns several mills. The natives used to have plain huts, but the Jesuits have taught them to build their houses in the French fashion. In each house are two rooms, one for the bed-chamber, and the other for the kitchen. They have a small oven, covered at the top with an iron plate. Their beds are near the wall, and they put no other cloathing on them than those which they are dressed in: their other furniture and utensils are equally wretched. Here is a fine church, with a steeple and bell, and the steeple is raised high, covered with tin plates. Divine service is as regularly performed here as in any of the other Roman Catholic churches: and we were pleased with seeing the alacrity of the Indians, especially of the women, and hearing their good voices, when they sung all sorts of hymns in their own language.

These converted Indians retain the custom of dressing like their ancestors, but some of the men dress like the French. It is certain that these Indians, upon their conversion, make a vow to God never to drink any sorts of strong liquors, so that we seldom found any of them intoxicated. We often lamented that this was not equally attended to by the savage Indians; who, in consequence of drinking strong liquors, which they purchase from the Europeans, are frequently driven to such a state of madness that they murder each other, nay, frequently their nearest and dearest relations.

This day we returned to Quebec, making what observations we could by the way, relating to botany.

August 15. The day before our arrival, the new governor-general from France landed at Quebec; but it being late, he did not make his public entrance till the next day. He had left France on the second of June, but could not reach Quebec till this day, on account of the great difficulties that ships meet with in passing through the sands at the mouth of the river St. Laurence. The ships cannot venture to go up without a fair wind, being forced to run into many bendings, and frequently in a very narrow channel. This day was a festival, in honour of the ascension of the Virgin Mary, which is celebrated in all Roman Catholic countries. This day was, accordingly, doubly remarkable, both on account of the holiday, and the arrival of the new governor-general, who is always received with great pomp, as he represents the king's person.

About eight o'clock in the morning, the chief people in the town assembled at the house of Mr. de Vaudreuil, who had lately been appointed governor of Three Rivers, and lived in the lower town. Thither came, likewise, the Marquis de la Galissonniere, who had, till now, been governor-general, but was about to sail to France, as soon as an opportunity offered for that purpose. He was accompanied by all the principal officers belonging to the government; and we were invited to be present at the procession.

At half an hour after eight, the new governor-general went from the ship into a barge covered with red cloth, upon which a signal with cannon was given from the ramparts, for all the bells in the town to be set a ringing. All the people of distinction went down to the shore to salute the governor, who, on alighting from the barge, was received by the marquis de la Galissonniere. After they had saluted each other, the new governor of the province was addressed by the commandant in a very elegant speech, which he answered courteously, when all the cannon on the ramparts gave a general salute. The whole street, up to the cathedral, was lined with men in arms, chiefly drawn out from among the burgeses. The governor-general then walked towards the cathedral, dressed in a suit of scarlet, trimmed with gold. His servants went before him, in green, carrying fire-arms on their shoulders. On his arrival at the cathedral, he was received by the bishop of Canada, with all his clergy, assembled for that purpose. The bishop was dressed in his pontifical robes, and had a gilded mitre on his head, with a crozier of massy silver in his hand; so that, in the eyes of the vulgar, he made a most dignified and splendid appearance.

After the bishop had addressed a short speech to the governor-general, a priest brought a silver crucifix, on a long stick, to be kissed by his excellency; and two priests walked on each side, with lighted tapers in their hands. The bishop and priests then walked up to the choir, followed by the servants of the governor-general, with their hats on, and arms on their shoulders. At last came the governor-general and his suite, followed by a vast crowd of people.

At the entrance into the choir, the new governor-general, and the marquis de la Galissonniere, stopped before a chair covered with red cloth, and stood there during the whole time of the celebration of mass, which the bishop performed himself. From the church he went to the palace, where he was waited upon by all the people of respect in the town. All the religious orders waited upon him at the same time, to testify their joy on his happy arrival. A grand entertainment was prepared, and it lasted longer than we imagined it would have done.

The name of the new governor-general was the marquis de la Jonquiere, about sixty years of age, and rather tall of stature. He had fought a naval battle with the English, but was obliged to submit to their superior courage. On this occasion, he was wounded by a ball, which entered at one side of his shoulder and came out at the other. He was very complaisant, but

knew

knew how to preserve his dignity when he conferred a favour.

August 17. This day we went to see the nunnery of the Ursulines, which is disposed nearly in the same manner as the two other nunneries. It is situated in the town, and has a fine church; and the nuns are renowned for their piety, because they go less abroad than any others. The men are not to go into this monastery without the special leave of the bishop; but we obtained leave through the interest of the governor. On our arrival, we were received by the abbess, who was attended by a great number of nuns, and for the most part old ones. We saw the church, and, it being Sunday, we found some men on every side of it kneeling by themselves, and saying their prayers. As soon as we came into the church, the abbess and the nuns dropt on their knees; and, although we were Protestants, we followed their example. We then went to the entrance of the chapel, dedicated to the Virgin Mary, where they all fell on their knees again. We afterwards saw the kitchen, the dining-hall, and the apartment they work in, which is large and fine. They do all sorts of neat work there, such as colouring prints, drawing fine artificial flowers; and embroidery, which they perform with great art, and it is much esteemed by all those who purchase it.

The dining-hall is disposed in the same manner as in the other two monasteries. Under the tables are small drawers for each nun, to keep her napkin, knife and fork in, together with other necessaries: their cells are small, and each nun has one for herself. The walls are not painted; but a little bed, a table with a drawer, a crucifix with pictures of saints on it, and a chair, constitutes the whole furniture of a cell. We were then led into a room full of young ladies, about twelve years old, who, before that age, had been sent thither by their parents, to be instructed in every thing necessary to complete their education. They were permitted to visit their relations once a day, but they were not to be above an hour absent. When they have finished their education, they return home to their parents again, without having any connection with what is commonly called a religious life.

Near the monastery is a fine garden, which is surrounded with a high wall: it belongs to this society, and is stocked with all sorts of fruit trees and vegetables, for the use of the kitchen. When the nuns are at work, or during dinner, every thing is silent in the rooms, unless it happens that some one of them reads to the others; but after dinner, they have leave to take a walk for an hour or two in the garden, or to divert themselves within doors. After we had seen every thing remarkable here, we took our leave and departed.

August 21. This day several deputies came from the Indian nations, to present their compliments to the governor-general, and they were distinguished by the following names: Hurons, Mikmaks, and Anies, the last of which are a nation of the Iroquois, and allies of the English; they were taken prisoners in the wars.

The Hurons are some of the same Indians with those who live at Lorette, and have received the Christian religion. They are tall, robust people; well shaped, and of a copper colour. They have short black hair, which is shaved on the forehead, from one ear to the other, and none of them wear hats or caps; some have ear-rings, and others not; many of them have their faces painted all over with vermillion, but others have only strokes of it on the forehead and near the ears. Red is the colour they chiefly make use of in painting themselves, but we sometimes saw some of them who daubed their faces over with a black colour. Many of them have figures on the face, and on the whole body, which are stained into the skin, so as to be indelible: these figures are commonly black. Some have the figure of a snake painted on each cheek, some have several crosses, some an arrow, others the sun, or any thing their imagination leads them to. They have each figures likewise on their breasts,

and other parts of the body, but some have no figures at all; so that in all those customs, we found a striking resemblance between them and the eastern Europeans.

With respect to their dress, they wear a shirt, which is either white or checked, or a shaggy piece of cloth, which is either blue or white, with a blue or red stripe below; this they always carry over their shoulders, or let it hang down, in which case they wrap it round their middle. Round their necks they have a string of violet wampums, with little white wampums between them. These wampums are small, of the figure of oblong pearls, and made of the shells which the English call clams. At the end of the wampum-strings, many of the Indians wear a piece of French coin, with the king's picture on their breasts. Others have a large shell on their breasts, of a fine white colour, which they set a great value upon, and it is sold very dear.

They all have their breasts uncovered, and before them hangs their tobacco-pouch, made of the skin of a wild beast, and the hair-side turned outward. Their shoes are made of skins, and are much like the sandals of the ancients. Instead of stockings, they wrap their legs in pieces of blue cloth, much in the same manner as is practised by the Russian boors.

The Mikmaks are dressed like the Hurons, but distinguish themselves by their long straight hair, of a jetty black colour. Almost all the Indians have straight black hair: however, we sometimes met with some who had hair a little curled. In general, they are not so tall as the Hurons, but their hair is mostly longer. Their language is different from that of the Hurons, and for that reason there is an interpreter.

The Anies are the third sort of Indians here, and they have something cruel in their looks, but their dress is the same as that of the other Indians. They wear pieces of tin between the hair, which lies on the neck. Each Indian has a tobacco-pipe of grey limestone, which is blackened afterwards, and has a long tube of wood. There were no Indian women present at this interview. As soon as the governor-general came in, and was seated, in order to speak with them, the Mikmaks sat down on the ground, in the same manner as Laplanders, but the other Indians sat on chairs.

There is no printing-press in Canada, but there was one formerly here, and now their books are brought from France. They pretended that printing should not be permitted here, lest it should encourage the publication of libels against religion and government. But the true reason seems to be, the poverty of the country, as no printer could put off a sufficient number of books, by which he could procure a subsistence; and another reason may be, that France may have the profits arising from the exportation of books.

The meals here, are in many respects different from those of the inhabitants in the English provinces. This, perhaps, depends upon the difference of custom, taste, and religion, between the two nations. They eat three meals a day, viz. breakfast, dinner, and supper; they breakfast commonly between seven and eight, for the French here rise very early, and the governor-general can be spoke with at seven o'clock, which is the time when he has his levee. Some of the men dip a piece of bread in brandy, and eat it; others take a dram of brandy, and eat a bit of bread after it. Chocolate is very common for breakfast, and many of the ladies drank coffee: some eat no breakfast at all. We never saw any tea, because, as we imagined, they could not get it without purchasing it from the English, which would be laying the money out of their own country: a principle that all sound politicians will attend to.

Dinner is exactly at one, and people of quality have always a variety of dishes, to which they invite strangers. The loaves are oval, baked of wheat flour, and for each person they put a plate, napkin, spoon, and fork: sometimes, they likewise give knives, but they are generally omitted, all the ladies and gentlemen being

being provided with their own knives. The spoons and forks are of silver, and the plates of delft ware. The meal begins with a soup, and a good deal of bread in it: then follows fresh meat, of various birds, both boiled and roasted, with poultry, game, fricasees, ragouts. They commonly drink red claret at dinner, mixed with water; and spruce beer is likewise much in use: the ladies drink wine and water mixed together. After dinner, the fruits and sweetmeats are served up, which are of many different kinds; some of which are brought from Europe: cheese is likewise a part of the desert; and so is milk, which they eat sweetened with sugar.

Fridays and Saturdays they eat no flesh, according to the Romish ritual, but they know how to guard against hunger. On those days they boil all sorts of vegetables, with fruits, fish, eggs, and milk, prepared in various ways. They cut cucumbers into slices, and eat them with cream, which they reckon a very good dish. Sometimes they put whole cucumbers on the table, and every body that likes them takes one, who peels and slices it, and dips the slices into the salt, eating them like radishes. Melons abound here, and are always eaten with sugar. They never put any sugar into wine or brandy, so that they are not so voluptuous as many of the Europeans. They say no grace before or after meals, but only make the sign of the cross. Immediately after dinner, they drink a dish of coffee, without cream. Supper is always between seven and eight o'clock, and the dishes are the same as at dinner.

August 23. In many places hereabouts they use their dogs to carry water out of the rivers, and this day we saw a great many dogs drawing carts loaded with water, which they had brought from thence. They had neat harness, like horses, and bits in their mouths, with a barrel in the cart. The dogs were directed by a boy, who ran behind the cart; and as soon as they came up to the river, they jumped in of their own accord. When the barrels were filled, the dogs drew their burthen up the hill to the place where it was wanted; each of those animals knowing the houses they came from. Sometimes they put but one dog before the water-carts, which are made small on purpose. The dogs are not very large, being commonly of the size of our farmers dogs. The boys that attend them have great whips, with which they make them go on occasionally, and we have seen them frequently carry, not only water, but even wood, and other necessaries of life.

In winter, in Canada, it is customary for travellers to put dogs before their sledges, to carry their cloaths; and this is practised by the poor people in winter, who, while those animals are drawing the cart, go on foot themselves. Almost all the wood, which the poorer sort of people bring out of the woods, is brought home by dogs, who have, therefore, procured the name of horses. They commonly place a pair of dogs before each load of wood; and we frequently saw some neat sledges, made for the use of the ladies, to ride on in winters, and they are drawn by a pair of dogs; and these creatures go much swifter than one would imagine. A middle sized dog is sufficient to draw a single person when the roads were good. We were told, by old people, that horses were scarce here, in their youth, and that almost all the land carriage was then effected by dogs.

August 25. The high hills, to the north of the town, abound with springs, and those hills consist mostly of black slate. They are pretty steep, so that it is difficult to get to the top. Their perpendicular height is about twenty-four yards, and their summits are covered with trees, with a thick crust of earth laying on the lime-slates, and are employed for corn-fields and pastures. It seems, therefore, inconceivable from whence these naked hills could take so many running springs, which, in some places, gush out of the rocks like torrents.

All the horses in Canada are strong, well made, swift, as tall as the horses in Europe, and improved on a breed brought over from France. The inhabi-

bitants have the practice of docking the tails of their horses; which is rather an act of cruelty, as they cannot defend themselves against the swarm of gnats which constantly infest them. They put the horses one before the other into their carts, which has probably occasioned the docking of their tails, as the horses before would, by their tails, hurt the eyes of those who went behind. The governor-general, and a few more of the officers here, have their coaches in the European manner, but the lower order of the people make use of covered waggons. It is a general complaint, that the country people begin to keep too many horses, by which many of the cows are kept short of food in winter.

The cows have likewise been imported from France, and are of the size of the common cows in Europe. Every body agreed that the cattle, which were produced from the French breed, did not come up to the original. This they ascribe to the cold climate in winter, during which they are obliged to put their cattle into stables, and give them what food they can procure. Most of the cows have horns, but we frequently saw some without them. This is a phenomenon in nature that we are not able to account for.

A cow without horns is reckoned an unheard of curiosity in Pennsylvania, because they are seldom found. The beef and veal at Quebec is reckoned far superior to that at Montreal. Some look upon the salty pastures below Quebec as the cause of the difference. In Canada the oxen draw with the horns, but in the English colonies they draw with their wethers, as horses do. The cows vary in colour; however, most of them are either red or black.

Every countryman commonly keeps a few sheep, which supply him with as much wool as he wants to clothe himself and his family with; but the better sort of cloaths are brought from France. The sheep degenerate here, after they are brought from France, and their progeny still more so; and this is ascribed to the want of food in winter. We saw no goats in Canada, and we were assured there were none. We saw but few in the English colonies, and only in their towns, where they are kept on account of some of their sick people, who drink their milk by the advice of their physicians. The harrows are triangular, two of the sides being six feet, and the other four feet long. The teeth, and every other part of the harrows are of wood. The teeth are about five inches long, and at about the same distance from each other.

The prospect of the country, about a mile south of Quebec, is extremely fine. The country is steep towards the river, and then begins to grow higher. In many places it is naturally divided into terraces, from whence there are very extensive prospects. To the west are the hills, which extended the prospect so far as it is connected with the river; but in the intermediate space are many well cultivated fields. The prospects are delightful, the meadows are pleasant, the pastures present agreeable objects to the eye, and there are corn-fields, covered with wheat and barley. Several fine houses and farms are interspersed all over the country, and none are ever to be found together. The dwelling house is commonly built of black lime-slates, and generally white-washed on the outside. Many rivulets and brooks run down the high grounds; above these the high mountains lie, and they consist entirely of the black lime-slates, that shiver in pieces in the open air. On the lime-slates lies a mould of two or three feet in depth, and the soil in the corn-fields is always mixed with little pieces of the lime-slate. All the rivulets cut their bed deep into the ground, so that their shores are commonly of lime-slates. A dark grey lime-stone is frequently found here, which, when broken, has a sulphureous smell. We spent several days in viewing the country, and in collecting natural curiosities; but we found that the common people in the country were both ignorant and poor. They were ignorant of all those beauties of nature which daily presented themselves to our view; and they were remarkably poor, in consequence

of the oppression they laboured under from the arbitrary government of France.

August 29. By desire of the governor-general, we set out this day to visit what they call a silver mine, near the bay of St. Paul's. We were glad to embrace this opportunity, as we had the advantage of seeing some parts of the country we had not visited before. Early in the morning we went on board a boat, and proceeded down the river St. Laurence, accompanied by several French gentlemen. The prospect from the river near Quebec is very lively. The town lies very high; and all the churches, with the other public buildings, are so situated, as to make them have something of a conspicuous air. The ships on the river below embellish the prospect on that side; and the powder magazine, which stands at the summit of the mountain on which the town is built, towers above all the buildings in that part, which rises above the extremity of the walls.

The country we passed, afforded a no less charming sight. The river St. Laurence flows nearly from south to west here; on both sides of it are cultivated fields, but more on the west side than on the east: the hills, on both sides, are steep and high. A number of hills separated from each other, large fields which looked white from the corn with which they were covered, and excellent woods, made the country appear very pleasant. Now-and-then we saw a church built of stone, and, in several places brooks fell from the hills into the river. Where the brooks are considerable, they have made saw-mills and water-mills.

After rowing about six miles, we came to the island of Orleans, situated in the middle of the river St. Laurence, and has very steep and woody shores. Here are some places without trees, which have farm-houses almost close to the shore. The island itself is well cultivated, and nothing but fine houses of stone, large corn-fields, meadows, parting woods of fir-trees, and other natural curiosities, are to be seen.

We went into that branch of the river which flows on the west side of the isle of Orleans, it being the shortest. It is about half a mile broad, but large vessels cannot get up it, on account of the sand-banks which lie here, near the projecting points of land; and on account of the shallowness of the water, with the rocks and stones at the bottom. The shores, on both sides, still kept the same appearance as before: on the west side, or on the continent, the hills have vast quantities of slate, which seems to be in greater plenty in Canada than in any other part of the world. On the west side of the river is a church, called St. Anne, close to the shore. This church is remarkable, because the ships from France and other parts, as soon as they are got so far up the river St. Laurence as to get sight of it, give a general discharge of their artillery, or a sign of joy that they have passed all dangers in the river.

About two o'clock in the afternoon, the tide began to flow up the river; and the wind being likewise against us, we could not proceed any farther till the tide began to ebb. We, therefore, took up our lodgings in a great farm-house, belonging to the priests of Quebec, near which is a fine church, called St. Joachim. We were exceedingly well received here, and so are all Europeans; for the whole country around belongs to the priests, and it is well known that the Romish ones are, for the most part, hospitable. Here we found two priests, and a number of young boys, whom they were instructing in reading, writing, and Latin, most of them being assigned for the priest's office. The strong easterly winds obliged us to lay all night at this farm-house, where all endeavours were used by the landlord, his wife, and servants, to make our time agreeable, by furnishing us with all those necessaries our situation required.

August 30. This morning we continued our journey in spite of the wind, which was very violent against us. The water in the river begins to get a brackish taste when the tide is highest, and the farther one goes down the saltier it becomes. The bay of

St. Paul's is a small parish, but well-inhabited. It is in a plain near the banks of the river, and behind the plain are vast high mountains. All the farms are at some distance from each other; and they told us, that the church was the first founded in Canada; which seems to be confirmed by its bad architecture, and want of ornaments; for the walls are formed of pieces of timber, erected at about two feet distance from each other, supporting the roof: between these pieces of timber they have made the walls of lime-slate, and the roof is flat. The church has no steeple, but a bell fixed above the roof in the open air.

August 31. We rested ourselves during the forenoon, and in the afternoon we went still lower down the river St. Laurence, to the place where we were told there were silver or lead mines; but upon the strictest enquiry it appeared, that the mine consisted of nothing more than slate. Late at night we arrived at the last village, towards the extremity of the province of Canada. This village has a little shore near the side of the river.

September 1. There was a woman with child in this village, who was now in the fifty-ninth year of her age. She had not had the catamenia during eighteen years. In 1748 she got the small-pox, and now she was very big: she said she was very well, and could feel the motion of the fœtus. Her husband was alive; and this being a most extraordinary case, she was brought to Mr. Gaulties, the surgeon who accompanied us in our journey, and had some private conversation with him.

At half an hour after seven we went down the river, and found vast mountains on each side; and here were a great number of small islands. In 1663 there was a most dreadful earthquake here, which discomposed the bed of the river, and has torn up several of the islands. Many hills tumbled down, and a great part of the corn-fields, on the lowest hills, were destroyed. About noon we arrived at Geese Cape, so called from the vast number of wild geese constantly found near it.

September 4. The mountains hereabouts were covered with a very thick fog this day, somewhat resembling the smoke of a coal-pit, when on fire. Many of these mountains are amazingly high; and we asked several intelligent persons here, whether the snow lay on them all the year? but were answered, that it never did; which may in some measure account for the vast overflowing of the rivers in Canada.

September 5. Early this morning we set out on our return to Quebec, and continued our journey till noon, notwithstanding the heavy rain and thunder incommoded us. At that time we were just at Petite Riviere; and the tide beginning to ebb, it was impossible for us to get up against it, so that we resolved to stay all night on shore. Petite Riviere is a small village on the western side of the river St. Laurence, and lies on a little rivulet, from whence it takes its name. The houses are built of stone, and are occupied over the country. Here is likewise a pretty church built of stone, and the architecture is far from being contemptible, for it is in many parts well constructed, though not in all.

The river St. Laurence entirely cuts off a piece of land on the east side of the village, so that the inhabitants fear they will, in a short time, lose all the land they possess here, which indeed is not much. One thing we remarked here was, that most of the houses were full of children, which may in some measure account for the solution of a problem in history.

It has been often wondered how the northern nations, from the beginning of the fourth till the latter end of the sixth century, could send out almost innumerable swarms of people to take possession of the southern provinces of Europe, of some parts of Asia and Africa, and to establish sovereignties on the ruins of the Roman empire. The reason was neither more nor less than this: that the people live in a sober frugal manner. Let us go into the most northern

extremities of the world, and you will find that few children die a natural death. But let us turn our eyes to capital cities, and we shall find that but few, comparatively speaking, live. Vigour, exercise, and sobriety, procure life in the exterior parts of kingdoms; luxury, drunkenness, idleness, debauchery, and a thousand other causes, sow the seeds of diseases in great cities. But this by way of digression.

September 6. Nothing extraordinary happened to us this day, except that we saw a vast number of eels, and porpoises which feed upon them. The greater the quantities of eels is, the greater is likewise the number of porpoises; which are caught in the following manner: when the tide ebbs in the river, the porpoises commonly go down, catching all the eels they can lay hold of. The inhabitants, therefore, of this place, stick little twigs or branches with leaves, into the river, in a curve line or arch, the ends of which look towards the shore, but stand at some little distance from it, leaving a passage there. The branches stood about two feet distant from each other, and when the porpoises come among them, perceiving the rustling the water makes with the leaves, they dare not venture to proceed, fearing lest there should be a snare or trap, and endeavour to go back. Mean while, the water has receded so much, that in going back they light upon one of the ends of the arch, whose moving leaves frighten them again. In this confusion, they swim backwards and forwards, till the water is entirely ebb'd off, and they lay on the bottom, where the inhabitants kill them. These creatures are of great service to the people, because they produce a large quantity of train oil.

September 7. Nothing worthy of notice happened to us this day, only that we took a view of the banks of the river, and found them well cultivated. Here were trees of various sorts growing, and, upon the whole, it was extremely agreeable. In the evening, we went to view the fall of Montmorenci, which is one of the highest I ever saw. It is in a river whose breadth is not very considerable, and falls over the steep side of a hill, consisting entirely of black slate. The fall is at the bottom of a little creek of a river, and both sides of the river consist of that slate. The rain of the preceding day had increased the waters of the river, which gave the fall a grander appearance: the breadth of the fall is about ten or twelve yards, and its perpendicular height about one hundred and ten.

At the bottom of the fall there is always a great fog of vapours spreading about the water, which is resolved into them by the violence of the fall. This fog occasions an almost perpetual rain here, which is more or less heavy, in proportion to its distance from the fall. We thought to have gone near, to take a proper view of it, but within twelve yards of the fall, a sudden gust of wind blew a thick fog upon us, which, in less than a minute, had wet us as thoroughly as if we had been at the bottom of the river: we therefore turned away as fast as we could. The noise of the fall is heard at the distance of six miles, and has something in it very awful. This evening we arrived at Quebec, but were much fatigued.

September 8. We spent this day in observing several other things concerning the manners of the people in Quebec, which are the more singular, because they are composed of a mixture of French and Indians. Some of the gentry make use of ice cellars to keep the beer cold during the summer, and likewise to keep their meat fresh. These ice cellars are commonly built of stone, under the house, and the walls are covered with boards, because the ice is more easily consumed by stones. In winter, they put in a large quantity of snow, which is trodden down by their feet, and then covered with water; they then open the cellar holes and doors, to admit the cold; and, in summer, it is customary to put a piece of ice into whatever liquor they chuse to drink.

All the salt made use of here is imported from France; for, although they could make good salt here, yet they are not permitted, for the French keep the

trade to themselves. We continued at Quebec during the remainder of this year, amusing ourselves partly by inquiring into the natural productions of the country, and partly in conversation with the jesuits, who are commonly men of knowledge, let their political principles be ever so opposite to civil and religious liberty.

As soon as the season would permit, we left Quebec with a fair wind, the governor-general having ordered one of the king's boats to attend us, with seven men, who were to conduct us to Montreal. The middle of the boat was covered with blue cloth, under which we were secured from the rain.

Though many nations imitate the French customs, yet we observed, on the contrary, that the French in Canada in many respects follow the customs of the Indians, with whom they converse every day; they make use of the tobacco-pipes, shoes, garters, and girdles of the Indians: they exactly follow the Indian way of making war; they mix the same things with their tobacco; they make use of the Indian bark boots, and use them in the Indian way, wrapping several square pieces round their feet instead of shoes. When one comes into the house of a Canada peasant or farmer, he gets up, takes his hat off to the stranger, desires him to sit down, puts his own hat on, and sits down again; the gentlemen and ladies, as well as the poorest peasants and their wives, are called Monsieur and Madame; the peasants, as well as their wives, wear shoes which consist of a piece of wood hollowed out, and are made almost like slippers. Their boys and the old peasants themselves wear their hair behind in queue, and most of them wear red woollen caps at home, and sometimes on their journies. The servants prepare most of their dishes of milk, for they seldom use any butter; and when they do, it is far from being so good as that made by the English.

January 9. This afternoon we saw three remarkable old people, one of them was a priest named father Joseph Aubany, who had been fifty years among the Indians; he returned to Quebec to renew his vows, and seemed as healthy as in his youth. The other two were our landlord and his wife, both eighty years of age, and they had been married forty one years. The year before, at the end of the fiftieth year after their marriage, they went to church to return thanks to God for all the mercies they had received from him: they were quite well content and happy; the old man said he was at Quebec when the English besieged it in 1690, and that the bishop went up and down the streets dressed in his pontifical habits, and a sword in his hand, in order to stimulate the ardour of the people.

This old man said, he thought the winters were much colder than formerly, and that there likewise fell a greater quantity of snow; he could remember the time when vegetables were killed by the frost about Midsummer; and he assured us, that the summers were warmer now than they had been formerly. About thirty years before, the severity of the frost had killed a vast number of birds, but the old man could not remember the particulars.

Such are the particulars of this account given us of North America by Mr. Kalms, who has been allowed in every part to be a man of understanding. He was much attached to the study of botany, like all the rest of countrymen, but the gentleman and the scholar can be seen in the whole. His travels are modern and entertaining, but we shall now proceed to some more modern accounts, by gentlemen who are alive at present.

Mr. Carver had been many years in the service of Great Britain, and during the last war he commanded a company of Provincials: the opportunity he had of seeing the country while in real action served only to stimulate his curiosity to visit the more interior parts: his whole view was, to do service to his country, by exploring those extensive regions that had been acquired

acquired by the peace of Versailles, in 1763. Here we find the spirit of patriotism joined to that of curiosity, and a gentleman's seeking knowledge, while he was desirous of promoting the good of his fellow-subjects.

This gentleman, in June 1766, set out from Boston, and proceeded by the way of Albany and Niagara to Michillimackinac, a fort situated between the lakes Huron and Michigan, and distant from Boston one thousand three hundred miles: this being the uttermost of the British factories towards the west. He and his company considered it as the most convenient from whence they might begin their intended progress, and enter at once into regions that had not hitherto been visited by Europeans.

They found Michillimackinac, which in their language signifies a tortoise, to be a strong fort, and usually defended by a garrison of one hundred men; it contains only little more than thirty houses, most of which are for the principal officers. There are likewise several traders residing here, all within the fortifications, and these carry on a sort of traffic with the Indian nations.

During the last war, Pontiac, a celebrated Indian warrior took their fort by surprize, but undoubtedly he had received instructions from the French, whose interest he had always been in. These savages, without any appearance of hostile intentions, approached the fort in a body, and began to play at foot-ball; for they are so cunning, that they always conceal their real intentions. Some of the English officers stood looking at them, without suspecting any thing, when one of the savages struck the ball over the wall of the fort; this they repeated several times, and then seeing nothing to oppose them, they rushed past the centinel and took possession of the fort without opposition: they took all the people prisoners, and carried them as far as Montreal, where they were all ransomed, and then the fort was given unto the English.

On the 3d of September they left the fort in company with several traders, who had agreed to furnish them with the goods which were necessary to give away as presents to the Indian chiefs, who are at all times so avaricious, that a traveller is in danger of having a hatchet knocked through his skull unless he gives them something.

The first place they arrived at was fort La Bay, situated on the southern extremity of the lake Michigan, but is now called by the English the Great Bay. This fort is a poor pitiful place, and a handful of men could at any time take possession of it. Mr. Carver and his company staid only one night at this place, where they were visited by some of the Indian chiefs, to whom they made presents of spirituous liquors, with which they made themselves merry, and all joined in a dance that lasted the greatest part of the night. In the morning, when they embarked, the eldest of the Indian chiefs fell down on his knees, and offered up a prayer, that his great spirit would be with them and preserve them from danger; and he continued praying on his knees till they were out of sight.

On the Green Bay is a fort, but it is only a poor place, and not capable of making any defence. Near the borders of the lake grow a great number of sand cherries, which are not less remarkable for their manner of growth, than for their exquisite flavour. They grow upon a small shrub not above four feet high, the boughs of which are so loaded, that they lie in clusters on the sand: as they grow only on the sand, the warmth of which probably contributes to bring them to so much perfection, they are called by the French sand cherries. They are not in general so large as the cherries in England, but they are reckoned the best for keeping in spirits. Near this place is found a kind of willow, which the French call red wood; and its bark, when only a year old, is of a scarlet colour, and appears very beautiful; but as it grows older, it changes into a mixture of green and red. The bark of this wood, when scraped from the trees, is mixed with tobacco, and smoked by the Indians.

September 20. They left the Green Bay and

proceeded up Fox river, accompanied by several Indians, who went with them as guides. They were five days on their journey before they came to the great town of the Winnabagoes, situated on a small island near the east end of a lake of the same name. Here, instead of a prince, they met with a queen, who presided over the whole tribe, and she entertained them with every sort of civility: they asked permission to pass through the country to explore more remote nations, and this was readily granted. The queen thought it a great honour to comply with any thing that could be of service to them, which may serve to shew that there is a spark or principle of humanity in those people, whom we may perhaps very properly call savages. Mr. Carver saluted the queen, which undoubtedly was considered as a great favour.

They made several inquiries while they were here, the reply to one was, that the inhabitants were descended from the people of Mexico, being driven from their native country either by intestine divisions, or by the extension of the Spanish monarchy, about a century ago: they were strengthened in this opinion, from the language being different from those of all the other Indian tribes: to this may be added, their most inveterate hatred to the Spaniards. Some of them said, that they had made several excursions to the south-west; and an elderly chief told Mr. Carver, that, about forty-six winters ago, he marched at the head of fifty warriors towards the south-west, for three moons or months together; that, among other things, they saw a great body of Spaniards on horseback, and these people they always, out of hatred, call blacks; when they saw them, they proceeded with caution, and concealed themselves till night, when they drew so near as to be able to discern the number and situation of the enemy.

Being unable to cope with such a great number in the day, they rushed upon them while they were asleep, and killed the greatest number; after which, they took eight horses loaded with different sorts of goods. When they had satiated their revenge, they carried off their spoil; and being so far as to be out of the reach of the Spaniards that had escaped their fury, they left the goods, with which the horses were loaded, in the woods, and mounting their backs, retired home to their friends. There is great reason to believe that this was a convoy coming from, or going towards Mexico.

The river, for about four or five miles from the bay, had a smooth easy current, till they arrived at the Winnabago Lake, where it is full of rocks, and very rapid. At many places, they were obliged to land their canoes, and carry them a considerable way. The lake is about fifteen miles from east to west, but it is seldom more than six miles in breadth. The land adjacent to the lake is very fertile, abounding with various sorts of fruits, which grow without cultivation. The natives here cultivate Indian corn, beans, and water-melons, with some tobacco. The lake abounds with fish, and, in the latter end of the summer, with geese and ducks.

Having made some acceptable presents to the good old queen, and received her blessing, they departed from this place on the twenty-ninth of September, and, about twelve miles farther, arrived at the place where the Fox River enters the lake, on the north side. They proceeded up this river, and, on the seventh of October reached the great Carrying-place, which divides it from the Ouisconsin. The length of this river, from the Green Bay to the Carrying-place, was almost two hundred miles, and the country on each side was extremely fertile, except in some places, where it is generally overflowed with water in spring season, after the snow has melted.

The inhabitants of the neighbourhood of this river were called Foxes by the French, by way of derision, because of their cunning, for they frequently used to go about in small parties, and murder a great number of the innocent inhabitants. About the beginning of the last century, the French missionaries and

and traders, having received many insults from these Indians, sent out a party to chastise them. The captain of the party came upon them unawares, so that he made an easy conquest of them, killing or taking prisoners the greatest part of them.

When the French were retiring to the green bay, an Indian chief in alliance with them, stopped to drink at a brook, and in the mean time his companions went on: one of the women whom they had made captives observing this, suddenly seized him, with both her hands, by the privy members, and squeezed them so hard that he died on the spot. As the chief, from the extreme acuteness of the pain he suffered, was unable to call out to his friends, they passed on without knowing what had happened, and the woman having cut the rope, by which the prisoners were tied, they, with her, made their escape. This Amazonian heroine was, ever afterwards, treated by her nation as their deliverer, and had such honours conferred upon her, as were consistent with the customs of the country.

Where the Fox River enters the Winnebago Lake, it is about fifty yards wide, but it decreases gradually towards the Carrying-place, where it is not above five yards over. The Carrying-place, between the Fox and Ouisconsin River, is nearly two miles in breadth, which serve to shew that most of our maps are wrong. Probably, this was first done by the French, to keep the English ignorant of the country, as all the English maps are copied from those of the French.

Here our accurate travellers saw a vast number of rattlesnakes; and a very remarkable story was related to them by a Frenchman, concerning one of them. An Indian having taken one of them, found means to secure it; and when he had done this, treated it as an object of worship, calling it his sweet lord; and wherever he went, he took it in a box along with him. This Indian did so for several summers, when Mr. Pinnifance, a French gentleman, met him near the Carrying-place, just as he was setting out for a winter's hunt. The French gentleman was surprised to find the Indian one day place the box, that contained his god, on the ground, and opening the door, gave him his liberty; telling him, whilst he did it, to be sure and return by the time he himself should come back, which was to be in the month of May following. As this was in October, the French gentleman told the Indian, that he believed he might wait long enough before his god returned, being of opinion, that he would rather stay in the woods.

The Indian was so confident of the snake's obedience, that he offered to lay a wager with the Frenchman, that at the time mentioned he would return, and crawl into his box. This was agreed on, and the second week in May was fixed for the deciding of the wager. At that time the Frenchman and the Indian met again, when the Indian set down his box, and called for his god and father, the snake. The snake did not hear him, and the time being now expired, he acknowledged that he had lost. However, without seeming to be discouraged, he doubled the bet; to pay the money, if the snake did not make his appearance, in two days. This was agreed on, and on the second day the snake returned, and of his own accord went into the box that had been prepared for him. The Frenchman affirmed the truth of this story; and several others told our travellers, that these creatures, if taken when young, could be taught like dogs, they being extremely docile.

October 8. They got their canoes into the Ouisconsin river, which at that place was about one hundred yards broad; and the next day they came to the great town of the Sankies, which was the largest they had hitherto seen among these Indians. Here were near one hundred houses, and each of these was capable of containing several families. These houses are mostly built of planks, neatly hewn, and jointed with bark so completely, that they can, at all times, keep out the rain. Indeed the whole appeared more like a town in a civilized country, than the re-

sidence of a parcel of savages. The ground around the town is very good, and well cultivated; for here provisions are in great plenty.

These people, called Sankies, send out at least three hundred warriors every year, who murder, plunder, and make slaves of their neighbours. However, they sometimes meet with retaliation, for they often invade them in their town. Here the travellers ascended one of the highest mountains, from the top of which they had an extensive view of the country. The prospect itself was dreadful, because there was such a vast number of rising grounds, upon which were no trees, except a few shrubs. Land was in great plenty here, but it did not appear to be an article of consequence.

October 12. They proceeded down the river, and the next day reached the first town of the Ottigaumies. In this town there are not above fifty houses, and at that time most of them were deserted on account of a raging distemper, which was looked upon as epidemical. The people had retired into the woods, in order to avoid the contagion.

October 15. They entered the great river Mississippi, and found the land on each side to be extremely good; and they were told, that there were many lead mines in the mountains. Near the mouth of this river they observed the ruins of a large town, in a very pleasant situation; and when they inquired of the Indians why it was thus deserted; they were informed, that about thirty years before, God, or the great Spirit, had appeared on the top of a pyramid of rocks, which lay at a little distance from it.

These infatuated people believed, or rather were taught to believe, that this imaginary apparition came to warn them to leave their habitations, because the land belonged to him, and he had occasion for it, for a particular purpose. The spirit told them further, that in proof of what had been said, the grass would grow upon the rocks; and the Indians were weak enough to believe so; though when we viewed it, we could see nothing supernatural. It is probable, that this was a secret design contrived by the French and Spaniards, in order to drive the people out of the place; but what means they used to effect it, we cannot say.

The Mississippi, at the entrance, is about half a mile in breadth, having several small islands in it; and near it is a mountain of considerable height. A little further to the west, a river falls in, which the French call the Yellow River; and here the traders, who had accompanied our travellers hitherto, took up their lodgings for the winter. There our travellers bought a canoe, and on the nineteenth proceeded up the river.

About ten days after they had parted from the traders, they landed, as they had done every evening, and pitched their tent on shore; at the same time ordering their servants to go to sleep. The travellers had a light burning, and by the assistance of it they sat down to take minutes of what had occurred to them during the course of the preceding day. About ten o'clock Mr. Carver, having just finished his memorandums, stepped out of his tent to see what sort of weather it was, and looking towards the river, thought he saw something like a herd of beasts coming towards him: whilst he was wondering what these creatures could be, one of them suddenly sprang up, and discovered himself to be a man. In an instant they all got up, and there seemed to be about ten or twelve of them running towards him. He immediately retreated to his tent, and awakening his servants, ordered them to follow him. As his first care was to preserve his canoe, he ran to the water side, in order to secure it, where he found a party of Indians going to plunder it. Before he came near it, he ordered his servants not to fire till he had given the word of command, being unwilling to commence hostilities with them, unless forced to it from motives of necessity. They advanced, with resolution, to the points of their spears, for they had no other weapons, and

and asked them what they wanted? This staggered them a good deal, and they retreated in the utmost confusion. They were pursued by our travellers into an adjacent wood; but they could not find where they concealed themselves. However, lest they should have returned, they were obliged to watch all the night. Their servants, some of whom were Indians, and others Frenchmen, were much intimidated, and said all they could think of to dissuade Mr. Carver from pursuing his journey, especially as it was likely to be attended with many difficulties; but he was deaf to all their intreaties.

They then got into the canoe, and the aforesaid gentleman, with some of his company, walked along the shore, to protect them from further attacks. They soon heard that the party of Indians, who wanted to plunder them, were connected with some straggling bands, that go about, during the summer, robbing in many places, and murdering the inhabitants.

November 1. Our travellers arrived at lake Pepin, which is no more than an extended branch of the Mississippi; and the river below this flows with a greater current, but the breadth of it is very uncertain; in some places it being upwards of a mile, in others not more than a quarter. This river has a range of mountains on each side, and most of these mountains are covered with grass. From the summits of them are the most beautiful and extensive prospects that can be imagined. These prospects consist of verdent plains, numerous islands, fruitful meadows, and all these abounding with a variety of trees, that yield abundance of fruit, without care or cultivation; but, above all, the river flowing gently beneath, and reaching as far as the eye can extend.

The lake is above twenty miles long, and five in breadth, abounding with various kinds of fishes. There are also a great number of wild fowls constantly hovering near the banks of the river; and in the groves are found vast numbers of partridges and turkies. There are likewise great numbers of buffaloes here, and the flesh of these animals is very delicious. One day, when Mr. Carver had landed some miles below lake Pepin, while his attendants were preparing his dinner, he walked out to take a view of the adjacent country. He had not proceeded far when he came to a fine open plain, from whence, at a little distance, he saw a sort of ruined fortification on an eminence, and, upon a nearer inspection, he imagined that it had been thrown up many centuries ago. It was then covered with grass, but he discovered plainly that it had been once a breast-work, of about four feet high, extending the best part of a mile in length, and capacious enough to hold five thousand men. Its form was almost circular, and the flanks extended to the river. All the angles were distinguished, although much defaced, and it seemed to have been planned by some person who was no stranger to the military art. The ditch was not discernible, but it appeared there had been one. The fortification fronted the country, and the rear was covered by the river, having nothing near it except a few straggling oaks. In many adjacent places were made small tracks, by the feet of the elks and deer, and the whole had great marks of antiquity. Here they found the river very full of islands, some of which were of a considerable size. Some of them were finely covered with trees and woods, but it did not appear that any of them were inhabited, except by wild beasts; nor did our travellers know by whom these beasts were claimed as articles of property, or that they were ever claimed at all.

Near this part of America we met with a tribe of Indians, called the River Bands, because they chiefly dwelt near the banks of the river, and inhabit the country laying more to the westward. Our travellers resided with these Indians a few days, during which time five or six, who had gone out on an excursion, returned in great haste, and acquainted their companions that a large body of Indians were coming to swallow them up. The chiefs applied to Mr. Carver,

and desired he would put himself at their head, in order to lead them out to oppose their enemies. As he was a stranger, he did not choose to stir up the Indians against his countrymen, and therefore he desired that he might be permitted to speak to them, in order to avert their fury. This was reluctantly agreed to, for the inveteracy these savages have for each other is beyond all description.

He then took his Frenchman along with him, and hastened to the place where these Indians were assembled. He approached them, smoking a pipe of tobacco, which with them is always a sign of peace, and a small party of their chiefs came forward to meet him. With these, by means of his interpreter, he held a long conversation; the result of which was, that their rancour, by means of his persuasions, was quite abated, and they agreed to return home to their own country, without accomplishing their savage purposes. It was remarkable, that although these savages were so far from Canada, yet they had muskets, and knew how to use them.

Having succeeded in his negotiation, he soon after returned, and desired the other Indians to remove immediately their camp to some other part of the country, lest their enemies should break the promise they had made, and put their first intentions in execution: they accordingly followed his advice, and immediately prepared to strike their tents.

To this adventure Mr. Carver was chiefly indebted for many civilities which he afterwards met with among these Indians. Nay, it happened that when he had proceeded further into the country, he found that the report of what he had done had reached thither before him. The chiefs received him with great cordiality, and the more prudent part of them thanked him for the mischief he had prevented. They informed him, that the war between them had continued upwards of forty years; and they would have put an end to it sooner, had it not been for the violent passions of the young warriors, who could not refrain their ardour when they met. They told him, they should be happy if some chief, of the same pacific disposition as himself, would settle the disputes that subsisted between them; for by the interference of such a person, an accommodation, which on their parts they sincerely desired, might be brought about. However, that gentleman had not the happiness of bringing this good work to a state of perfection; for so enraged were the Indians against each other, that they would sometimes see one another killed in cold blood, rather than submit to any reasonable terms of peace.

Our travellers proceeded till they came to a remarkable cave, of an amazing depth, where the Indians believe the great God, or, as they call him, the great Spirit, resides. The entrance into it is about ten feet wide; within, it is fifteen feet in diameter; and the bottom consists of fine clear sand. About twenty feet from the entrance begins a lake, the water of which is transparent, and extends to an immense distance; for the cave is so dark, that no person can venture to go to the extremity of it. Mr. Carver threw a small pebble as far as he could, and although he heard it fall into the water, yet it made a most amazing noise.

In this cave they found several Indian hieroglyphics inscribed on the walls, which appeared to be very antient, for they were in several places covered with moss, so that it was with no small difficulty they could be read. They were cut upon stones so extremely soft, that a common knife could easily penetrate into it; and these sort of stones are common every where in this part of North America.

At a little distance from this cave is the burying-place of several of the Indian chiefs; for although these savages have no fixed habitations, yet they generally bring the remains of their deceased relations to be interred here, imagining it to be the residence of the great Spirit. And yet, what is very remarkable, they have not any temple here, like the Heathens of old, who always buried their dead

dead near the places where they worshipped their gods.

Before our travellers left their canoe, they overtook a young Indian prince, who was going on an embassy to some of the neighbouring nations. Finding that they intended to take a view of the falls, he consented to go along with them; his curiosity having been excited by the accounts he had received from travellers. Accordingly, the whole company set out to visit this celebrated place: they heard the noise of the water falling long before they arrived at it, and they were surprised when they approached within sight of this extraordinary natural curiosity. Their astonishment was, however, diverted by the behaviour of some of their companions.

As soon as the Indian prince had gained the point that overlooks this wonderful cascade, he began to address the great spirit whom he imagined had his residence there. He said, in his prayers, that he had come a great way to visit him, and would make him the best offerings in his power. He accordingly first threw his pipe into the stream, then the roll that contained his tobacco, after these the bracelets he wore on his fingers, next an ornament that encircled his neck, composed of beads and wifes, and at last the rings from his ears. In short, he presented to his god every part of his dress that was valuable.

During the whole of this ceremony, he frequently smote his breast with great violence, and seemed to be much agitated. At last, he concluded by begging that the great spirit would give them a fair sky, and a safe passage through the rivers. Our travellers were surprised at seeing such an instance of elevated devotion in an Indian so young as this prince was, and therefore none of them treated him with ridicule but a Roman Catholic servant whom they had along with them. Perhaps, the principles of this poor ignorant Indian were as acceptable to the Divine Being as some of those offered up in the most lofty temples.

The conduct of this young prince was, in all respects, consistent with the dignity of human nature; for, during the few days he was along with our travellers, he did every thing to serve them, so that when they were obliged to part with him, it was with the utmost reluctance. Perhaps the artless behaviour of the savage, or Indian, may serve to point out that there is more real virtue, at times, to be found among these people, than among the inhabitants of more enlightened nations.

The falls of St. Anthony are above two hundred and fifty yards over, and form a most pleasant cataract. They fall perpendicularly, about thirty feet, and the rapid billows, for the space of three hundred yards, render the descent considerably greater; so that when viewed at a distance, they appear to be much higher than they really are. In the middle of the falls stands a small island, about forty feet broad, and somewhat longer, on which are a few trees growing; about half way between this island and the eastern shore, is a rock laying at the very edge of the fall, that appeared to be not above six feet broad.

The country around having been, in some measure, cultivated, is extremely beautiful: there is an uninterrupted plain where the eye finds no relief, and in the summer it is covered with the finest verdure. On the whole, when the falls are included, which may be seen at the distance of four miles, no view in the universe can be more beautiful. At a little distance below the falls, stands a small island, on which are a vast number of oak trees, although it does not contain above two acres of land; and in it were vast numbers of eagles nests. The reason why these creatures resort here in such numbers is, that they are secure from the attacks either of man or beasts; their retreat being, in some measure, guarded by the rapid falls, which the Indians never attempted to cross. Another reason is, they find a constant supply of food for themselves and their young, from the animals and fish which are dashed to pieces by the falls, and driven on the adjacent shore.

Our travellers having satisfied their curiosity at this place, they continued their journey, accompanied by the young Indian, who treated them with every mark of respect.

The country in some places is hilly, but has no very high mountain, and the land is in general very good. A little to the north east, are a vast number of small lakes, but they are little frequented, although the country around affords much game for the sportsmen:

On the twenty-fifth, our travellers returned to their canoes, which they had left at the mouth of the river, and parted with regret from their young friend, the Indian prince, who had accompanied them so far. This branch of the river is called St. Pierre, and they found it clear of ice, on account of its westerly situation; nor was there any thing to obstruct their passage.

On the twenty-eighth, they advanced about forty miles, and arrived at a small branch that fell into the river from the north, to which Mr. Carver gave his own name. About forty miles higher up, they came to the red marble rivers, which unite together before they run into St. Pierre.

The river St. Pierre, at its junction with the Mississippi, is at least one hundred yards broad, having a vast depth of water in some places, and is very rapid in its current. They proceeded up this river about two hundred miles, to the country of the Naudoneffins, which lies at a considerable distance:

December 7. Our travellers, having proceeded far to the westward, met with a party of Indians, who resided in a wild place, and with these people they actually lived seven months. As they proceeded up the river St. Pierre, and had nearly reached the place where those Indians were encamped, they observed two or three canoes coming down the stream; but no sooner had the Indians that were on board of them descried the Europeans, than they rowed towards the land, and leaping ashore in the most precipitate manner, left their canoes to the mercy of the current. Several other Indians appeared at the same time, but they followed the example of their countrymen, by going on shore.

The company, for their own security, having been obliged to observe much caution, they kept on the opposite side of the river to that where the Indians landed. However, they still continued their course, satisfied that the pipe of peace was fixed at the end of their canoes; and, at the same time, they saw the English colours flying at the stern, which they imagined would be a sufficient security. After rowing about half a mile farther, they discovered a great number of tents, in which were above a thousand Indians. Being nearly opposite to them, they ordered the boatmen to row to the place where they were encamped, that they might be convinced they placed some confidence in them, for flattery operates upon the minds of all ranks of people. As soon as they had reached the shore, two of the Indian chiefs presented their hands to Mr. Carver, and led him amidst the astonished multitude, who had never seen a European before. They were led into a tent, but they had not sat long, when a vast crowd gathered round them, so that they were in danger of being crushed to death. Having gratified their curiosity, they returned to the plain, and were treated by those Indians with every mark of respect. The chiefs were so hospitable to the above gentlemen, that their benevolent conduct made a lasting impression on his mind, and he has acknowledged it in the account he has written of those people.

The Indian chiefs were so friendly, that our travellers often sat and smoked their pipes with them, and were much entertained with the accounts they gave us of the expeditions they had undertaken against their enemies. Every question proposed to them was answered in a pertinent manner; and, to do justice to those people called savages, they treated our travellers with every mark of civility. Mr. Carver's chief intention was, to draw from them all the information he

he could procure, concerning those countries which lay more to the westward; and although they pretended to draw out plans for him, yet he could not trust to their geography. They had some faint notions of the situations of places, which they sketched with charcoal; but these, upon enquiry, we found to be very erroneous.

They left the habitations of those hospitable Indians about the latter end of April, 1767, but did not part from them for several days, and at least three hundred of these Indians accompanied them; some of whom were considered as their chiefs. At this season, these heads go to the cave already mentioned, to hold a general council with all the other tribes, when they settle their operations for the ensuing year: at the same time they carry their dead with them for interment, in buffaloe skins. During the whole of the journey, they behaved in the most cheerful manner, which made some amends for the fatigue which they were under the necessity of going through.

The first evening that they landed, and were preparing to set up their tents for the night, a heavy shower came on, attended with some dreadful claps of thunder and lightning. The Indians were greatly terrified, and ran to such shelter as they could find, for only a few tents were as yet erected. Our travellers would not rest here, but this gave much offence to the Indians, and they drew from it conclusions very injurious to us; yet the night being so dreadful, we could not say any thing against them. The peals of thunder were so loud, that they shook the earth, and the lightning flashed along the ground, in streams of sulphur, so that the Indian chiefs themselves, although their courage in war is generally invincible, could not help trembling at the horrid scene. As soon as the storm was over, they flocked round our travellers, and informed them, that it was a proof of the anger of the evil spirit, whom they were apprehensive they had highly offended, and yet they could not assign any reason.

As soon as they arrived at the great cave, and the Indians had deposited the remains of their deceased relations in the burial place that stands adjacent to it, they held their great council, into which Mr. Carver was admitted, and, at the same time had the honour to hear recited the character of one of their chiefs. On this evening, one of the chiefs made a speech, which, although insipid in its own nature, yet shewed that these people were not destitute of common sense. This speech was much in favour of the English; and the chief declared that the great king, meaning the king of Britain, was their father; and to this speech the above-mentioned traveller made a very suitable reply, flattering their passions; and at the same time telling them, that the great king would be glad to cultivate a friendship with them.

They cautioned the Indians against any malicious reports that might be spread to the prejudice of the English; a custom too frequently practised by the French: for they saw several belts of wampum, that had been delivered for that purpose to the people of some of the nations through which they passed. On the delivery of each of these, a talk was held, when the Indians were told that the English, who were but a handful of people, had stolen that country from their great father, the king of France, while he was asleep, but that he would soon awake, and take them again under his protection.

Whilst our travellers tarried at the mouth of the river St. Pierre with these friendly Indians, they endeavoured to gain intelligence whether any goods had been sent towards the falls of St. Anthony, as had been promised by Mr. Rogers; but meeting with some Indians, they were told that they had not. The want of these necessaries obliged them to return once more to La Prairie le Chien, where they bought as many goods as the traders could spare.

These, however, being not sufficient, they resolved to cross the country to Lake Superior, in hopes of meeting with some traders, from whom they could

purchase as many different articles as would answer their purpose during the remainder of their journey. They reached the eastern side of Lake Pepin, where they went on shore, and encamped as usual. The next morning, they proceeded some miles farther, and perceived at a distance a smoke, which intimated that some Indians were near, and, in a little time, saw ten or twelve tents at a short distance. As they did not know whether these were friends or enemies, so they knew not what course to take. Their attendants desired them to pass by them on the opposite side of the river; but experience taught them that the best way was to meet the Indians boldly, without shewing the least signs of fear. In consequence of this resolution, they crossed over, and landed in the midst of them, for by this time most of them were come towards the shore.

The first of these Indians, whom they accosted, treated them with great civility; and at some little distance behind there stood a chief, remarkably tall and well made, but of so stern an aspect, that a person could not look on him without being filled with some sort of dread. He was a person of high rank among them, and seemed to be above the middle age. They approached him in a respectable manner, but, to their great surprize, he would not give them his hand, telling them, that the English were not good. As he had his tomohawk in his hand, they expected every moment that he would knock one of them on the head; to prevent which, Mr. Carver drew a pistol from his belt, holding it in a seemingly careless position, passing by him, to let him see that he was not afraid. They soon heard that this chief had always been in the French interest; and that when Canada was conquered, he swore that he would never submit to the English, but be their enemy to the last.

Finding him thus disposed, they took care to be upon their guard while they were there; but boldly ventured to take up their abode for the night. They pitched their tents at some distance from the Indians; but they had no sooner laid themselves down, than they were awakened by their French servant. The Frenchman had been alarmed by the Indian music, and looking out of the tent, saw a party of savages coming towards them in an extraordinary manner, each of whom carried lighted torches in their hands, fixed to the tops of poles.

Nothing, however, happened at that time, and next morning they continued their journey. In the evening they arrived at La Prairie le Chien, where we were followed by the Indians. Whenever the Indians meet at this place, although the different nations should happen to be at war, yet they are obliged to refrain from all hostile attacks during the time they stay. This regulation has been long established, and it was necessary it should be so, in order to promote their mutual advantage.

The river St. Pierre flows through a most delightful country, abounding with most of the necessaries of life. At a little distance from the banks of the river, are rising grounds, from whence there are considerable prospects. At the mouth of the river is a hill, composed entirely of white stone, but so soft, that it easily crumbles to pieces. One branch is called the Marble River; and near it is a rock, from whence the Indians get a red stone, which they make use of for several purposes. This country abounds with several sorts of clay, of different colours, which might be of considerable advantage to the inhabitants, if they knew how to manufacture it.

Having finished their business at this place, they proceeded once more up the Mississippi, to a place near the lake Pepin. There they agreed with an Indian pilot to shew them towards the Ottoman lakes, which are near the head of this river. This he did, and they arrived there about the middle of July. For sixty miles, and upwards, the country adjoining to the river is very flat, and has fine meadows on its banks. Towards the falls there are but few trees, so that it looks very barren. Here a most attracting prospect

prospect presented itself to their view; on the east of the river was a wood, about three quarters of a mile in length, but they could not tell how far its depth extended. Many of the trees were six feet in circumference, and some of them, torn up by the roots, were laying on the ground. This appeared to have been the effect of some dreadful storm, or rather hurricane, that had blown from the west some years before.

This branch of the river is named the Chipeways, from a tribe of Indians, from whom it takes its name. There is a town, which lies adjacent to the bank of a small lake, containing about forty houses, and can send out above one hundred young warriors, most of whom are fine stout fellows. The houses had fine plantations behind them; but the inhabitants seemed to be extremely nasty, for when the women searched for lice in their childrens heads, they put them into their mouths, and ate them: a circumstance so horribly abominable, that we should not have mentioned it, had it not been asserted by a person of veracity.

In the latter end of July they left the town, and having crossed a great number of small lakes, they came to the head of the river St. Croix. Here they came to a small brook, which their guides told them that by a connection of some streams, it might be made navigable. The water at first was so shallow, that it would not carry the canoe; but having stopped up some of the beavers drains, which had been broken down by the hunters, they were enabled to proceed some miles, till, by the conjunction of a few brooks, these aids became, in a manner, unnecessary. In a short time the water increased so fast, that they entered with the greatest ease into the lake Superior.

There is another small river to the west of this, which empties itself into the lake, and it is called the Strawberry River, from a great number of strawberries, of a good size and fine flavour, that grow on its banks. About the latter end of July they arrived at the Grand Paturage, after having crossed the bay, which lies to the north of lake Superior. At the Grand Paturage is a small bay, before the entrance of which is an island that interrupts the views over the lake, which otherwise would have rendered the same pleasant, as well as agreeable.

Here they met a large party of Indians, who had come to the place under the command of their chiefs, accompanied by their wives and children. They were come to this place to meet with European traders, and from them our travellers received the following account of those parts of America which they had not hitherto visited, especially such as lay to the north of lake Superior.

The most remarkable of those yet discovered is lake Bourbon, which received its name from some French traders, who accompanied a party of Indians to Hudson's-Bay some years ago, and was thus denominated by them in honour of the royal family of France. It is composed of the waters of the Bourbon river, which run a great way to the southward, very near one of the heads of the Mississippi. The lake is about eighty miles in length from north to south, and nearly of the same breadth, but has no very large islands on it. On the eastern side the land is very good, and on the south-west are several mountains. There are but few animals to be found here, the winter being extremely cold.

The next lake is called Winnepeck, and is in length about two hundred miles from north to south; but its breadth has never been properly ascertained, although it has generally been considered as one hundred miles. In this lake are a vast number of small islands, and several rivers empty themselves into it; but they are not distinguished by any names, although the waters are well stored with fish.

On the banks of this river is a factory, which was built by the French; and hither a vast number of wild Indians resort every year, to exchange their goods for the manufactories of Europe. This lake has some mountains on the north-east side, and between these

are several barren places. Here are great numbers of buffaloes, and their flesh is reckoned very delicious. These buffaloes differ from those found more to the south only in magnitude, the former being much smaller; just as the black cattle in Scotland differ from those in England. The whole of this country abounds with the most excellent furs, and some of these are carried to the factories and settlements at Hudson's-Bay, from whence they are exported to Europe, as one of the most valuable branches of commerce.

It is, however, much to be lamented, that the traders at Hudson's-Bay often cheat these Indians, which gives them a sort of attachment to the French, who, although equally knavish, yet have a more polite way of effecting their roguery.

The Lake of the Wood was the next they visited, and is so called, from the vast quantities of wood that grow near it. It is in some places very deep, and in length, from east to west, about seventy miles; the breadth being about forty. There are but few islands in it, and these are small, without names. The fishes in it are the same as those in the other lakes, so that they do not merit a particular description. The waters of this lake are not esteemed so pure as those of the others, the bottom in many places being extremely muddy.

The next is the Rainy Lake, supposed to have obtained this name from the first travellers, who passed over it, meeting with an uncommon degree of rain, which is very common in this part of America. This lake is divided by an isthmus in the middle, which gives it the appearance of two lakes; the western being called the Great Rainy Lake, and the eastern the Small Rainy Lake. In general this lake is very shallow, but there are some excellent fish in it. A great many wild fowls resort hither at the fall of the year, and mouse-deer are to be found here in great plenty. The lands on the borders of the river are good, and in some parts well cultivated.

Eastward from this lake are several smaller ones, which extend as far as lake Superior; and between these are several carrying-places, which render the trade to the north-east difficult to carry on, and exceedingly tedious.

At the head of Bourbon River is the Red Lake, which, in respect of the others, is comparatively small. Its form is nearly round, and it is about sixty miles in circumference. Near one side is a pretty large island, close by which a small river enters. The parts adjacent are very little known or frequented even by the savages themselves. White Bear Lake is situated a little to the south-east, and nearly about the size of that already mentioned. The streams from which this river has its source are far to the north; and a few miles from it, to the south-east, are several small lakes, none of which are more than ten miles in circumference. The adjacent country is reckoned extremely fine for hunting, and here the Indians often indulge themselves in that diversion.

The Indians informed our travellers, that to the north-east was another lake, whose circumference greatly exceeded any of the others already mentioned. They said it was much larger than lake Superior; but as it lay so far to the northward, it is probable that it was no more than a collection of broken waters separated from each other by some small rocks. It is impossible to describe the amazing number of lakes that are to be met with in this country; for no sooner did we leave one, than we met with another. This is a proof that there must be many high mountains at a distance, which many of the Europeans never visited, for it is from them that these waters fall into the low countries, and form the lakes. They were told that there is, in this country, a kind of roots resembling both sexes of the human species; but we never saw any of them, though some of our travellers afterwards told us they were the same that Reuben brought to his mother Leah.

Our travellers were informed, that there was a nation

tion a little more to the eastward, where the people were whiter than those of the neighbouring tribes who cultivate the lands, and are in general very civilized; they added, that some of those who dwell in the south-west had many mines of gold; but this we paid little regard to, although we shall have occasion to take notice of it hereafter. The mountains where these mines were said to be, divide North America from the South Seas. The people dwelling near them, are supposed to be some of those Indian tribes that were formerly subject to the Mexican kings, and who fled from their native country, to avoid the horrid cruelties committed upon them by the Spaniards.

To confirm, or at least support this notion, it has been observed, that they have chosen the most interior parts for their residence, being still persuaded that the sea coasts have been infested, ever since the arrival of the Spaniards, with a species of monsters, who constantly vomit fire to kill the harmless Indians. From their traditions it appeared, that their ancestors, to avoid those monsters, fled into the deserts: we have here the history of the conquest of America in epitome, for the Indians believed the ships to be sea monsters, and the noise of the guns as fire and thunder flowing from their mouths.

It is likewise supposed, that the Winnebagoes, who dwell on the Fox river, are descended from some of those Indians who fled from the Mexicans, but they have but dark traditions concerning it. They say, they formerly came a great way from the westward, and were driven by wars, to take shelter in these parts. The face of the country here is the most amazing that can be imagined. There is a range of mountains which begins at the gulph of Mexico, and continue separating all the great lakes and rivers to the bay of California, and from thence continuing their course northward, between the sources of the Mississippi and the rivers that fall into the South Seas, they at last reach to Hudson's Bay. That part of those mountains, called the Shining Ones, are on the west of the river St. Pierre, and they receive their name from the vast number of crystal stones of an amazing size, with which they are covered, so that when the sun shines upon them, they use a screen at a vast distance. It is not certain to what length this range of mountains runs, but the general opinion is, that it is upwards of three thousand miles; which perhaps is not to be equalled in the whole world. Our travellers made several very judicious remarks, while they were here, particularly concerning the Europeans having neglected to search into the hidden treasures which probably are contained in them: but to go on with our narrative.

The traders that Mr. Carver and his company expected to meet, happened to come later than usual, and the number of travellers being great, their provisions were almost exhausted, so that they began to be greatly alarmed: one day while they were looking from an eminence, in hopes of their arrival, an Indian priest told them, that he would consult the great Spirit, who would let him know when the traders would arrive. The travellers, no doubt, looked upon the proposal with the contempt it merited, but prudence induced them to comply, rather than give an offence to the Indians, who are as ready to quarrel and fight about religious sentiments, as the Christians are.

When every thing was properly prepared, the king of the Indian tribe led several of our travellers to the door of a spacious tent, the covering of which was drawn up in such a manner, that the people might see what was transacting within. The tent was surrounded by Indians, but they made way for our company, and placed skins on the ground for them to sit on.

They observed, in the center, a place of an oblong shape, composed of poles stuck in the ground; the empty space being large enough to contain the body of a man. The tent was illuminated by a great number of torches, made of splinters of lime or birch trees, which were held by the Indians. As soon as the

priest entered the skin of a large elk was spread on the ground, and he laid himself down upon it, being quite naked, except about the middle; he then laid hold of each side of the skin, and wrapped it about every part of his body, except the head: this being done, two young men took pieces of elk skins, cut into the forms of ropes, and bound them fast around him: thus bound up, one took him by the heels, and the other by the head, and lifted him over the poles into the inclosure.

In this situation he had continued only a few seconds, when he began to mutter some words, and continued doing so for some time, gradually raising his voice, till at last he spoke articulately: however, what he muttered, was composed of such jargon that we could understand but little of it. After this, he began to rave like a madman, and threw himself into such agitations, that he foamed at the mouth: in this condition he continued full three quarters of an hour, when he seemed to become insensible; but in a moment started on his feet, and shook off his covering, with as much ease as if the bands had been burst asunder: he looked around to us, and told them that the great Spirit had conversed with him, but had not mentioned when the persons they expected would be there; a canoe, however, would arrive next day, when they would bring full information. This was the whole of the ceremony; and the Indians watched all the motions of our travellers, to see whether they failed at their priest, but they kept themselves on their guard.

Next day, vast numbers of the Indians assembled, on the top of a hill, to see the canoe arrive; and our travellers were, from motives of prudence, obliged to accompany them. As soon as they had reached the summit of the hill, they saw the canoe mentioned by the priest, coming round a point of land, and the Indians shouted in praise of the great Spirit. As soon as the people landed, they walked to the king's tent, where they began to smoke tobacco, and our travellers were obliged to join with them, before they could ask any questions: at last the king asked them whether they had seen the traders, and they told him that they had parted from them only a few days before, and that they expected them to arrive on the day after the next: and they arrived at the time, greatly to the satisfaction of the Europeans, and to the Indians, who rejoiced that their priest could foretel such an event.

Whatever the reader may think of this story, Mr. Carver has declared that he was witness to it, and has not mentioned one word but the truth. Perhaps the priest might have either known that a canoe was to arrive at that time, or, being better acquainted with the place than they, he might have discovered one at a distance. After all, it is not impossible but the devil might give him advice.

The anxiety our travellers found, occasioned by the delay of the traders, was not much altered by their arrival; for they could not procure all the goods they wanted: this obliged them to change their first resolution, and return to the place from whence they had set out. The king of these Indians was about sixty years of age, tall and slender, but walked very erect; in his disposition he was affable and engaging, and treated the Europeans with the utmost civility.

They have one very remarkable custom among those Indians, and that is, when any stranger arrives among them, to invite them to remain some time in private with their wives; and this is considered (as well it may) the greatest proof of their politeness to strangers.

After having coasted round the north and east borders of the lake Superior, they arrived, in the beginning of October, at Cadot's fort, which adjoins to the falls of St. Marie, and situated near the south-west corner of it. This lake, which was formerly called the Upper Lake, on account of its northern situation, is now called Superior: hence it exceeds in magnitude all other lakes on this vast continent. It might be called the Caspian Sea, in America; for it is supposed to be the largest body of fresh water on the

whole globe, as it is not less than sixteen hundred miles in circumference. The water in general is so clear, that where it was six fathoms deep, our travellers could sit in their canoes and see the stones at the bottom.

There are a vast number of islands of different sizes in this lake, and the land of which they are composed is of such a rich soil, that it is very proper for cultivation; but none of them are inhabited: some of the Indians believe, that the great Spirit resides in them; and they relate many ridiculous stories concerning them.

One of the chiefs told our travellers, that some of their people were driven on the island of Manopus, which lies towards the north-east side of the lake, and that they found on it great quantities of yellow sand; which, from their description of it, must have been gold dust. They were so pleased with its beautiful appearance, that they attempted to bring some away, but a dreadful large spirit prevented them: this terrified them so much, that they took to their canoes and set sail; being glad they had so easily made their escape. Ever since this affair happened, these Indians have been afraid to land on the coast. The country on the north and east sides of the lake Superior is very mountainous and barren, so that vegetation is very slow, and consequently but little fruit is to be found on its shore. There is a species of fruit here somewhat like raspberries, and the taste is the most delicious that can be imagined: if it was transplanted into a more kindly climate, it would perhaps be one of the finest fruits in the universe.

It is amazing to think what numbers of rivers empty themselves into this lake; but then there are others issuing from it. Not far from Nipagon is a small river, that just before it enters the lake has a perpendicular fall from the top of a mountain of near seven hundred feet in height; being very narrow, it appears at a distance like a white garter suspended in the air. Round the eastern banks of the lake are some Indian tribes, but they are not numerous, because most of them have been extirpated by the Iroquois in Canada.

On the south-side of this lake is a point, or cape, of about sixty miles in length, called point Chegomegas; but properly speaking, it is a peninsula, for it is separated from the continent on the east-side by a narrow bay, that extends from west to east. A little to the westward of this cape is another river, which falls into the lake, the head of which is composed of a vast number of streams, and near its banks are found vast quantities of copper ore. This ore is also met with on the banks of many of the other rivers, but it does not appear that the Indians know any thing of the nature of its qualities.

Soon after the conquest of Canada, a company of adventurers from England arrived here, and began to bring away some of this metal, and probably it might have been attended with beneficial and even important consequences, had not the present troubles broke out in the British Provinces in America. It is certain it might become a valuable branch of commerce; but till these troubles are settled, nothing of that nature can be expected. The ease and cheapness with which any quantity of it might be procured, would make a sufficient amends for the length of the way through which it is necessary to bring it, before it reaches the sea coast.

In this lake are almost all different sorts of fish, and they may be bought in abundance at any season in the year: some of the trouts weigh twelve pounds, but others of them exceed fifty, which surpasses any thing of that nature found in Europe.

There is one species of white fish taken here, which seems to be peculiar to the lake. They are in shape like our shads, but much thicker, and in general weigh about four pounds: these fish are taken with nets, but the trouts are caught with baits and hooks. There are likewise vast numbers of small fish here, besides crabs; but the latter are rather small. The

vast body of water in this lake gives it the appearance of a sea, and in stormy weather it is as much agitated as the Atlantic ocean. The waves run high, and it is equally dangerous for travellers to sail on the one as on the other. A large body of water is discharged from the south-east corner through the streights of St. Marie, and at the upper end of these streights is a fort that receives its name from them. There is a strong rapid current near the fort, whither the canoes cannot ascend, unless conducted by very careful pilots, and then they are in no danger.

Although this lake is supplied with water from a vast number of rivers, and many of those very large ones, yet it does not appear that one half of the waters are carried off by the rivers that issue from it.

This must be caused by evaporations, there being no other way of accounting for it. At St. Marie, the falls are not perpendicular, like those of Niagara, or St. Anthony; but rather consist of a rapid course, which continues three quarters of a mile. The rocks at the bottom of those falls are well adapted for catching of fish, which are found in amazing quantities. They have little more to do than throw in their nets, and they are full in an instant. Those streights of St. Marie are about forty miles in length; but they vary greatly in their breadth. The current between the falls and lake Huron is not so rapid as to prevent canoes sailing along it, but then they must be managed by skilful pilots.

Several travellers have observed, that the entrance into lake Superior, from those streights, affords one of the most pleasing prospects in the world; on the left, many beautiful islands extend themselves; and on the right are several small points of land, projecting into the water. Lake Huron is the next in magnitude to lake Superior; and its shape is nearly triangular; the circumference being about one thousand miles. Towards the north side of this lake is an island, near one hundred miles in length, but not above eight miles broad. It is like a long slip running parallel with the shore, but there are no inhabitants on it, for the Indians believe that it is inhabited by some of their imps or devils.

The bay of Sugantum is about the middle of the south-side of this lake; and the capes that separate the bay from the lake are about eighteen miles distant from each other. There are two islands near the intermediate space, which are of great service to those who sail past them, in canoes and other small vessels, by affording them shelter, especially when the weather is boisterous; and it saves them the trouble of coasting round the banks of the lake. The bay here is, at least, eighty miles in breadth, and just adjoining it is another, called Thunder Bay: it is called by this name, on account of the dreadful storms of thunder that are met with here in those seasons when the Europeans pass through it. This bay is about nine miles broad, and little more in length; and although our travellers were full thirteen hours in crossing it, yet it thundered the whole of the time, to a most excessive degree. There appeared no satisfactory reason for this wonderful phenomenon, especially as in the adjacent country there is seldom any thunder; nor did they find that the hills, near the banks of the river, were impregnated with sulphur; however, they were certain that there must have been some sulphureous substances in the mountains, or some sort of mineral qualities, that by an electrical source were driven up to meet the clouds; which, in consequence, occasioned these dreadful explosions.

In this lake, the fish are much the same as in Superior, but the lands on its banks are much more fertile. There is one circumstance relating to these lakes which must not be passed over in silence; and that is, that while the French were in possession of the fort, although there is no tide here, yet they observed a periodical alteration. The waters arose by a gradual, but by an almost imperceptible motion, till they had reached three feet in height; but indeed all these lakes

are so affected by the winds, that they rather resemble seas, where there is a reflux and influx of the tide.

There are many tribes of Indians living around this lake, and on its banks are found an amazing quantity of sand cherries, much like those which grow on the banks of the other rivers and lakes. Leaving the falls of St. Marie, our travellers proceeded back again to Michillimackinac, and arrived there about the beginning of November, 1667, having been fourteen months on their hazardous journey. They had travelled near one thousand miles, and visited twelve nations of Indians. As the winter was setting in, they were obliged to remain there till the spring; for, till June, the navigation for shipping was not open on Lake Huron, on account of the vast shoals of ice. Here, however, they had the good fortune to meet with some social company, with whom they spent the time very agreeably.

Their chief amusement was that of catching trouts; and, although the streights were covered with ice, yet they found means to make holes through it, and letting down lines of above fifteen yards in length, to which hooks were fixed, they frequently brought up two at a time, which weighed upwards of thirty pounds each: but the common size did not exceed twenty pounds, and frequently they were much less. These trouts are good eating, and in winter, when they want to preserve them, they hang them up in the air: thus, in one night, they will be frozen so hard, that they will keep as firm as if they had been cured with salt. This practice is not, however, confined to America, for there are many places in the northern parts of Europe where it is observed, and perhaps there can be no method used, in cold countries, that is so likely to be attended with beneficial consequences in preserving fresh water fish.

In June, 1768, they left this place, and sailed over Lake Huron, in a vessel of about eighty tons burthen, and arrived at St. Claire, where they left the ship, and proceeded in boats to Detroit. This lake is not above eighty or ninety miles in circumference, and its form inclines rather to that of a circle. In some places it is deep enough to contain large vessels, but, towards the middle, there is a sand bank, which renders it very dangerous, unless there is a skilful pilot to conduct them across it. In cases where it is found dangerous, they put the passengers into small boats, and thus the vessel being lightened, they all get safely across the bar.

The village of the ancient Hurons is almost opposite to the eastern shore, and here they found a Lutheran priest, who resided as a missionary. There are great numbers of settlements here, extending upwards of twenty miles; and, in general, the country is well cultivated. General (now Lord) Amherst, when he reduced Canada, gave great encouragement to the settlers, but the present troubles in America have prevented them from reaping the fruits of their labours.

There are about one hundred houses in the town of Detroit, and the streets are far from being irregular. They have very convenient barracks for soldiers, and at the south end is the parade. The garden, called the king's, but which is the property of the governor, is on the west side; it is not only well laid out, but is kept in excellent order. All round the town are strong fortifications, and piles are fixed in the ground, in the form of pallisadoes. There are likewise several bastions, but the cannons mounted upon them are very indifferent: however, they are sufficient to repel the attacks of the Indians, but they would be of little service against a regular army. The commander in chief has generally two hundred men under him in times of peace; and being a field officer, he discharges likewise the duties of a civil magistrate. He is appointed by the governor of Canada; and Mr. Trumbull, of the royal Americans, was commander when our travellers were there. It is almost impossible to express the civility with which our company were treated by this gentleman, and indeed he was in much esteem by all those who visited the fort.

The vulgar, in all countries, are fond of recording omens, which is the sure sign of a weak mind; and in 1762, in the month of July, it rained on this town a sort of water of a sulphurous taste; soon after this the Indian war broke out, and this circumstance, although natural, was considered by the people as an omen. Such natural events are, however, below our notice, and therefore it is needless to say any thing concerning them. We are no way acquainted with the nature of omens; we know not whether there are any in the world at present; but if men will consider natural appearances as pointing out some general calamities, then they ought to improve them in a proper manner, for all things should be done well.

During the late war between the English and the French, Pontiac, one of the Indian leaders, kept attached to the interests of the latter, and actually continued to be an enemy to the English after peace was concluded; for these savages never look upon themselves as bound by any articles of peace concluded between the European princes, whom they look upon as people who intrude upon their civil rights, without any title or privilege. This warrior collected an army of confederate Indians, with an intention of renewing the war; but before he declared war, or, in other words, took up the hatchet, he laid a scheme for taking, by surprise, all the forts which the English had taken from the French. Having succeeded in several of his operations, he directed his whole force against Detroit, because it was not only a place of considerable strength, but likewise well fortified; and he thought that, if he could take it, it would inspire his men with fresh courage. He took the management of the whole upon himself, and advanced to it with the principal part of his army; but he was prevented from carrying his design into execution by one of those common accidents which, although they may appear trifling in their own nature, yet are frequently attended with such consequences as decide the fate of kingdoms, and bring about very important revolutions.

When Pontiac formed this plan, the town of Detroit was garrisoned with upwards of three hundred men, commanded by Major Gladwyn, an officer of courage and experience. War with the English and French was then at an end, and every one expected to enjoy the blessings of peace, with all that temporal happiness which flows from it. This very chief, however, approached the fort, while the governor had no suspicion of his intentions. He sent notice to the commander that he was come to trade, and desired that he and his subordinate chiefs might be permitted to converse with him. The governor had no suspicion, nor did he doubt the sincerity of the Indians, so that their request was granted, and the next morning was appointed for receiving them.

It happened that, the evening before, an Indian woman, who had been employed by the governor to make him some shoes of elk skins, brought them home; and he was so pleased with them, that he ordered his servant to pay her more than the common allowance. The woman being dismissed, looked some time at the door, which being taken notice of by one of the servants, he asked her what she meant by doing so, but she gave him no answer. Soon after this the governor saw her himself, and asked the servant what she waited for, but could not receive any answer to give him satisfaction. He ordered her to be called in; when she told him, after much hesitation, that as he had always behaved with great kindness to her, she was afraid she should never see him again. He insisted on her declaring to him what she meant; and, at last, she told him, that, at the council to be held the next day, Pontiac, and his companions, were to murder him, to massacre the garrison, and to plunder the town of every thing valuable they could carry along with them. She added, farther, that the chiefs who were to be admitted into the council, were to be properly armed for executing their design.

Having gained from the woman every sort of intelligence he could procure, relative to the manner in which

which this diabolical plot was to be carried on, he dismissed her, with instructions to keep every thing secret, and, at the same time, promising that he would reward her according to her fidelity.

The governor was very much disturbed on account of the intelligence he had received from the woman, and therefore he sent for the next officer in command, to consult with him. That gentleman, however, treated the information as a story invented to amuse them by an artful woman, who had some private ends in view, and therefore advised him to pay no regard to it. The governor, however, being a man of good sense, resolved to act with prudence till it should be discovered that it was not so as had been reported; and therefore, without revealing his suspicion to any person whatever, he took all the precaution the time would admit of. He walked round the fort during the whole night, and took care to see that every sentinel was on duty. This conduct ought to be imitated by every military officer who is entrusted with the command of a garrison.

During the time that this brave officer traversed the ramparts, which lay near to the Indian camp, he heard them making themselves extremely merry, without imagining that their plot had been discovered; and, undoubtedly, pleasing themselves with an assurance of success. In the morning, as soon as it was light, he ordered all the men under arms, and gave such directions to the officers as he thought necessary. As there were several traders at that time in the place, he sent word to them to be upon their guard; to prevent themselves from being plundered, and to have arms ready to defend themselves from any attack that might be made by the Indians.

Pontiac, and his chiefs, arrived about ten o'clock, and were received into the council-chamber, in the most friendly manner; where the governor and chief officers were, with pistols fixed to their belts. The Indians, who are always cautious, were surprised at seeing a greater number of troops than usual drawn up; and no sooner had the savages taken their seats on the skins prepared for them, than Pontiac asked the governor why so many young men, meaning the soldiers, had been drawn up? He was told that it was only to learn them their exercise as soldiers. Here was prudence indeed; and such as becomes any military officer who had to do with desperate designing villains.

Pontiac now began his speech, which contained the strongest professions of friendship and good will towards the English; but when he came to deliver the belt of wampum, which was, according to the woman's information, to be the signal for all the chiefs to fire; the governor, with all his attendants, drew their swords half way out of their scabbards, and the Indians, at the same instant, made a clattering with their arms before the door, which had been left open.

The Indian chief, Pontiac, although a hardened villain, yet immediately turned pale; and his chiefs, who had looked at each other for the signal, were astonished; they neither knew what to say nor what to do.

The governor made a speech in his turn, but instead of thanking the great warrior for the services he proposed to him, he declared that he was a traitor. He told him that the English, who knew every thing, were convinced of his treachery and villainy, and as a proof of that, he stepped up to the nearest Indian chief in the room, and drawing aside his blanket, discovered the short musket he had concealed under it. This put the Indians to the blush, and disconcerted the whole of their design.

The governor, as a man of honour and prudence, told them, that he had given his promise no injury should happen to them, although they did not deserve such an indulgence. He advised them to make the best of their way out of the fort, lest his young men, by which he meant the soldiers, should cut every one of them to pieces; which, indeed, would have been no more than a just reward for their treachery.

Pontiac, the Indian chief, had the effrontery to deny all that was alledged against him and his companions; but the governor refused to listen to him, upon which the Indians immediately left the fort, without being apparently sensible of the great favour that had been shewn them; but next day they pulled off the mask, and made a regular attack upon it. Had Major Gladwyn confined these Indians while he had them in his power, an attack of this nature might not have happened; but then it may be asked, who are aware at all times? Errors committed by military officers should be considered with tenderness, and treated with candour. Brave men will often do that for the best, which is frequently attended with fatal consequences. However, our gallant major made such a defence as must ever do him honour.

The savages besieged the fort upwards of a year; and, during that period, some very sharp skirmishes happened between the besiegers and the besieged; of which, the following may serve as a specimen.

Captain Dalzeeb, a brave officer, and one who had been long in the wars, prevailed upon the governor to give him the command of two hundred men, and leave at the same time to attack the enemy's camp. This request being complied with, he sallied forth from the town before day-light, but Pontiac having received intelligence from some of his men, met our officer at a place, since called Bloody Bridge. The Indians were vastly superior in numbers to Captain Dalzeeb's party, so that he was soon overpowered and driven back: being now nearly surrounded, he made a vigorous effort to regain the bridge, he had just crossed, by which only he could find a retreat; but in attempting this he lost his life, and many of his men fell along with him. But Major Rogers, the second in command, found means to draw off the scattered remains of the army, and to conduct them safely into the fort.

Reduced to this degree of distress, it was difficult for the major to maintain his ground or defend the town, but notwithstanding all this, he held out against the Indians till he was relieved by fresh reinforcements, so as to be able to make a stand against the enemy.

The Gladwyn schooner, on board of which our travellers had taken their passage, arrived about this time, and brought with it a large supply of fresh provisions. This vessel had been vigorously attacked by a party of Indians, who surrounded it in their canoes, and killed several of the crew. Among those killed was the captain himself; and then the Indians began to attempt climbing up the sides of the ship. At this instant, Mr. Jacobs, the lieutenant, upon whom the command naturally devolved, was determined that the stores should not fall into the hands of the enemy; and seeing no other alternative, he ordered the gunner to set fire to the powder room, and blow the vessel up. This order was very near being executed, when a chief of the Hurons, who understood the English language, mentioned to his friends the intention of the commander. On receiving this intelligence, the Indians jumped down the sides of the ship with the utmost precipitation, and got as far from it as possible. The commander took the advantage of this circumstance, and arrived at the town without any further obstruction.

The garrison were now in high spirits, and Pontiac was convinced that he would never be able to reduce the place.

The Indians soon after separated, and returned to the places from whence they came; and till the war broke out in America, every thing was quiet here. Pontiac seemed now to have dropped all resentment against the English, and to be their most zealous friend. For this he was allowed a handsome pension; but his vile restless ambition was such, that he could not be quiet any where. If he had not an enemy, he was sure to create one; and in 1767, he held a meeting with the Indians, at which he delivered a speech, wherein he endeavoured to excite them against the English. This speech might have been received with applause;

applause; but when he had done, an Indian chief, who wished well to the English, plunged his knife into his heart, and left him dead on the spot. But this is only mentioned by way of digression.

Lake Erie is supplied with water from some of those we have already mentioned. This lake is between three and four hundred miles long, from east to west; yet in the broadest part it does not exceed forty: but the prospects from it are cheerful and delightful. Near the west end are several small islands; but there are so many rattle-snakes on them, that it is dangerous to go on shore. But, besides the rattle-snakes, there are some peculiar to the water, such as the hissing-snake, which is about eighteen inches long, and commonly speckled. When any thing approaches it, it becomes quite flat, and its spots become brighter than before: at the same time it emits such a smell from its breath, as becomes noxious to every person upon whom it fixes. The lake discharges itself into the river Niagara, and then it falls into the lake Ontario. The fort Niagara is at the entrance of this river, on the eastern shore; and about fourteen miles further are those falls, which are considered among the wonders of the creation.

The waters that compose these falls, rise two thousand miles to the north-west; and having acquired a vast addition in their course, they rush down a stupendous precipice of one hundred and forty feet perpendicular; and in a violent rapid, that extends in length eight or ten miles. The noise of these falls can be heard at an amazing distance, and in a calm morning, our travellers heard them twenty miles off. This account is not exaggerated, because several travellers have asserted, that the noise can be heard at a much greater distance. Near the falls the land is hilly and uneven, but in some parts it is extremely good for pasturage. The fort of Niagara was taken from the French in 1759, by the forces under the command of Sir William Johnson, and has, since that time, had a garrison in it. The fort is situated near the east end of the lake Ontario, and very near the straits of Niagara.

The lake of Ontario is the least of the five lakes in Canada. It is in circumference about six hundred miles; and near the south-east it receives the waters of the river Oswego. At the entrance of the river stands a fort of the same name, where a small garrison is kept; nor is it of any great importance. In 1756, the French took this fort, by the assistance of the Indians; and these savages murdered the greatest part of Shirley and Pepperel's regiments, although they had surrendered on terms of capitulation: but lawless power knows no bounds, and destruction is the business of war.

The country about the lake Ontario is composed of good land, and, in time, may make excellent settlements. Near to it is a tribe of savage Indians, whose chief town is Toronto; but they are not numerous. It is almost amazing to describe all the lakes in this extensive country; but we shall mention something relating to a few more of them.

A little to the eastward of lake Ontario is lake Champlain, which is about eighty miles in length, but not above fourteen in breadth. It abounds with a variety of fish, which are taken here in great numbers. A little to the south-west is lake George, which is about thirty-five miles in length, but extremely narrow. The country here is very mountainous; but where there are vallies it is tolerably good. Besides these three, there are a vast number of lakes on the north of Canada; but these having been described by former travellers, it was thought unnecessary to say any thing concerning them. They are discernible, upwards of twenty in number, and are all within the province of Canada: from all which it may be conjectured, that there is a greater quantity of water in North America, than in any other part of the globe.

In the month of October, 1768, our travellers arrived at Boston, after having been absent from it

two years and five months; and during that time they had travelled near seven thousand miles. From thence Mr. Carver set out for England, in order to adjust his materials, and publish his travels. At the same time this accurate and ingenious traveller, in the most pious manner, acknowledges the numerous obligations he was under to divine Providence, for carrying him through so many difficulties.

This gentleman, however, proceeds to descend more particularly to a description of the manners of the inhabitants of the Indian nations. He takes notice, that those who have had much acquaintance with the English, have acquired their vices. This is much to be lamented, but it is too true to be denied; reason points it out, and experience confirms the assertion. It is very remarkable, among the North American Indians, that the women have no midwives to assist them while in labour; for the healthiness of their constitutions renders them altogether unnecessary. Nay, such is their natural strength, that they are seldom confined above a day from their common employments. Soon after their children are born, they lay them on boards, bound with soft moss, with the skins of wild beasts wrapped round them. At particular times they hang them to branches of trees; and in such manner the children are kept for some months, only that the mother gives them suck two or three times in the day. When they are taken out, the boys are suffered to go naked, and the girls are covered from the neck to the knees, with a petticoat and shift: but in other respects, where female weakness is not concerned, the Indian women are, perhaps, more modest than the European.

In all their towns there is a place which serves for a camp; and as the women accompany the men, so they have a private place reserved for them, to which they retire till their disorders are over, and then they purify themselves in a running stream.

On all such occasions the men avoid holding any communication with them; and some of these Indians are so rigid in the observation of this ceremony, that they will not suffer any belonging to them to bring even the common necessaries of life from these female retreats, notwithstanding their being much wanted. They are so superstitious as to imagine, that if a pipe should break, that the possessor of it has either lighted it in an improper manner, or from those polluted fires where the women resided.

As the Indians are grave and circumspect, so they are very slow in all their undertakings. They have not that warmth of temper, which hurries others into the repetition of irregular actions; nor have they any of that intemperate rashness, which perpetually leads men into such unguarded actions as become injurious to civil society. Their greatest fault is that of an inveterate hatred to their enemies; and we are sorry to say, that the Europeans have, in some measure, shewn them a bad example. The friendship that takes place between these people is very strong; and it is remarkable, every one will, with cheerfulness, lay down his life, rather than betray his friend. So far they are highly commendable; but still they are extremely cunning, and at all times ready to take the advantage of those who are not prepared against their tricks.

When an Indian has been absent from his family some months, and his wife and children meet him at some distance from his habitation, instead of those affectionate and pleasing sensations that commonly arise in the human mind, he goes on without paying the least regard to them, till he comes to his own house. There is something brutal in this, but it is the custom of the country.

When he arrives at his own house, he sits in the same unconcerned manner as if he had not been absent above a day, and smokes his pipe along with such of his acquaintances as have followed him. It is generally some hours before he relates his adventures to his family, although, perhaps, he has left a father, or a brother, dead on the field.

When an Indian has been several days out on hunting, he returns in such an unconcerned manner, that he never rises for any of the necessaries of life, unless they are set before him. Pride will not suffer him to betray the least symptoms of impatience, lest he should be looked upon with contempt. However, as soon as he is invited, he sits down, and smoaks his pipe with as much composure as if nothing had happened to him. This custom is strictly adhered to by every tribe; for they consider it as a proof of fortitude; and imagine the acting in a contrary manner would induce their countrymen to call them cowards, or, which is still more odious among the Indians, they would be apt to call them by the atrocious appellation of old woman.

When an Indian is told that any of his children have signalized themselves against the common enemy, and have taken a great number of scalps, and brought home a certain number of prisoners, he does not appear to feel any extraordinary pleasure on the occasion, but in the coolest manner answers, that it is well, without making any further enquiry: on the contrary, when he is told that his children are killed, or taken prisoners, he makes no complaint, but only says, it does not signify; and, very frequently, never asks how it happened. This seeming indifference, however, does not proceed from an entire suppression of those passions which are the basis of human society; for although they are generally called savages, yet in all those duties which we call paternal, or filial, they shew themselves to be endowed with the same passions.

There is another thing very peculiar in these Indians, and that is, the manner in which they visit each other. If an Indian goes to visit a family, he gives notice beforehand of his intentions; and when he arrives, the rest of the family, except the master and mistress, retire to the opposite side of the house, that they may not interrupt them in their conversation. The same method is observed when a man goes to pay his respects to the other sex, but then he must be careful not to converse of love while day-light remains.

The Indians are not only inquisitive, but they are at the same time sure contrivers of things. Thus, for example, they will cross a forest, or a plain, which is two hundred miles in breadth, and reach, with great exactness, the point at which they intend to arrive, keeping, during the whole of that space, in a direct line, without any material deviations; and this they will do with the same ease, whether the weather is fair or cloudy. For these talents they seem to be indebted to nature, and not to any thing extraordinary. They are generally happy in a very retentive memory, for they can recapitulate any thing that happened many years before. Their belts are of wampum; and their treaties are concluded by them. Every station pays great respect to old age; and the advice of a father will often go so far, that his child will not contradict it. They have much respect to antient records, or, rather, antient traditions. If they take, during their hunting seasons, any game that is reckoned particularly delicious, it is immediately presented to one of their chiefs. They never suffer themselves to be overclouded with care, but live in a perfect state of tranquillity. Being naturally indolent, if they can procure as much provision as is necessary for themselves, they never trouble themselves any further. Having much leisure time, they indulge their indolence in eating, drinking, and sleeping. They ramble about from one place to another, without so much as regarding those wars in which they are to be engaged the next season, which is generally the case among these barbarians.

There seems to be a principle of gaming to be found among all the people of Europe; and what is still more remarkable, it is to be found among the American savages. They sometimes stake all they have in the world, and, when they lose, they bear it with a philosophic calmness. The greatest fault they are

guilty of, is, that of cruelty to their enemies. It is surprising, that human nature, under all its weaknesses, should delight in cruelty; and yet we have many instances of it in history. The state of a prisoner should always excite compassion; but what shall we say, when we read of the eastern inhabitants of the world putting out the eyes of their prisoners. The Romans exposed them to wild beasts; the Carthaginians crucified them; and the story of Regulus is well known. But of all those we read in history, the savages in America are the only people who ever reduced barbarity to a system. They seem to have studied this species of barbarity as much as if it had been a rational science: they enjoy a savage pleasure in it, which is certainly a disgrace to human nature.

There is one passion, to which the Europeans are subject, but the American savages are strangers to it, and that is jealousy. Among some of them the very idea is not known; for the most abandoned of their young men seldom attempt any thing against the chastity of married women; and as for the women, they seldom put themselves in the way of temptation. Here Mr. Carver relates a story, which we shall take on his own veracity, as we doubt not but it is true.

He tells us, that while he was among the Naodowessies, he observed, that they paid the most uncommon respect to a woman, whom, upon enquiry, he found would have been considered as infamous in Europe. She was then far advanced in life; but once, when she was young, she had given what the Indians call a rare feast. She invited forty of the principal warriors to her tent, where having feasted them with venison and rice, she then admitted each of them to partake of her charms, behind a screen fixed for that purpose.

By this act of courtesy, which was a considerable one, she obtained the approbation of her whole tribe; and so sensible were the young Indians of her superior merit, that each of them strove who should obtain her for a wife. Soon after this, one of the principal chiefs took her for a wife, over whom she obtained a great sway, and from whom she received the strongest marks of love. It is seldom, however, that one of these feasts happen, but such events as this generally attend them.

There is no such thing as distinction of property in this country, among the savages, but every one cultivates whatever spot of ground he pleases. They are so connected in their tribes, that they give mutual assistance to each other; for even savages know something of charity. When any of their neighbours have their young men killed in battle, then those who have the greatest number of slaves, distribute them, to make up the deficiency. These slaves are adopted as children, and considered as the sons of those to whom they are given. When they are told, that the Europeans imprison each other for a small parcel of yellow dust, they can hardly be brought to believe it, because they think it inconsistent with nature.

It is certain, that these Indians are ignorant of astronomy, and therefore they reckon their years by winters; but some of them reckon time by moons. Every month has, with them, a name expressive of its season. Thus the month of March, with which they begin their year, is called the worm month, because in this month the worms quit their retreat in the bark of the trees, where they had sheltered themselves during the winter. All the other months are named in a similar manner, according to the natural productions of the earth.

They mention the distance of plains not by miles, but by days journies, which, in general, are about twenty English miles. They have no idea of arithmetic, though they can, by the strength of their memory, reckon up any sum whatever.

Like the antient barbarians, the Indians in North America are all divided into clans or tribes, and these form small communities, each being distinguished by

some

some particular symbol. This is consistent with the ancient manner of carrying banners, a custom much used, but little understood. In ancient times, every tribe or clan had its own banner, by which it was distinguished, and such at present is the case with the American savages. Most of these are distinguished by the figures of different animals: thus, one tribe has a snake, a second a squirrel, a third a tortoise, a fourth a wolf, a fifth a buffalo, and so on with all the rest. These signatures, or symbols, are carried down from one generation to another; and, perhaps, the best name we can give them, is the American coats of arms.

Every tribe has its own chief, who takes the command in war, and they construct their tents in such a manner that every tribe knows their own encampments. If the chief should be unable to go out to war with the army, another is elected in his room, and he acts with despotic authority. They have no regular law of succession, for, in the descending line, the possessor carries it rather by election than succession. Each family has a right to appoint one of its most experienced persons to assist the commander in chief; and these form a sort of council of war, without whose consent nothing can be carried into execution.

In their councils, every thing is freely declared, nor can any thing be undertaken without their consent. They commonly assemble in a tent or hut appropriated for that purpose; and being seated in a circle, on the ground, the eldest chief rises and makes a speech, and then the rest, if they think proper, speak in their turns. On such occasions, their language is nervous and expressive, and their stile is well adorned. The young men are allowed to be present at their councils, but they are not permitted to speak, but only to give their assent.

Their food consists chiefly of the flesh of bears, buffaloes, deers, and elks, and they can dress the flesh of these animals in a decent and proper manner. The lower sort of Indians are very nasty in dressing their victuals, but some of the chiefs are both cleanly and decent. They commonly eat in large parties, but they do not attend to any particular times, for their feasts are regulated by their appetites. This is an ancient custom, and, when all things are considered, a very natural one. They consider themselves as bound, by motives of religion, to dance either before or after their meals; for by this cheerfulness they render themselves, in their own imagination, the more acceptable to the great Spirit, the name which they constantly give to the great God. In private, the men and women eat together, but in all public meetings, where they have feasts, they dine separately.

Dancing, among the Indians, is considered as a favourite diversion, and, indeed, they have no entertainments without it. They are extremely regular in their dances, but they do not join in concert; for as soon as one had done dancing, the other stands up in his turn, and thus the dance goes round from one to another. Some of the women dance very gracefully, and they carry themselves much with their hands hanging down. They perform their movements with great art, and indeed they shew themselves, in many respects, as ingenious as the Europeans. At these dances, the women mingle themselves with those of the men who sit around, for the sexes never intermix in their dances. However, they have a variety of dances amongst them, but some of these do not merit a particular description.

When they set out on parties of war, they have their dances; and this ceremony is performed amidst a company of the warriors: one of the chiefs generally begins the song, and it is followed by all the rest dancing. The chief who begins the song, relates the account of some memorable achievement, and then he strikes his war club against a post that is fixed in the ground, near the centre of the assembly, for that purpose: the rest of the warriors repeat the number of their achievements, and then they all dance in concert. It then becomes very alarming to any stranger that happens to be in their company, as they throw

themselves into the most horrid postures that can be imagined; relating, at the same time, the part they intend to act against the common enemy in the field. During the whole of this ceremony, they hold their sharp knives in their hands, which they whirl about in such a manner, that they are in danger every moment of cutting each others throats; nor could this be avoided if they were not extremely dextrous.

By these motions, they intend to represent the manner in which they are to treat those persons whom they take in battle; and, to heighten the scene, they set up the same dreadful yell that they use when they attack their enemies. They are really like a parcel of devils, who have no regard to moral obligations; and cruelty to them seems to be a virtue. In these war dances, there are frequently some things that cannot be accounted for on any other principles besides those of the corruption of human nature. Our travellers were once invited to be present at one of their ceremonies of this nature, and it was performed in the following manner:

About noon-day they began to assemble, when the sun shone bright, and this they considered as a good omen, for they never hold any of their meetings under a cloudy sky. A great number of chiefs appeared, at first, dressed in their best apparel, and after them came the head warrior, clothed in a robe of fur, which reached to the ground: he was attended by above twenty persons, who were all painted and dressed in the gayest manner. Next followed such of their wives as were considered as favourites; and these were followed by the rabble, who made a very odd appearance.

The assembly was begun by one of the chiefs making a speech concerning the occasion of their meeting. The chief acquainted them, that one of their young men desired to be admitted into the meeting, and be a member of the society; and, taking him by the hand, presented him to the warriors as one of their brethren; asking them, at the same time, whether they had any objections against him: as no objections were made, the young candidate was placed in the centre, and four of the chiefs took their seats close by him. They began by exhorting him to be courageous under all the fatigues he was likely to suffer, and to behave like an Indian, and a man. Two of them took hold of his arms, and commanded him to kneel, whilst the other placed himself so as to receive him, and the last of the four retired to the distance of four feet in the front, out of respect to him.

The disposition being completed, the chief that stood near the kneeling candidate began to speak to him in an audible voice: he told him that, now was the time for him to display his valour, and not bring dishonour upon his countrymen. As he spoke this, he seemed to be greatly agitated, till at last, his emotions became so violent, that his countenance was distorted, and his whole frame convulsed. At this instant, he threw something like a small bean at the young man, which seemed to enter his mouth, and he instantly fell as motionless as if he had been shot. The chief that was placed behind him received him in his arms, and, by the assistance of the other two, laid him on the ground, to all appearance deprived of life.

Having done this, they immediately began to rub his limbs, and to strike him on the back, giving him such blows, as seemed more calculated to kill the quick, than to raise the dead. During these extraordinary applications, the speaker continued his harangue; desiring the relations not to be surprised, or to despair of the young man's recovery, as his present state proceeded only from the operations of the spirit on faculties that had hitherto been unacquainted with things of that nature.

Thus the candidate lay several minutes without sense or motion, but at length, after receiving several blows, he began to discover some returning signs of life and motion: these, however, were attended with strong convulsions, but they were soon at an end; for having discharged from his mouth the bean, or what-

ever

ever it was the chief had thrown at him, he soon after appeared to be tolerably recovered. This part of the ceremony being happily effected, the officiating chiefs divested him of those cloaths which he had formerly worn, and put on him a set of apparel entirely new. When he was dressed; the speaker once more took him by the hand, and presented him to the society as a regular, and thoroughly initiated member: exhorting them, at the same time, to give him such necessary assistance and directions as he should stand in need of.

Every one of the company, who had been admitted within the rails, now formed a circle around the new warrior, and the chiefs sung a martial song. The instrument most esteemed by them, in music, is a drum composed of a piece of a hollow tree, wrought out in a curious manner. Over one end of it is a skin, strained hard, which they beat with one stick, and it gives a sound which is not very harmonious. Sometimes they have a pipe, made of a reed, which has a shrill, but harsh noise.

As soon as the assembly were collected together, the dances began, and several persons joined their voices to the sound of the instruments; and this was one of the most agreeable entertainments that our travellers met with amongst them. However, during some parts of the dance, the people discovered a great share of superstition. Most of them carried in their hands the skins of otters and monkeys, which being taken whole from the body, and blown full of wind, made a squeaking noise through a pipe fixed in the mouth. When the sound emitted from this instrument is held to the faces of any of the persons present, they instantly fall down, to all appearance dead; and sometimes two or three, both men and women, were on the ground together; but recovering soon after, they started up and joined in the dance.

The dance being over, the feast began, and the principal dish consisted of dogs flesh; which, it seems, they prefer to all other sorts of food. This custom of eating dogs flesh, has induced many learned men, who have visited the north-east parts of Asia, to believe that these Americans are descended from them. When they are afraid of the effects of an infectious distemper, they kill a dog, and winding the guts about two poles, pass through between them. From these similarity of customs, there is great probability that there was once a passage from the northern parts of Asiatic Russia to America; and, perhaps, that passage might be yet discovered, if a proper reward was offered to the adventurers.

Our accurate travellers took notice of several other dances practised by the Indians, among which the following is rather singular: this was at Pepin, on the banks of the Mississippi. About twenty young Indians, quite naked, came dancing towards them; and, in their shapes, they were the most handsome persons they had seen in that country. At the end of ten or twelve yards they halted, and made the most hideous yells, enough to frighten any body of people but themselves.

When they reached the tent where our travellers were, they appeared to have been painted and black, as they usually are when they go out to war; and it appeared there was something of the war dance intermixed with their other entertainments. From these circumstances, Mr. Carver concluded that they had some hostile intentions, and therefore they resolved to defend themselves to the last extremity. For this purpose, they received the Indians with their arms ready loaded, and the servants were ordered to keep a watchful eye over them, and to be upon their guard, lest they should make any efforts upon them by surprise, which is a custom frequent among these savages.

As soon as the Indians entered, they continued dancing, and singing accounts of their warlike exploits. Their language and manner of speaking was so terrible, that it would have made the warmest blood run cold, and yet, to give it the greater force, they struck their war clubs with such violence against the

tents in which our travellers were, that they expected every moment they would tumble to the ground. In passing round the tents, they put their hands on their eyes, and looked through their fingers at the travellers, which was not considered as a token of friendship. All the Europeans present gave themselves up for lost, expecting every moment that they would be massacred.

When their dance was over, Mr. Carver presented to them the pipe of peace, but they would not receive it. He then attempted to try what presents would do, and offered them some trinkets. These seemed to have some effect upon them, and in some degree to avert their anger: for, after they had consulted some time together, they sat down upon the ground, as if they had been very well pleased.

A little after this, they took up the pipe of peace; and smoked along with our travellers. They, at the same time, took up the presents, and seemed to be well pleased with them. It was certain that they had hostile intentions, but prudence on the part of our travellers made every thing easy. The next morning, the wives of the Indians visited the travellers; and from them received a few more ribbands.

They have another dance, called that of the sacrifice, because at that time they offer up sacrifices to a good or evil spirit, according as their inclinations lead them. The sacrifice consisted of a deer roasted whole; and this was considered a lucky omen, as it happened at the change of the moon. After the feast was over, they all joined in a dance, which, because it was of a religious nature, they called, the dance of the sacrifice.

We have already taken notice of their manner of hunting, and making war, so that we shall not at present say any thing more concerning any of these articles. It is very remarkable of these people, that they are continually subduing each other, and yet they never love to extend the borders of their dominions. They are contented with the small spot they enjoy, but not with what it produces. Whenever they engage in war, their deliberations are slow and formal, and the priests are always consulted. If the determination is for war, then they all agree to prosecute it with the utmost vigor. The chief commander of a tribe does not always lead the warriors himself, but deposes another person to act in his room; and this is generally such a one as is well esteemed by the people. The person thus fixed on, being first bedaubed with black all over, observes a fast several days; during which he invokes the great Spirit, holding, while the fast lasts, no conversation with any person whatever.

When he awakes from sleep, he is careful to observe his dream; for they suppose that these contain information of what will happen to them. After the time of fasting is over, he assembles the warriors together, and holding a belt of wampum in his hand, addresses them in words to the following import:

“My dear brothers, I now speak to you by the assistance of the great Spirit, who rules both heaven and earth. The blood of our deceased brethren is not yet wiped away, nor are their bodies yet covered. The great Spirit has commanded me to revenge these injuries, and it is your duty to assist me. I have, therefore, resolved to march through the war path to surprise them. We will eat their flesh, and drink their blood; we will take scalps, and make prisoners; and should we perish in the glorious enterprize, we shall not be for ever hid in the dust; for this belt shall be as a recompense to him who buries the dead.”

As soon as he has done speaking, he lays the belt on the ground, and the first who takes it up declares himself his lieutenant, and is considered as the second in command. This, however, is only done by some distinguished warrior, and his valour is rated according to the number of scalps he has taken.

Although these Indians threaten that they will eat the

the flesh, and drink the blood, of their enemies, yet this is no more than a figurative expression; but for all that, their ferocity is often such, that they actually tear in pieces with their teeth the flesh of those whom they kill, and also drink their blood.

This part of the ceremony being over, the chief is washed clean, and then anointed with bears fat, and painted over with such figures as would make him appear the more terrible to the enemy. He then sings the war-song, in which he recites all the gallant acts he had formerly achieved. After this, he fixed his eyes upon the sun, and addressed himself to the great Spirit; and in this he is accompanied by all the warriors. Dances, like some of those already described, follow this ceremony, and the whole concludes with a feast of dogs flesh. This feast is held in the chief warrior's tent, and dishes of the dogs flesh are sent out to all those warriors who are to accompany the chief.

It is natural and reasonable for the warriors to expect that some of them will be wounded in their expedition; and therefore their priests, who are likewise their physicians, accompany them. These priests, who are the most arrant impostors in the world, pretend to cure their wounds by the most simple medicines, compounded of roots and herbs; and these applications are made with great ceremony. It is certain, however, that these priests, or by whatever name they may be called, have some knowledge, although, perhaps, very superficial, of the nature of plants; and they know how to make proper prescriptions from them: but then it is well known, that their prescriptions will not suit all constitutions, nor all habits of bodies.

Sometimes these barbarians solicit the assistance of neighbouring powers, when they intend to go to war; and in such cases they send one of their chiefs, with a belt of their wampum in one hand, and a hatchet in the other. These are signatures of war, and they are signatures of friendship. As soon as the chief arrives at the camp, he informs the commander of his business, who immediately, on the delivery of his message, calls a council of the warriors; and to this council the ambassador is invited. Here the ambassador lays the hatchet on the ground, and holds the belt in his hand, while he relates the nature of his embassy. In his speech, he invites them to take up the hatchet; and as soon as he has done speaking, he delivers the belt. From which circumstance we may learn what vast formality is observed by these savages, although, according to our notions, they have not a regular form of government.

When those to whom the ambassador has addressed himself, intend to espouse the cause of his nation, one of the chiefs steps forward, and takes up the hatchet; but if this is not done, the ambassador knows that they are either neutral, or his enemies, and therefore he goes away.

We have, in the history of Europe, accounts of heralds going to proclaim war in the nation of the enemy. Among the American savages it is not less formal: when these Indians declare war against each other, they send a slave with a hatchet, the handle of which is painted red, intimating that they are going to war; and the messenger, notwithstanding the fury to which he is exposed, sets the whole at defiance, and generally returns without meeting with any danger. He delivers his commission with the strictest fidelity, and is honoured, upon his return, by his countrymen.

In this, however, there is not a regular plan attended to; for sometimes the savages will rush out upon the inhabitants of those nations who live near them, and murder them, without any permission from their chiefs. In some of the more remote tribes of the Indians in North America, war is declared by holding out a spear, dipped in blood; and to exasperate their enemies the more, they call them old women, which, as well as in Europe, is with them a term of reproach.

The Indians generally take the field in small detached parties, because a great number would be unable to procure a subsistence in such inhospitable deserts, and over lakes and rivers.

When they pass through a country where they have no apprehensions of meeting with an enemy, they use very little precaution, and sometimes not above a dozen of them are to be found together; the rest being dispersed in pursuit of the game: but although they rove in that manner, yet they always meet at one general rendezvous, unless some accident happens to them. They always pitch their tents before sun-set; and being rather presumptuous, they take little care to guard against a surprise. They place great confidence in their household gods, or idols; which, indeed, has been the invariable practice with all heathen nations.

As soon as they have entered the enemy's country, they act with great caution, and fires are no longer lighted among them, nor is any shouting heard; they are not even permitted to speak, but must understand each other by signs and motions. They never attack their enemies in a regular manner, but always by some sort of stratagem or ambuscade. This shews that they have a great share of natural cunning, which would distinguish them in public life, if it was improved by education.

As soon as they discover where their enemies are, they send some of their parties to take observations concerning them; and then a council is held, during which they speak only in whispers. They generally make the attack before day-light, at which period of time they suppose their enemies to be in a profound sleep. Throughout the whole of the preceding night, they often lie flat on their faces, and make their approaches in the same position, creeping on their hands and feet. On a signal given by the chief warrior, all the others stand upon their feet, and, with the most hideous yells, discharge their arrows in an instant, without giving their adversaries time to recover from the confusion into which they have thrown them.

The Indians, in the more remote parts of North America, never esteem it as honourable to attack their enemies in the field; for their greatest pride is to surprise and destroy them: nay, so cunning are they, that they seldom engage without the prospect of considerable advantage: when they find the enemy prepared for them, they retire, and shelter themselves in the woods. The Europeans, who are not acquainted with their manner of fighting, are often surprised, and frequently murdered. Of this, the following is a striking instance:

In the year 1755, General Braddock was sent to attack fort du Quesne, and in his way thither was intercepted by a party of Indians in the interest of the French, who, by laying among the bushes, defeated his whole army, which, at that time, consisted of three thousand men. These Indians were posted in such a secure manner, that the English scarcely knew from whence, or by whom they were annoyed. During the whole of the engagement, the English had hardly the sight of an enemy, and were obliged to retreat without the satisfaction of being able to take the least degree of revenge for the havock made among them. The general paid for his temerity with his life, and was accompanied in his fall by a great number of brave men, whilst his invisible enemies had only two or three killed.

When the Indians succeed in their attempts, and are able to storm a camp, the feat of horror that follows exceed all description. The horrid ferocity of the conquerors, and the desperation of the conquered, who well know what they are to expect, occasions the most hideous exertions. The figures of the combatants, all besmeared with black and red paint, and covered with the blood of the slain, their horrid cries and unconquerable fury, are not to be conceived by any persons who have not been witnesses of them. Mr. Carver was an eye-witness of these scenes of horror, and what grieved him most was, he had it not in his power to stop the fury of the savages.

In 1757, when General Webb, who commanded the British army in North America, encamped his men near fort Edward, and had received intelligence that the French army under General Montcalm were making towards him, he sent a detachment of fifteen hundred men to strengthen the garrison, and in this detachment Mr. Carver went a volunteer. The apprehensions of the English were not always without foundation; for the day after the general arrived at lake George, he found the lines attacked by the French general, who had just landed with eleven thousand regulars, and two thousand Indians. Colonel Monro, a brave officer, commanded in the fort, and had no more than two thousand three hundred men with him, besides the detachment.

With these, he made such a gallant defence as would have done honour to one of the heroes of old, and probably would have maintained the place, had he been properly supported. Every time the French general sent him a summons to surrender, he answered, that he would keep the garrison to the last extremity, and, if he thought his present force insufficient, he could soon procure a sufficient reinforcement.

However, the colonel having found means to let General Webb know his situation, and desiring he would send him some fresh troops; the general dispatched a messenger, informing him, that it was not in his power to give him any assistance, but that he must surrender the fort on the best terms he could procure with honour.

This packet fell into the hands of the French general, who immediately sent a flag of truce, desiring a short conference with the governor. They accordingly met in the centre of the lines, attended by a small guard; when General Montcalm told the colonel, that he was come in person to demand possession of the fort: the colonel answered, that he would not deliver it up while it was in his power to keep it. At that instant, the French general shewed him the packet that had been intercepted, and said, "By this authority I make the requisition." The brave governor had no sooner read the contents, than he hung down his head in silence, and with reluctance entered into a negotiation. The garrison was allowed all the honours of war, with covered waggons to convey their baggage to fort Edward, together with a guard to protect them from the fury of the savages.

The garrison consisted of above two thousand men, besides women and children, and, on the morning after the capitulation was signed, great numbers of the Indians gathered together and began to plunder: nay, these savages went so far, as to attack the British soldiers who were wounded, and barbarously murdered several of them. The little British army imagined that this would have put an end to the disturbance; but instead of that, they soon found themselves insulted by the savages. They expected that the guard, which the French had agreed to allow them by the articles of capitulation, would have arrived, and put an end to their fears, but none of them appeared. The Indians now began to strip every one of them, without the least distinction, and those who resisted were instantly knocked on the head. Mr. Carver was, at that time, in the rear of this small army, but the savages laid hold of him, and stripped him of every thing that was valuable. As this happened in the lines, near the French fort, he then ran up to the sentinel, and claimed his protection; but he only called him an English dog, and drove him back again among the Indians.

He then endeavoured to join the main body, but received several blows from the savages; however, none of the wounds proved mortal. At last, he got amongst his countrymen, but not till the greatest part of his cloaths had been torn off. By this time the war-whoop was given, and the Indians began to murder such as were nearest to them, without any distinction. The horrid scene that followed exceeds all manner of conception, and much more so of description. Men, women, and children, were dispatched in the most

horrid manner, and scalped immediately after. Some of the savages drank the blood as it flowed warm from their wounds.

The little army of British forces now perceived, when it was too late, that they were to expect no favour from the French; and that, instead of complying with the articles of capitulation, they had let the savages loose upon them; for they perceived the French officers walking at some distance, without the least appearance of concern. It is possible, however, that the French had it not in their power to restrain the ferocity of the savages, who cannot, unless by force, be kept under proper restraints. Thus much is certain, that a body of ten thousand French might have restrained these savages, and prevented them from committing the barbarities they were guilty of: but, whatever were the causes, the consequences were dreadful, and such as are hardly to be paralleled in antient history, and we hope seldom found among the moderns.

As a great number of the British forces had been killed, and death seemed to be approaching on every side, it was proposed, by some of the most resolute, to make one general effort, and endeavour to force their way through the savages, as the only probable means of preserving the lives of those who were still left. This, however desperate, was resolved on, and twenty brave Englishmen ran into the midst of the barbarians. Some of these were killed, and only a few made their escape. Mr. Carver endeavoured to make his way through the savages in the best manner he could, but it was with much difficulty. Indeed, our ingenious traveller gave himself up for lost, and resigned himself to his fate, not doubting but they would dispatch him: nay, they began to hurry him to a swamp, but, before they had got many yards, an English gentleman came up, and although almost naked, was perceived to have been finely dressed. Some of the Indians immediately let go their hold, and springing on this new object, endeavoured to seize him as a prey. The gentleman, however, was strong, and threw several of the Indians on the ground, and would have got away, had not the Indians who had the charge of Mr. Carver let him go, who, that instant, joined another body of English troops that were yet unbroken, and stood in a body at some distance. But, before he had got far, he looked, and saw one of the Indians murder the gentleman.

Mr. Carver had only left this shocking scene a few moments, when a fine boy, about twelve years of age, came up to him, and begged he would protect him from the savages. Our humane traveller would have protected the boy, but he was soon torn from him, and most barbarously murdered. The last mentioned gentleman forgot his own cares, for a few minutes, to sympathize with the young sufferer, but it was impossible for him to preserve his life.

He now joined his friends, but they were not able to afford him any assistance. However, they agreed that the most prudent method they could use, would be to force their way through the Indians, so as to get to a wood, which they perceived at some distance. They reached the wood, but when they had only got a little way into it, he found himself so much exhausted, that he threw himself down, expecting every moment to expire. In a little time, however, he recovered, and saw some Indians at a distance, in pursuit of him. He endeavoured to conceal himself till night came on, fearing they would run the same way; and therefore, striking into another path of the wood, they hastened on as fast as the briars and thorns, and other obstructions would admit. After some hours slow progress, they gained a hill that overlooked the plain, from whence they descried that the bloody storm raged with unabating fury.

It was computed, that fifteen hundred persons were killed or made prisoners, by the savages, during this fatal day: many of the latter were carried off by them, and never more returned: some few, indeed, made their escape: but the brave Colonel Monro sent an ambassador

ambassador to the general, desiring he would procure for him the guard, as stipulated in the articles of capitulation; but his application proving ineffectual, he remained there till general Ewell sent a party of troops to escort him back to fort Edward. These unhappy occurrences had such an effect on the spirits of Mr. Monro, that he died soon after of a broken heart.

The small-pox was not known among them till their communication with the Europeans, but ever since it has made dreadful havock amongst them. When they have overcome an enemy, and victory is fully decided, the first thing they do is to dispatch all those whom they think they cannot conveniently carry along with them as prisoners. They then take as many prisoners as they can, and scalp the dead and wounded. At this horrid business they are amazingly expert: they seize the head of the disabled or dead enemy, and placing one of their feet on the neck, twist the left-hand in the hair, and by this means having extended the skin that covers the top of the head, they draw out their scalping-knives, which are always kept in good order for this cruel purpose, and with a few strokes take off that part of the head called the scalp; all which is so dexterously performed, that it seldom exceeds a minute. These they preserve as proofs of their valour, and as monuments of the vengeance they have taken on their enemies.

When two Indians have taken a prisoner, and a dispute arises between them whose property he is to be, it is soon decided; for, to put a stop to the argument, one of them immediately knocks the unhappy victim on the head with his hatchet. When they have committed as many barbarities as possible, they immediately retire towards their own country, with the prisoners and other booty; and they make vast expeditions, lest they should be pursued.

When they happen to be pursued, they make use of many stratagems, to elude the searches of their pursuers. They sometimes scatter sand, leaves, dirt, or any thing else, over the prints of their feet. They sometimes tread in each others footsteps, and at other times they lift their feet so light as not to make any thing of a deep impression. But when they find all these precautions are failing, they immediately dispatch and scalp their prisoners. They then divide themselves into small parties, each going a different way; and thus having divided the enemy likewise, they frequently join again, and murder them.

When the successful party has the good fortune to get home with their prisoners, they hasten, with the greatest expedition, to reach a country where they are not to be molested; and that their wounded companions may not retard their flight, they carry them, by turns, in litters; and sometimes they draw them on sledges. Their litters are made in a very rude manner of the branches of trees, and their sledges consist of two small thin boards, which is not above a foot wide, when joined, and near sixteen long. It is surprising to think with what ease these Indians will draw their sledges and litters, let them be ever so heavy loaded.

During their march, they take great care to guard their prisoners; and when they are obliged to cross the lakes, they fasten them to the canoes. During the night, if they are travelling by land, they are stretched along the ground, quite naked, with their backs, legs and arms fixed to hooks, fastened to the ground. Besides this, they have cords on each of their arms, which the Indians hold in their hands, who, when they make the least motion, awake, and knock them on the head. But, notwithstanding all their precautions, and many more that might be mentioned, yet they are not always successful; for even some of the fair sex, who have been prisoners among them, have made their escape, and effected it in such a cunning manner, that they frequently set some of their countrymen free.

Some few years ago a small band of Canadian warriors made an irruption into the back settlements

of New England, and lurked for some time near one of the exterior towns. At length, after having killed and scalped several people, they found means to take prisoner a woman, who had with her a son, about twelve years of age. Being fatiated with the murders they had committed, they returned towards their native country, which was distant about three hundred miles, and carried along with them their two captives.

The second night after their retreat, the woman, whose name was Rowe, formed a resolution, which would have done honour to one of the greatest heroes of antiquity. She thought that if she could get her hands at liberty, she would make one desperate effort to regain her freedom. For this purpose, when she concluded that the Indians were fast asleep, she strove to strip the cords from off her hands; and was happy enough to succeed. She cautioned her son, whom they had suffered to go unbound, against being surprised at what she was going to do. She removed the weapons of the Indians which lay beside them, and having done this, she put one of the tomohawks into the hands of the boy, telling him to follow her example; and taking another herself, fell upon the sleeping Indians, several of whom she instantly dispatched. But her attempt was nearly frustrated by the want of courage in the boy, who having made a feeble stroke at one of the Indians, only awakened him; she, however, sprung at the rising warrior, and before he could recover his arms, she made him sink under the weight of her tomohawk; and continued doing so to all the others, till only one Indian woman made her escape.

The heroine having thus regained her liberty, took off the scalps of her vanquished enemies; and having seized all those they were carrying along with them, she returned in triumph to the town from whence she had been dragged.

During their march, they make their prisoners sing what they call the death-song, and with a few intermissions, the song continues till they come near their village, or camp. As soon as they arrive within hearing, they set up different cries, to let those in the village know what success they have had. The number of the death-cries they give, points out how many of their own people have been lost; and the number of war-whoops, how many prisoners they have taken. These cries oftentimes are the most horrid that can be imagined, and they can be heard at a great distance. While they are uttering these cries, those to whom they address themselves continue, as it were, motionless, and are all attention.

When the ceremony is performed, the whole village issues out to learn the success of the relation they have just heard in general terms; and just as the news affects them, they are either mournful or joyful. When they arrive at the camp, the women and children are armed with bludgeons, and the prisoners are obliged to pass through rows of them. Sometimes they are so beaten over the head, and other parts of their bodies, as to have scarcely any remains of life; and happy would it be for them, if an end was put to their wretched and pitiable existence. But their tormentors take care that none of the blows they give them shall prove mortal; and their design is in so doing to make them suffer as much as possible.

The next thing done is to bind them hand and foot, and keep them in that condition till the chiefs have held a council, to decide in what manner they are to be disposed of. Those who are to be put to death, are delivered over to the chief of the warriors, and the others are distributed among the rest of the chiefs; so that in a very short time they all know their fates. They never recede from their sentence, therefore it is in vain for the condemned person to ask for mercy, for nothing can obtain or procure it.

Such prisoners as have been most reputed for their courage, and who have performed the greatest number of warlike feats, are condemned to suffer the

most

most severe tortures. Their success in war is readily known by the blue marks upon their breasts and arms, which, to the Indians, are as legible as common letters are to the Europeans. These marks are made by an incision with a flint stone, cut very sharp, and dipped into a particular sort of ink. There is in this something so like the antient Britons and Picts, that we have great reason to believe, that about two thousand years ago there was but little difference in the manners of men.

Such of the prisoners as are condemned to suffer death, are not kept long in suspense, for they are instantly led to the place of execution, which is generally in the middle of the camp, or village. There they are stripped naked, and every part of their bodies are blacked over, like the skin of a raven, or crow: They are then bound to a stake, and faggots heaped around them; and then they are obliged, for the last time, to sing the death-song. Those who are condemned to suffer, are only such as have been warriors; and they recount, with an audible voice, all their grand exploits, and pride themselves in the number of enemies they have killed. In this rehearsal they say every thing they can to vex their tormentors, and to insult them for their cowardice. This they do in order that they may be the sooner dispatched; and it has generally that effect. They use several other methods in order to put their prisoners to death, but these are only occasional cunning, the above being the most common.

Whilst Mr. Carver was travelling through that country, an Indian was one day brought in, who had been taken prisoner by one of their tribes. Having been tried and condemned, in their manner, he was carried, early in the morning, to a place at a little distance from the town, where he was bound to a tree. This being done, the young boys were permitted to amuse themselves by shooting arrows at the unhappy victim. As the boys were young, and stood at a considerable distance, so they had not strength to penetrate the vital parts, and the unhappy creature continued with the arrows sticking in him full two days.

During the whole of this time, he sang his war-song, repeating his wonderful exploits; he boasted of the numbers he had killed, and the scalps he had taken; he described the barbarous methods he had used when he put his enemies to death, and seemed to take pleasure in it: but he was more copious in his account of the cruelties he had inflicted on his present tormentors; endeavouring, by these insults, to provoke them to inflict the severest torments upon him, that he might have an opportunity of displaying his fortitude.

One day, while some of these Indians were tormenting a prisoner, he told them they were old women, and did not know what they were about; adding, that he once took a prisoner, and having bound him to a tree, stuck the fleshy part of his body full of splinters of turpentine wood, to which he set fire, and danced round him till he was burnt to ashes. This insult irritated the Indians so much, that one of them ran up to him, tore out his heart, and stopped that mouth with it, from whence the insulting language flowed.

Those prisoners who are to be saved, are disposed of in the following manner. A person is sent round the village, to inform all the inhabitants to come to the council of the chiefs, and give in an account of what relations they have lost. The young men, among the prisoners, are first given to those women who have lost their husbands, and then the rest are disposed of in an equal manner; the boys being given to those who chuse to adopt them as their own sons.

The division being thus made, the prisoners are led home and unbound. If they have received any wounds, they are dressed; their bodies are washed all over, and they are supplied with plenty of provisions. The widows receive the prisoners as husbands, if they are agreeable to them, but if madam happens to have her affections otherwise engaged, her intended spouse

is put to death, without any ceremony. The women are always distributed to the men, who receive them very favourably, and the boys and girls are all employed in different acts of servitude.

When they make peace, they observe a great number of ceremonies, and frequently a stop is put to their hostilities, by seemingly simple attitudes. In 1763, when our travellers were there, all that vast and extensive country, between Quebec and the bank of the Mississippi, and north as far as Hudson's River, enjoyed profound peace, but that seldom lasts long. They carry before them a large pipe, made of red leather, lined with thin pieces of horn, which is the first signal of peace, when the chiefs treat about such an important matter. This is the same to them, as a flag of truce is to the Europeans:

The French call the pipe of peace, the calumet, and it is generally four feet long: Every nation has a different way of decorating their pipes, and no sort of treaties are undertaken without them. They mix their tobacco with different sorts of herbs, and the smell of some of them is very agreeable. As soon as the pipe is filled, they light it by a piece of coal; which they put over it; and when it is once lighted, the chief turns the steam of it towards the heavens, after this towards the earth, and now, holding it horizontally, moves himself round till he has completed a circle.

He is supposed, by the first action, to present the smoke to the great Spirit, where assistance is begged for. By his holding it towards the earth, implies that he is begging that the evil spirits would not prevent them from making peace; and by turning round, he implores the assistance of the spirits who reside in the air.

Having, as he imagines, secured the favour of all those invisible agents, he presents the pipe to the first chief of his own tribe, and then it is handed to the ambassadors, and all present smoke of it, one after another. They have particular songs which they sing on these occasions, and, indeed, they have songs on all occasions whatever. When the ambassadors have held a council together, and concluded the terms of agreement, a belt of wampum is given, which ratifies the peace. These belts, which are made of shells, found on the coasts of New England and Virginia, are sewed round like beads; they are then strung upon thongs of leather, and some of them look very neat and beautiful. The shells are generally of two or three colours, such as white and violet, but the white is not so much esteemed as the latter. The Indians look upon these shells to be of the same value as the Europeans do either gold or diamonds, and the belts are composed of different numbers of them, according to the choice of the person who makes it up.

These people are much addicted to gaming, and they meet in large companies for that purpose. They have an amazing number of different games, among which, running is one. There is another game likewise in use amongst them, of the platter or bowl. They have a bowl, and each person has six or eight little bones, generally made like a peach-stone. These, they throw up into the air, and make them fall into the bowl; below which they make a round hole: these bones are white on the one side, and black on the other; and he that has the greatest number of one colour, which number must be at least forty, wins the game. Whoever wins, keeps his play; but the loser is obliged to give up his to another. These Indians seem, during the game, to be greatly agitated; and, at every throw, set up such a hideous shout, as is sufficient to make one's blood run cold. The losers imprecate thousands of curses on the evil spirits, believing that it is through their influence that they have not been so successful as they wished. They sometimes, at these games, stake all they have in the world, even their cloaths; and when they lose, it is considered as dishonourable to complain.

We shall now give the most accurate account we are able, from our ingenious travellers, of the marriages of these people, who, contrary to the practice of most northern

northern nations, tolerate polygamy, or a plurality of wives.

Their chiefs have, generally, from six to twelve women: the lower ranks are not permitted to have any more than they are able to maintain; and it is common for an Indian to marry two sisters, and these two live in mutual union together. The young wives are obliged to submit to the elder ones; and those who have no children, are obliged to do the drudgery work of the house, which is considered as little better than a state of servitude. When one chief goes to visit another, he is desired to lay, for his amusement, with one of the women. But, on the other hand, if a woman should presume to take this liberty without the consent of her husband, she would be punished in the same manner as if she had committed adultery. These customs are most prevalent among those who live at the greatest distance from the English; for such as live nearest to New England are much more civilized than the others.

However, they differ but very little from each other in their marriage ceremonies. When a young Indian, in Canada, intends to marry a young woman, upon whom he has placed his affections, the courtship is, in general, short; and the parents seldom contradict them in their choice. When the day appointed for the marriage arrives, they assemble in the morning, at the house of the bridegroom's eldest relation, where a feast is prepared, and sometimes on these occasions the company is very numerous. They have, likewise, several sorts of diversions, and when these are over, the bridegroom and bride are left alone, with a few of their nearest relations. Then the young couple take their places on a mat, placed in the centre of the room; they each lay hold of the extremities of a twig, about three or four feet long, by which they remain separated, till the older male relations present repeat some words in their own language.

After this, the new married couple dance and sing for some time, holding the twig still by the ends. When they have finished, they break the twig into as many pieces as there are witnesses present, who each take one and preserve it with great care. The bride is then conducted to her father's house, and the bridegroom goes to her, and the marriage is consummated. If the daughter is a favourite, she remains at her father's hut, along with her parents, till she has borne her first child; after which, she accompanies her spouse home to his own habitation.

When the married couple have been some time together, and cannot agree, so that a separation is found necessary, they generally part on good terms, and are seldom found to quarrel. Such of the witnesses as were present at the ceremony, meet at the house of the married couple, and bring along with them all the broken pieces of the twig which they held while the marriage ceremony was performing; these they throw into the fire, and then the marriage is dissolved. This is the whole of the ceremony, and then the parties may marry again as soon as they please. The children are, generally, divided between the husband and the wife, and where the number is odd, the odd one falls to the share of the woman.

They look upon adultery as a very horrid crime, although they prostitute their own wives. Among some of the Indian nations, the husband bites off the wife's nose; of which, Mr. Carver saw once an instance. Amours are as frequent among the Indians as the Europeans, and the young warriors that are thus disposed seldom want opportunities of gratifying their passions, and this mode is rather singular; a description of it may not, perhaps, be altogether disagreeable to the reader.

When one of these young men imagine they have met with a woman who will gratify his passion, he goes in the middle of the night to her place of abode, where he finds all in darkness: he has his blanket wrapped about him, that he might not be known. He first lights the fire, then approaches the place where she reposes, and awakes her gently. If it happens,

that she gets up and puts out the light, this is a sufficient intimation to him that his company is not, at that time, agreeable to her: but if she does not, then he goes to bed to her without further ceremony. The young women who admit lovers to such pleasures, are taught by the older females to make use of a composition of herbs, to prevent their being with child; and it seems they are well acquainted with this practice; for, should they once become pregnant, they would remain unmarried as long as they lived.

All the children of these Indians are named after their mother, even though she should have them by several husbands; and these names always convey along with them different ideas. The reason they give for this strange practice is, that the children are indebted to their fathers for their souls, but to their mothers for their bodies. Names are not given to their children till they have passed a state of infancy, but they use some sort of ceremonies on these occasions, which they will not admit strangers to be present at.

All their chief warriors are distinguished by a name that relates either to their actions or qualities; and these are never acquired till they have performed some warlike exploit. Those who are the most expert at hunting, receive their names from those animals of which they have killed the greatest number. In the same manner, he who kills the greatest number of rattle-snakes, is called by their name, and so on in all other things of that nature.

With respect to the religion of these savages, it is not an easy matter to form a proper notion of it; for they have been so often ridiculed concerning it, by the Europeans, that whatever ceremonies they make use of, they endeavour to conceal. As the Indian nation, called the Nadowessies, is, perhaps, one of the most antient, a better notion may be formed of their religion than of any of the others. Thus much is certain, that they acknowledge one supreme Being, who gives life, and whose providence presides over every thing. They also believe in a bad spirit, to whom they ascribe great power; and they imagine, that through his means all the evils that happen are brought about. To this spirit they pray, when they are labouring under any afflictions, and beg to be released from them. They believe that there are three good spirits, who act as inferior deities under the great Spirit, who is the author of all good: and what is very remarkable, they believe that the great Spirit leaves these inferior spirits to execute all the purposes of his providence. This is just what epicureanism was among the Greeks and Romans of old; and there are some modern gentlemen, in the present age, who have embraced notions exactly similar.

There is great reason to believe, that these Indians have a notion that the great Spirit is of a corporeal substance, although he is invisible; and the same notion takes place in many parts of the East Indies, as well as in Africa, Lapland, and other places.

With respect to futurity, they believe that they shall exist hereafter; but their notions are so carnal, that they believe their employments there will be similar to what they are here, only that the future will not be attended with any labour or difficulty. They are of opinion, that they will be translated to a most delightful country, where the sky will for ever remain unclouded, and there will be a pure perpetual spring. The forests will abound with all sorts of game, and the rivers with the most delicious fish; and all these will be taken without any labour. In a word, that they shall live for ever in regions of plenty, and enjoy all those delights their natures are capable of. But still they have no just notions of those fine intellectual pleasures which the true Christians, and even the moral heathens, aspire after. They look for nothing beyond animal pleasure, which is incompatible with the dignity of a rational creature.

They consider merit as their title to happiness, and in this they would differ much from the heathens of old, and some of those who are called Christians, were

not these notions of merit so prevalent in every thing human. Thus, they imagine that their merit is proportioned according to the number of robberies they have committed, and cruel murders they have perpetrated. Their priests are a sort of vagabonds, who pretend to the knowledge of physick, though they are grossly ignorant; but then it must be observed, that these savages, who live in a state of nature, are seldom afflicted with those diseases which luxury brings upon the inhabitants of Europe. All they have to do, is to apply a few simple plants to a wound, and use a few spells or charms. If the patient recovers, the priest, or physician, is considered as a prodigy; and if it should be otherwise, his death is ascribed to his having done something to offend the evil spirits.

When they are taken ill, the physician comes, and assumes as much formality as those of the same order in Europe. He sits down beside the patient, and rattles in his ears a shell filled with beans, or small stones, and makes such a horrid noise, as would be sufficient to dispatch one of the Europeans who was labouring under any affliction. Indeed this would be the case with these savages, were they not of such a nature and disposition that nothing can intimidate them.

From the whole of this, it appears they have but very dark and confined notions concerning religion. It likewise appears, that there is great difficulty in making any lasting impression upon them; for they are so addicted to their antient customs and religious rites, that they despise all those who converse with them on the subject. The French have made many attempts to introduce their religion amongst them, but popery is not calculated to make converts of heathens. As for the cruelties they inflict on their prisoners, it is no more than what those prisoners justly deserve; for, had the tormentors fallen into the hands of the tormented, they would have been served in the same horrid manner. This consideration must, in some measure, make them bear with their sufferings; for what human being has a right to expect mercy, who has it not in his nature to shew mercy to others?

These Indians are of such an intrepid disposition, that they meet death in their huts with the same fortitude as in the field. They are altogether indifferent concerning that important article, which creates so much terror in many of those who have had the benefit of a liberal education: when the physician, who is as ignorant as himself, tells him that there are no hopes of his recovery, he seems rather pleased than dejected, and delivers an harangue to all those who attend near his bed. If he has a family, and is one of their chiefs, then he delivers a speech to them much in the same manner as, Xenophon tells us, Cyrus did to his children of old. He then takes leave of his relations, by giving orders that there may be a feast prepared for them after his decease.

When it is once announced that he is dead, the body is washed clean, and dressed in the same cloaths that he wore before he was taken ill. They paint his face, and place him in an erect posture, on a skin or mat, spread in the middle of the hut, with all his implements of war about him. One of the chiefs, in an animated speech, according to the nature of their own language, delivers an oration; in which he recites all the warlike actions of the deceased, and points out his conduct as an object to be imitated by the young warriors.

If he dies in winter, and is at a great distance from the place where his ancestors have been interred, they wrap the body up in skins, and lay it on a high stage built for that purpose, and sometimes on the branches of a tree, there to remain till the spring arrives. It is then carried, along with such others as have died in the mean while, to the burying-place of the tribe or clan; but they will not permit any strangers to be present at the last of their ceremonies.

The funeral being over, the friends and relations of the deceased fix up some poles near the grave, with figures engraven upon them, to point out to future

ages their many shining qualities. Whereas, if any of them die in summer, at a considerable distance from the burying-ground, and they find it, in a manner, impossible to remove the body before it putrifies, they burn the flesh off from the bones, and carry the latter in the manner already described. They always carry along with them all those instruments, whether of agriculture, hunting, war, or fishing, that they used while on earth. This is done, in consequence of the belief that they will be employed in the same manner in eternity as they had formerly been in time. They likewise deposit along with them skins and stuffs, not doubting but they will want cloaths. They also put along with them a considerable share of paint, which they imagine they will make use of, in order to take from them that languid appearance occasioned by death.

The relations of the deceased, who are frequently numerous, lament the death of him whose body they are about to part from, with all the marks of real grief; but whether that sorrow is real or not, we cannot say. Among some of these Indians, the men, to shew their grief, often pierce their arms with knives, or with arrows; and these scars are to be seen on all ranks of them, in a greater or lesser degree. The women, on the other hand, cut and wound their legs with sharp broken flints, so that the blood flows plentifully from the wounds. Whilst Mr. Carver was amongst them, there were a couple, whose tent was very near to his, and they had lost a son about four years old, and they practised these barbarous ceremonies in such an incessant and cruel manner, that the father of the child died under the agonies of those torments which he had inflicted on himself.

The mother, who had hitherto been inconsolable for the loss of her child, no sooner saw her husband expire, than she seemed to be quite chearful and merry. Our accurate traveller asked her why this change had so suddenly taken place, telling her, at the same time, that he imagined an increase of grief would rather have taken place, than such a sudden and instantaneous transition of joy.

She told him, that as the child was so young when it died, and unable to support itself in that country to which spirits go, both she and her husband had been apprehensive that its situation would be extremely miserable; but, as soon as she saw her husband die, she considered him as going to accompany it. She added, that her husband was a good hunter, and would provide for it in a plentiful and tender manner. This made her happy, and therefore she ceased to mourn for it.

She was not, however, destitute of bowels of compassion, for she retained the tenderest regard for her husband and son. She went every evening to the branches upon which they were laid, and cut off a lock of their hair, which she kept as a precious relick.

In general, the Indians are very exact in observing all such ceremonies as are kept in honour of the dead. In some of the more remote nations, they cut off their hair, blacken their faces, and sit in an erect posture, with their heads close covered, and deprive themselves of all those pleasures to which, in time of health, they are more than commonly addicted. In this manner, they will frequently continue several months together, eating nothing more than what is sufficient to keep them alive: they sometimes howl so loud, as to be heard at a vast distance.

The Indians in North America are guilty of many barbarities, but, at the same time, they are not destitute of several good qualities. They are solely directed by their passions and appetites, just as whim or caprice leads them; and sometimes these appear as dreadful and ferocious as in wild beasts. That they are of a cruel disposition, no man of common sense, who has visited them, will deny. They are revengeful and inexorable; for, besides making their way through pathless and almost unbounded woods, they will frequently watch whole days and nights, neglecting all the calls of nature, in order to be revenged on their enemies.

They hear, unmoved, the piercing cries of women and children, and take an amazing diabolical pleasure in seeing tortures inflicted on their prisoners.

On the other hand, such of them as have not been contaminated by the Europeans, are very temperate in their manners, and can withstand the most violent attacks of hunger and drouglt. It has already been observed, with what seeming indifference an Indian meets his wife and children when he returns from the wars. This, however, is but a seeming indifference, for, as soon as their common formalities are over, they treat both with the greatest tenderness.

They have no sense of danger, having been accustomed to innumerable hardships from their youth. Their fortitude seems to have been implanted by nature, and nourished by example and precept. While their provisions remain, they are slothful and inactive; but no sooner are they exhausted, than they are indefatigable in procuring more. They are cool and deliberate in their councils, and artful in putting the schemes they have formed in execution. They frequently boast that they have the sagacity of a hound, the penetrating sight of a lynx, the cunning of the fox, the agility of a bounding roe, and the ferocity of the tyger. They have a strong attachment to that tribe to which they belong, which exceeds, by far, the patriotism of other countries. They seem as if they were actuated with but one soul, when they take up the hatchet against the enemies of their nation. They always hold their councils without much opposition, except where it appears to be necessary.

When they enter into the war, they have but two things in view, and those are, either to conquer, or sell their lives as dear as possible; for the taking of prisoners is with them no more than a secondary consideration. Although barbarous in their manners, they have, what many nations have not considered, a sense of honour; for they will not suffer a coward to live amongst them: but, indeed, these are seldom to be found.

It is from these principles that that insatiable desire of revenge flows; for it cannot be supposed, that uncultivated minds can judge of the propriety of actions; and thus the courage, which, if properly extended, would do them honour, degenerates into savage barbarity.

As for the language of these Indians, it seems to differ from all others in the world; and as they have no letters, so it is difficult to give a proper account of it. They have a variety of different languages in this vast extensive country, but all these have a near affinity to each other. But although they have no letters, yet they can convey their ideas to each other by hieroglyphics, as will appear from the following instance:

When Mr. Carver left the Mississippi, and proceeded up the Chipeway river, in his way to lake Superior, his guide, who was a chief of the Chipeways

that dwell on the Ottwan lake, near the head of the river where they had just entered, fearing that some parties of the Nadowessies, with whom his nation are perpetually at war, might be lurking thereabouts, he took the following steps to deceive them:

He went up to a tree, near the banks of the river, and pulled the bark from off it, and with charcoal and bears grease, made a strange sort of a figure. He then drew on the other side the figure of a man, dressed in skins. After this he proceeded to draw the figure of a canoe sailing up the river, with a man in it, who had a hat on. The man with the hat was to point out, that there was an Englishman on board the canoe. He drew several others, and had the pipe of peace painted on the canoe.

Such is the narrative delivered by Mr. Carver; and when it is considered what dangers he encountered; we are led to admire that unbounded curiosity which is often found in the human mind. If some others had taken the same pains to explore the deserts of North America, perhaps we might, by this time, have been informed whether that extensive country is connected with any other.

What an incredible loss to the public, that Mr. Rogers should have disappointed Mr. Carver of provisions, so that he was obliged to return without having performed one half of his intended journey. It is probable, that Rogers was jealous of Mr. Carver; for Rogers had actually written an account of some parts of America; and as he knew that this gentleman was going much further than he had gone, so he resolved to disappoint him. Strange that men should suffer their passions to interfere with the public good. When the public is once concerned, then all private resentments should cease; men should become unanimous, and all join in the common cause.

Had Mr. Carver finished his intended journey, it would have been attended with several advantages. As, first, it would have opened new scenes of commerce, which would have produced new sources of wealth. Secondly, it might have facilitated the civilization of the Indians; and their conversion to the Christian faith. And, lastly, it would have been a pleasing and most delightful satisfaction to the learned and curious, who are always seeking after new discoveries: but we were disappointed in these, and in many other things. However, we have this advantage, that our traveller went further than any before him, and with integrity describes what he saw. His long residence in America enabled him to speak the language of the Indians, which was of great service to him, as it gave him an opportunity of conversing with them. We shall now take leave of this part of the world, leaving some new discoveries, more to the south, to be taken notice of afterwards, as we shall have ample materials for that purpose; but, in the mean time, take notice of some parts of Europe.

TRAVELS THROUGH SEVERAL PARTS OF EUROPE.

By BURNET, ADDISON, DALRYMPLE, BARRETTI, KEYSER, MILLAR, SHARP, and several others.

THE continent of Europe is so well known, that we need not say much of it here. It extends from the streights of Gibraltar on the south, and reaches northward to the Frozen Ocean, and from the Hellespont on the east, to the British Isles on the west. It contains the seats of three empires, viz. Germany, Russia, and Turkey. Twelve kingdoms, viz. Britain, France, Spain, Portugal, Sardinia, Naples, Poland, Prussia, Denmark, Sweden, Bohemia, and Hungary; but these last two belong to the house of Austria. Besides these, it has in it several republics, such as Holland, or the United Provinces,

Genoa, Switzerland, Venice, &c. with a vast number of smaller states.

Having said thus much, we shall begin with Dr. Burnet, late bishop of Salisbury.

That gentleman had been intrusted with a great many court secrets in the reign of Charles I. but when he found the design of the king was to pave the way for the introduction of popery, he opposed that measure with so much zeal, that he had great reason to fear that he was marked out for destruction. On that account, and having no church-living at that time; he set out for France, in 1685. He staid only

only a few days in Paris, having seen that city before; but he gives a striking description of the state that country was then in. From Calais to Paris he saw nothing but misery among the wretched people. At Paris he saw grandeur enough at court, and among the people of quality; but these were melancholy things, while the people were starving.

Leaving Paris, he set out for Geneva, a small, but neat city, near the banks of the lake Lemna, just on the borders of France and Savoy. They have in this city, at all times, in the public granary, as much corn as will serve the inhabitants at least two years. None but the bakers are obliged to purchase it, and the price is fixed by the magistrates. It brings in considerable advantages to the state, and enables them to pay off the debts contracted during the wars. The annual revenue produced by the corn is one hundred thousand crowns; but they have much to do with it, for they have three hundred soldiers to maintain, and an arsenal, where their cannon and ammunition, with all things requisite for the defence of the town, are kept.

They have likewise the masters and professors to pay, who are twenty-four in number; and they are paid one hundred crowns each. Every syndic, or chief magistrate, has two hundred crowns: and when all this is considered with the other necessary expences, it will appear, that no man can enrich himself at the expence of the state.

There is an universal civility among these people, not only to strangers, but to one another. The religion is the presbyterian, and they are so careful in bringing up their children, that all the boys learn Latin. The citizens can speak it: they are well acquainted with history and controversy, and, in general, are men of integrity, virtue, good sense, piety, and all other qualities that adorn human nature.

There is no public lewdness tolerated here, and when disorders of that sort happen, they are managed with great care. Public justice is quick and expeditious, and notwithstanding their being in the neighbourhood of Switzerland, yet drinking is but little known among them. When a man buys an estate, he agrees with the owner, and then mentions it to the state, who orders three several proclamations to be made, one after another, of the intended sale. If the creditors of the seller think enough is not offered for the estate, they out-bid the person who intended to purchase it; but if they do not interpose, the buyer delivers the money to the state, who first pay the seller's creditors, and then give him the remainder of the money. This custom prevails also in Switzerland; and nothing can set aside a man's title, who has been in possession twelve years.

The sovereignty is lodged in a council of two hundred, called the great council, and they depute twenty-five, who are called the lesser council. They are chose by ballot, so that no man can know for whom he is to give his vote; which prevents factions, cabals, and resentment. There is another council of sixty, composed of such as have been officers; but this court has no authority, being only called together by the twenty-five, when they want their advice. Their syndics are chosen on the first Sunday in the year. The difference between the burgeses and citizens is, the former may be bought, or given to strangers, and they are capable of being of the two hundred; but none is a citizen but he who is the son of a burges, and born within the town.

The chief support of this little republic consists in its firm alliance with the cantons of Berne and Zurich; and it is visibly their interest to prevent the French from getting possession of it, for were it not for that, it might have been taken long ago. The walls are strong, and large cannons mounted on them. The houses are decent, and some of them are handsome structures. All the children are educated at the public expence, and great care is taken of them. The people are so clean and decent in their dress, that they seem to point out a virtuous conduct. Their

industry is surprizing; and they have amongst them many ingenious mechanics, particularly in the different branches of watch-making. These watches are exported to various parts of the world; but the greatest part of them are sent to Marseilles, and from thence exported to Turkey. This trade once belonged to England, but by some means we have lost great part of it. There are likewise several jewelers here, and, in general, such as understand the fine arts.

The prospect from the walls, over the lake, is as fine as the eye can behold, either when it is agitated or still, but particularly in a mild summer evening. The walks along its banks are shaded with trees, and here the citizens take their walks. It affords them many sorts of excellent fish, which, with their cattle, makes all sorts of provisions cheap. There are but few crimes committed here; for the place is, perhaps, the best governed city in the world. There is not any want of employment here, for even the chief magistrates are obliged to sit five hours in a day, to do the business of the state, and administer justice.

This little republic is certainly one of the best governed in the world; nor is there any complaint to be made, except that they retain the use of the torture: but this is practised by all nations in Europe, except Britain and Ireland. It is not an easy matter to bring people off from ancient customs; their ideas leads them to the way which, perhaps, their humanity does not approve of. But a repetition of such barbarity serves rather to harden than to humanize the mind; for, what is often seen, is little regarded. It wears off from the human mind those common sensations of feeling, which should always distinguish our characters as rational beings. And, to use the words of Dr. Stewart, "The tortured criminal will look with indignation, and silent contempt, on those men, who, pretending to administer justice, can actually corrupt its channels."

When a man is strongly suspected of having committed a crime, either at Geneva, or in any part of Switzerland, he is asked if he is guilty; and if he denies the charge, he is immediately put to the question, that is, the torture, which is performed in the following barbarous manner:

He is fixed to a stake in the middle of the court, and the executioner twists his arms by the upper joint, over his shoulders, till they hang backwards. The poor creature generally faints away under the torture; and although he should recover, and be acquitted by his merciless judges, yet he is not able to do any work ever afterwards. We shall have occasion to mention some other modes of torture hereafter: in the mean time we shall follow our learned traveller.

From Geneva, says Dr. Burnet, I travelled till I came to Lausanne, a town in Switzerland, in my way to Berne. The town of Lausanne is situated on three hills, so that the whole is an ascent and descent, and very steep, particularly on that side on which the church stands, which is a very noble fabric. The south wall of the cross was so split by an earthquake, about the year 1655, that there was a rent made from top to bottom, above a foot wide: and what is very remarkable, it was closed up by another earthquake, about ten years afterwards.

This romantic situation of the church was occasioned by a legend of some miracle wrought near the place, which prevailed so much on the credulity of the people, that they built the church, and soon after erected houses near it. The lake is between Geneva and this, which, at the one end, is called the lake of Geneva, and at the other, the lake of Lausanne. In some places the depth has never been found, and in other places it is above five hundred fathoms. Near the banks of the river are the most beautiful pieces of ground that can be imagined; for they look as if they had been laid out by art. The sloping is so easy and so equal, and the grounds are so well cultivated and inhabited, that a more delightful

ful prospect cannot be seen any where. The fish in the lake are numerous; and yet I was told that they were beginning to decrease, which the people ascribe to the rapaciousness of the pikes, which abound in it in vast numbers.

It is believed there are a great many fountains all over the lake; and, probably, these fountains flow from vast cavities under ground, beneath the neighbouring mountains, which, as great cisterns, discharge themselves in the vallies that are covered over with lakes. And on the two sides of the Alps, which are both north and south, there is so great a number of these little seas, that it must have vast sources, that feed so constantly these huge ponds. And when one considers the height of these hills, and the long chains of them together, a traveller is naturally led to believe that these are not what came out first from the hands of the Author of nature, but that they are the ruins of the first world, which broke into many inequalities. There is one hill near Geneva, called Curfed, which is always covered with snow, and is two miles perpendicular, according to the observations made by several learned mathematicians.

But I shall now say something concerning the canton of Bern, for the territory of that canton alone takes up one half of all Switzerland: Its history is well known; and as for its government, it has a very near resemblance to that of Geneva. It has a council, called the Council of Two Hundred; but their number is not fixed, for they frequently amount to near three hundred. They have another council of twenty-five, in the same manner, and invested with the same power, as at Geneva; but they are for life, and have an authority much like that of the Roman consuls. Next to these are the two treasurers; one for the antient German territories, and the other for the valley. These may be considered as their secretaries of state, for to them all secrets are committed. They have authority to call the two hundred together: they may likewise call the magistrates to an account for any part of their conduct that seems to be contrary to the rights of the people; but this seldom happens. The whole canton of Bern is divided into seventy-two bailiages, as they call them, each having a governor over it, who is called a bailiff; and he is named by the council of two hundred, and he must be a citizen of Bern. He must likewise be one of the two hundred; and no man can be chosen till he is named.

The places to which these bailiffs are appointed, are both honourable and profitable; for although all of them have some assessors to sit along with them on the bench of judicature, yet they decide matters which ever way they please, against all other opinions. To this may be added, that the bailiff has all the fines and confiscations; and as drinking is so common in the country, which produces lucrative quarrels, so in about six years he generally returns to Bern, with twenty thousand crowns in his pocket. The executions of the bailiffs are the only hardships the people groans under; but as it falls only on the irregular and debauched, so it cannot with reason be complained of; for while the people are sober, they have not these fines to pay. There is something like the feudal law in this country, where the lords of manors exercise an authority over their tenants; and in smaller matters, no appeal lies from their courts to the bailiffs. But in all matters of debt, or fines, above the value of two pistoles, an appeal lies to the bailiff: and sentence of death cannot be executed till it has been confirmed by the council of Bern. Here are frequent complaints made against these bailiffs, and, perhaps, with good reason; for the offending parties are summoned, and punished, before they have time to make any defence. It is true, an appeal lies from their sentence to the council at Bern; but should the offender lodge the appeal, the bailiff would contrive ways and means to work his vengeance upon him. The citizens of Bern consider these bailiages as the greatest places they can obtain, and therefore

the first families make great interest to procure them, which is not always done without bribery and corruption, cabals and parties being formed for that purpose.

In Bern there is very little trade besides what is, in a manner, actually necessary for the support of the town. They have two professors in Bern and Lausanne; the first for the antient German canton, and the other for the valley, which is a new conquest. In the former there are about three hundred parishes, but in the latter not above one hundred and fifty. In the benefices, on the German side, the antient rights of the incumbents are preserved, so that some livings are worth one thousand crowns; but in the valley, which was conquered from the French, the livings are very small. This, indeed, is the case in most conquered countries; for the weakest are always the sufferers.

It appears evident, that the council of Bern trust more for protection to the fidelity of their subjects, than to the strength of their walls; for as they have never finished them, so those that are left unbuilt, cannot be brought to a regular degree of perfection: nor are those they have completed paid any proper regard to. However, although they have not many cannon on their ramparts, yet they have good store in their arsenal, in which, they say, they have arms for forty thousand men.

The peasants are generally rich, particularly on the German side, and are all well learned. They pay no duties or taxes to the public; and the soil is capable of great cultivation, in which, some succeed so well, that I was told there were those who had estates of one hundred thousand crowns: but that is not common, though many of them are worth ten thousand. They live much on their milk and corn; and they breed many horses, which brings them in considerable sums of money. The worst thing in the country is the moistness of the air, which is not only occasioned by the many lakes that are in every part of it, and the neighbouring mountains, which are covered with snow, some all the summer long, and the rest till Midsummer; but also by the vast quantities of woods of fir-trees, which seem to fill near one half of their soil. If most of these were once rooted out, as they would have much more soil, so their air would be much more wholesome: yet till they can either find turf, or coal, for fuel, this cannot be done. I was told they had found coal in some places, but I saw nothing of it. If they have, or do find coal, and it were conveniently situated, so that by their lakes and rivers it might be easily conveyed to any part of the country, it would save them a vast expence, and be the means of enabling them to cut down the woods.

They have some fountains of salt-water, but it has never yet turned to any account, because the necessity they are under to save fuel, will not let them cut down their trees. The men are generally sincere, but grave; although they are fond of entertainments, and great slaves to drunkenness. The women are always employed in their domestic affairs, in which they seem to take a virtuous pleasure; and the wives even of the greatest men in Bern, inspect into every thing in their own houses, the kitchen not excepted. Men and women seldom converse in public together; for the women are too much concerned in their domestic affairs to see company.

The third act of adultery is here punished with death, which is also the punishment of the fifth act of fornication, of which I saw an instance while I was in Bern. For a woman having confessed herself guilty of many whoredoms, and designed to be revenged on some men that did not furnish her liberally with money, was, upon that, condemned and executed. The manner was solemn; for the adoujer, or magistrate, something like our sheriff, came into an open bench, in the middle of the street, and, for the satisfaction of the people, read the sentence aloud, pronouncing it in the hearing of all present. The

counsellors all stood around, and when it was read, he led her out, and prayed with her; then she was delivered over to the executioner, who beheaded her, and then there was a sermon preached on the nature of her crime.

The whole of this state is disposed for war; for any man that can bear arms is enlisted, and knows his post and duty: and there are beacons so dispersed over the country, that the signal can run over the whole canton in a night. And these military lists are contrived, and so laid out, that every man knows whether he is to come out at the first, or second, or general summons. They assured me at Bern, that, upon a general summons, they could bring above eighty thousand men into the field. The men are robust, strong, and capable of enduring great hardships. They are well disciplined, and have generally an extensive sense of liberty, and a great love to their country; but they labour under the want of good officers. And though the subjects of this state are rich, yet the public is poor. They can easily resist a sudden invasion of their country, but they would not be able to hold out long against an enemy. The soil requires so much cultivation, that they could not spare from their labour the men that would be necessary to preserve the state. They were, indeed, happy enough when the emperor had Alsace on the one hand, and the Spaniards had the French Comté on the other; they had then no reason to fear their neighbours: but now that both these provinces are in the hands of the French, the case is quite altered; for as Basil is every moment in danger from the garriſon of Huren, that is but a cannon shot distant from it, so all the valley lies open to the French Comté; nor has it any places in it properly fortified to defend it.

The truth is; many of the members of the state do so prey upon the vitals of the subjects, that unless they with one consent reform those abuses, they will never be in a condition to do much. For in many of their bailiages; of which some are abbeys, the bailiffs not only feed on the subjects; but likewise on the state. It is true, that the powers and privileges bestowed upon them are so great, that it is not an easy matter to call them to an account.

The city of Bern is divided into four bodies, not much unlike the companies in London, which are the bakers, the butchers, the joiners, and the blacksmiths; and every citizen of Bern must incorporate himself with one of these societies which they call abbeys; for it is likely they were antiently some sorts of religious assemblies. Every one of these chooses two persons, whom they call bannerets, who bears office by turns, from four years to four years; and every one of them has a bailiage annexed to his office, which he holds for life. They take their names from the banners of the several companies they belong to; and the adoujer continues still the name from that of advocate, this title having been formerly conferred by the German emperors on the chief magistrate of the city. It is certain; that the term advocate means a pleader; but words vary in different ages and nations.

From Bern I continued my journey to Zurich, which, although the first and most honourable of all the cantons, yet is much less than Bern, but the public is richer. They assert, that they can bring fifty thousand men into the field upon twenty-four hours warning. The subjects live happily, for the bailiffs have fixed appointments, and only one hundred pence of the fines; so that they are not tempted as those in Bern are, to whom the fine belongs entirely.

The government is almost the same as at Bern: but the magistrate, who at Bern is called adoujer, is here called the burgomaster. The public treasury is very rich, the fortifications are in excellent repair, and the arsenal is much better furnished than at Bern. An extensive trade is carried on here; and as their lake, which is twenty-four miles long, and two or three broad, supplies them well with provisions,

so their river carries their manufactures to the Rhine, from whence it is conveyed where they please. One of their chief manufactures is crape, which is, in all respects, the best I ever saw.

The situation of the town is extremely pleasant, but the country near it is mountainous, and the winters are severe; for the lake freezes quite over, only in some places the ice never lies on. They imagine that the reason why the ice does not lie in some parts of the lake, is because there are springs underneath.

We here beheld the simplicity of the antient Switzers, not corrupted by luxury or vanity. The women are extremely modest, and never converse with strangers; nor are they saluted, as in other countries, that ceremony being performed by taking them by the hand. The virtue of this country has appeared signally in their adhering firmly to their antient capitulations with the French. They have converted the antient revenues of the church more generally to pious uses than has been done any where else that I know of. They have many hospitals, and in one of them, I was told, were six hundred and fifty poor, all well supported. But although they are so charitable, yet they despise that vain munificence of laying out money to build hospitals like palaces for the poor.

The dean and chapter are still continued as a corporation, and enjoy the antient revenues of the church; but if they subsist plentifully, they are obliged to labour hard, for they have generally two or three sermons a day, and always one. The first begins at five o'clock in the morning, but they are generally too long. The preachers have departed from the first design of these sermons, which was, to deliver a plain exposition of a chapter, in the manner they do in Scotland; but now they deliver long tedious sermons on a single text of scripture.

After a short stay at Zurich, we passed over the bridge of Riperſwove, which is a very noble work for such a country. The lake is there about half a mile broad, and the bridge is about twelve feet broad; it hath no rails on either side, so that if the wind blows hard either way, a man is in great danger of being blown into the lake. And this is the case with most of the bridges in this country: and in Lombardy, which is the more surprising, because all their bridges are both high and long: but I did not hear of any misfortune that happened.

After two days journey we came to Coire, which is the chief town of the Grisons; and here was the general diet of the states met: and as I staid ten days there, I received information of many particulars I had not known before.

The town is but little, and contains between four and five thousand inhabitants. It lies in a valley, upon a small brook, that, a little below the town, falls into the Rhine. It is environed with mountains on all sides, so that they have a very short summer, for the snow is not melted till May or June; and it began to snow in September, when I was there.

On a rising ground, at the east end of the town, is the cathedral, the bishop's palace, and the close where the dean and prebendaries reside. All those who live within the close are papists; but all those who live in the rest of the town are protestants, and live pretty neighbourly together. About a quarter of a mile up the hill, one goes up by a steep ascent to St. Lucius's chapel, for my curiosity carried me thither, though I did not believe a word of the story. His chapel is a little vault, about ten feet square; where there is an altar, and where mass is said on some particular festivals. It is situated under a natural arch that is in the rock, which was thought proper to be given out to be the cell of a hermit; and from it some small drops of a fountain fall down near the chapel. The bishop assured me, that this water had a miraculous virtue in curing disorders in the eyes. I believe it may be very good for the eyes, as all rock water is.

I told the bishop, who was a good old man, that the story concerning St. Lucius was false, and that when he is said to have been king of Britain we had no kings, but were conquered by the Romans; but all this had no effect with him, for he told me that he believed it, because they had a tradition in their church concerning it. He told me another story concerning St. Emerita, the sister of St. Lucius, who was burnt there, and of whose veil there was yet a considerable remnant preserved among their relics. I confess I never saw a relic so ill disguised, for it was a piece of coarse linen cloth washed, and the burning did not seem to be a-month old; when they took it out of the case, to shew me it, the people present rubbed their beads upon it.

At the time I was there, the bishop had some contest with the dean, and he being a prince of the empire, he had proscribed him. The dean himself had also believed so insolently, that, by an order of the diet, he was committed to prison as he was coming out of the cathedral. By the common consent, both of the papists and protestants, a law had been made, long before, against any immunities to the clergy, and this happening four years before I went there, the dean sent to Rome to lay his complaint before the pope. It was thought that the popish party would move in the diet for the repeal of that law, but they did not.

The foundation of the dispute between the dean and the bishop, related to some exemptions the dean claimed, and upon which, as they pretended, the bishop had usurped an illegal power. Upon this, I took occasion to shew him the reality of these exemptions; and that, in the primitive church, it was believed, that the bishop had authority over his presbyters by a divine right; and, if it was by a divine right, then the pope could not set it aside. But the bishop would not carry the matter so high, and contented himself with two maxims, one of which was, that the bishop was Christ's vicar in his diocese, and the pope was the same in the catholic church.

The people of this country were once under the Austrian yoke; but having shaken that off, they framed themselves into little states; and the Austrians have, in vain, attempted to regain the power they had over them: some incidents having always happened to prevent them from subduing it. Once, a party of Austrians turning into a village, they found it deserted by the men, and only the women left, so that they were under no apprehensions about their personal safety. But the women intended to let their husbands see that they were capable of contriving, and executing a bold exploit, although it must be confessed it was rather too rough and barbarous for the softer sex.

They entered into a combination to cut the throats of all the soldiers at one time. The woman that proposed this, had four lodged with her, and she with her own hand dispatched them all, and so did all the rest; for, although there were several hundreds of them, not one escaped. In another part of the valley, a body of Austrians took up their lodgings, and found it quite abandoned; as the men had no arms but clubs, they had got up into the mountains; but they had taken their measures so well, and possessed themselves so of the passes, that they came down upon the soldiers with such fury, that they quite defeated them, very few of them escaping; and it is certain that they could not otherwise have subdued them.

It is true they would not be able to hold out long, because the public is poor, and some individuals are rich. The league of the Grisons is the first and most antient in Switzerland, and is composed of eight and twenty counties, of which eighteen are papists, and ten protestants. The counties of the two religions live peaceably, and yet they do not suffer those of a different religion to live among them, so that every community is entirely of the same sentiments; and if any one changes his religion, he must go into another county.

Each county is an entire state within itself, and all

the inhabitants must meet, once a year, to chuse the judge and his assistants, whom they either change, or continue from year to year, as they think proper. There is no difference made between gentlemen and peasants, and the tenant has a vote as well as his landlord; nor does the landlord use him ill when he votes contrary to his inclinations; for the peasants would look upon that as a common quarrel.

An appeal lies from the judge of the community to the assembly of the league, where all matters end; for, from their decision, lies no appeal. There is one chosen by the deputies for the assembly of the league, which is called the president, and he can call them together when he sees cause: he can bring before them a cause that has been already judged. Illerts is the chief town of this league, where the diet meets. The second league is that called the House of God, in which there are four and twenty counties, and the burgo-master of Coire is always the head of this league. The inhabitants are all protestants in this division, and although they behave very peaceable, yet the papists are taught, by their priests, to hate them as cannibals.

Among the Grisons, the Roman law prevails, but is somewhat altered, according to the manners of the country. A man that hath an estate by his wife, enjoys it as long as he remains a widower; but when he marries again, he must divide it amongst the children he had by her. Their justice is short and simple, but it is generally believed that the judges take bribes. The married women here seldom appear abroad, except at church, but the young women take greater liberties.

There is such plenty of all things, by reason of the gentleness of the government, and the industry of the people, that in all the six days, in which I staid in Coire, I was but once asked an alms in the street. There are two churches in Coire, in the one there is an organ that joins with the voices in the singing of psalms, and there was an anthem sung there in honour of the diet, while I was in the town, by a set of musicians, who performed their parts with very great exactness, and better than I had heard before in any part of Switzerland.

At all the churches I ever was, in Switzerland, this was the only one where I saw the minister preach uncovered; in all others they wear their hats during the sermon. And I observed a particular mark of devotion here in saying the Lord's prayer, which was, that the masters took off their caps when they said it.

The women here, as in Bern, turn all towards the east during prayer, and also in their private devotion, before and after prayer: some of them also bow when the name of Jesus is repeated. They pour water over the whole head of the child in baptism, for which reason their heads are bare. In the middle of the prayer, the ministers give some time for leisure, that the people may gather their scattered thoughts together.

The schools here do not go above the Latin or Greek languages, and for the rest they send their children to Zurich or Basil. The clergy are meanly provided for, having little more than the benevolence of the people to subsist on. They complained much to me, of a great coldness and indifference in the people towards them, and likewise in matters of religion. The common people are very insolent, and many crimes go unpunished, if the criminal has either money or interest.

The poor ministers here are in a shocking state of slavery, for the Grisons pretend that they have a right to dismiss their ministers as often as they please. How it is among the papists, I cannot say; but the dean told me that they had a bad custom of ordaining their ministers without a title. Their examination took up no more than six or seven hours, and then they were ordained without further ceremony.

From Canipdolein, there is about three hours journey to Chiavenna; all in a slow descent, and, in some places, the road is very stony. Chiavenna is very pleasantly situated, at the foot of the mountains, and a beautiful river runs through the town. The houses

are

are nobly built, and near the town are a great many rich vine yards. The reflection of the sun-beams doth so increase the heat here, that the soil is as rich as in any part of Italy. Here one begins to see a noble architecture in many of the houses, with all the marks of a rich soil and a fine government.

The town stood a little more to the north formerly, but a piece of the Alps fell down and buried it. At the upper end of the town, are some rocks that look like ruins, and much trouble, as well as expence, has been used to remove them. On the tops of these rocks, which are inaccessible except on one side, they used to have a garrison during the wars, and there are fifteen hundred soldiers on that rock, in the middle. There frequently fall down stones from the hills, which do considerable damage; but, at the same time, the soil that falls after the pieces of the rock is of great service in fattening the soil.

On both sides of the town, the gardens cover the whole bottom that lies between the hills; and, at the roots of the mountains, they dig great cellars and grottoes, and strike a hole about a foot square, which, all the summer long, blows a fresh air into the cellars, so that the wine of these cellars drinks as cold as if it was ice; but this wind-pipe did not blow when I was there, for it was at the end of September. The sun opening the pores of the earth, and rarifying the exterior air, that which is within rushes out with a constant wind; but when the operation of the wind is finished, this course of the air is less felt.

There is a sort of wine here, which I never heard called by the name before: it is called aromatic wine, and, according to the taste, it seems to be a sharp composition; for it tastes like strong water drawn from spices. Its strength is equal to that of weak brandy, and inclines one to believe that it is not natural, and yet it is the pure juice of the grape.

This liquor being singular, I inquired in what manner it was prepared; and was informed they let the grapes hang on the vines till November, that they may be perfectly ripe; then they carry them to their garrets, and set them all upright on their ends, near one another, for two or three months: after which they pick them, and throw away all such as have the least appearance of rottenness, so that they press none but sound grapes. After they are pressed, they put the liquor into an open vessel, in which it throws up a scum, which they take off twice a day; and when no more scum comes up (which, according to the difference of the season, is sooner or later; for sometimes the scum comes no more after eight days, and at other times it continues a fortnight) then they put it into a vessel, and, for the first year, it is very sweet and luscious, but at the end of the year they pierce it a little higher than the middle of the vessel, almost two thirds from the bottom, and drink it off till it comes to such a place, and then every year they fill it up again.

Once every year, in the month of March, it ferments, and cannot be drank till that is over, which continues a month, but their other wines do not ferment at that time. Madam Galis, a lady in that country, who entertained us three days in the most magnificent manner, had wine of this sort forty years old, and it was so very strong, that one could hardly drink above a spoonful. It tasted high of spices, although she assured me she had put none into it, nor of any other mixture whatever. Thus the head that is in the wine becomes a fire and distills itself, throwing up the more spirituous parts of it to the top of the hoghead.

From Laufanne I went to the Lago Maggione, which is a great and noble lake, being in length upwards of fifty miles, and six broad, and about one hundred fathoms deep in the middle. It makes a great bay to the eastward, and here are two islands, called the Barronean Islands; these are certainly the loveliest spots of ground in the world: there is nothing in all Italy that can be compared to them. They have the full view of the Zube, and the ground rises so agreeably, that nothing can be imagined equal to the terraces here,

which belong to two counts of the Barronean family. I was only in one of them, which belongs to the chief branch of the family, and who is nephew to the famous cardinal, called St. Carlo. On the west end lies the palace, which is one of the best in Italy for lodgings, though the architecture in the outside is not so admirable.

There is one noble apartment, above twenty-four feet high, and here is a vast collection of noble pictures, beyond any thing at Rome. The whole island is a garden, except a little corner to the south, parted off for a village of about forty little houses; and because the figure of the village was not made regular by nature, they have built great vaults and porticoes along the rock, which are all grotesque, and so they have brought it to a regular form, by laying earth over those rocks.

Here is first a garden to the east, that runs up from the lake by five rows of terraces, on the three sides of the garden, that are watered by the lake. The stairs are noble, the walls are all covered with oranges and citrons, and a more beautiful spot of ground cannot be seen. There are two buildings in the two corners of this garden, the one is only a mill for fastening up the water, and the other is a noble summer-house, all faced in the inside with alabaster and marble, of a fine colour, inclining to red. From this garden, one goes in a level to all the rest of the alleys and pastures, to the herb garden and flower garden, in all which there are a variety of fountains and arbours; but the great pasture is a surprising thing, for, as it is well furnished with fountains and statues, and of a vast extent, being finely situated near the palace, so at the further end of it there is a great mount.

The face of it, that looks up the pasture, is made like a theatre, all full of fountains and statues, the height rising up in several rows, it being full fifty feet high, and about fourscore feet in front. Round this mount, answering to the five rows into which the theatre is divided, there go as many terraces of noble walks, all covered with oranges and citrons. The top of the mount is twenty feet long, and forty broad; and here is a vast cistern, into which the mill plays the water to supply the fountain.

The fountains were not quite finished when I was there, but, when all is finished, this place will look like an enchanted island. The freshness of the air, on account of its being both in the lake and near the mountains, the fragrant smell, the beautiful prospect, and the delightful variety that reigns here, make it an habitation for summer, that, perhaps, the whole world hath nothing to equal.

From this delightful place, I went to Sestio, a miserable village, at the end of the lake; and here I began to feel a mighty change, being now in Lombardy, which is certainly the most beautiful country that can be imagined. The ground lies so even, it is so well watered, so sweetly divided by rows of trees, inclosing every piece of ground of an acre or two acres in compass, that it cannot be denied that here is a vast extent of soil, above two hundred miles long, and in many places a hundred miles broad; where the whole country is equal to the loveliest spots in all England or France. It has all the sweetness that Holland or Flanders have, but with a warmer sun and a better air. The neighbourhood of the mountains causes a freshness of air here, that makes the soil the most fertile place to live in that can be seen, if the government was not so excessively severe; but there is nothing but poverty to be seen all over the country.

A traveller seldom finds any thing to eat in it, nor any sort of accommodation; so that, if he does not buy provision in the great town, he will be in danger of starving, in a country which he would naturally imagine to abound with all sorts of plenty.

From this place we went in the canal named St. Frances, which is about thirty feet broad, and arrived safe at the city of Milan, one of the most famous places in Italy; whether we consider its antiquity, its revolutions, or its magnificent buildings.

The

The city of Milan is one of the noblest in the world, considering that it is not situated on the sea; nor is there either commerce or navigation carried on at it: and yet it is the metropolis of Lombardy. The vast extent of the city, the nobleness of the buildings, and above all, the surprising riches of the churches and convents, are signs of great wealth. The dome of the cathedral hath nothing to recommend it, with respect to its architecture, it being built in the rude Gothick manner; but for the size and richness of the building, and the wealth contained in it, it is equal to any in Italy, St. Peter's at Rome excepted.

It is all marble, both pavement and walls, also the outside and inside, and on the top it is entirely flagged with marble. There is the greatest number of niches for statues I ever saw. It is true the statues, in some of the niches, are not in the least proportioned to the niches themselves. The frontispiece is but indifferent, but it is adorned with vast numbers of statues.

The church, as well as I could measure it, by walking over it in an equal pace, is five hundred feet long, and two hundred feet wide. The chair is wainscoted, and carved in so extraordinary a manner, that I never saw the passion so well carved in wood. It contains sixty stalls, and they have almost the whole Gospel history represented on them. Just under the cupola, lies the body of St. Carlo, in a green case of crystal, of vast value, but I could not come near it; for we were there on two holidays, when there were vast crowds of people in the church. And indeed the superstition of the people is such, that a stranger, who is a protestant, would run a great hazard were he to come near the shrine of this saint without adoring it.

His canonicals cost the town a hundred thousand crowns, and they pretend that they can work miracles as well as his body. The plate, and other presents made at the shrine of St. Carlo, are things of amazing value. Some leaves for the altar are all of gold; some of which are very massy and set with jewels; others so finely wrought, that the fashion is thought equal to the metal. He was certainly a man who did much good, particularly to the city of Milan, of which he was archbishop. Besides the cathedral, he built several schools, where the youth are instructed gratis, and supplied with all sorts of necessaries. He founded, and endowed several hospitals for the aged and infirm; and, besides private charities, whenever there was a public work set on foot, he contributed towards promoting it. He built the archbishop's palace, which had fallen to decay; and near it erected a college for the education of young Switzers, whose parents were poor.

The riches of the church of Milan strike one with amazement; the buildings, the paintings, the altars, the plate, and every thing in the convent, except their libraries, are all signs, both of wealth and of a powerful superstition. But their libraries, not only here, but all over Italy, are scandalous things. The room is often fine and richly adorned, but the books are few, ill bound, and worse chosen; and the ignorance of the priests, both secular and regular, is such, that the man who hath not had an opportunity of discerning it, can scarcely believe it.

The convent of St. Victor, that is without the town, is by much the richest. It is composed of canons regular, whom the Italians call the canons of the Mount of Olives. The convent of the Barnabites is very rich; and there is a pulpit and confessional, all inlaid with agates of different colours, finely spotted rubies and of lapis lazuli, which are considered as inestimable.

St. Laurence has a noble cupola, and a pulpit made in the same form as that of the Barnabites. The Jesuits, as well as all the other orders, are extremely rich; having fine convents, beautiful gardens, and elegant churches. The citadel is built on a very regular plan, and very useful for keeping the town in order, but it could not stand out against an army, there being so many houses in it that it would be easily set on fire.

The hospital is, indeed, a royal building, and I was told that it had a revenue of ninety thousand crowns. The old church is large, and would look grand, were it not for the new court that is near it, which is two hundred and fifty feet square, and there are three rows of galleries all round the court, one in every stage, according to the Italian manner, which makes the lodgings very convenient, because there is a gallery before every door. It is true, these take up a great deal of the building, being commonly eight or ten feet broad; but then there is an open space, that is extremely cool on that side where the sun doth not shine; for it is all open to the air, the wall being only supported by pillars, at the distance of fifteen or twenty feet from one another.

In this hospital there are not only galleries full of beds on both sides, as is common in all hospitals, but there are also a great many chambers, in which persons, whose conditions were formerly distinguished, are treated with particular care. There is an out-house, called the Lazarette, that is without the walls, which belongs to this hospital. It is an exact quarter of a mile square, and there are three hundred and sixty rooms in it. A gallery runs before the rooms, so that the sick have a covered walk before their doors. In the middle of this vast square there is an octagonal chapel, so contrived, that the sick, from all their beds, may see the elevation of the host, and adore it. This house is for such as have the plague, or any infectious fever; and the sick that are in want of a freer air, are removed hither.

Most of the curious crystals found in the Alps are brought here, so that there are more crystals in Milan than in any other town in the world. It is certain the Alps have much wealth, and many precious stones are shut up in their bowels; but the inhabitants know not how to search for them. But, I heard of no mines that were wrought, except one iron-mine, yet, by the colour of the fountain in many places, one has reason to believe that there are mines and minerals shut up within them; gold hath been often found in the river Arve, that runs near Geneva.

The last curiosity that I shall mention in the town of Milan, is the cabinet of the canon of Settala; which, at his death, came to his brother. There are in it a great many valuable things, both of art and nature. There is a lump of ore, in which there is gold, silver, emeralds and diamonds, which was brought from Peru. Here are many curious motions, where, by an unseen spring, a ball, after it hath run down through many windings, is thrown up, and so it seems to be a perpetual motion. This is done in several forms, and it is well enough disguised to deceive the vulgar. Many motions of channels, that run about by springs, are also very pretty. There is a loadstone of vast strength, that will lift up a very heavy iron chain. There is a monstrous child, that was lately born in the hospital, which is preserved in spirits of wine. It is double below, hath one breast and neck, two pair of ears, a vast large head, and but one face.

As for the buildings in Milan, they are large and substantial, but the architecture is neither regular nor beautiful. The governor's palace hath some noble apartments in it. The chief palace of the town is that of the Homo Dei, or House of God, and was built by a banker. But there is one inconvenience in Milan, which destroys all the pleasure one can find in it: they have no glass windows, so that one is either exposed to the air, or shut up in a dungeon. And this is so universal, that there is not one house in ten that hath glass in the windows. There is the same defect in Florence, and most of the other towns in Italy, which is the effect of their poverty. For, what by the oppression of the government, and by the still greater oppression of the priests, who squeeze every thing they can to enrich their churches and convents, the people here are reduced to such an abject state of poverty, as can hardly be believed by one who sees the wealth that is in their churches; and this goes on

to be constant and regular at Milan, for papistry has room for much more.

The trade of Milan consists chiefly in silks, but it has begun to decline, in consequence of the flourishing state of the European East India companies; and all Italy feels this very sensibly. There is a great magnificence in Italy, but particularly in Milan. The nobility affect grandeur, both in their houses, carriages, cloaths and servants; and here the women go abroad with more freedom than in any other town in Italy.

Leaving Milan, I travelled in company with several other persons, and passed through Lodia, a miserable garrison, although a frontier town, and situated about twenty miles from the capital. We continued our journey to Crema, which is the first town in the Venetian dominions, and fortified in as wretched a manner as Lodia. These towns have sustained sieges for months together, but either of them might be now taken in a few hours. The whole may serve to shew that the neighbouring states are not much afraid of each other. Happy if it was so throughout the world.

The senate of Venice sends *podestas* to their provinces on the Terra Firma, as well as to their Transmarine Islands; and these act much in the same manner as the bailiffs in Switzerland. Here is also a captain general, who hath the military authority in his hands, and these two are checks over each other; as the *bashas* and the *cadis* are among the Turks. But in Crema, as the town is small, both these are in one person.

We were there in the time of the fair, where there were vast quantities of linen cloth, and cheese, which they called *Parmesan*, though it is made at Lodia. Here we saw something of that vain magnificence peculiar to the Italians. The *podesta* went through the fair with a train of coaches all in his own livery, and the two coaches in which he and his lady rode were both extremely magnificent. His was a hedge bed coach, all the outside black velvet, and a mighty rich gold fringe, lined with black damask, and flowered with gold. His lady's was neater, but dressed almost in the same manner.

From Crema it is thirty miles to Brescia, a town belonging to the states of Venice, like the other, but is extremely rich and full of trade. Here they make the best barrels for pistols and muskets of all Italy. There were great iron works near it, but the wars with the Turks had occasioned an order that none should be sold without a written licence from the state of Venice.

They were building a noble dome to the church of Brescia, and there we were shewed a nunnery that was then in a state of confusion. Some years before, a new bishop had come there, and being a very strict person, began with the visitation of the religious houses. In this nunnery he discovered two vaults; by one of these men came in, and by the other the nuns, when they were near the time of their delivery, went out. While he was examining the nuns about these practices, some of them told him that his own priests did worse. He shut up the house, so that those who had taken the veil were to remain, but no new ones were to be admitted:

“ Behold the effects of Romish celibacy ! ”

The citadel is built on a rock, so as to have the command of the town. Both here and in Crema, the *podestas* are so much honoured and esteemed by the people, that they erect statues in memory of them, and do every thing they can to beautify their palaces. The name *podesta* is of great antiquity; for the Romans had an officer, governor of the smaller towns, who was called *potestas*.

From Brescia, the beauty of Lombardy is a little interrupted; for, as all the way from Milan to Brescia is as one garden, so here, on the one side, we came under the mountains, and on the other side was the lake of Guarda, which is forty miles long. We passed through a heath at least sixty miles in length, but the

ground began to appear cultivated as we came towards Verona.

Verona is a vast town, and much of it well built, with many rich churches in it. But there is so little trade stirring, and so little money passing, that it is not easy here to change a pistole, without taking bad coin, which does not pass out of their own state. The amphitheatre of Verona is one of the greatest pieces of Roman antiquity in the world; and, although one of the least that the Romans built, yet it is the best preserved. It is true, many of the great stones in the outside have been pushed out, yet the great sloping vault, on which the row of the seats are, is all intire. They consist of several rooms, one behind another, each rising above the other gradually, so as to give the people an opportunity of seeing the diversions. It is reckoned that the whole amphitheatre can hold twenty thousand people.

In the vaults, under the rows of seats, were the stalls for the beasts that were presented to entertain the people. The thickness of the building, from the outward wall to the lowest row of seats, is ninety feet; so that when we consider it as one of the least amphitheatres of those once illustrious people, what must we think of those which are so famed in their history, and which stood both in Rome and many other parts of the world?

The next thing to be seen at Verona is the Museum, where there is one whole apartment furnished with antiquities. Here are some inscriptions, made by the deputies of two towns, in honour of Marcus Crassus. There is a great collection of medals and medallions, and of the Roman weights, also their instruments for their sacrifices: there are likewise many natural currents, with a vast collection of pictures.

There is a noble garden in Verona that rises up in terraces, as far as the top of a hill, where there are many antient inscriptions. From Verona to Vinzenza, which is ninety miles, we began once more to behold the beauties of Lombardy; for there is all the way as it were a succession of gardens. Here the ground is better cultivated than in any other parts of Italy; but the wine is not good, for at the roots of all their trees they plant a vine, which grows up winding about the tree till it comes to the top.

Verona hath still retained much of its antient freedom. Here one sees many marks of liberty in the grandeur of their palaces and richness of their churches, some of which are elegant structures. The gardens belonging to the count de Valarano, at the port of Verona, is the finest thing in the town: there is in it a very noble alley of oranges and citrons, some of which are extremely large, but they are kept covered all the winter long; and in this appears the sensible difference of Lombardy from those parts of Italy that lie to the south of the Appenines; that here generally they keep their oranges and citrons in great boxes, as we do in England, that so they may be lodged in winter, and defended from the breezes that blow sometimes so sharp from the Alps, that otherwise they would kill those delicate plants. But in January, they grow as other trees in their gardens; and in the kingdom of Naples they grow wild, without any sort of cultivation.

We were at Vinzenza upon a holiday, and there we saw them make preparations for a procession that was to be in the afternoon. I did not wonder at what a French papist told me, that he could never bear the religion of Italy, the idolatry was so gross. The statue of the Virgin was of wood, so finely painted, that I thought the head was of wax. It was richly cloathed, and had a crown on its head, set full of flowers. How they did when it was carried about, I do not know; but in the morning, all the people ran to it, and said their prayers before it. They even kissed the ground before it, with all the appearances of devotion.

From Vinzenza it is eighteen miles to Padua, all the way like a garden. Here one sees the decays of a vast city, which was once one of the most splendid in Italy. The compass is the same that it was, but there

is much uninhabited ground on it, and the houses go almost for nothing. The air is extremely good, and there is so great a plenty of all things, except money, that a little goes a great way.

The university here, although supported by the state of Venice, who pay fifty professors, dwindles extremely. There are no men of any great fame now in it; for the almost continual quarrels among the students have driven away most of the strangers that used to come and study here; for it is not safe to stir abroad after sun-set. The number of the palaces here is incredible; and though the nobility of Padua are almost ruined, yet the beauty of their antient palaces shew what they once were.

The Venetians have been unwilling to let all the antient quarrels in conquered cities remain on the same footing they were on before; for, when one kills another, and the children take their revenge afterwards, both have their estates forfeited, which goes to the senate. At particular times, when the senate wants money, and offers a pardon to such guilty persons as will compound for it, it is in a manner incredible to consider what vast numbers of guilty persons will come in to claim the benefit.

I was assured by Patin, the learned professor, that at one time, no less than thirty-five thousand compounded for crimes. I could hardly believe it, but he bid me write it down upon his word. The nobility here seem not to understand what a vast profit their quarrels bring to the state, and how they ruin their families in order to gratify that brutal passion, revenge, which degrades men to the character of beasts.

There are still the remains of an amphitheatre here, though only the outer walls stand. There are also, as at Milan, two towns, one called the inner and the other called the outer; but there is a ditch goes round both, which is eight miles in circumference, and is almost round. The public hall is the noblest in Italy, but the dome is antient. The church of St. Anthony, especially the holy chapel, in which the saint lives, is one of the best pieces of modern sculpture. Round the chapel the chief miracles in the legend of that saint are represented in a very lively and surprising manner.

The devotion paid to this saint all over Lombardy is amazing. He is called, by way of excellence, "the saint;" and the beggars generally ask alms for his sake. But among the little verses that hang about the chapel, there is one with the greatest blasphemy inscribed on it that can be imagined; "He hears those whom God himself does not hear."

The church of St. Justin is a fine piece of architecture, being constructed in the most elegant manner; and if the outside was equal to that within, it would be one of the most beautiful churches in Italy.

In the Venetian territories, their subjects might live easy and happy, could they but be so wise as to give over their quarrels; but these are so frequent, that they are sometimes more like beasts than men. Jealousy is, for the most part, the cause of their quarrels; and it is surprising to consider to what height they will frequently carry that abominable passion. They do not fight in that manly manner as in other nations, but they hire ruffians to assassinate those whom they imagine have affronted them. This is so contrary to the practice of the antient Romans, that one is tempted to believe they are not descended from them.

From Padua down to Venice, all along the river Brent, there are many palaces belonging to the antient families of the noble Venetians; and these are situated on both sides of the river, which gives it a most noble appearance, and furnishes out a fine prospect to the travellers. These houses are built in the Venetian taste, so that we must not look among them for the strict rules of antient architecture: they vary so much, that there is not one like another.

There is the same diversity in the manner of laying

out their gardens, and here they retire during the hot months of the summer. In that season it is common for them to allow themselves all those indulgences which animal passions are so fond of, and which too frequently degrade human nature.

From the mouth of the river we passed over what they call the Shallows, to Venice. These shallows begin to sink so much, that to preserve Venice still an island, will probably be as expensive to the state as it is for the Dutch to keep the sea from making encroachments on them. This, however, the Venetians have still done, at a vast expence; otherwise, by this time, there is reason to believe, that their city would have been joined to the terra firma.

It is, certainly, one of the most surprising sights in the world, to see so vast a city situated in the sea, and such a number of islands so united together by bridges, brought to such a regular figure, and all so nobly built, that they cannot be seen without amazement. And although this republic is much sunk from its antient grandeur, yet there is still an incredible degree of wealth, and all the necessaries of life, in it.

In the hall of the palace of St. Mark, where the senate assembles, we saw the figure of pope Alexander III. treading on the neck of the emperor Frederick Berbanfon; but this is what every historian is well acquainted with. The grandeur of the stair cases, the richness of the halls, and the beauty of the whole building, are much injured by the slovenly manner in which the people, who visit them, go along. And the great hall, in which the nobility meet, has nothing to recommend it except the roof, for the seats are more like common benches for scholars in a college, than for the members of such an august republic.

When the two sides still wanting of this palace are built, it will be one of the most glorious structures in the world. The two sides that are most seen, the one joining the square of St. Mark, and the other fronting the great canal, are built entirely of brick. The third was begun with marble, but was not finished, when we visited the place. The church of St. Mark hath nothing to recommend it besides its antiquity, and the vast decorations of the building. It is dark and low, but the pavement is so thick a mosaic, that nothing can equal it. The outside and inside are of most excellent marble, and the frontispiece is adorned with pillars of jasper, porphyry, and four horses of Corinthian brass.

These horses were brought by Tiridates to Tiberius, when he was emperor of Rome, about the time of our Saviour's crucifixion: they were afterwards carried to Constantinople, and from thence brought back to Venice. The gilding is so grand, that nothing can equal it, and it displays a specimen of the magnificence of the antients.

The noblest convent in Venice is that of the Dominicans, dedicated to St. John and St. Paul. The church and chapel are vastly rich; and there is a library, the building of which is elegant, but there are no curious books in it.

The convent of St. George stands on an island by itself, and is richly ornamented. It belongs to the Benedictines, and is situated opposite to St. Mark's. The church is well erected, and beautifully adorned: the whole building is very magnificent, and, what is very extraordinary at Venice, they have a noble garden, and fine walks in it. It is certain, that there are a vast profusion of riches here, buried, as it were, from common use: but who can set bounds to superstition?

That spirit of debauchery and licentiousness, which prevails so much in Venice, has extended itself among the clergy to such a degree, that ignorance and vice is all they have to recommend them: but these qualities are sufficient to recommend them to a corrupt people. There is a sort of an association among the clergy, to judge of their common concerns; and on these occasions they are joined by some of the laity, so that here is a real presbytery.

The

The nuns of Venice are frequently scandalized on account of the liberties they take with the men. Some of the nunneries are filled with ladies of the highest distinction, who pretend that they have not taken the veil from motives of devotion, but purely to live in a state of retirement. These see all companies who come to visit them; but when I was in their hall, they talked so quick, that I could not understand what they said. These nuns talk much, and very ungracefully, and allow themselves such freedoms as would not be borne with in other places.

About four years before I was there, the patriarch of Venice intended to reform some of these convents; but the nuns of St. Laurence, with whom he began, told him plainly they were noble Venetians, who had chosen that way of life as more convenient for them; and they would not subject themselves to his regulations. The patriarch was so much enraged, that he actually came to shut up their house; upon which they threatened to set fire to it: but some of the senators, like men of judgment, advised the patriarch to desist.

There is no Christian state in the world more jealous of the clergy getting into their councils than the Venetians; for as a noble Venetian, when he goes into orders, forfeits his right to vote in their councils, so when any of them are promoted to be cardinals, the whole of his kindred must, during his life, withdraw from the senate, and are also incapable of holding any employments.

The inquisition, that dreadful engine of papal power, has always been under the direction of the state of Venice; and this much is certain, that it has never had any authority in Venice over the consciences of men. In civil matters it takes cognizance, but this is in conjunction with the senate. It is, indeed, a court absolutely subject to the senate, nor are any of their decrees valid till such time as they have been examined and reviewed.

No citation can be issued, nor any examination taken, unless some deputies from the senate are present; and thus it happens, that although there is a court of inquisition at Venice, yet it seldom happens that any person is injured by it. People of all religions may live there without molestation, so that they take care to behave themselves in a prudent and decent manner.

The Venetians are, perhaps, of all those who bear the name of Christians, the most ignorant in the world in matters of religion: they are so even to a scandal, and totally unconcerned about those things upon which their eternal happiness depends. The grandeur of their churches, and the pomp of their ceremonies, may be considered rather as articles of magnificence, than as any thing that has the least connection with religion. Superstition hath here such a power over the minds of the people, that it generally leads them to all crimes. The generality of the young nobility are so corrupted in their manners, and so utterly unacquainted with all sorts of real knowledge, that it is scarce worth one's while to say, that they are beneath contempt. They have lost that martial spirit which distinguished their ancestors, and their pusillanimity is equal to that meanness to which they have degraded themselves.

The pride of the noble Venetians is such, that the ladies keep girls for their sons, lest they should inadvertently marry beneath their rank. Venice is, perhaps, the only place in the world where pleasure is studied, and where it is least understood. As for the pleasures of friendship and marriage, they are utter strangers to them; for the terrible distrust in which they all live towards one another, makes it very rare to find a friend in Italy, much less in Venice. And though romances have held out to us several stories of friendship in Venice, yet we are in all respects certain, that no such thing is now to be found.

As for their wives, they are bred up in so much ignorance, and learn so little, that all their pleasure, if it deserves that name, consists in attending their processions on holy-days, in which they stay in

the churches as long as they can. By these means they prolong the little liberty they have of going abroad, as children do their hours at play. They are not employed in their domestic affairs, and, in general, they understand no sort of work. Indeed I found them the most insipid creatures in the world, and they were equally vicious. They are bold and forward; so that instead of being led into intrigues by the men, they boldly meet them more than half way. An Italian, who had seen much of the world, told me, that their jealousy made them restrain their daughters and their wives so much, that they could have none of those entertainments of wit, conversation, and numerous amusements, which the French and English enjoy at home.

He observed further, that the French and English might, by some imprudent steps, endanger the peace of their families; but the Italians, by their excessive caution, made it appear, that they had no relish for the happiness of a marriage state. He thought it would be much better to take off all those restrictions from the women, and let them converse in public company, as they do in many other nations.

The houses in Venice are almost all built in the same manner. There is on their cove a hall that runs along the body of the house, and chambers on both sides; but there are no apartments, no closets, nor yet stairs; so that in great houses they are actually destitute of conveniences. Their bedsteads are of iron, because of the vermin which the moisture of the soil produces; and the bottoms are of boards, upon which they lay mats and quilts; but they are so high, that it is difficult to get into them. Their great chairs are all upright, without a slope in the back, hard at the bottom; and the wood at the arms is uncovered.

They mix water with their wine in their hogsheds, so that for above half the year their wine is sour, or dead. They do not put baum into their bread, so that it is very heavy; and the oven is too much heated, so that the crum is like dough, while the crust is as hard as a stone. In all their inns they boil meat first before it is roasted, and thus it is quite tasteless and insipid. As for their carriages all over land, they are extremely inconvenient; for their coaches are fastened to the axle-tree bed, which makes them as uneasy as a cart. Besides this, their calashes are open, so that the travellers are exposed to all the inclemencies of the weather, whether it be in the violent heat of summer, or the extreme cold in winter.

They have a place at Venice, which they call the brogha, where all their young nobility meet, and form parties of pleasure, as they call it; but it does not deserve that name. They are so much sunk into all sorts of sensuality, that they are rather brutes than men; and there is too much reason to believe, that they are frequently guilty of unnatural crimes. These young nobility have no notions of true honour; they are become as effeminate as the Romans were, when Alexander the Great made so easy a conquest of them.

The Venetian nobility, who were the descendants of those heroes who had raised their state to its present grandeur, kept every honour to themselves, till the love of money induced, or rather, obliged them to humble their pride. For this reason they set up their titles to sale, and many rich merchants became purchasers. This gave an opportunity for the Jews to enrich themselves, who bought and sold their places, and, by their dexterity, brought down the price from one hundred thousand to sixty thousand ducats; and no other qualifications were requisite, if they could only produce the money.

The old families do not always declare against the new ones in the senate, because that would create factions, and raise disturbances. The greatest inconvenience attending the state of Venice is, that they can seldom find men enough amongst their nobility to discharge those duties which are incumbent upon

upon them. The vices of the nobility have lessened their dignity; but this will always take place, where the feudal laws begin to decrease.

From Venice we went again to Padua, and from thence to Rorigo, which is but a small town, and so on to the Po, which divides the territories of this republic from those of the Duke of Ferrara. This part of the country is now subject to the pope; and here one sees a vast difference between the different forms of government in Europe. For though the soil is the same on both sides of the river, and the duchy of Ferrara was one of the most beautiful spots in Italy, nothing now can appear more miserable. The soil is, in a manner, exhausted, and the country abandoned of its inhabitants, there being not so many left as to mow the hay, which was withering, while we were there, for want of hands to cut it down. We were amazed to see such a rich soil thus forsaken; and that country, which might have been an ornament to the habitable globe, left, as it were, in a state of negligence and uncultivation.

I could not refrain from asking every one I met with, how such a rich soil as Ferrara came to be thus, as it were, abandoned? Some said the air was become more unhealthy than it was formerly, so that those who lived in the country were subject to many mortal diseases, which carried them off soon. But this badness of the air is occasioned by the want of inhabitants; for there not being people enough to drain the ground, and keep the ditches clean, the roots lie on the ground and rot. This infects the air in the same manner as in that rich, but uninhabited country, the Romana Campana. Thus it appears, that this ill air is the effect, rather than the cause, of the depopulating of the pope's dominions.

The true cause is, the severity of the government, and the heavy taxes, together with the frequent confiscations that take place, by which the nephews of the popes have been enriched at the expence of the people. This appears evident, when we consider the flourishing state of Bologna, where there are great numbers of inhabitants. Bologna delivered itself up by capitulation to the popes, but reserved, conditionally, several of its most valuable privileges. Crimes are there punished in the persons of those who commit them; for confiscation of goods, or real estates, is not permitted.

The pope, it is true, claims to himself the power of judging criminals, which is done by his legate; but in all things relating to the state, the civil government is governed by the magistrates. And by this regulation it is, that as the riches of Bologna amasses stronger, because it is not on a navigable river, yet the taxes which the pope draws from thence are greater, and more cheerfully paid, than in those provinces over which he exercises an unlimited authority.

It is a maxim in politics, that the greatness of a prince must always arise from the number of his subjects, and to draw amongst them as many strangers as possible. And I could not but observe with scorn, the folly of some Frenchmen, who made use of the following argument to aggrandize their nation, namely, that some of their countrymen were to be found everywhere: but this is just the contrary consequence that ought to be drawn from the observation. It is certain, that few go and leave their country to settle anywhere else, if they do not labour under some sort of oppression: so that a mild government never drives out the inhabitants; whereas it is the sure mark of a severe government, to weaken itself by oppressing the inhabitants.

But to return to the wealth of Bologna; it appears at every corner of the town, and, indeed, all around it. This is the more remarkable, because the situation is not very favourable, for it lies at the foot of the Appenines, on the north side, and is extremely cold in winter. The houses are built as at Padua and Bern, so that one walks all over the town, covered with arches, or piazzas: but the walks here are both higher and larger than any where else. There are

many noble palaces all over the town, and the churches and convents are incredibly rich: within the town the Dominicans are the richest; and here is the chief house of their order, for the body of their founder is interred in the church. Next to them are the Jesuits and Franciscans, who have fine convents and splendid churches. There is likewise a convent for the canons regular of St. Salvator; and in their library is a manuscript of the Hebrew bible, which the monks pretend to be of great antiquity; but when I examined it, I found that it was no more than one of those copies which the Jews impose upon the monks.

The principal church in the town is dedicated to St. Petrone, and is, indeed, a noble structure. Here one sees the curious and exact meridional line which that great astronomer drew along the pavement, in a brass circle: It makes the true points of mid-day, from June to January, and is one of the best performances, perhaps, the world ever saw.

In the great square before the church, on the one side of which is the legate's palace, among the different statues, one surprised me much. It is said to be that of pope Joan, who was, according to traditional accounts, a woman. Some of the people told me, that it was the image of pope Nicholas IV. who had a very young and effeminate countenance. I looked through a perspective-glass I had along with me, and it appeared plainly that it had the face of a young woman: For my own part, I did not believe the story, so I paid no regard to it.

On the hill above Bologna stands the convent of St. Nicholas, which hath a most charming situation, with a delightful prospect, and is one of the best monasteries in Italy: It hath many courts, and one that is cloistered, very richly adorned with paintings. The dormitory is very magnificent, the chapel is fine, and the halls are richly adorned.

On the other side of Bologna, in a valley, the Carthusians have a very rich monastery, where the gardens are the most delightful that can be imagined. Four miles from Bologna, there is a madona of St. Luke; and because many go thither in great devotion, there is a portico, walled towards the north, but on the south it stands on pillars. It is about twelve feet broad, and fifteen feet high. Most of the new convents in Italy are built in this manner; and although it is rather a new taste, yet it has met with general approbation.

In Bologna they reckon there are seventy thousand persons; but, perhaps, this account is exaggerated. Certain it is, that the city is extremely populous; and, possibly, the number may exceed seventy thousand; for so far as we can ever make inquiry, there is but little certainty in the accounts of the numbers of the people in different towns. There is a continual fluctuation, because some are daily coming; and others leaving the place. The best way of calculating the numbers of inhabitants in any great city, is by the bills of mortality; but these are far from being regular in Italy. It is generally admitted, that in thirteen out of the human species, one dies every year; and, possibly, it will be found that this is true.

Leaving Bologna, we travelled eight miles over a plain, and then entered upon that range of mountains called the Appenines, though that name is only given to one hill, which is the highest. All the way to Florence, this track of hills continues, though there are several bottoms, and some large villages between them. But all is up-and-down hills, and Florence itself is at the bottom of the last. The highways all along these hills are kept in good repair, and in many places in Europe the roads are not so good as on these almost unfrequented mountains. However, the passage is so great, that the money spent by passengers serves to defray the expence of keeping the roads in repair. On the last of these hills stands Prafolino, one of the grand duke's palaces, where the retreat in summer must be very agreeable;

able; for the air of those mountains is thin and fine, and nothing in the world can more contribute towards promoting health.

The gardens in Italy are laid out at a vast expence, and adorned with statues and fountains. The walks are long and even, but they have no gravel, so that it is difficult to walk over them during the winter. However, they have many conveniences which we want, namely, that adjoining to all their walks are canals of fresh water, which is conveyed to nourish the plants in the gardens.

Florence is a noble and beautiful town, full of great palaces, stately churches, and rich convents. The streets are paved in imitation of the antient Roman highways, with large stones, bigger than what we use in our common pavements; and joined together in such a manner, that the horses can draw carriages along them without stumbling. There are many fountains and statues in the streets, so that in every corner one meets with a variety of agreeable objects.

The grand duke's palace is one of the most splendid edifices in the world; it would take up a whole volume to describe it. The paintings are grand, and the curiosities are in a manner innumerable. The great dome is a magnificent building, but the frontispiece towards the gate is much inferior to the rest of the edifice. Their cupola is, next to St. Peter's, the highest and grandest that I saw in Italy. It is three hundred feet high, of a vast compass, and the whole architecture is both singular and regular. However, that which was intended to add to its beauty served, in some measure, to lessen it; for the walls, which are all of white and black marble, had not that air of nobleness which became so noble a fabric.

The baptistery that stands before it was a noble heathen temple; and its brazen gates, still remaining, are, perhaps, the best in the world. There are so many histories, so well represented on them, and with so much exactness, that the work appears to be natural, and yet so fine, that a curious person may spend several days in examining all its beauties. But the church and chapel of St. Laurence exceeds them all in its riches within, though it is inferior to them without. In a chapel, within this church, the bodies of the great dukes lie deposited, till such time as a grander mausoleum is finished.

Here I was much surprised to see in churches, where public worship was carried on, statues with nudities, which I do not remember to have seen any-where else. This is certainly a great indecency, and calls aloud for animadversion. It is abominable to the last degree, and is a disgrace to a country where the name of Christ is professed. It is inconsistent with natural religion, and shocking to a virtuous mind.

Florence is much sunk from what it was, for they do not reckon that there are above fifty thousand inhabitants in the town; and the other states, such as Pisa and Sienna, who have now lost their liberties, are almost shrunk into nothing. It is certain, that all three being put together, are not so numerous as one of them was two hundred years ago. Legona, indeed, is full of people, and all round Florence there are a great number of villages; but as one travels near Tuscany, it appeared to be so depopulated, that we lament to see a country, which hath often been the scene of great actions and many wars, now in a manner utterly forsaken; and so poor that, in many parts, the soil is totally neglected, there being no hands to cultivate it. In other places, where there are more people, they look so poor, and their houses are such miserable ruins, that it seems unaccountable how there should be so much poverty in so rich a country, for it is over-run with beggars: and here I found the stile of beggars a little altered from what it was in Lombardy; for, whereas in Lombardy they begged for the sake of St. Anthony, here they begged for the sake of the souls who are in purgatory, and this was the stile in all the other parts of Italy through which I passed.

It appears plain, that the depopulation of Tuscany, and the pope's dominions, arises from the severity of the government, which occasions the great decay of trade; for the greatest branch of trade in Italy being in silk, the vast importations from the East Indies have contributed to reduce it. Yet this is not the chief cause of the depopulation of these countries: the taxes are so high, and the people live in such a miserable state of subjection, that they are glad to go where they can live under more mild and equitable governments. Besides this, the vast wealth of the convents, which is lost to the public, and where the monks live in all sorts of luxury, makes many of the people forsake all sorts of industry, and seek for a subsistence somewhere else. From all these circumstances, and many others that might be mentioned, the people decrease daily; for who would live under the most cruel oppression?

A traveller is surprised, when he goes through the Venetian territories, through the kingdom of Naples, and several other places, to see so few inhabitants. On the coast of Genoa there are, for many miles, a great number of towns and villages filled with people, though the soil is extremely barren; laying as it were quite under the mountains, and that exposes them to a most uneasy sun. However, the gentleness of the government draws such multitudes thither, and those are so full of wealth, that money goes at two per cent.

But, on the other hand, to balance this a little, so strange and wild a thing is the nature of men, at least of the Italians, that I was told, that the worst people in that country were the Genoese, and the most generally corrupted in their morals as to all sorts of vice; so that, though severe government and slavery are both contrary to the nature of man, to human society, to justice and equity, and to that essential equality that nature hath made among men; yet, on the other hand, all men cannot bear that ease and liberty that becomes the human nature.

The superstition of the Italians, and the great waste of wealth that one daily sees in their churches, particularly those prodigious masses of plate with which their altars are covered on holy days, jointly contribute towards diminishing their trade. For, silver being an article of commerce, what spirits can men have when that is dead, and circulates no more? It is, therefore, no wonder that this should occasion a great deadness in their trade, and render the people almost miserable.

In travelling over the Appenines, although the roads are kept in good order, yet the ruggedness and hardness of the stones makes them very disagreeable. Just above Florence we saw a fine grove of cypress, and indeed the best I had seen in Italy. This was the more surprising, because it appeared in the winter; and it is well known these trees can seldom resist the severity of the cold, and here the winters are very severe.

The country round Florence has but a gloomy aspect, only that there are some well cultivated spots near the banks of the Arno, which runs through the city. The monks have, in a manner, swallowed up all the riches of the country; and the priests are rioting in voluptuousness, while the industrious peasants are in a manner starving. Strange infatuation! that princes should be blind to those duties which will always do them the highest honour, will make them respected by their neighbours, and beloved by those subjects whose fathers they ought to be.

When I got within a few days journey of Rome, I was led to imagine that the neighbourhood of so great a city must have been finely cultivated; but I found myself greatly disappointed. How melancholy a thing was it to see a soil so rich, and capable of producing all the comforts of life, left quite uncultivated! it had neither inhabitants nor cattle upon it, equal to a tenth part of what it could support.

The surprise this gave me increased as I went out of Rome, on the other side; chiefly all the way to Naples, and from Civita Vecchia all along to Terracina, which is upwards of one hundred miles, the whole

whole appeared like a desert; there is not one house to be seen for several miles together, and by this depopulation of the country, the air is become very unwholesome: this is always the case when the water is left to stagnate and corrupt, for in such cases it produces noxious vapours, which in many places exhale, and create a vast number of diseases which prove fatal to the people. This is the case at Rome itself, and were it not for the fresh breezes that come off from the mountains, the air would be intolerable.

When a person sees this fine country from the hill of Marino, about twelve miles beyond Rome, he is filled with astonishment, and laments the rigour of the government, which has driven away the inhabitants. And their being driven away has reduced it to such a pass, that it will be very difficult to re-people it: for, it would be attended with dangerous consequences to attempt to drain off the corrupted water; and for all their pains, the people would have no other reward but that of living under a tyrannical government.

There is one remark necessary to be made here, and that is, that when the regal dignity is elective, it should never be absolute; for an hereditary prince is induced to consider his posterity who are to come after him; whereas, an elective one regards nothing but pleasing the people, in order to enrich his dependents. To expect that the pope should be a man of generosity, would be to look for a miracle.

No sooner is a pontiff elected, than he sends for all his relations, and, having imposed new taxes on the people, fleeces them without mercy. These taxes are divided among his relations; for, as the popes are generally old before they are elected, and as they have always been in cloisters or colleges, so they have no passion but that of avarice.

The kingdom of Naples is the richest part of all Italy, for the very mountains produce either wine or oil, in great abundance. Aquileia is a rich and populous country, producing vast quantities of corn; but it is so hot, that, in some of the summer months, it is almost burnt up. The jesuits are the proprietors of near one half of this province, so that these fathers are extremely rich. The jesuits treat their tenants with great rigour; and so miserably are they oppressed, that many of them have died with hunger in the midst of plenty.

“ They starve, in midst of nature's bounty curst,
“ And in the loaded vineyard die with thirst.”

ADDISON.

The oil of this kingdom is still a vast branch of commerce; but the people are not well acquainted with the art of conducting it, so as to receive proper emoluments from the sale of it. England takes some thousand tons of it annually for the woolen manufactures, but the whole is carried on by brokers. They make no more silk than what is barely sufficient to serve themselves; so much has that trade fallen off of late years, on account of the vast quantities imported by the English East India company. The people are lazy and slothful, and strangers to honest industry; they lose all those comforts which a rational mind enjoys; and they reap no advantages from the richness of the soil.

It amazes a stranger to see vast numbers of men, in the market places, walking idly about, with tattered rags, more like beggars than such as have useful employments. Nay, even their inns are so miserable, that it is difficult to procure a good bed: a footman, in England, would not lay in one of them. Their provisions are equally bad, and their wine is intolerable. The bread is ill baked, and the oil is, in general, nauseous. In a word, unless one carries his whole provisions from Rome to Naples, he must undergo a great many hardships during a journey of four days.

And this is what a traveller, who sees the richness of the soil, is most astonished at; but, as they have not hands enough to cultivate the soil, so those they have are generally so little employed, that it is no

wonder to see the country so barren, notwithstanding all the profusions of nature yearly heaped upon them. But to this must be added the vast wealth locked up in their churches and convents, which is of no manner of service whatever, but to aggrandize the lazy monks, by captivating the attention of the vulgar. One that knew the state of this kingdom well, assured me, that, if its whole revenues were divided into five equal parts, four of these would be found to belong to the clergy; for no rich man dies without leaving either to the churches or convents.

The wealth that one sees in the city of Naples alone exceeds imagination. Here are twenty-four convents for the order of Dominicans, seven for the Jesuits, twenty-two for the Franciscans, besides a vast number for the other orders; and the Carthusians have a rich convent on a hill near the city. They have an hospital, at Naples, supposed to be one of the largest in the world: the revenue is four hundred thousand crowns a year, and yet the number of patients are less than in Milan.

In their galleries, I observed one convenience which was very considerable, namely, that every bed stood as an alcove, and had a wall on both sides, separating it from the beds on either side, and a void space on both sides. The number of poor children they maintain is really amazing, but I could not get an exact account of them, only that there were upwards of three thousand. The surplus of the revenues of the hospital is expended in decorating the church, which is paved with rich marble, of the most beautiful colours. The plate that is in the vestry here, and in the dome, as well as in many other churches, exceeds imagination. It is so prodigious, that, at a moderate computation, it exceeds eight millions of crowns.

The new church of the jesuits, with those of the apostle St. John and St. Paul, are surprisngly rich. The gilding and paintings on the roofs of those churches have cost millions: and, as there are above one hundred convents in Naples, so every one of these, if it was in another place, would be thought well worth the seeing. Every year there is a new governor sent to the convent of the Marianicate, who generally puts into his pocket at least twenty thousand crowns: and to make some sort of composition, when he goeth out of office, he makes a present of a piece of plate, or the image of a saint, to the house.

The jesuits are great merchants here, and carry on a very lucrative trade. Their wine-cellar holds above a thousand tons, and their wine is esteemed the best in Naples. It is true, the Neapolitans are not great drinkers, but vast quantities are exported. The jesuits college hath one of the finest chapels in the world, but the trade they carry on seems very unbecoming men of their profession. The convents have a very particular privilege in this town, for they may buy all the houses that lie on either side, till they come to a street that makes a breach, so that they raise the rents on the people in whatever manner they please, and priests are seldom merciful landlords.

The city of Naples is one of the noblest in Europe; and although it is not half so big as London or Paris, yet it is more beautiful than either. The streets are large and broad, the pavement is grand and noble, the stones being generally above a foot square, and it is full of palaces and lofty buildings. The town is well supplied with all sorts of provisions, so that every thing is in great plenty, and the wines are the best in Europe. Their flesh and fish are very good, and so are their vegetables.

The air is scarcely ever cold in winter, and there is a fresh air comes from the mountains and the sea in the summer. The royal palace has a grand stair-case, and is very richly furnished. Here are a vast variety of paintings and statues, and some figures of the Egyptian idols, which are reckoned great curiosities. Whatever antiquities were formerly at Naples, there are but few at present, for they have been destroyed.

On the west side of Naples is the cave that is called the Pausalippe, and is four hundred and forty paces long,

long, for I walked on foot to take its true measure. It is twenty feet broad, and, at least, twenty feet high; and the stone of which it is built is exceeding hard. About twenty paces from this there is a grotto, that sends out a most noxious smell, of such a sulphurous nature, that it will extinguish the light of a candle. When a dog is put into it, he immediately dies of convulsions, for which reason it is called the Grotto of Dogs.

From this place we went to visit Puzzuolo, which was formerly the summer retreat of the Romans. The people pretended to shew us the houses where Cicero and Virgil formerly lived; but we paid no regard to them. We were well acquainted both with tradition, and their ignorant credulity, which leads people away from the truth.

The Sulfutura here is a very surprising thing; for there is a bottom, out of which the force of the fire, that breaks out in many places in a thick streaming smoke, that is full of brimstone, used formerly to throw up fire, to the distance of three miles.

They told me, that there used to be a channel here, which, probably, was made by Julius Cæsar; but by the swelling of the ground, upon the eruption of the Sulfutura, this passage is now stopped up; and the Averno is now fresh water above eighteen fathoms in depth. On one side of it is that amazing cave, where the sybil is said to have delivered her oracles. It has been a prodigious work, for it is all cut out of the solid rock, and the rock is one of the hardest in the world. The cave is seven hundred feet in length, twenty feet broad, and about eighteen feet high.

From the end of this great gallery there is a narrow passage of three feet broad, and two hundred feet long, and seven high, which leads to a small apartment, where there are several rooms. In one of them are some remains of an old mosaic pavement; and there is a spring of water, and a bath, in which it is supposed the sybil bathed herself. It is said, that there is a subterraneous passage all the way from this cave to another at Carma, which is three long miles; but the passage is now choaked up by the falling in of the rock in several places.

This piece of work amazed me; but I did not mind what the vulgar people told me, namely, that it was the work of the devil. The neatness of the chapel, in every part of the rock, shewed that it was not the work of nature. Certainly they had much time, and wise heads, who conducted it: and it seems to have been wrought out with no other design but to seduce the people more entirely to the conduct of the priests, who managed the imposture; so base and industrious hath the ambition and avarice of the priests been in all ages, and in all corrupt religions.

But of all the remains of antiquity that present themselves here, the bridge of Calligula is the most amazing, for there are yet standing eight or ten of the pillars that supported the arches, and of some of the arches, one half is yet entire.

I had not a line with me to examine the depth of the water, where the furthest of those pillars is built, but my waterman assured me it was fifty cubits. This, however, I could not believe; but still it is so deep, that one is rather amazed how they could lay the foundation of arches in it. It is, undoubtedly, a noble monument of brutal tyranny, and profuse unnecessary extravagance. What could induce this young monster of iniquity to begin such a work? The answer is obvious; he lived in a continual state of intoxication: and it was a common expression with him, that he wished all the Romans had but one neck, that he might strike off their heads at one blow.

It is certain, that a man can no where pass his time more agreeably than in a journey to Puzzuolo, and along the bay. But although this was well peopled in antient times, and had many spacious buildings, yet these are all now falling to decay, nor are

there many of their remains left. Naples hath, in every respect, driven away the inhabitants, and the country is left desolate. Puzzuolo itself is now but a small village, which was formerly a celebrated city.

Having seen every thing worth notice in the city of Naples, as well as in its neighbourhood, I returned to Rome, once the mistress of the world, and still retaining something of her antient grandeur. It is true, this city is on the decline, and yet there is much to be seen.

“Her setting sun still shoots a gleaming ray.”

On the side next Tuscany the entry into Rome is very surprising to strangers, for we walk for several miles along an old Roman causeway, which is one of the remains of their grandeur. The first gate is called the gate of the people, and within it is a fine obelisk, with two churches, both built in the same manner, and standing near to each other. Here we were presented with the view of a long vista of streets, but they did not seem to be filled with inhabitants.

There is not a town in the world where the churches are so noble, or the convents so grandly furnished; and yet the other buildings are so mean, that the modern Romans may be considered as in a real state of poverty. St. Peter's is one of the greatest, and, perhaps, the most amazing structure in the universe. The cupola rises four hundred and fifteen feet above the roof of the church, and in the inside of it is blasphemously painted the image of God the Father, in the figure of an old man, surrounded by angels. Such paintings are frequently to be seen in Italy; but to a pure and virtuous mind they must always give offence. The palace adjoining is so well known, that it does not need a particular, nor, indeed, any description at all in this place. The paintings are the grandest that can be imagined, and they are almost innumerable.

The vast length of the gallery on one side, and the library on the other, are really surprising; and the gardens have many statues of exquisite workmanship. Their gardens, however, are not kept in proper repair; and this is the fault with most of the public places in Rome.

In all their palaces the doors are generally very mean, and they have but few conveniences. The flooring of the palaces is all of brick, which appears so very mean, that one sees the disproportion between it and the other parts of the room, and we behold that with dislike. It is true, they say their air is so cold and moist in winter, that they cannot pave with marble; and the heat is sometimes so great in summer, that flooring of wood would crack with heat, as well as be eaten up by the vermin that would fix in it. But were they to keep servants to clean their rooms from time to time, as they do in Holland, where the air is moister, none of these complaints would take place.

There are, perhaps, no people in the world who lay out more money in building their houses, and decorating their gardens, than the Italians; and yet they take no care of them afterwards. There was another thing I observed in their palaces, where there is indeed a great series of noble rooms, one within another, of which their apartments are composed; but I could not find at the end of the apartments where the bed-chamber was: such a disposition of rooms was there for back stairs, dressing-rooms, closets, servants rooms, and other conveniences, as are necessary for an apartment of state, in which magnificence is more considered than conveniency. But I found the same want in the apartments in which they lodged; and their gardens are much worse kept than their palaces.

There is a particular exception in what is here said in the Villa Borghese, where there is such a vast collection of pictures and statues, that the walls are covered with them. The whole grounds of the park, which are laid out in the most delightful manner,

net, extends three miles in length; and in it are six or seven lodges, or summer-houses.

The Villa Pamphilia is more pleasantly situated, upon a higher ground, and hath more water-works, with twice the extent of the soil; but neither do the house, nor the statues, approach to the richness of the other; nor are the grounds either so well laid out, or kept in such good order.

In Rome, the chambers have the walls all covered over with pictures, and the bed-chambers are generally furnished either with red velvet or damask, with a broad gold galloon at every breadth of the stuff, and a gold fringe at top and bottom; but there is very little tapestry in Italy.

The pope's palace is a vast building; but that which is lodged in it is worth all the palaces in the world: where a vast collection of books fills the human eye. There is, first, a great hall, and at each end of it run out two galleries, of so great a length, that although the one half of them is already furnished with books, yet one would hope that there is room left for more new books than the world will ever produce.

The Heidelberg library stands by itself, and fills one side of a gallery; as the duke of Urbinus's manuscripts fill the other: but though these last are very fair and beautiful, yet they are not of such antiquity as those of Heidelberg. When the library-keeper was informed that I had come from England, he shewed me the book on the seven sacraments, said to have been written by Henry VIII. The king's name, with his own hand, was written upon it. I knew his hand-writing, so that I could not be deceived.

There is nothing delights a traveller more at Rome than to see the great fountains of water that are in almost every corner of it. That old aquaduct that Paul V. restored, rises from a collection of sources, five and thirty miles distant from Rome, that runs all the way upon an aquaduct, in a channel that is vaulted, and is more like a river than a fountain.

It breaketh out into five several fountains, of which some give water above a foot square. That of Sixtus V. the great fountain of Aqua Travi, that hath yet no decorations, continues to discharge a great quantity of water. The glorious fountain of the Piazza Navona, that hath an air of greatness in it that surpriseth one: the fountain in the Piazza di Spagna; those before St. Peter's, and the Palazzo Zarnese, with many others, furnish Rome so plentifully, that almost every private house hath a fountain that runs continually.

All these are noble decorations, and have so much utility in them, that they cannot be too much commended; and give a most lovely idea of those who have taken care to supply this city with one of the greatest pleasures and conveniences of life, than of others, who have laid out millions merely to bring quantities of water, to give the eye a little diversion; which would have been laid out much more nobly and usefully, and would have more effectually eternalized their fame, if they had employed their treasures in the same manner as the antient Romans did.

There is an universal civility reigns among all ranks of people in Rome, which, in a great measure, flows from the nature of their government: for every man is deemed capable of every advancement of that state, so as even a common monk may be made a cardinal, and afterwards a pope. This makes every one, who has good sense, to behave with great decorum; for no one individual knows what another may be advanced to. But this makes professions of kindness and esteem go on so promiscuously to all sorts of persons, that one ought not to build too much upon them.

The conversation at Rome is generally upon news; for although they are not permitted to print a newspaper there, yet news are continually the subject matter of conversation of the people, whenever they meet together.

As for a particular description of Rome, it is in vain for me to attempt it. It is certain, that when one is in the capital, and sees those remains of what it once was, he is surpris'd to see the building so far sunk from its original dignity. He can scarce imagine that it was once a castle, that held out against the whole force of the Gauls, until it was taken by stratagem.

The Tarpeian rock is now so low, that any person, in a fit of diversion, might leap from it; and yet this was the dreadful place where criminals were thrown down headlong, and had their brains dashed out. The triumphal arch of Severus is at the bottom of the hill, but it is now almost buried under ground. In the same manner we beheld the grand and more elegant amphitheatre of Titus, which, during his reign, was the glory of Rome.

Within the capital are seen many remains of antiquity, but none equal the fables of their consuls, which are upon the walls; and the inscriptions, which were engraven in the time of the first Punic war, are, undoubtedly, the greatest antiquities in Rome. From this, all along the sacred way, one finds such remains of antient Rome, in the ruins of the temples, in the triumphal arches, in the porticoes, and other remains of that glorious body, that as one cannot see these too often, so every time one sees them, they kindle in the breast vast ideas of that republic, and make the spectator reflect on that which he learned in his youth with great pleasure.

From the height of the convent of Araceli one hath a whole view of Rome, with great part of the country around it; but it appears, that those parts of the city, which were most inhabited in antient times, are now laid out in gardens and vineyards: and in this manner the glory of the world passeth away. Some of these gardens and vineyards are half a mile in compass, and from that circumstance we may be able to form some judgment of the extent of the antient city.

The vastness of the Roman magnificence and luxury passeth all imagination. The prodigious amphitheatre of Titus was capable of containing eighty-five thousand persons; so justly does Mr. Addison say,

“And held unpeopled nations in her womb.”

Besides these grand remains of antiquity, there are several others, such as the circus maximus; the vaults that furnished the waters for Tatius's baths; and, above all, the famous baths of the emperor Dioclesian, although erected when the empire was in its decay. The extent of these baths is above half a mile in compass, and so capacious were the rooms for bathing, that one of them is now a grand church, belonging to the Carthusian convent. In this church are many pillars of marble, all of one stone, beautifully spotted, and so finely wrought, that later ages can produce nothing like them.

The beauty of their temples, and the porticoes before them, is really amazing, particularly that of the Rotunda, where the fabric without looketh as mean as the architecture is bold; for it riseth up in a vault, and yet at the top there is an opening left of thirty feet diameter, which, as it is the only window in the church, so it fills it with light, and is the most solid piece of architecture I ever saw.

The pillars of the portico are the noblest in Rome, and, perhaps, they are the largest that ever were made of one piece of marble. The vast number of remains of those pillars with which Rome is beautified, both in churches and in private houses, gives us a striking idea of her antient and glorious greatness.

Many of these pillars are of porphyry, some of jasper, others of granated marble, but the greatest number are of white marble. The two columns, namely, those of Trajan and Antoninus; the two horses on mount Cavallo, and the other two horses in the capitol, which, indeed, have not the posture and motion of the others; the brazen horse, which

is supposed to have belonged to Marc Anthony, with the remains of Nero's colossus, are all stupendous vestiges of Roman grandeur.

The great temple of Rome, those of the sun and moon, with that of Romulus and Remus, which I considered as the greatest antiquity in Rome, are all so magnificent, that they fill the mind with the utmost amazement. In some of the porticoes one can trace the architecture of the age of Constantine, which is far inferior to that of the Romans who lived when the empire flourished in its glory. The fine arts were then beginning to decay; for, what with the inroads of the barbarians, and the priestcraft of the clergy, mankind were in the highest road towards a state of ignorance.

But that which exceedeth all the rest is the vast number of aqueducts, that come from almost every quarter, and run over a vast space of ground, and they are such things as cannot be enough admired. There are many statues and pillars, and other antiquities, hung up in all the quarters of Rome, during the last hundred years, since the time of pope Leo X. who, as he was the greatest patron of learning and arts that, perhaps, ever was in the world, so he was the most generous prince that ever reigned; and, it was he that first set on foot the inquiry into the riches of ancient Rome, which had laid till his time under ground: and, indeed, if he had not been a most scandalous libertine, and even an atheist, of which, neither he himself nor his court were ashamed, he would have been one of the most celebrated persons in any age or nation.

Soon after his death, pope Paul III. gave the ground of Mount Palatino to his family: but I was told that this large piece of ground, in which one should look for the antiquities of the highest value, since it is the place where the grand palace of the Roman emperors was, hath never yet been looked into with any exactness: so that when a curious prince, or other great man, cometh to Rome, and is willing to employ many hands in digging up and down this hill, we may expect to hear of vast numbers of Roman antiquities; but when such an event will take place cannot be known, perhaps never; and all those curiosities will remain concealed to the latest ages of posterity.

As the churches and convents of Rome, in the number, the extent, the richness both of fabrick, furniture, painting, and other ornaments amaze one, so here again a stranger is lost, and the convent that one seeth last is always the most admired. I confess that the Minerva, which is the dominion where the inquisitor sitteth, is that which makes the most sensible impression upon one that passeth at Rome for an heretic; but unless a man committeth great follies, he is in no danger there; and the poverty that reigns in that city maketh them find their interest so much in using strangers well, whatsoever their religion may be, that no man needs be afraid there. And I have more than ordinary reason to acknowledge this, who, having ventured to go thither, after all the liberty I had taken to write my thoughts freely both of the church and state of Rome, and was known by all with whom I conversed here, yet met with the highest civility possible, both among the English and Scottish jesuits, though they knew well enough that I was no friend to their order.

In the gallery of the English jesuits, among the pictures of their martyrs, I did not meet with Gurnet, for, perhaps his name was so well known that they would not have exposed a picture with such a name on it to all strangers; and yet Oldcont being a name less known, was hung there among their martyrs, though he was as clearly convicted of the gunpowder treason as the other was. And it seemed a little strange to me, to see that, at a time when the writers of that communion have not thought fit to deny the conspiracy, a jesuit, convicted of the blackest crime that ever was projected, should be reckoned among their martyrs.

I happened to be at Rome during the fair of St. Gregory, which lasted several days, and in his church

the host was exposed. From thence, all the people went in procession to the house where, it was said, he had lived, and where a chapel is now erected, in which is the table where the victuals were spread, with which, it is said, he fed the poor.

I saw such vast numbers of people there, that one would have thought all Rome had got together. They all kneeled down to his statue, in the most devout manner, and, after a prayer said to it, they kissed his feet, and every one touched the table with his beads, as hoping to draw some virtue from it.

And here I am, in a manner, obliged to take notice of a curious piece of natural history; the truth of which was confirmed to me by Cardinal Howard, who treated me with every sort of respect while I was at Rome.

There were two nuns near Rome, and one, as I remember, was in the city, and the other not far from it, who, after they had been for some years in a nunnery, perceived a very great change in nature. Their sex seemed to be altered, which, by some degrees, grew to a total alteration in one: and though the other was not so totally changed, yet it was visible she was more man than woman. Upon this, the matter was looked into, and inquiry was made by the most learned physicians.

It was found that these persons had always been what they appeared to be at that time, and that they had gone into a convent in order to gratify a brutal passion. When I mentioned this, answer was made me, that the person who most resembled a woman had breasts like one of that sex, which a man never has. All the surgeons, many of whom were men of knowledge, declared, that they had been both born females; and if there had been the least doubt, they would have been proceeded against in the inquisition, with the utmost rigour. They were, however, both absolved from their vows, and, upon further inquiry, it was found that one of them had been formerly valet de chambre to an Italian nobleman.

At Civita I took shipping for Marseilles, and arrived safe in that city. The harbour here is safe, but the road is dangerous. It is certainly one of the best, if not really the best, sea-port in the world. The freedom the people enjoy, although under the command of the citadel, are so many, and of such an extensive nature, that many people come to it to enjoy the benefits arising from trade. Here one sees a great appearance of wealth; and the people live easy, agreeable, and happy.

There is in the port of this city a perpetual heat; and the sun was so strong in the Christmas week, that I was often driven off the quay. I made a tour from thence through Provence, Languedoc, and Dauphine. At Nismes, we saw the remains of a famous amphitheatre, with a vast number of other antiquities. Here the persecution of the protestants raged with the utmost fury, no regard being paid to age, rank, or sex. I do not believe that, were all the ten persecutions put together, their cruelties could equal this.

And here I observed, that many of the soldiers shuddered back at what they were commanded to commit; and they would have been less cruel, had not the priests hindered and threatened them. If any of the clergy seemed to be less blood-thirsty than others, they were in danger of being treated in the same manner as the protestants themselves. At every execution, a new thanksgiving was offered to the God of peace, and, as if they had been cloyed or tired with these executions, they sent the remainder to the galleys as slaves.

All these cruel, and more than barbarous proceedings, were approved of by the pope and court of Rome. The king (Lewis XIV.) was flattered as a faint; and nothing was to be heard in their pulpits but flattery on the conduct of their sovereign, invectives against the protestants, and inflammatory incentives to stir up the soldiers to be more cruel than they were. Of those condemned to the galleys, thus

much is certain, that they suffered so much, that they died a thousand deaths: that is, they were subjected to so many hardships, and suffered such cruel torments, that they died daily. Death, in a natural way, was longed for by them as a friend; and one of them, when chained to the oar, being brought up against an English ship of war, where he saw nothing but the prospect of death before him, under the agony of his sufferings, exclaimed, "O God, as it has been thy will to make my life miserable in this world, for the sake of my dear Redeemer, receive me into the arms of thy mercy."

From this depopulated country, and these dismal scenes of cruelty, I returned to Geneva, where I spent the winter, and with more pleasure than I thought to have met with any where out of England. But even that place was frequently interrupted, by the many lamentable accounts that were daily brought us concerning the severity of the persecution in France. But there is a sorrow by which the heart is made better; for while we lamented the sufferings of our fellow protestants, we knew they were suffering for the truth.

Before I left Geneva, there were a great number of English people there, of both sexes, so that I found we were able to make a small congregation: upon which I addressed myself to the council of twenty-three, to have the privilege of our own worship there, according to the liturgy of the church of England. This was immediately granted, in so obliging a manner, that there was not one person that made any exception to it. Nay, they sent one of their body to inform me, that, if a private room was not sufficient to contain our number, they would grant us the use of a church, as had been done in the reign of Queen Mary.

For this, however, there was no necessity; and during the remainder of my stay there, we had divine service according to the form of the church of England, and I preached to them every Sunday. The last Sunday I was there, I administered the sacrament, and, as some of the town's-people understood English, they partook along with us.

From Geneva, I went a second time through Switzerland to Basil, and, at Avranche, I saw the noble remains of a famous Roman work, which seems to have been the portico to some heathen temple. The cornices of the pillars are about four feet square, and are all executed in the Romish order. The temple had been dedicated to Neptune, or at least to some sea-god; for, on the fragments of the architecture, which are very beautiful, there are dolphins and sea-horses in bas-relief, and the nearness of the place to the lakes of Inverdam and Morat makes this more evident.

There is also a pillar standing up in its full height, or rather the corner of a building, in which one sees some of the remains of Roman architecture. If a person had time, and was stimulated by curiosity to search near this place, many remains of antiquity would undoubtedly be found. Morat is situated at a little distance, and on every side of it is a chapel, filled with the bones of the Burgundians that were killed by the Switzers, when this place was besieged by the famous Charles, duke of Burgundy, who lost a great army, which was entirely cut off by the besieged. The bones are so piled up that the chapel is quite filled with them, and there is an inscription engraven on a stone, intimating to the traveller the nature of the action.

When a traveller views the town of Morat, he is naturally surpris'd to think how a place so situated, and slightly fortified, could hold out against so powerful a prince, and so potent an army, who brought cannon against it.

I met with nothing remarkable between this and Basil, only that, while I staid at Bern, I became better acquainted with that city than before. I had then an opportunity of examining at large into their records, and read many curious particulars, that can have no room here.

Basil is a town of the greatest extent of any in Switzerland, but is not populous. The Rhine makes

a turning before it; and the town is situated on a rising ground, which hath a noble effect on the eye when one is upon the bridge; because it hath the appearance of a theatre. Little Basil, on the opposite side of the river, is almost a fourth part of the whole, and the town is surrounded by a wall and a ditch, but it could not sustain a long siege, there being nothing regular in the fortifications.

In the town hall is a famous painting of the Reformation, which has given much offence to the papists, though it ought not to have done so, because it was erected long before the Reformation. The painter, who seems to have been an arch wag, has placed the pope, with several cardinals, on the condemned side; and, in another part of the painting, their priests are represented to be in hell. It is imagined that the council which sat so long here, and conceived an inveterate hatred to the popes, caused this painting to be executed.

The cathedral of this city is a large and Gothic building, but the chamber where the council sat is but a mean place. The tomb for the great Erasmus, who died here, has nothing to recommend it; there being only a brass plate with his name. There are some fine paintings here, but in general they are very indecent. Most of these paintings are by the famous Holbein, who was a native of this place; and one of them contains all the parts of our joints so admirably represented, that nothing, perhaps, can equal the ingenuity of the artist. It is on wood, but the freshness of the colours is such, as we may suppose it to have been at the beginning. There are many other of his paintings here, but, except this, most of them have suffered through the injury of time.

The people in Basil are extremely decent in their habits, and very courteous to strangers. The clergy are strict in the discharge of their duty; the men attend to their business with a sober regularity; and the women attend to the conducting of their domestic affairs. All the married women go to the churches with coifs on their heads, so formed, that they come down and cover their eyes: another of these foldings covers their chins, so that nothing but the nose appears, and the whole turneth back into a folding that covereth their mid-legs. This coif is always white, so that, in all their churches, there are such a number of white heads as are not, perhaps, to be seen any where else in the world. The unmarried women wear their hats with the brims turned up behind and before; but they are so broad, that they stretch out to a considerable length. This fashion is not only common here, but likewise in many parts of Germany.

The next place I visited was Strasburgh, which is a great city indeed, situated on the banks of the Rhine, and has been for some time under the French government. The Lutherans, however, are tolerated, but they are obliged to have their meetings at a separate part of the town. In the public library here, are many curious manuscripts, but none of them are of great antiquity. As some of our reformers resided here during the reign of Queen Mary, so I met with several of their letters, particularly those of Dr. Jewel, afterwards bishop of Salisbury, from which I learned that he was not in love with the ceremonies; nor, indeed, were either Grindal or Sandys, who accompanied him. This, indeed, is not much to be wondered at, when we consider the temper of the people of that age.

Leaving Strasburgh, I went down the Rhine to Philipburgh, which is situated near a quarter of a mile from the river, and is only a small place, guarded by a few bastions: but there are so many marshes around it, that in them lieth the strength of the place. The French intended to have inclosed the fortifications, and have made the works capable of holding above a thousand men, but in this they were interrupted by the emperor, who marched a great army against them, and drove them away from the place, so that it has now very little to recommend it to public notice.

The next place we visited was Spreis, an imperial city, and where the diet of the empire frequently meets. This city is neither large nor rich, nor has it much to support it besides the imperial chamber. I wanted to have seen the form of their proceedings, but the court was not then fitting, so that I had not so much as an opportunity of examining their records. The halls and chambers of this court are mean beyond imagination, and have more the appearance of halls belonging to small companies, than to such an august body as the regulators of the German empire.

All the magistrates are Lutherans, but the Roman catholics keep the churches to themselves. The cathedral is a large Gothic building, and in it are many tombs of the emperors. These tombs are remarkable for their meanness, for they consist of nothing but a few flag-stones, with plain inscriptions upon them.

There are also to be seen here the marks of a ridiculous fable concerning St. Bernard, which is too foolish to be related, but, as it has been in much esteem, I shall endeavour to give some account of it.

There are, from the gate all along the nave of the church to the steps that lead up to the altar, four round pillars of brass, above a foot in diameter, and they are about the distance of thirty feet from each other; on the first of these is engraven, *O CLEMENS*; on the second, *O Pia*; on the third, *O Felix*; and on the fourth, *O Maria*.

The last is about thirty feet distant from a statue of the Virgin, and the traditional story is as follows:

One day, St. Bernard came up the whole length of the church at four steps, and these four palliades, with the plates, were laid in memory of it. At every step he pronounced the words engraven on them, till he came to the image of the Virgin, which, in a miraculous manner, called out, "Salve, Bernard;" upon which he answered "Let a woman keep silence in the church." They added, that the Virgin statue has kept silence ever since. I had no doubt concerning this last part of the story, because, I believe the statue never spoke either before or after.

It was a man of learning who shewed me this, and I asked him if he believed it. He told me, that not only himself and all the people in the place believed it, but also, that a jesuit had written a book to prove the truth of it. He said it was not an article of faith; so I was satisfied.

There is, in the cloyster, an old Gothick representation of our Saviour's agony in stone, with a great many figures of the apostles, and the company that came to apprehend him. The sculpture is not bad, when it is considered that it hath stood several centuries, and been exposed to all the inclemencies of the weather, which is severe here during the winter.

The Calvinists have a church in this town, but their members are not considerable. I was told, that here were several antient manuscripts in the cathedral; but the prebend here, to whom I addressed myself in order to see them, was too proud and too ignorant to give me any account of them, and the dean was absent; so that, whatever might be in them, I had no opportunity of perusing it.

From this place, we proceeded to the lower Palatinate, which is, undoubtedly, one of the finest countries in the world. It is a great plain till one comes to the rising ground upon which the city of Heidleberg is built; but we found the air extremely pure.

The castle is a most magnificent structure, and there is a cellar, with a ton in it filled with water, seventeen feet high, and twenty-six feet in diameter. It is built with a strength equal to that of the ribs of a ship, and is, perhaps, one of the greatest wonders in the world. It is a compliment paid to travellers to ask them to drink out of this tun, and some, for the sake of a bravado, do it to excess.

From Heidleberg to Frankfort, the road is the most beautiful that can be imagined: for, we went under a ridge of little hills that were all covered with vines; and from them, as far as the eye can reach, there is a most beautiful plain of corn-fields and mea-

dows, all regularly divided, and cloathed with rows of trees. The beauty of the place almost induced me to believe that I was once more in Lombardy; with this difference, that here was a pleasing inequality.

Frankfort is of great extent as a city, and it is well known what respect is paid to it by the Germans. Their squares are large and spacious, and they have some fine public structures. The churches are divided between the Lutherans and papists, so that I shall not say any thing concerning them here. From Frankfort we came down to Holland, where we found that illustrious prince William of Orange, who afterwards became king of England.

Such is the account that bishop Burnet hath left us of his travels; and such as know any thing of him, as a man, a scholar, an author, or a Christian, will frankly acknowledge, that no narrative could be more candid. This illustrious divine came over in the fleet with the prince of Orange, and was appointed bishop of Salisbury. In that high station he distinguished himself in such a manner as few clergymen in England had ever done before. He lived respected, and died lamented.

The travels of Mr. Addison through Italy, and several other parts of Europe.

The character of Mr. Addison is so well known, that we need not say much concerning him here. He was the son of Dr. Samuel Addison, dean of Litchfield, and was educated in grammar learning in the Charter-House, along with the celebrated Sir Richard Steele, so well known in the literary world.

From the Charter-House Mr. Addison was removed to Queen's-College, in Oxford, where he remained three years, and then was elected on the foundation of Magdalen's. When he had finished his studies at the university, he received an invitation from Sir John, afterwards lord Somers, at that time keeper of the great seal, who recommended him to king William.

The king settled upon him a pension of three hundred pounds a year, to enable him to travel into foreign parts; and these travels are the subject matter of the present narrative.

On the twelfth of December, 1699, says Mr. Addison, I set out from Marseilles for Genoa in a small vessel, called a tartan, and arrived late at a French port, called Cassis. The next morning we were surpris'd to see all the mountains about the town covered with green olive-trees, or laid out in beautiful gardens, which gave us a great variety of pleasing prospects, even in the depth of winter.

The most uncultivated of them produce abundance of sweet plants, such as wild thyme, lavender, balm, rosemary, and myrtle. We were shewn at a distance the deserts, which have been rendered so famous by the romance of Mary Magdalen, who, after her arrival with Lazarus, and Joseph of Arimathea, at Marseilles, is said to have wept away the rest of her life among these solitary rocks and mountains. It is so romantic a scene, that it gave occasion to Claudian, the poet, to write the following description of it:

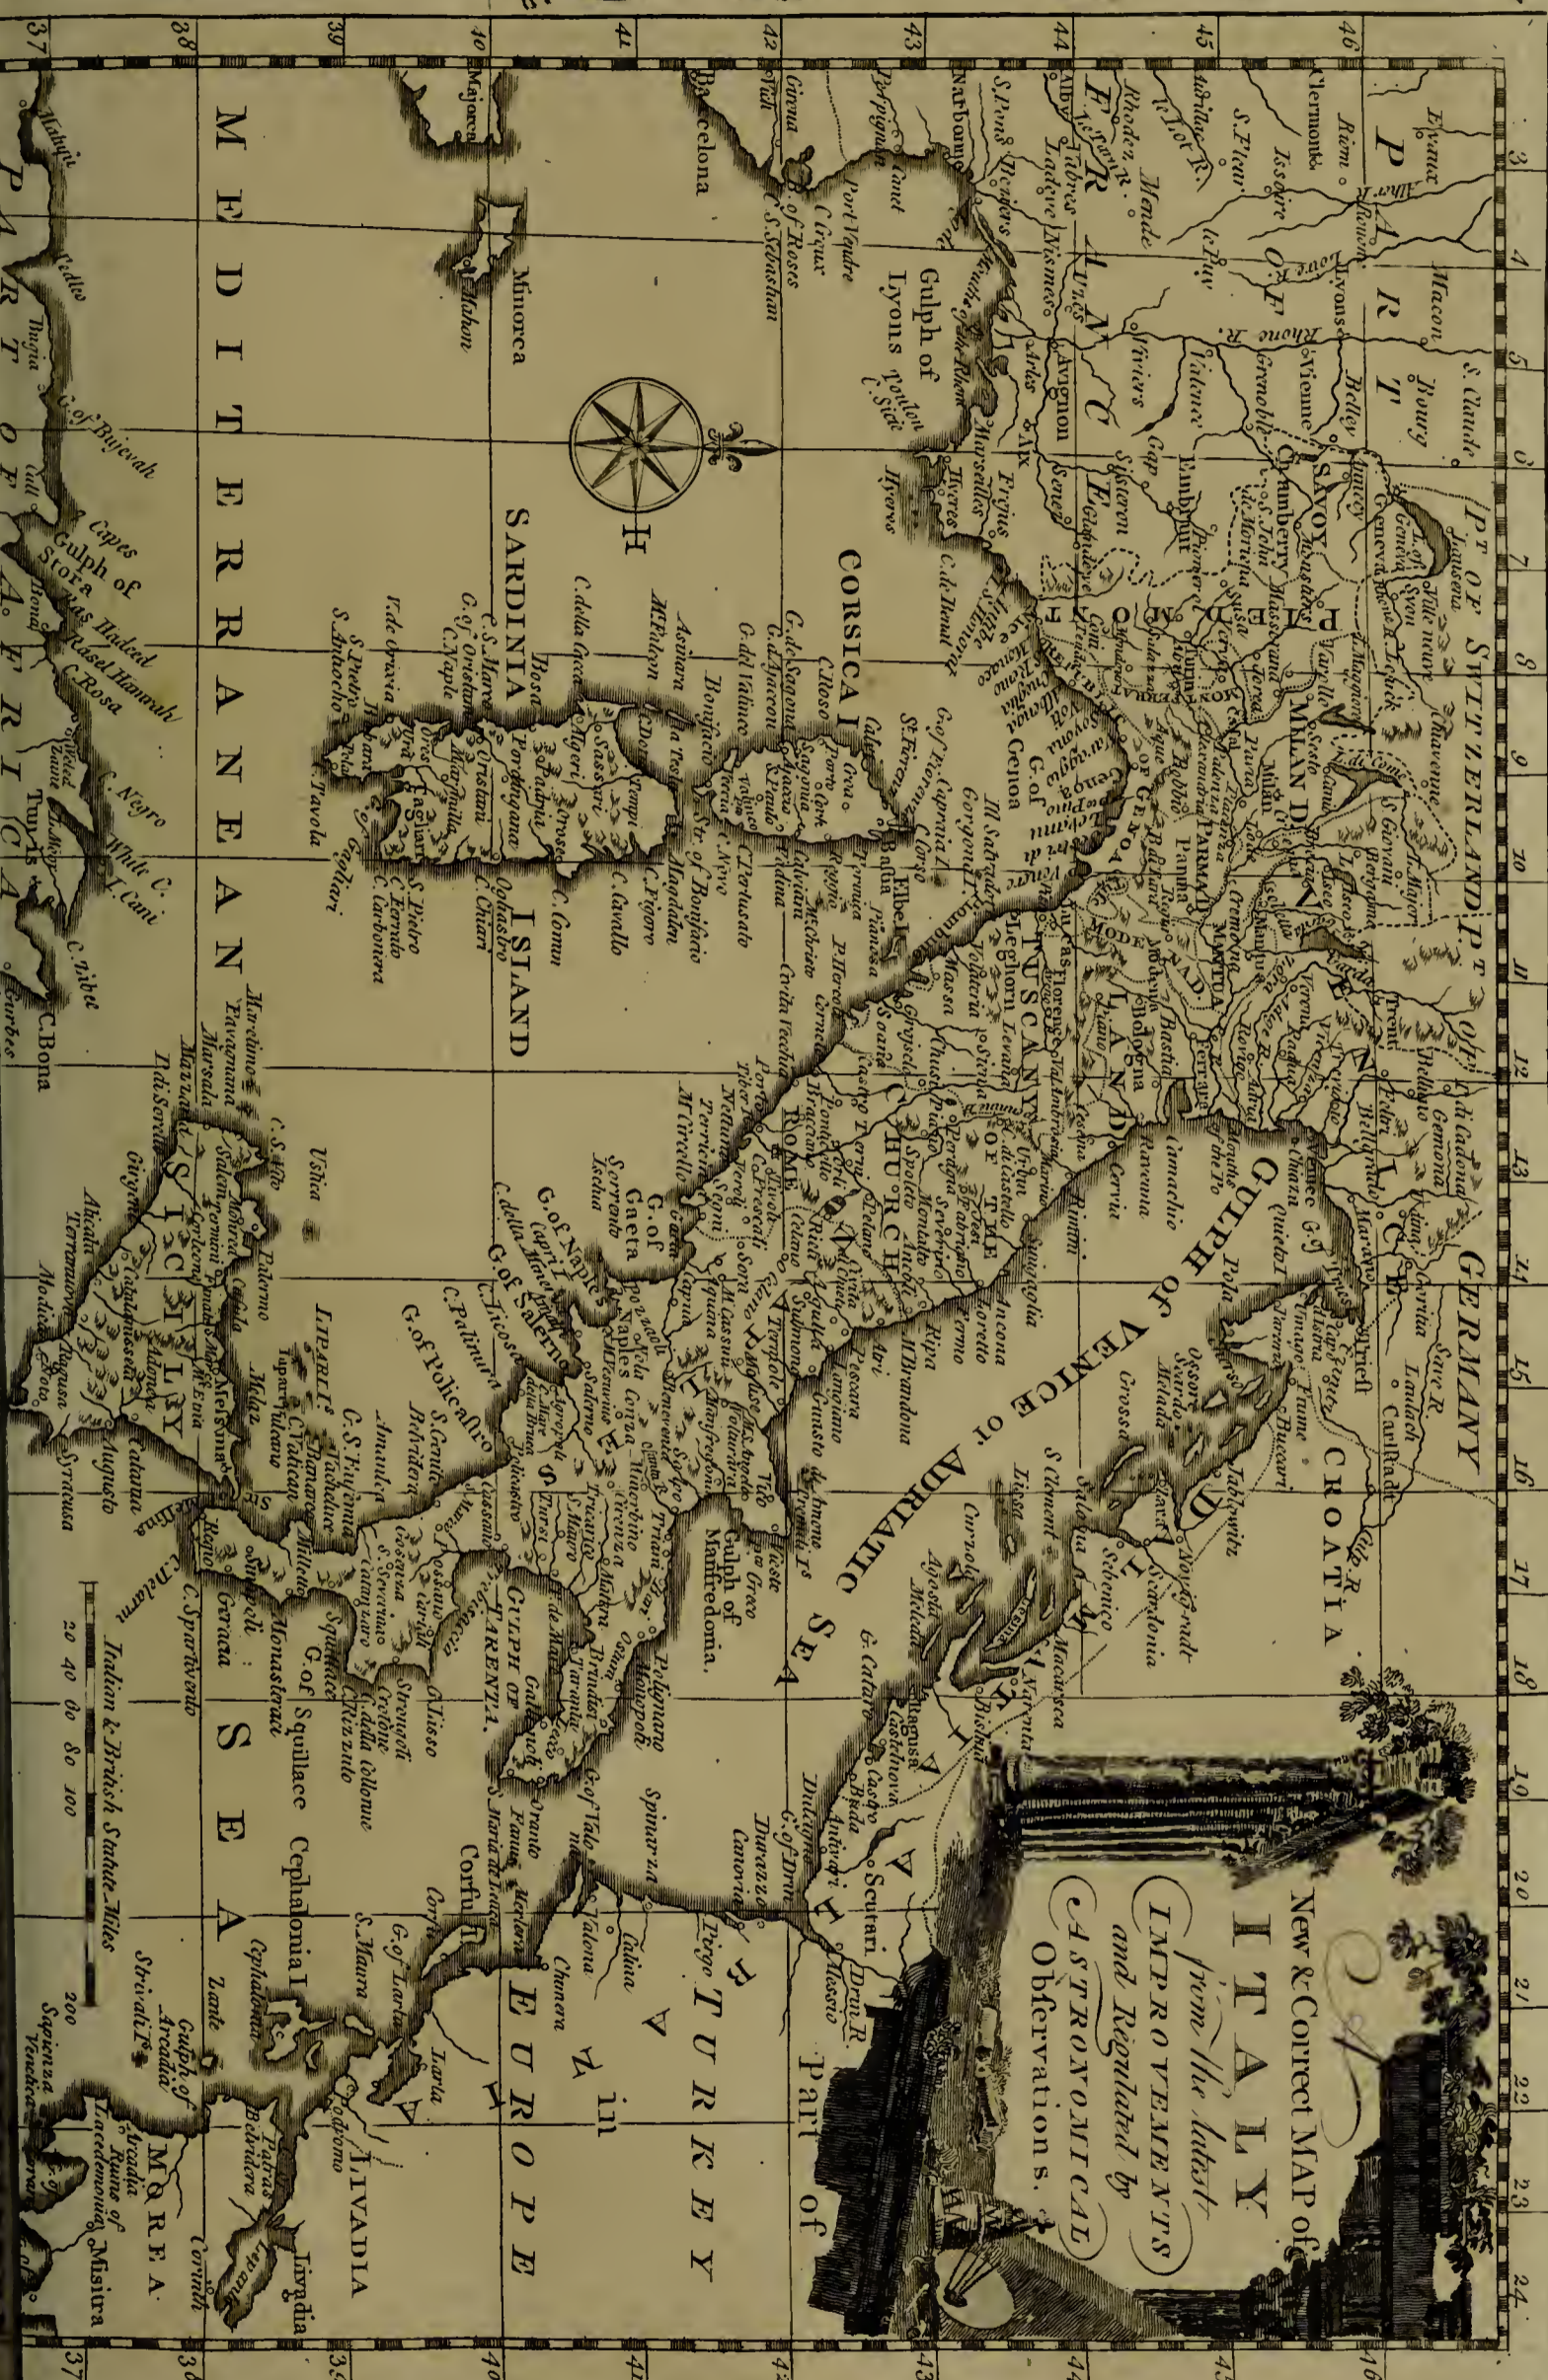

A place there lies on Gallia's utmost bounds,
Where rising seas insult the frontier grounds.
Ulysses here the blood of victims shed,
And rais'd the pale assembly of the dead.
Oft in the winds is heard a plaintive sound
Of melancholy ghosts, that hover round.
The lab'ring plowman oft with horror spies
Thin airy shapes, that o'er the furrows rise,
(A dreadful scene) and skim before his eyes.

The next day we set sail again, and made the best of our way, till we were forced, by contrary winds, into St. Rimo, a very pretty town, subject to the republic of Genoa. The front to the sea is not large, but there are a great many houses behind it, built up the side of the mountain, to avoid the winds and vapours that come from the sea.

Here we saw several persons, in the middle of December,

ember, who had nothing over their shoulders besides their shirts; and they did not so much as complain of the cold. It is certainly very lucky for the poorer sort to be born in a place that is free from the greatest inconveniences, to which people of our northern nations are subject. And, indeed, without this natural benefit of their climate, the extreme misery and poverty that are in most of the Italian governments, would be insupportable.

There are at St. Remo many plantations of palm-trees, that do not grow in other parts of Italy, nor, perhaps, in any other parts of the world. These seem to be peculiar to the country, for this soil differs from all others: but the poverty of the inhabitants is such, that they do not cultivate them on account of the rigor of the taxes that are imposed on them.

We sailed from hence directly for Genoa, and had a fair wind, that carried us into the middle of the gulph, which is remarkable for tempests, and scarcity of fish. It is probable, that the one may be the cause of the other. Whether it be that the fishermen cannot employ their art with so much success in so troubled a sea, or that the fish do not choose to inhabit such troubled waters, we cannot determine.

Thus Horace says,

While black with storms the ruffled ocean rolls,
And from the fisher's art defends her finny shoals.

We were obliged to live in the gulph two days, and our captain imagined his ship to be in so great danger, that he fell upon his knees, and confessed himself to a capuchin, who was on board along with us: but at last, taking the advantage of a side wind, we were driven back in a few hours as far as Monaco. Lucian has given us a description of this port, which we found so very welcome to us, after escaping so many dangers.

The winding rocks a spacious harbour frame,
That from the great Alcides takes its name:
Fenc'd to the west, and to the north it lies;
But when the winds in southern quarters rise,
Ships, from their anchors torn, become their sport,
And sudden tempests rage within the port.

There are but three towns in the dominion of the prince of Monaco, and the chief of them is situated on a rock, which runs out into the sea, and is well fortified by nature. It was formerly under the protection of the Spaniards; but some few years ago it drove out the Spanish garrison, and admitted a French one, which, when we were there, consisted of five hundred men. The officer, who shewed me the palace, told me, with a good deal of gravity, that the prince his master, and the French king, had always been good allies. Probably this ignorant fellow believed, that the kingdom of France was not larger than his prince's dominions.

The palace has handsome apartments, many of them being hung with rich tapestry, and a great variety of pictures: but as the prince was then at Rome, he had taken the greatest part of the furniture along with him. We hired a little boat here to carry us along the shore to Genoa; but at Savarna, finding the sea too high, we were forced to make the best of our way by land, over very rugged mountains and precipices; for this road is much more difficult than that over mount Cennis.

The Genoese are esteemed extremely cunning, and inured to hardships above the rest of the Italians; which was likewise the character of the old Ligurians. And, indeed, it is not much to be wondered at, while the barrenness of their country continues, that the manners of the inhabitants do not change; since there is nothing makes men sharper, or sets their hands and wits more at work, than want. The Italian proverb say of the Genoese, "They have a sea without fish, land without trees, and men without honesty."

Indeed this was the opinion of the antients, particularly Virgil.

VOL. II. No. 77.

Vain fool and coward, cries the lofty maid,
Caught in the train which thou thyself hast laid:
On others practise thy Ligurian arts;
Thin stratagems, and feats of little hearts,
Are lost on me; nor shalt thou safe retire,
With vaunting lies, to thy fallacious fire.

There are a great number of beautiful palaces standing along the sea shore, near Genoa, on both sides of the city, which makes the town appear much longer than it is, to those who sail past it. Most of these palaces are inhabited by the ancient nobility of the city, and particularly by those who are senators, and who have the privilege conferred upon them of conducting all the affairs of state.

The city of Genoa makes the noblest show of any in the world. The greater part of the houses are painted on the outside; so that they look extremely gay and lively: besides that, they are extremely high, and stand close to each other. The new street is a double range of palaces from one end to the other, built with much ingenuity, and fit for the greatest princes to inhabit. I cannot, however, be reconciled to their manner of painting several of their houses. Figures, perspectives, or pieces of history, are certainly very ornamental; but, instead of these, one often sees the fronts of their palaces painted with the figures of different orders. If these were so many columns of marble in their proper architecture, they would certainly very much adorn the palaces where they stand; but as they are now, they only shew us there is something wanting, and that the palace, which without these counterfeit pillars would be beautiful in its kind, might have been more perfect by the addition of such as are real.

About a mile distance from Genoa is the Imperial Villa, without any thing of this paint upon it; and consists of two rows of pillars, the one Doric, and the other Corinthian, and is one of the most handsome streets I ever saw.

The duke of Dorio's palace has the most handsome outside of any in Genoa, as that of Durazza is the best furnished within. There is one room in the first that is hung with tapestry, in which are wrought the figures of the great persons which the family has produced; for, perhaps, there is no town in Europe that can produce such a list of heroes, who have done so much good for their country. Andrew Dorio has a statue erected for him at the end of the doge's palace, with the glorious title of Deliverer of the commonwealth; and there is another to one of his family.

In the doge's palaces are the rooms where the great and little council sits, and where their public assemblies are held; but as the state of Genoa is very poor, though some of the members are rich, so one may observe more magnificence in the houses of private persons, than in those that belong to the public. But we find, in most of the states of Europe, that the people live in the greatest poverty, where the governors are rich.

The churches here are very fine, particularly that of the Annunciation, which looks wonderfully beautiful in the inside; all, except one corner of it, being covered with gilding or paint. One would expect to find, at Genoa, a great many remains of antiquity, especially as it has been so much celebrated by the Latin poets. But all they have to shew of this nature, is an old rostrum of a Roman ship, that stands over the door of their arsenal. It is not above a foot long, and, perhaps, would never have been thought the beak of a ship, had it not been found in the haven. It is all of iron, fashioned at the head like a boar's head, and figures of it have been frequently represented on medals.

It would have been well for the republic of Genoa, had she followed the example of Venice, in prohibiting her nobles from purchasing land or houses, in the dominion of foreign princes: for, at present, the greatest among the Genoese are subjects to the king of Spain; because they have estates in his dominions.

The Spaniards rate them very high, and are so sensible of the advantage this gives them over the republic, that they will not suffer a Neopolitan to purchase the lands of a Genoese; who, if he wants to sell, must find a purchaser among his own countrymen. For this reason, as well as on account of the great sum of money which the Spaniards owe the Genoese, they are under the necessity of being in the interest of the French, and would probably continue so, though all the other states of Italy should join in league against them.

Genoa, however, is not yet secure from the fatal consequences that might attend a bombardment, although it is not so much exposed as it was formerly. They have built a sort of a mole, with some little forts, and have provided themselves with long guns and mortars. But still it is easy for those who are strong at sea to bring them to what terms they please; for having but very little arable land, they are forced to bring most of their corn from Naples, Sicily, and other foreign countries, except what comes to them from Lombardy.

Their fleet that formerly gained so many victories, is now altogether contemptible. They had no more than six galleys while we were there, and although they built four more, yet the French king sent an order for them to be laid up, telling them, that he knew how many they had occasion for. This little fleet serves only to fetch them wine and corn, and to give their ladies an airing in the summer evenings. This republic has a crown and sceptre for its doge, by reason of their conquest of Corunna, where there was formerly a Saracen king. This indeed gives their ambassadors a more honourable reception at foreign courts, but, at the same time, it teaches the people to have a very mean opinion of their own government.

From Genoa we took chaise for Milan, and by the way stopped at Pavia, once the metropolis of a kingdom, but now a very poor town. We here visited the convent of Augustine Monks, who, in 1626, pretended they had found the body of that antient father. How St. Austin, who was buried at Hippo, in Africa, should be brought over to Italy, we could not tell, but relics, whether real or imaginary, are a vast fund of treasure for the church of Rome.

They told us, that the Gothic king Luitprand brought over these relics from Africa, and had them interred in the church of this convent. The monks did not consider that there were then no convents in the world. The monks, however, do not find their account in the discovery they have made; for there are some canons regular, who have one half of the same church, and they will not allow that these are the bones of this saint, nor has it been recognized by the pope, who, by his infallibility, can tell every thing!

The monks say, that the very name of the saint was written on the urn where the ashes lay, and that in an old record in the convent they are said to have been interred between the wall and the altar, where they were taken up. The monks had, when we were there, begun to justify themselves by miracles, but they were of such a bungling nature, that they only excited laughter.

At the corner of one of the cloysters of this convent are buried the duke of Suffolk, and the duke of Lorraine, who were both killed at the famous battle of Pavia. Their monuments were erected for them by one Charles Parker, a priest, as I learned from the inscription.

This pretended duke of Suffolk, was Sir Richard de la Pole, brother to the earl of Suffolk, who was put to death by Henry VIII. In his banishment he took upon him the title of duke of Suffolk, which had been ever since the attainder of the great duke of Suffolk, in the reign of Henry VI. He fought very bravely in the battle of Pavia, and was magnificently interred by the duke of Bourbon, who, though an enemy, assisted at his funeral in mourning. Parker the priest is buried in the same place, but who this man was, I could not learn. Probably one of these priests who had left

England at the time of the dissolution of the monasteries.

There is an university in Pavia, consisting of seven colleges, one of which was founded by cardinal Borneo, and is an exceeding fine structure. There is likewise a statue in brass of Marcus Antoninus, on horseback, which the people of the place call Charles V. and some critics, Constantine the Great.

This city is of great antiquity, and was called by the Romans, Ticinum, from the river Ticinus, that runs through it, and is now called the Tessin. This river falls into the Po, and is excessively rapid. And here we may observe, that either the antients were mistaken, or the course and motion of the river has changed; for the bishop of Salisbury tells us, that he sailed down it thirty miles in one hour, and our company found it the same. But how different is all this from what the poet Silius Italicus says,

Smooth and untroubled the Ticinus flows,
And through the bottom shining crystal flows.
Scarce can the sight discover if it moves,
So wond'rous slow amidst the shady groves;
And Tunfish birds that warble on its sides,
Within its gloomy banks the limpid liquor glides.

Between Pavia and Milan, I saw the famous convent belonging to the Carthusians, which is, perhaps, the noblest structure in the world.

At Milan we went to visit the great church, of which we had heard much before we left England. This vast pile of Gothic architecture is all of solid marble, except the roof, which would have been of the same materials, had not its weight rendered it improper, and too heavy for such a part of the building.

The outside of the church looks much better than the inside, for where the marble is often washed with rain, it preserves its freshness, and it continues to be as beautiful as when it was first erected. That side of the church indeed, that faces the Tramontane winds, is more disagreeable than the others, by reason of the dust and smook that are driven against it.

This profusion of marble, though astonishing to strangers, is not very wonderful in a country that has so many veins of it within its bowels. But though the stone is cheap, the workmanship is very expensive. It is allowed that there are upwards of ten thousand statues in and about this church, but in this number are included all the smaller ones. There are, indeed, a great number bigger than the life. I reckoned above two hundred and fifty on the outside of the church, though I only viewed three sides of it, and these were not very thick set.

These statues are all of marble, and for the most part finely executed; but the most valuable one they have is a St. Bartholomew, new flay'd, with his skin hanging over his shoulder. It is esteemed worth its weight in gold, and the people revere it above every thing in their church.

A little before the entrance into the choir is a small subterraneous chapel, dedicated to St. Charles Borneo, where I saw his body in episcopal robes, lying on the altar in a shrine of rock crystal. His chapel is adorned with abundance of silver work; he was but twenty-two years of age when he was appointed archbishop of Milan, and only forty-six at his death; but made so good a use of so short a time, by his works of munificence and charity, that his countrymen continue to bless his memory, which is still fresh amongst them. He was canonized some years ago, and I think that if this honour can be done to any man, I think such public spirited virtues may lay a juster claim to it than a four retreat from mankind, a fiery zeal against heresy, a set of chimerical visions, or of whimsical penances, which are, in general, the qualifications of Romish saints. Miracles, indeed are required of all those who aspire at this dignity, because they say a hypocrite may imitate a saint in all other particulars, and these they attribute a great number to Borneo.

His merit, and the importunity of his countrymen, procured

procured his canonization; before the ordinary time; for it is the policy of the Romish church, not commonly to allow this honour till fifty years after the decease of the person, who is the candidate for it; in which time it may be supposed, that all his contemporaries are worn out, who, if alive, could contradict a pretended miracle, or remember any infirmity of the saint.

One is apt to wonder why Roman catholics, who are fond of this kind of worship, do not address themselves to the holy apostles, who have a more unquestionable right to the title of saints, than those of a modern date. But these are at present quite out of the fashion in Italy, where there is scarce a great town which does not pay its devotions in a more particular manner to some saint of their own making. This renders it very suspicious that the interests of particular families, religious orders, convents or churches, have too great a sway in their canonization.

The great church of Milan has two noble pulpits, both made of brass, each of them running round a large pillar, like a gallery, and supported by large figures of the same metal. The history of our Saviour, or rather of the Blessed Virgin; for it begins with her birth, and ends with her coronation in heaven; but the history of our Saviour comes in only by way of episode. This piece is finely cut in marble, and was executed by one Andrew Biffy, an ingenious artist in that city.

This church prides itself in the number of its relics, and they have some which they pretend reach as high as the times of Abraham. Among others, they shewed us a fragment of our countryman Becket, as indeed there are very few treasures in Italy that has not a tooth (as they say) or some bone of this saint. It would be endless to reckon up the vast enormous loads of gold, and silver, in this church, together with precious stones, and many other valuable things.

There are in Milan sixty convents of women, eighty of men, and two hundred churches. At the Celestines is a picture in fresco, of the marriage of Cana, very much esteemed; but the painter, whether designedly or not, has put six fingers to the hand of one of the figures. They shewed us the gate which St. Ambrose ordered to be shut against the emperor Theodosius, as considering him unfit to assist at divine service, till he had done some extraordinary penance, for his having barbarously massacred the people of Thessalonica. The emperor, however, was so far from being in the least displeas'd with the behaviour of the saint, that at his death he committed to him the education of his children.

Some people have picked splinters of wood out of these gates, as relics. Near this church is a small chapel, where they say, St. Ambrose baptized St. Austin, and there is an inscription on the wall, that tells how St. Ambrose, on this occasion, first spoke and sung the *Te Deum*.

In one of the churches I saw a pulpit and confessional very finely inlaid with lapis-lazuli, and several kinds of marble, by one of the fathers of the convent. It is necessary that these men who have so much time on their hands, should have something to amuse themselves with; and, indeed, we often meet with some monks who were ingenious in painting, sculpture, engraving, mechanics, and all the other arts.

The Ambrosian library has but very few books, but there is a vast number of paintings and statues. This is in general the case throughout all Italy, where the people are more fond of shew than utility. In an apartment behind the library, are several curiosities, amongst which are Bruceul's elements; a head of Titian, by his own hand; a manuscript of Josephus, in Latin, as old as the time of the emperor Theodosius; and another of Leonardus Vinci, which king James I. could not procure, though he offered for it three thousand Spanish pistoles. It consists of a vast variety of designs in mechanism and engineering, and here we were shewn some of the first guns and mortars.

Among its natural curiosities, I took particular notice of a piece of crystal, that inclosed a couple of drops, which looked like water when they were shaken, though perhaps they were no more than bubbles of air. At Vendome, in France, I saw just such another curiosity as this, which the priests told us was one of the tears our Saviour shed over Lazarus, and was taken up by an angel, who put it into a crystal vial, and made a present of it to the Virgin Mary, or to Mary Magdalene. The famous father Mabillon was then employed in writing a vindication of this tear, which a learned priest in Venice wanted to suppress as an imposition.

Several pamphlets have been written concerning it, but all to very little purpose. It is in possession of the benedictine convent, and it brings in to these fathers a considerable revenue. Such ceremonies as these were well known to the antients. Thus we read in Claudian,

Deep in the snowy Alps, a lump of ice,
By frosts was harden'd to a mighty price;
Proof to the sun it now securely lies,
And the warm dog-star's hottest rage defies:
Yet still unripen'd in the dewy mines,
Within the ball a trembling water shines;
That through the crystal dart, its spurious rays,
And the proud stone's original betrays:
But common drops, when thus with crystal mix'd,
Are valued more than if in rubies fix'd.

As I walked through one of the streets of Milan, I was surpris'd to see a pillar erected to the memory of a barber, who had agreed with some malcontents to poison the whole of his fellow citizens.

The Italians consider Milan as a strong fort, and it is certain that it has sustained several very severe sieges, but at present it is too large to admit of regular fortifications; nor could it sustain a siege of three days; it would require such a numerous army to defend it, that they would soon eat up all the provisions in the town.

About two miles distance from Milan, there stands a building that would have been a master-piece in its kind, had the architect designed it for an artificial echo; we discharged a pistol, and had the sound returned upon us above sixty times, although the air was very foggy. The first repetitions follow one another very quick, but are heard more distinctly in proportion as they decay. Here are two parallel walks, which beat the sound back on each other, until they are quite worn out. This has been taken notice of by several of the learned, so that we shall not say any thing more concerning it.

The state of Milan is like a vast garden, surrounded by mountains and rocks. Indeed, when a man considers the face of Italy in general, he is led to imagine, that nature has laid it out for a variety of small governments. For as the Alps alone end at the long range of mountains that divide it, and branch out into several divisions, so they serve as so many natural fortifications. Accordingly, we find the whole country cut out into a vast number of small states, or as they call them, principalities. And so it was in antient times, till the Romans power, like a torrent, burst out upon them, and consigned them over to a state of slavery. This power rose from all those weak beginnings which generally attend an infant state, but in the end it became too great, and sunk into its primitive nothing.

In the court of Milan, as in many others of Italy, there are several persons who fall in with the dress and fashions of the French. One may, however, observe a backwardness in the Italians, which discovers that those gaudy airs they assume are not natural, but rather the consequence of affectation.

It is, indeed, very strange there should be such a diversity of manners, where there is so small a difference in the air and climate. The French are always open, familiar, and talkative; on the contrary, the Italians are still, ceremonious, and reserved. In France, every one aims at a gaiety of behaviour, and

thinks

thinks it an accomplishment to be brisk and lively. The Italians, notwithstanding their natural fierceness of temper, affect always to appear sober and sedate, so that one sometimes meets young men in the streets with spectacles on their noses, in order to make people imagine that they have impaired their sight by study, and seem more grave and judicious than their neighbours.

This difference of manners proceeds chiefly from difference in education. In France, it is usual to bring their children into company, and to cherish in them, from their infancy, a kind of forwardness and assurance. Besides that, the French apply themselves more universally to their exercises than any other nation in the world; so that one seldom sees a young gentleman in France that does not dance, fence, and ride to some tolerable perfection.

These agitations of the body do not only give them a free and easy carriage, but have, at the same time, a kind of material operation on the mind, by keeping the animal spirits always awake and in motion. But what contributes most to this light airy humour of the French is, the free conversation that is allowed them with their women, which does not only communicate to them a certain vivacity of temper, but makes them endeavour after such a behaviour as is most taking with the female sex.

The Italians, on the contrary, who are excluded from making their court this way, are for recommending themselves to those they converse with by their gravity and wisdom. In Spain, where there are fewer liberties of this nature allowed, there is something still more serious and composed in the manner of the inhabitants. But as mirth is more apt to make proselytes than melancholy, it is observable the Italians have gone much into the French fashions.

It may be worth while to consider how it comes to pass that the common people of Italy have, in general, so very great an aversion to the French; which every traveller cannot but be sensible of that has passed through the country. The most obvious reason is, certainly, the great difference that there is in the humours and manners of the two nations, which always works more upon the meaner sort, who are not able to vanquish the prejudices of education, than with the nobility. Besides that, there is a vast difference between the gravity of the Italians, and the vivacity of the French. In Italy, they are very reserved; in France all manner of freedoms are used, without proceeding to indecencies.

At the same time the people of Italy, who dwell much upon news and politics, have, in general, some notions that lead them to hate the French. It is certain, that the people of Milan prefer the Germans to the French; and the reason seems to be, that they are jealous of the French getting a settlement in their country. This, however, cannot take place while the Italian states keep on good terms with the king of Sardinia; for it would be in a manner impossible to march an army across the Alps, without his permission, unless it was done by sea, which would be attended with many difficulties.

We shall conclude our account of Milan in the following beautiful lines from Ausonius.

Milan with plenty and with wealth o'erflows;
And num'rous streets and cleanly dwellings shows:
The people, blest'd with nature's happy source,
Are eloquent and chearful in discourse;
A circus and a theatre invites
Th' unruly mob, to races and to fights;
Monaca consecrated buildings grace,
And the whole town redoubled walls embrace.
Here spacious baths, and palaces are seen,
And intermingled temples rise between;
Here circling colonades the ground inclose,
And here the marble statues breathe in rows:
Profusely grand, the happy town appears,
Nor Rome itself, her beauteous neighbours fears.

From Milan, we travelled over a very beautiful

country to Brescia, and, by the way, crossed the river Adda, that falls into the lake of Como, and running out at the other end, loses itself in the river Po, which is the great receptacle of all the rivers in this country.

The town and province of Brescia have their access to the senate of Venice, and have a quicker redress of grievances than the inhabitants of any other parts of their dominions. They have always a mild and prudent governor, and live much more happily than their fellow subjects. For, as they were once a part of the Milanese, and are now on their frontiers, the Venetians dare not exasperate them, lest they should revolt. They are forced, from these motives, to treat them with more indulgence than the Spaniards do their neighbours, that they may have no temptation to rebel.

Brescia is famous for its iron works, but these are so well known, that they need not a particular description. A small day's journey more brought us to Verona, where we saw, in our way, the lake Benacus. It was so rough with tempests where we passed by it, that it brought into my mind Virgil's noble description of it.

Here, vex'd by winter storms, Benacus raves,
Confus'd with working sands and rolling waves;
Rough and tumultuous like a sea it lies,
So loud the tempest roars, so high the billows rise.

There is something very noble in the theatre at Verona, though many parts of it are now fallen to decay. The lower seats are almost sunk into the earth, although it was formerly high enough to let the people see the engagements and combats with safety. That these combats consisted of a mixture of barbarism, cannot be doubted; and yet in those days they were not without their utility. It is, undoubtedly, barbarous to torment an animal, which, however ferocious, was in some sense or other created for the use of man: and yet lord Lyttelton has justly observed, that as the bull-fights fell into disrepute in Paris, the martial spirit of the people dwindled into cowardice. It was just the same among the Romans; for horrid as these engagements were, they stimulated the youth on to exercise, and detached them from those effeminate practices, which, in the end, overthrew their empire.

Claudian has finely described these shows in words to the following import:

So rushes on his foe the grisly bear;
That banish'd from the hills and bushy brakes,
His old hereditary haunts forsakes:
Condemn'd, the cruel rabble to delight,
His angry keeper goads him to the fight.
Bent on his knees, the savage glares around,
Scar'd with the mighty crowd's promiscuous sound;
Then rearing on his hinder paws, retires,
And the vast hissing multitude admires.

There are several other antiquities in Verona, of which the principal is the ruin of a triumphal arch, erected in honour of Flaminius, where one sees old doric pillars, without any pedestal or basis, as Vitruvius has described them. I have not yet seen any gardens in Italy worth taking notice of; for the Italians, in this particular, fall much short of the French.

It must, however, be said, to the honour of the Italians, that the French took from them the first plans of their gardens, as well as of their water-works: so that their surpassing them at present is to be attributed rather to the greatness of their riches; than the excellence of their taste. I saw the terrace-garden of Verona, but it did not seem to have any thing curious in it. The walks are but badly laid out; the prospect is delightful.

Among the churches, that of St. George is the handsomest. Its chief ornament is the martyrdom of that faint; done by Paul Veronese; and there are many other paintings in the town, done by the same hand.

hand. A stranger is always shewn the tomb of pope Lucius, who lies buried in the dome. I saw in the same church a monument, erected by the public, to the memory of one of their bishops. The inscription borders on blasphemy, for it compares him to his Maker.

The Italian epitaphs are generally more wild and extravagant than those of other nations, because the people delights in hyperbole. This may serve to shew, that they are not what the old Romans were, who had that cool deliberation that should always distinguish men of sense and understanding.

From Verona to Padua we travelled over a very beautiful country. It is planted thick with rows of white mulberry-trees, that furnish food for great quantities of silk-worms, with their leaves, as the swine and poultry consume the fruit. The trees themselves serve at the same time as so many stays for their vines, which hang all along like garlands from tree to tree. Between the several ranges lie fields of corn, which, in these warm countries, ripen much better among the mulberry shades, than if it were exposed to the open sun. This was one reason why the inhabitants of this country, when I passed through it, were extremely apprehensive of seeing Lombardy the seat of war, which must have made miserable havock among the plantations; for it is not here as in the corn fields of Flanders, where the whole product of the place rises from year to year.

We arrived so late at Vicenza, that we had not time to take a proper view of the place. The next day brought us to Padua. St. Anthony, who lived above five hundred years ago, is the great saint to whom they here pay their devotions. He lies buried in the church that is dedicated to him at present, though it was formerly dedicated to the blessed virgin. It is extremely magnificent, and very richly adorned. There are narrow cliffs in the monument that stands over him, where good catholics rub their beads, and smell his bones, which, they say, have in them a natural perfume, though very like apoplectic balsam; and what would make one suspect they rub the marble with it, it is observed, that the scent is stronger in the morning than at night.

There are abundance of pictures and inscriptions hung up by his votaries, in several parts of the church; for it is common for those who are in any signal danger, to implore his aid; and if they come off safe, they call their deliverance a miracle, seldom neglecting to hang up something in memory thereof in the church. This custom spoils the beauty of many Roman catholic churches, and often covers the walls with wretched daubings, impertinent inscriptions, heads, legs, and arms of wax, with a thousand idle offerings of the same nature.

They sell at Padua the life of St. Anthony, which is read with great devotion. The most remarkable part of it is, his address to an assembly of fishes. As the audience and sermon are both very extraordinary, I will set down the whole passage at length.

“When the heretics would not regard his preaching, he betook himself to the sea shore, where the river Marecchia disembogues itself into the Adriatic. He here called the fish together in the name of God, that they might hear his holy word. The fish came swimming towards him in such vast shoals, both from the sea and from the river, that the surface of the water was quite covered with their multitudes.

“They quickly ranged themselves according to their several species, into a very beautiful congregation, and like so many rational creatures, presented themselves before him, to hear the word of God. St. Anthony was so struck with the miraculous obedience and submission of these poor animals, that he found a secret sweetness distilling upon his soul, and at last addressed them in the following words:

“Although the infinite power and providence of God, my dearly beloved fish, discovers itself in all the works of his creation; in the heavens, in the sun, in the moon, in the stars, in this lower world, in

men, and in other perfect creatures; nevertheless the goodness of the Divine Majesty shines out in you more eminently, and appears after a more peculiar manner, than in any other created beings: for notwithstanding you are comprehended under the name of reptiles, partaking of a middle nature between men and beasts, and imprisoned in the deep abyss of water; notwithstanding you are tost among billows, thrown up-and-down by tempests, deaf to hearing, dumb to speech, and terrible to behold:

“Notwithstanding, I say, these natural disadvantages, the divine greatness shews itself to you after a very wonderful manner. In you are seen the mighty mystery of an infinite goodness: the holy scriptures has always made use of you as the types and shadows of some profound sacrament.

“Do you think, without a mystery, the first present that God Almighty made to man was of you; O ye fishes? Do you think, that without a mystery; among all creatures and animals which were appointed for sacrifices, you only were excepted? O ye fishes, do you think there was nothing meant by our Saviour Christ, that, next to the paschal lamb, he took so much pleasure in the food of you? O ye fishes, do you think it was by mere chance, that when the Redeemer of the world was to pay a tribute to Cæsar, he thought fit to find it in the mouth of a fish? These are all of them so many mysteries and sacraments, that oblige you, in a more peculiar manner, to the praises of your Creator.

“It is from God, my beloved fish, that you have received being, life, motion, and sense: it is he that has given you, in compliance with your natural inclinations, the whole world of waters for your habitation. It is he that hath furnished it with lodgings, chambers, caverns, grottos, and sent such magnificent retirements as are not to be met with in the seats of kings, or in the palaces of princes. You have the water for your dwelling, a clear transparent element, brighter than crystal; you can see, from its deepest bottom, every thing that passes on its surface; you have the eyes of a lynx, or of an Argus; you are guarded by a secret and unerring principle, delighting in every thing that may be beneficial to you, and avoiding every thing that may be hurtful; you are carried on by a hidden instinct to preserve yourselves, and to propagate your species; you obey, in all your actions, works, and motions, the duties and suggestions of nature, without the least repentance or contradiction.

“The colds of winter, and the heats of summer, are equally incapable of molesting you. A serene or a clouded sky are indifferent to you; let the earth abound with fruits, or be cursed with scarcity, it has no influence on your welfare; you live secure in rain and thunder, lightning and earthquakes; you have no concern in the blessing of spring, or in the glowings of summer; in the fruits of autumn, or in the frosts of winter; you are not solicitous about hours or days, months or years, the variableness of the weather, or the change of seasons.

“In what dreadful majesty, in what wonderful power, in what amazing providence, did God Almighty distinguish you among all the species of the creatures that perished in the universal deluge! You only were insensible of the mischief that had laid waste the whole world.

“All this, as I have already told you, ought to inspire you with gratitude and praise towards the Divine Majesty, that has done such things for you, granted you such particular graces and privileges, and heaped upon you so many distinguishing favours. And since, for all this, you cannot employ your tongues to the praises of your benefactor, and are not provided with words to express your gratitude, make at least some sort of reverence: bow yourselves at his name, give some shew of gratitude according to the best of your capacities; express your thoughts in the most becoming manner that you are able, and be not unmindful of all the benefits he has bestowed upon you.”

He had no sooner done speaking, but behold a miracle! The fish, as though they had been endowed with reason, bowed down their heads with all the marks of a profound humility and devotion, moving their bodies up and down with a kind of fondness, as approving what had been said by the blessed father St. Anthony. The legend adds, that after many heretics, who were present at the miracle, had been convinced by it, the saint gave his benediction to the fish, and dispersed them.

They who reads this sermon, will easily conceive that it was forged by some one of the monks, not many years ago.

The custom of hanging up limbs in wax, is derived from the old heathens, who used, upon their recovery, to make an offering in wood, metal, or clay, of the part that had been afflicted with the distemper, to the deity whom they imagined delivered them. I have seen, I believe, every limb of a human body figured in iron or clay, which were, at different times, made on this occasion.

The church of St. Justina, designed by Palladio, is the most handsome, luminous, disincumbered building, in the inside, I ever saw, and is esteemed, by many artists, the finest piece of architecture in Italy. The nave consists of a row of five cupolas, and the cross one has, on each side, a single cupola, deeper and broader than the others. The martyrdom of St. Justina hangs over the altar, and was painted by Paul Veronese. In the great hall of Padua is a stone, on which every debtor, who swears he is not worth five pounds, must sit, with his bare buttocks, one hour at least, and then he is discharged.

The university of Padua is much more regular than it was formerly, though it is not yet safe walking the streets after midnight. There is, in this city, a manufactory of cloth, which has brought in very great revenues to the republic. At present, the English have engrossed most of the Venetian trade, and few of the Venetian nobility wear any cloaths but what they import from England.

The original of Padua is thus set down by the poet:

Antenor, from the midst of Grecian hosts,
 Could pass secure, and pierce the Illyrian coasts;
 Where rolling down the steep, Tinnaxes raves,
 And through nine channels disembogues his waves:
 At length he founded Padua's happy seat,
 And gave his Trojans a secure retreat;
 This fix'd their arms; and there renew'd their
 nerves,
 And there in quiet lies——

From the city of Padua, I went down the river Brent, in the common ferry-boat, which brought me, in a day's time, to Venice. This celebrated city has been often described, but never to any satisfaction: I shall, therefore, be a little particular concerning it. Indeed, I took great care to inform myself of every particular relating to it; to consider its origin from obscurity, its progress to grandeur, and its present state; its conquests in the islands of the Archipelago, its military force, the nature of its government, whether civil or ecclesiastical, the state of its senate, its power as a political state, the weight it bears in the balance of power between the contending parties, the power of the inquisition in that republic, its influence on the manners of the people, and all the other particular circumstances.

The city of Venice stands, at least, four miles from any part of the Terra Firma; nor are the shallows that lie across it ever frozen hard enough to bring over an army from the land side; the constant flux and reflux of the sea, or the natural mildness of the climate, hindering the ice from getting to any thickness, which is an advantage the Hollanders want, when they have laid all their country under water. On the side that is exposed to the Adriatic, the entrance is so difficult to hit, that they have marked it out with several stakes, driven into the ground, which they would not fail to cut upon the approach of an enemy's fleet.

For this reason, they have not fortified the little islands, that lie at the entrance, to the best advantage, which might, otherwise, very easily command all the passes that lead to the city from the Adriatic. Nor could an ordinary fleet, with bomb vessels, hope to succeed against a place that has always in its arsenal a considerable number of galleys and men of war, ready to put to sea on a very short warning. If we could, therefore, suppose them blocked up on all sides by a power too strong for them, both by sea or land, they would be able to defend themselves against every thing but famine; and this would not be a little mitigated by the great quantities of fish their seas abound with, and that may be taken up in the midst of their very streets, which is such a natural magazine as few other places can boast of.

This city stands very convenient for commerce. It has several navigable rivers, that run up into the body of Italy, by which they might supply a great many countries with fish and other commodities; not to mention their opportunities of going to the Levant, and each side of the Adriatic. But, notwithstanding these conveniencies, their trade is far from being in a flourishing condition, for many reasons. The duties are great that are laid on merchandizes, and their nobles think it beneath their dignity to have any connection with trade.

From these circumstances, the merchants manage most of the public affairs, and, whenever they please, they can buy the nobility; that is, they can purchase titles, and then they leave off trade. Formerly, they engrossed to themselves the whole manufacture of silk, glass, and rich cloth; but now they are excelled by several countries in Europe. They are tenacious of old laws and customs, to their great prejudice; whereas a trading nation must be still for new customs and expedients, as different junctures and emergencies arise.

The state is, at present, very sensible of this decay in their trade, and, as a noble Venetian, who is still a merchant, told me, they will speedily find out some method to redress it; possibly, by making it a free port: for, they look with an evil eye upon Leghorn, which draws to it most of the vessels bound for Italy. They have hitherto been so negligent in this particular, that many think the great duke's gold has had no small influence in their councils.

Venice has several things in it that are not to be found in other cities, so that no place can be more entertaining to a traveller. It looks, at a distance, like a great town floated by a deluge; for, there are canals every-where crossing it; so that one may go to most houses either by land or by water. This is a very great convenience to the inhabitants; for a gondola, at Venice, with two oars, is as magnificent as a coach and six in another country; besides that, it makes all sorts of carriages extremely cheap.

The streets are, for the most part, paved with brick, or free-stone, and always kept very neat; for there is no carriage, not so much as a chair, passes through them. There is an innumerable multitude of very handsome bridges, each of one single arch, and without any fence on either side, which would be a great inconveniency to any city, where the people are less sober than in Venice. One would, indeed, wonder that drinking is so little in vogue among the Venetians, who are in a moist air and a moderate climate, and have no such diversion as hunting, fowling, walking, riding, and such-like exercises, to employ them without doors.

But, as the nobles are not to converse too much with strangers, they are not in much danger of learning it; and they are, generally, too distrustful of one another, for the freedoms that are used in such kind of conversation.

In the noble families, the furniture is not always rich, except their pictures, which they have in greater plenty than in any other place in Europe, and from the hands of the best masters of the Lombard school. Their rooms are generally hung with gilt leather, which they cover, on extraordinary occasions, with
 tapestry.

Engraved for, Hooper's Voyages and Travels.

The beautiful WATERFALL at TIVOLI, in ITALY.

tapestry, and other hangings of great value. The flooring is a kind of red plaister, made of brick ground to powder, and afterwards worked into mortar: it is rubbed with oil, and makes a smooth shining and beautiful surface. These particularities are chiefly owing to the moisture of the air, which would have an ill effect on the other kinds of furniture, as it shews itself too visibly in some of their best paintings.

Though the Venetians are extremely jealous of any great merit or fame in a living member of their commonwealth, they never fail of giving a man his due praises, when they are in no danger of suffering from his ambition. For this reason, though there are a great many monuments erected to such as have been benefactors to the public, yet they frequently add many others after their death.

When I was at Venice, they were making very curious stones of the several edifices that are most famous for their beauty or magnificence. The arsenal of Venice, is an island about three miles round, and contains all the stores and provisions for war, although they have seldom any use for them. Here are docks for their gallees and ships of war, most of which are full, as well as warehouses for all land and naval preparations for war. That part of it where arms are laid up, makes a great show, and was once very extraordinary, but, at present, a great part of its furniture is grown useless. There seems to be as many suits of armour as there are guns: the swords are old fashioned and unweildy, and the fire-arms are fitted with locks of little convenience, in comparison of those that are now in use.

The Venetians pretend they could, in case of necessity, fit out thirty ships of war, with one hundred gallees; but I could not conceive how they could man a fleet of half the number. It was certainly a mighty error in this state, to make so many conquests on the Terra Firma, which has only served to raise the jealousy of the Christian princes, and, about three hundred years ago, had like to have ended in their utter extirpation; whereas, had they applied themselves with the same politics and industry, to the increase of their strength by sea, they might, perhaps, have now had all the islands in the Archipelago in their hands; and consequently the greatest fleet, and the most seamen of any state in Europe. Besides that, this would have given no jealousy to the princes their neighbours, who would have enjoyed their own dominions in peace, and would have been very well contented to have seen so strong a bulwark against all the forces and invasions of the Turks.

This republic has been much more powerful than it is at present, and it is not likely to rise to its former greatness. It is not impossible but that some political countries may deprive them of all their conquests; for all they have on the continent might be taken in one summer, their fortifications being poor wretched things.

On the other side, the Venetians are in continual apprehensions from the Turks, who will certainly endeavour at the recovery of the Morea, as soon as they have recruited a little of their antient strength. They are now very sensible that they ought to have pushed their conquests on the other side of the Adriatic, into Albania, for then their territories would have lain together, and have been nearer the fountain head, to have received succours on occasion. But the Venetians are bound by articles to resign into the hands of the emperor whatever dominions they conquer from the Turks.

The noble Venetians think themselves equal, at least, to the electors of the empire, and but one degree below kings; for which reason, they seldom travel into foreign countries, where they must undergo the mortification of being treated like private gentlemen. Yet it is observable in them, that they discharge themselves with a great deal of dexterity in such embassies and treaties as they undertake for the republic; for their whole lives are employed in intrigues of state, and they frequently give themselves the air

of princes, of which the ministers of other nations are only the representatives.

There were, at one time, two thousand five hundred nobles in this republic, but at present there are not above fifteen hundred, notwithstanding the addition of many new families. It is very strange that, with this addition, they are not able to keep up their antient number, considering that the nobility spreads through all the brothers, and very few are killed in the wars. This must be partly owing to their luxury, and to the celibacy of the younger brothers, or, perhaps, to the last time the plague was here, which swept away a great many of them.

They generally thrust the young ladies into convents, the better to preserve their estates. This makes the Venetian nuns famous for the liberties they allow themselves. They have openings within the walls of their convents, and often go out of their bounds to meet their admirers. They have many of them their lovers, who converse with them daily at the grate: and are very free to admit a visit from a stranger. There is, indeed, one of Cornara's, that will not admit of visits from persons under the degree of princes.

The carnival of Venice is every where talked of; the grand diversion of the place at that time, as well as on other occasions, is masking. The Venetians, who are naturally grave, love to give into the follies and entertainments of such seasons, when disguised in a false personage. They are, indeed, under a necessity of finding out diversions that may agree with the nature of the place, and may make some amends for the loss of several pleasures that may be met with on the continent. These disguises give occasion to abundance of love adventures, for there is something more intriguing in the amours of Venice than in that of other countries; and I question not, but the secret history of a carnival would make a collection of very diverting novels.

Operas are another grand entertainment at this season, and the poetry is generally as bad as the musick is good. The subjects are frequently taken from some passages in the classical authors, which look ridiculous enough; for who can endure to hear one of the old hardy Romans squeaking through the mouth of a eunuch, especially as they may chuse a subject out of courts, were eunuchs are kept.

The operas that were mostly in vogue at Venice, while I was there, were built on Cæsar and Scipio, as rivals for Cato's daughter. The daughter gives the preference to Cæsar, which is the occasion of Cato's death. Before he kills himself, he withdraws into his library, and after a short soliloquy, he strikes himself with the dagger he holds in his hand; but being interrupted by one of his friends, he stabs him for his pains, and by the violence of the blow breaks the dagger on one of his ribs, so that he is forced to dispatch himself by tearing up his first wound. This last circumstance puts me in mind of a contrivance in the opera of St. Angelo, that was acted at the same time.

The king of the play endeavours at a rope, but the poet being resolved to save the honour of his heroine, has so ordered it, that the king always acts with a great case knife stuck in his girdle, which the lady snatches from him in the struggle, and so defends herself. The comedies at Venice are more lewd than in any other country, for their poets have no notion of common decency, much less of gentility. There is no part generally so wretched, as that of the fine gentleman, especially when he converses with his mistress, for then the whole dialogue is a mixture of pedantry and romance.

On Holy Thursday, among the several shews that are exhibited, here I saw one odd enough, and is in all respects particular to the Venetians. There is a set of artists, who, by the help of several poles which they lay across each others shoulders, build themselves up into a kind of pyramid, so that one sees a pile of men in the air of four or five rows rising one above another. The weight is so equally distributed, that every man is

able very well to bear his part of it; the stories, if I may so call them, growing less and less as they advance higher. A little boy represents the point of the pyramid, who, after a short space, leaps off with a great deal of dexterity into the arms of one that catches him at the bottom. In the same manner, the whole building falls to pieces. I have been the more particular on this, because it explains the following passage in Claudius, which shows the Venetians are not the inventors of this trick.

Man pil'd on man, with active leaps arise,
And build the breathing fabric to the skies;
A sprightly youth above the topmost row,
Points the tall pyramid, and crowns the show.

It is well known that Venice is of a very modern date, compared with the time of Claudius; but for all that his famous city has been celebrated by many of the modern poets, among whom was Sannazarius.

Venetia stands with endless beauties crown'd,
And as a world within herself is found;
Hail, queen of Italy! for years to come,
The mighty rival of immortal Rome!
Nations and seas are in thy streets enroll'd,
And kings among thy citizens are told,
Ausonia's brightest ornament! by thee
She sits as sovereign, uninflav'd and free:
By thee the rude barbarian, chas'd away,
The rising sun cheers with a purer ray
Our western world, and doubly gilds the day.
Thou too shalt fall by time, or barbarous foes,
Whose circling walls the seven fam'd hills inclose;
And show whose rival towers invade the skies,
And thou from midst the waves with equal glory rise.

At Venice, I took a barge for Ferrara, and in my way thither saw several mouths of the Po, by which it empties itself into the Adriatic. It is certain this is one of the most rapid rivers in Italy, and runs with an amazing swiftness.

The Po, that rushing with uncommon force,
O'ersets whole woods in its tumultuous course;
And rising from Hesperius' wat'ry veins,
The exhausted land of all his moist'ning drains.
The Po, as sings the fable, first convey'd,
Its wand'ring current through a poplar shade:
For when young Phaeton mistook his way,
Lost and confounded in the blaze of day,
This river with surviving streams supply'd,
When all the rest of the whole earth were dry'd;
And nature's life lay ready to expire,
Quench'd the dire flame that set the world on fire.

From Venice to Ancona, the tide comes in very sensibly at its stated periods; but runs more or less in proportion as it advances near the head of the gulph. At Ferrara, I met with nothing extraordinary. The town is very large but extremely thin of people. It has a citadel, and something like a fortification running round it, but so large, that it requires more soldiers to defend it than the pope has in his whole dominions. The streets are as beautiful as any I have ever seen in their length, breadth, and regularity. The Benedictines have the finest convent in the place.

I came down a branch of the Po, as far as Alberto, within ten miles of Ravenna. All this space lies miserably uninhabited till you come near Ravenna, where the soil is made extremely fruitful, and shows what most of the rest might be, were there hands enough to manage it to the best advantage. It is now on both sides of the road very marshy, and generally overgrown with rushes, which made me believe it had been once floated by the sea, that was within four miles of it. Nor could I in the least doubt it when I saw Ravenna.

One may guess of its antient situation from what Martial says,

Ravenna frogs in bitter music croke.

And the description that Silius Italicus has given us of it,

Encumber'd in the mud, their oars divide,
With heavy strokes, the thick unwieldy tide.

Accordingly, the old geographers represent it as situated among marshes and shallows. The place which serves for the haven, is on a level with the town, and has probably been stopped up by the great heaps of dirt that the sea has thrown upon it; for all the soil on that side of Ravenna, has been left there insensibly by the sea's discharging itself upon it for many ages. The ground must have formerly been much lower, for otherwise the town must have been laid under water.

The remains of the pharos, that stands about three miles from the sea, and two from the town, have their foundations covered with earth for some yards, as they told me, which notwithstanding are on a level with the fields that lie about them, though it is probable they took the advantage of a rising ground to set them on. This pharo was a square tower of about twelve yards in breadth, as appears by what is intire; so that its height must have been very considerable to have preserved a proportion.

On that side of the town, where the sea is supposed to have been formerly, there is a little church called the Rotunda. At the entrance of it are two stones, the one with an inscription on it, in Gothic characters, that has nothing in it remarkable. The other is a square piece of marble, that by the inscription appears antient, and by the ornaments about it shows itself to have been a little Pagan monument of two persons who were shipwrecked, perhaps in the place where now their monument stands. The first line and a half that tells their names, and families, in prose, is not legible, the rest in English runs thus:

Both with the same indulgent master blest'd,
On the same day their liberty possess'd;
A shipwreck slew whom it had join'd before,
And left their common friends their fun'ral to deplore.

There is a turn in the third verse, that we lose by not knowing the circumstances of their story. As it is said, they were both made free in one day, so it seems they had been favourite slaves, who had not only received their manumission, but had been likewise advanced to high honours. This practice was common enough among the Romans, but it is needless to insist on it here.

There stood on the outside of this little cupola a great tomb of Porphyry, and the statues of the twelve apostles; but they were all broken to pieces during the war, by the stroke of one cannon ball.

It was perhaps the same blow that made the flaw in the cupola, though the inhabitants say it was occasioned by thunder and lightning, at the same time that one of their Gothic princes was killed; who had taken shelter under it's having been foretold what kind of death he was to die. I asked a priest who happened to be in the church at the time, what was the name of this Gothic prince, who, after a little hesitation, told me, that he believed his name was Julius Cæsar. This shews how ignorant the Italian clergy are of history.

There is a convent at Theatines, where they shew a little window in the church; through which they say the Holy Ghost entered in the shape of a dove, and settled on one of the candidates for the bishoprick. The dove is represented in the window, and in several pieces of sculpture, in different parts of the church.

I should not think it indeed impossible for a pigeon to fly in accidentally through the roof, where they still keep the hole open, and, by its fluttering over a particular place, to give so superstitious an assembly occasion of favouring a competitor, especially if he had many friends among the electors, that would make a politic use of such an accident. But they pretend the miracle has happened more than once.

The statue of Alexander the seventh stands in the large square of the town. It is cast in brass, and has the figure that popes are represented in, with an arm extended, blessing the people. In another square, on a high pillar, is set the statue of the Blessed Virgin, arrayed like a queen, with a sceptre in her hand, and a crown upon her head, for having delivered the town from a raging pestilence. The custom of crowning the Blessed Virgin is in so much vogue among the Italians, that one often sees in their chambers a little tinsel crown, or perhaps a circle of stars glued to the canvas, over the head of the figure, which frequently spoils a good painting.

In the convents of the Benedictines, I saw three chests of marble, with no inscriptions on them, that I could find; though they are said to contain the ashes of several of the Roman emperors.

From Ravenna I came to Rimini, having passed the Rubicon by the way. This river is not so very contemptible as it has been represented; and it was swelled by the melting of the snow, when Cæsar passed it with his legions, to put a final period to the commonwealth of the Romans.

Lucan was well acquainted with this, when he wrote the following lines:

While summer lasts, the streams of Rubicon,
From their spent course, in a small current run:
Hid in the winding vales, they gently glide,
And Italy from neighbouring Gauls divide.
But now with winter storms increas'd, they rise,
By wat'ry moors produc'd, and Alpine snows,
That melting on the hoary mountains lay,
And in warm eastern winds dissolv'd away.

Rimini has nothing modern to treat of, but it has several antiquities.

There is a marble bridge of five arches, built by Augustus and Tiberius, for the inscription is still legible. There is a triumphal arch, raised by the emperor Augustus, which makes a noble gate to the town, though much of it has been ruined. There is likewise an amphitheatre, and the suggestum on which it is said Cæsar stood when he ranged his army, after having passed the Rubicon. I must confess, that I can by no means look upon this last as authentic. It is built of hewn stone, like the pedestal of a pillar, but something higher than ordinary, and is cut just broad enough for one man to stand on. On the contrary, the antient suggestums, as I have often observed on medals, as well as on Constantine's arch, are made of wood, like a stage; for the heads of the nails are sometimes represented, that are supposed to have fastened the boards together. We often saw on them the emperor, and two or three general officers, sometimes sitting, and sometimes standing, as they made speeches, or distributed favours and words to the soldiers. They were, probably, always in readiness, and carried among the baggage of the army; whereas this at Rimini must have been built on the spot, and required some time to finish it.

At twelve miles distance from Rimini stands the little republic of St. Marino, which I could not forbear visiting, though it lay out of my way. I shall here give a particular description of it, because it has never been done by any one else. One may at least have the pleasure of seeing in it something more singular than is to be found in great governments, and conceive from it an idea of virtue, when she first rose out of obscurity.

The town and republic of St. Marino stands on the top of a very high and craggy mountain. It is generally hid among the clouds, and lay under snow when I saw it, though it was clear and warm weather in all the country round about it. There is not a spring or fountain I could hear of in the whole dominions, but they are always well provided with huge cisterns and reservoirs of rain and snow-water. The wine from the grapes on the sides of the mountains is extraordinary good, and, I think, much better

than any I met with on the cold side of the Appenines. This puts me in mind of their cellars, which have, most of them, a natural advantage, that renders them extremely cool in the hottest seasons; for they have generally in the sides of them deep holes, that run into the hollows of the hills, from whence there generally issues a kind of breathing vapours, so very chilling in the summer time, that a man can scarce suffer his hand in the wind of it.

The mountain, and a few scattered hillocks that lie at the bottom of it, is the whole circuit of these dominions. They have what they call three castles, three convents, and five churches; and reckon about five thousand souls in the country. The inhabitants, as well as the historians who mention this little republic, give the following account of its origin.

St. Marino, the founder of it, was a Dalmatian; and, by trade, a mason. He was employed above thirteen hundred years ago in the reparation of Rimini, and after he had finished this work, retired to this solitary mountain, as finding it very proper for the life of a hermit, where he lived in the greatest austerity of a religious life. He had not been long here before he wrought a very signal miracle, which, joined with his extraordinary sanctity, gained him so great an esteem, that the princes of the country made him a present of the mountain, to dispose of it at his own discretion. His reputation quickly peopled it, and gave rise to the republic that is called after his name: so that the commonwealth of St. Marino may boast of a nobler origin than that of Rome; the one having been at first an asylum for robbers and murderers, and the other a resort of persons eminent for their piety and devotion.

The best of their churches is dedicated to the saint whose name the republic bears, and where his ashes are said to be deposited. His statue stands over the high altar, with the figure of a mountain in its hand, crowned with three castles, which have likewise the arms of the commonwealth. They attribute to his protection the long duration of their state, and look upon him as the greatest saint, next to the Blessed Virgin.

I saw in their statute-books, a law against such as speak disrespectfully of him, who are to be punished in the same manner as those who are guilty of blasphemy.

This little republic has existed upwards of thirteen hundred years, while all the other states have frequently changed their masters, and forms of government. Their whole history is comprised in two volumes, which they made a present of to a neighbouring prince, during a war that took place between them and the popes. In the year 1100 they bought a castle in the neighbourhood, as they did in the year 1170. The papers containing the conditions are preserved in the archives of the republic, where it is very remarkable, the name of the agent for the commonwealth are the same in both of the instruments, though drawn up at seventy-years distance from each other: nor can there be any mistake in the date, because the emperors and popes names are set down in their proper order. This serves to shew that there can be no deception, notwithstanding the nature of the singularity, as it has been represented.

The sovereign power of the republic was lodged unjustly in what they call arengo, a great council, in which every house had its representative: but because they found too many in such a multitude of statesmen, they devolved their whole authority into the hands of the council of sixty. The arengo, however, is still called together in cases of extraordinary necessity; and, after a due summons, if any member absents himself, he is to pay a fine of about a penny in English money.

In the ordinary administration of justice, the council of sixty, as it is called, though they seldom amount to above forty, have the whole power in their hands. They decide all by balloting, are not admitted till twenty-five years old, and they choose the officers

of the commonwealth. Thus far they agree with the great council of Venice; but their power is much more extended, for no sentence can stand good, that is not confirmed by two-thirds of the council: and that no son can be admitted during the life of his father, nor two to be in it of the same family, except by election.

The chief officers of the commonwealth are the two capitaneves, who have such a power as the Roman consuls had of old; but they are chosen every six months. I talked to some who had been in that office six or seven times, though, according to that law of them, it is not permitted for any individual to enjoy it more than twice.

The third officer is the commissary, who judges in all matters, whether civil or criminal: but because the many alliances, friendships and marriages, as well as the personal feuds and animosities that happen among so small a people, might frustrate the course of justice, if one of their own number had the distribution of it, they have always a foreigner for this employ, whom they choose for three years, and maintain out of the public stock. He must be a doctor of laws, and a man of known integrity. He is joined in commission with the other judges, and acts somewhat like the recorder of London, under the lord mayor, and the court of aldermen.

The commonwealth of Genoa was forced to make use of a foreign judge for some time, whilst their republic was split into many provinces. The fourth man in the state is the physician, who must likewise be a stranger, and is maintained by a public salary. He is obliged to keep a horse, to visit the sick, and to inspect all drugs that are imported. He must be, at least, thirty-five years old, a doctor of the faculty, and eminent for his religion and honesty, that his ignorance or rashness may not in any manner dispeople the commonwealth; and that they may not suffer long under any bad choice, he is only elected for three years.

Next to the physician is the schoolmaster, whose business it is to instruct the youth in grammar learning. In this, however, they are very defective, for having but small knowledge of letters, they cannot convey much to their pupils.

The people in this republic are esteemed very honest, and rigorous in the execution of justice; and they seem to live more happy and contented amongst their rocks and snows, than others of the Italians do in the pleasanter vallies of the world. Nothing, indeed, can be a greater instance of the natural love that mankind has for liberty, and of their aversion to an arbitrary government, than such a savage mountain covered with people, and the Campania of Rome, which lies in the same country, almost destitute of inhabitants. All those who are in the least acquainted with natural law, will readily acknowledge this; and the historian will find his observations in all respects verified. He will attend to what was said by the moralist, namely, "Shut nature out at the door, and she will come in at the window."

Leaving Rimini, we travelled through the following towns to Loretto, viz. Pessaro, Fano, Senigalia, and Ancona; Fano receives its name from the fane, or temple of Fortune, that stood in it. One may still see the triumphal arch, erected there to Augustus. It is true, it has been much defaced by time, but still what remains is a noble piece of antiquity.

In each of these towns is a beautiful marble fountain, where the waters run through little spouts, which look very refreshing in those hot countries, and contribute towards cooling the air: that of Pessaro is handsomely designed. Ancona is the most considerable of these places; and being situated on a promontory, looks beautiful from the sea.

This town was first built by the emperor Trajan, in memory of which there is a triumphal arch erected for him, near the sea-side. The marble of this arch looks very white and fresh, as being exposed to the winds and salt sea vapours, that, by continually fret-

ting it, preserves itself from that mouldy colour which others, of the same materials, have contracted.

At Loretto, I enquired for the houses where the English jesuits resided; and, on the stair-case, I saw paintings of some of those who had been executed in England, on account of the gunpowder plot: whatever were their crimes, the inscriptions all pointed out that they died for their religion; and some of them are represented as expiring under such tortures as are not known in this country. Those who suffered for the popish plot in 1769 are set by themselves, with a knife stuck in the bosom of each figure, to point out that they were quartered.

The riches in the houses of Loretto are amazingly great, and much surpassed any thing I could form a proper idea of. Silver can scarce find an admission, and gold itself looks but poorly among such an incredible number of precious stones. If the devotion of the princes of the Roman catholic nations continues to increase in fervor, there will, in a few years, be more riches here than in any part of the world.

The last offering was made by the queen dowager of Poland, and cost her eighteen thousand crowns. Some have wondered that the Turks never attack this treasury, since it lies so near the sea-shore, and is so weakly guarded. That the Turks have intended to do so, is certain; but the Venetians keep such a watchful eye over all their motions, that they are afraid to venture too far into the Adriatic gulph. It would, indeed, be an easy thing for a Christian prince to surprize it, who has ships always sailing thither, especially while there is no motive for suspicion. He might send a party on shore disguised like pilgrims, who would soon find an easy admittance into the town, and then might easily secure one of the gates; but this has never been attempted. The ballance of power among European princes makes them, at all times, jealous of each other; and an action of this nature would be highly resented.

It is, indeed, an amazing thing to see such a quantity of riches lie dead and untouched, in the midst of so much poverty and misery as reign on all sides of the place. There is no doubt, however, but the pope would make use of these treasures in consequence of any public calamity, if he should once consider that the ecclesiastical state was in danger from any enemies whatever. If these riches were all turned into current coin, and employed in commerce, they would make Italy the most flourishing country in Europe.

The outside part of the structure of the Holy House, as it is called, is nobly designed, and has been executed by some of the greatest masters in Italy. The statues of the sybils are very finely wrought, and each of them in a different air and posture, as are likewise those of the prophets underneath. The roof of the tapestry is painted with the same kind of device, and there stands, at the upper end of it, a large crucifix, very much esteemed. The figure of our Saviour represents him in the last agonies of death, and, among all the ghastliness of death, has something in it very amiable.

The gates of the church are said to be of Corinthian brass, with many parts of scripture history engraven upon them. The pope's statue, and the fountain beside it, would make a noble shew in a place less beautiful with so many productions of art. The spicery, the cellar and its furniture, the great remains of the convent, with the story of the Holy House, are all too well known to be here insisted on.

Whoever were the first inventors of this imposture, they seem to have taken the hint of it from the veneration that the old Romans paid to the cottage of Romulus, which stood on Mount Capitol, and was repaired from time to time till it fell to decay. Virgil has given a pretty image of this thatched palace, in words to the following import:

High on a rock heroic Memlius stood,
To guard the temple, and the temple's god:
Then

rocks and mountains, that look like so many natural green-houses, as being always shaded with a great variety of trees and shrubs, that never lose their verdure.

The Via Flavinia has been so often described, that I need not say much concerning it; but it may not be unentertaining to hear Claudian's description of it:

They leave Ravenna, and the mouth of Po,
That all the borders of the town o'erflow;
And spreading round in one continued lake,
A spacious hospitable harbour make.
Hither the seas at stated times resort,
And shove the loaden vessels into port;
Then with a gentle ebb retire again,
And render back their cargo to the main:
So the pale moon the restless ocean guides,
Drawn to and fro by such submissive tides.
Fair Fortune next, with looks serene and kind,
Receives 'em in her antient fane unshrin'd:
Thus the high hills they cross, and from below,
In distant murmurs hear Melaunes flow,
Till to Clytumnus bound with speed they come,
That send white victims to almighty Rome:
When her triumphant sons in wars succeed,
And slaughter'd hecatombs around 'em bleed,
At Narni's lofty seats, arriv'd from far,
They view the windings of the hoary Nar;
Thro' woods and rocks impetuously he glides,
While froth and foam the fretting surface hides.
And now the royal guest, all dangers past,
Old Tiber, and his nymphs, salute at last;
The long laborious present time he heeds,
That to proud Rome th' advancing nations leads,
While stately vaults and tow'ring piles appear,
And shows the world's metropolis is near.

As soon as I arrived at Rome, I took a view of St. Peter's, and the Rotunda, leaving the rest till my return from Naples, when I should have time and leisure enough to consider what I saw. St. Peter's seldom answers the expectation we form of it, when one first goes into it; but it enlarges itself every moment, and gradually mends on the eye. The proportions are so well observed, that nothing appears more advantageous than another. It seems neither extremely high, low, or broad, because all the proportions are just.

There we see a vast difference between this splendid edifice, and some of the Gothic structures, where there is not a regular proportion observed. It is true, there is in all the Gothic cathedrals something that inspires the mind with a sort of sedateness, and they were well calculated for the devotion used in the middle ages.

Though every thing at St. Peter's is the most admirable that can be imagined, yet the cupola exceeds them all. Upon my going to the top, I was surpris'd to find that the dome we see in the church is not the same that one looks upon without doors, the last of them being a sort of cone for the other; and the stairs laying betwixt them both, by which one ascends into the ball. - Had there been only the outward dome, it would not have shewn itself to an advantage to those that are in the church; or had there only been the inside one, it would scarce have been seen by those that are without. Had they both been one solid dome of so great a thickness, the pillars would have been too weak to have supported it.

After having survey'd this dome, I went to see the Rotunda, which is generally said to have been the model of it. This church is at present so much changed from the antient Pantheon, that some have been inclined to think it is not the same temple; but the contrary of this has been shewn by a learned French author.

In my way from Rome to Naples, I found nothing so remarkable as the beauty of the country, and the extreme poverty of its inhabitants. It is indeed an amazing thing to see the present desolation of Italy,

when one considers what incredible multitudes of people it abounded with, during the reigns of the Roman emperors. And notwithstanding the removal of the imperial seat, the interruptions of the barbarous nations, the civil wars of the country, with the hardships of its several governments, one can scarce imagine how so plentiful a soil should become so miserably unpeopled in comparison of what it once was.

We may reckon, by a moderate computation, more inhabitants in the antient empire than are now to be found in all Italy. And if we could number up those prodigious swarms that settled here in this most delightful country, I doubt not but they would amount to more than can be found at present in any sixth part of Europe, of the same extent. This desolation appears no-where greater than in the pope's territories; and yet there are several reasons that would induce one to expect to see these dominions the best regulated, and the most flourishing in the world. Their prince, the pope, is generally a man of learning, advanced in years, and well acquainted with the world, and who has seldom any vanity to gratify at the expence of his people. He is not incumbered with a wife or children; for, according to the supposed sanctity of his character, one would imagine that he was, in a manner, dead to temporal and perishing enjoyments. The direction of the affairs both of church and state are lodged in his hands, so that his government is naturally free from those principles of faction that are mixed in the very constitution of most others. His subjects are always ready to fall in with his designs, and are more at his disposal than any others of the most absolute government, as they have a greater veneration for his person, and not only court his favour, but wish for his blessing.

This country is extremely fruitful, and has fine havens, both for the Adriatic and Mediterranean; which is an advantage peculiar to herself, and the Neapolitans above all the rest of the world. There is still a benefit the pope enjoys, above all other sovereigns, in draining great sums out of Spain, Germany, and many other countries that belong to other princes; which, one would think, would be no small ease to his own subjects.

We may here add, that there is no place in Europe so much resorted to by strangers; whether they are such as come out of curiosity, or such who are obliged to attend the court of Rome on different occasions, as are many of the cardinals and prelates, that bring considerable sums into the papal treasury.

But notwithstanding all these promising circumstances, and the peace that has reigned so many years in Italy, there is not a more miserable people in Europe than the pope's subjects. His state is thin of inhabitants, and a great part of the soil is uncultivated. His subjects are wretchedly poor and idle, and have neither sufficient manufactures nor traffick to employ them. These ill effects may arise, in a great measure, out of the arbitrary nature of the government; but I think they are chiefly to be ascribed to the very genius of the Roman catholic religion, which here shews itself in its highest degree of perfection.

It is not strange to find a country half unpeopled, where so great a proportion of the inhabitants, of both sexes, is confined down under vows of chastity; and where, at the same time, an inquisition lays a restraint, and a dreadful one too, on liberty of conscience. Nor is it less easy to account for the great poverty and want that are to be met with, in a country which invites into it such a swarm of vagabonds, under the title of pilgrims; and, shuts up in cloisters such an incredible number of young and lusty beggars, who, instead of increasing the common stock by their labour and industry, lie as a dead weight on their fellow subjects, and consume that charity which ought to support the aged and infirm.

The many hospitals that are every-where erected serve only to encourage idleness, instead of relieving the weak and infirm. The riches that are concealed

in their churches becomes a scandal to any government; and to maintain a croud of lazy monks is inconsistent with civil polity. To speak truly, they are here so much taken up with men's souls that they pay little regard to their bodies; or, as the poet says, they are like

—Our worthy mayor,
Who can dine on a prayer,
And sup on an exhortation.

The greatest pleasure I took in my journey from Rome to Naples was in seeing the fields, towns, and rivers, that have been described by so many of the classical authors, and have been the scenes of so many great actions.

If we may guess at the common travelling of persons of quality among the antient Romans, from this poet's description of his voyage, we may conclude they seldom went above fourteen miles a day, over the Apian way, which was more used by the noble Romans than any other in Italy, as it led to Naples, Baix, and the most delightful part of the nation.

This is finely described by Lucan:

He now had conquer'd Anxur's steep ascent,
And to Pontina's watry marshes went:
A long canal the ruddy fen divides,
And with a clear unfully'd current glides.
Diana's woody realms he next invades,
And, crossing through the consecrated shades,
Ascends high Alda; whence with new delight,
He sees the city rising to his sight.

In my way to Naples, I crossed the two most considerable rivers of the Campania Felix, that were formerly called the Liris and Volturnus, and are, at present, called the Gorigliano and Volturno. The first of these rivers has been celebrated by the Latin poets for the gentleness of its course, as the other has for its rapidity and noise.

Where the smooth streams of Liris stray,
And steal insensibly away;
The warlike Alpine borders on the sides
Of the slow Liris, that in silence glides,
And in its tainted stream the working sulphur hides.

Again the poet says,

The rough Volturnus, furious in its course,
With rapid streams divides the fruitful ground,
And from afar in hollow murmurs sounds.

The ruins of Anxur and old Capua, mark out the pleasant situation in which those towers formerly stood. The first of them was on the mountain where Terracina now stands; and by reason of the breezes that came off the sea, and the height of its situation, was one of the summer retirements of the antient Romans. Thus the poet says,

Ye warbling fountains and ye shady trees,
Where Anxur feels the sweet refreshing breeze
Blown off the sea, and all the dreary strand,
Lies cover'd with a smooth unfinking sand.

And again, Horace describes it in the following manner:

On the cool shore, near Baya's gentle seats,
I lay retired, in Anxur's soft retreats:
Where silver lakes, with verdant shadows crown'd,
Disperse a grateful chillness all around:
The grasshopper avoids th' unkindly air,
Nor in the midst of summer wantons there.

There are many antiquities in this part of Italy, but most of them are so mutilated as not to merit a particular description; so that, passing them over, I shall proceed to give an account of Naples.

My first days at Naples were taken up with the sight of processions, which are always very magnificent in the holy week. It would be tedious to give an account of the several representations of our Saviour's death and resurrection, of the figures of himself, the

Blessed Virgin, and the apostles, which are carried up and down on this occasion, with the cruel penances that several inflict on themselves, and the multitude of ceremonies that attend these solemnities.

I saw, at the same time, a most splendid procession for the accession of the duke of Anjou to the crown of Spain, in which the viceroy bore his part, at the left hand of Cardinal Cantelmi. To grace the parade, they exposed, at the same time, the blood of St. Januarius, which liquified at the approach of the saint's head, though they say it was hard congealed before. I had twice an opportunity of seeing the operation of this pretended miracle, and must confess, I think it so far from being a real miracle, that I look upon it as one of the most bungling that I ever saw.

Yet it is this that makes as great a noise as any in the Roman church. The modern natives of Italy seem to have copied it from an antient heathen custom; as appears from the following lines in Horace.

At Gnatia next arriv'd, we laugh'd to see
The superstitious crouds' simplicity;
That in the sacred temple needs would try,
Without a fire, th' unheated gums to fry;
Believe who will the solemn sham, not I.

One may see, at least, that the heathen priests used the same secrets among them as those of the Roman catholics at present.

I must confess that, though I had lived above a year in Roman catholic countries, yet I was surpris'd to see many superstitions and ceremonies in Naples that are not so much as thought of in France. Thus much is certain, that a secret kind of reformation has taken place among the Roman catholics, in consequence of their disputes with the protestants, but this has never been publicly owned.

For this reason, the French are much more enlightened than the Italians, on account of their frequent controversies with the huguonots; and we frequently meet with gentlemen in our own country, who will not stick to laugh at the superstition they sometimes meet with in other nations. Naples is not constructed to make a vigorous defence against a potent enemy; for the roofs of the houses being flat, a ball falling upon them would do immediate execution. There are vast numbers of paintings in most of their palaces, but none of them are of an antient date. Two of their finest modern statues are those of Apollo and Minerva, placed on each side of Sannazarius's tomb: on the face of this monument, which is all of marble, and very neatly wrought, is represented Neptune among the satyrs, to shew that this poet was the inventor of piscatory eclogues. Grotius has attempted, though in a very awkward manner, to prove that he was the first who brought the muses to the sea-side, but here we suppose such a learned man could only mean his own country.

Piscatory eclogues were written long before the time of Grotius, as appears from the following lines.

Thou bright celestial goddess, if to thee
An acceptable temple I erect,
With finest flow'rs and freshest garlands deck'd,
On tow'ring rocks, whence Mergilino's shore
The ruffled deep in storms and tempests roar;
Guide thou the pious poet, nor refuse
Thine own propitious aid to his unpractic'd muse.

There are several delightful prospects about Naples, especially from some of the religious houses; for one seldom finds, in Italy, a space of ground more agreeable than ordinary, that is not, in one manner or other, covered with a convent. The cupola's of this city, though there are many of them, do not appear to the least advantage when one surveys them at a distance, as being generally too high and narrow.

The bay of Naples is the most delightful one I ever saw, and is about thirty miles in diameter: three parts of it are sheltered with a noble circuit of woods and mountains. The excessive height of its rocks se-

cures a great part of the bay from the fury of the winds; and, indeed, this appears to have been its state in antient times, from what Virgil wrote on the subject.

Within a long recess there lies a bay,
An island shades it from the rolling sea;
And forms a port secure for ships to ride;
Broke by the jutting land on either side,
In double streams the briny waters glide,
Between two rows of rocks a sylvan scene
Appears above, and groves for ever green.

In the bosom of this bay Naples is situated, perhaps, in the most pleasant part in the world: and yet, for all that, the people are miserably poor: they have been oppressed by a load of taxes, and vast sums are drained from them to support an indolent clergy. Industry dies away where the iron hand of oppression is held up:

They starve; in midst of nature's bounty curst;
And in the loaded vineyard die for thirst.

They are of a very litigious disposition, and generally have suits carrying on in their courts of law and equity. This finds out employment for their proctors and civilians, but in the mean time their people are ruined: this may serve to shew what vast change sometimes takes place in the manners of people. In antient times, they were described in the following manner:

By love of right, and native justice led,
In the straight paths of equity they tread;
Nor know the bar, nor fear the judges frown,
Unpractis'd in the wranglings of the gown.

About eight miles from Naples, is that noble piece of antiquity, called Virgil's tomb: It is certain that that poet was buried somewhere near Naples, but, I think, it is almost as certain that his tomb stood on the other side of the town, which looks towards Vesuvius. By this tomb, is the entry into the grotto of Paullippo: the common people, in Naples, believe it to be the work of some infernal agent, and that the great poet, Virgil, was the magician, who is in greater repute among the Neapolitans, for having made that grotto, than for having wrote the *Æneid*.

If a man would form to himself a just idea of this place, he must fancy a vast rock undermined from one end to the other, and a highway running through it.

This subterraneous passage is much mended since Seneca gave so bad a character of it. The entry, at both ends, is higher than the middle parts, and sinks by degrees, to let in more light to the rest. Towards the middle, are two large funnels, bored through the roof of the grotto, to let in light and fresh air.

There is not, near the mountains, any vast heap of stones, though it is certain there must have been many of them formerly. This confirmed me in a conjecture I made at the first sight of this subterraneous passage, namely, that it was not at first designed so much for a passage, as for a quarry of stones; but, that the inhabitants, finding a double advantage by it, hewed it into the form we now see. Perhaps the design gave the original to the Sybils' grottoes, for there were many stones in the neighbourhood formerly.

I remember, when I was at Chateaudun in France, I met with a very curious person, a member of one of the German universities. He had staid a day or two in the town longer than he intended, to take the measures of several empty spaces that had been cut in the sides of a neighbouring mountain: some of them were supported by pillars, formed out of the rock; some were made in the form of galleries, and some not unlike amphitheatres. The gentleman had formed several notions concerning these subterraneous apartments; but, upon communicating his thoughts to one of the most learned men in the place, he was not a little surpris'd, to find that these stupendous works were nothing more than the remains of some stone-quarries. But to return to Naples:

About five miles from the grottoes, lie the remains of Puteoli and Baiæ, in a fine air and a delicious situation. The country about them, by reason of its vast caverns and subterraneous fires, has been miserably torn in pieces by earthquakes, or stopped up by mountains, that have fallen upon them. The lake of Avernus, formerly so famous for its streams of poison, is now plentifully stocked with fish and fowls:

Mount Gaurus, from being one of the fruitfulest parts in Italy, is become one of the most barren. Several fields, which were laid out in beautiful groves and gardens, are now naked plains, smoaking with sulphur, or incumbered with hills, that have been thrown up by eruptions of fire. The works of art lie in no less disorder than those of nature, for that which was once the most beautiful spot in Italy; covered with temples and palaces, adorned by the greatest of the Roman commonwealths, embellished by many of the Roman emperors, and celebrated by the best of their poets, has now nothing to shew but the ruins of its antient splendor, and a great magnificence in confusion.

The mole of Puteoli has been frequently mistaken by several authors for Caligula's bridge: They have all been led into this error from the form of it, because it stands on arches. It is certain, that it was not made till long after the time of Caligula, and, probably, about the time of Antoninus Pius. It would have been difficult to have made such a mole as this in a place where they had not so natural a commodity as the earth of Puzzuola, which immediately hardens in the water, and after lying a little while, it looks rather like stone than mortar. It was this that gave the antient Romans an opportunity of making so many encroachments on the sea, and of laying the foundation of their villas and palaces within the very borders of it.

Some years ago they dug up a great piece of marble near this place, with several figures and letters engraved round it, which have given occasion for some disputes among the antiquaries, but they all agree that it is the pedestal of a statue, erected to the memory of Tiberius, by the fourteen cities of Asia, which were flung down by an earthquake the same time that, according to the opinion of many learned men, happened at our Saviour's crucifixion.

There are two medals of Tiberius stamped on this occasion, and he is represented on both with a patera in one hand, and a spear in the other. It is probable this might have been the posture of the statue, which, in all likelihood, does not lie far from the place where they took up the pedestal; for they say there were great pieces of marble near it, and several of them had inscriptions, but nobody understood them.

The pedestal lay neglected in an open field, where I saw it, and near it were several other remains of antiquity. It is certain, that the antiquities we met with in Italy are more remarkable, because they are uncommon, than on account of their curiosity; and a traveller would not esteem them so much as he does, were it not that he seldom sees such things in his own country.

Triumphal arches, baths, grottoes, and catacombs rotundos, highways, bridges of an amazing height, subterraneous bridges for the reception of rain and snow-water, are most of them, at present, out of fashion, and only to be met with among the antiquities of Italy: we are, therefore, immediately surpris'd when we find any considerable sums of money laid out in any thing of this nature; though at the same time there is many a Gothic cathedral in England that has cost more pains and money than several of these celebrated works put together.

Among the ruins of the old heathen temples, they shewed me what they call the chamber of Venus, which stands a little behind her temple. It is wholly dark, and has several figures on the building, wrought in stucco, that seem to represent Lust and Strength,

by the emblems of naked Jupiters and Gladiators, Tritons and Centaurs; so that we are naturally led to believe, that it was formerly the scene of filthy and lewd mysteries.

On the other side of Naples are the catacombs. These must have been full of the vilest corruption, if the dead bodies that lay within them were suffered to rot there. But, upon examining them, I found that they had each of them been stopped up at the mouth, when the corpse was put in; for at the mouth of the niche one always finds the back cut into little channels, to fasten the boards or marble that was to close it up; and I think I did not see one but what had some mortar sticking to it.

In some I found pieces of tiles, that tallied exactly with the channel, and in others a little wall of bricks, that sometimes stopped up above a quarter of the niche, the rest having been broken down. The sepulchre of St. Proculus seems to have been a piece of mosaic work, for I observed at one end of it several small pieces of marble, ranged together after that manner.

It is probable they were adorned more or less, according to the quality of the deceased. One would indeed wonder to find such a multitude of niches unstopped, and I cannot imagine any body should take the pains to do it, who was not in quest of some supposed hidden treasure.

Baiae was the winter retreat of the old Romans, that being the proper season to enjoy all the sweets of the place. Thus we read in Martial;

While near the Lucrine lake, consum'd to death,
I draw the sultry air, and gasp for breath;
Where steams of sulphur raise a stifling heat,
And thro' the pores of the warm pumice sweat;
You taste the cooling breeze, where nearer home,
The twentieth pillar marks the mile from Rome:
And now the sun to the bright lion turns,
And Baiae with redoubled fury burns;
Then briny seas, and tasteful springs farewell,
Where fountain nymphs, confus'd with Neriads
dwell:

In winter you may all the world despise;
But now 'tis Tivoli that bears the prize.

The natural curiosities about Naples are as numerous as the artificial ones. They are too numerous to be all mentioned here, but I shall take notice of some of the most extraordinary.

The grotto Del Cani, i. e. of Dogs, is famous for the noxious streams that it emits, and there float within a foot of the surface. The sides of the grotto are marked with green as high as the malignity of the vapour reaches. Several experiments has been tried in this grotto; a dog that has his nose held in the vapour, loses all signs of life in a very little time; but if carried into the open air, or plunged into a neighbouring lake, he immediately recovers, if his breath is not quite gone.

A torch goes out in a moment, after held over this vapour. A pistol cannot be fired off in it. I split a reed, and laid in the channel of it a train of gunpowder, so that one end of the reed was above the vapour, and the other at the bottom of it, and I found that the steam was strong enough to hinder a pistol from being fired in it: this experiment I repeated several times, to try the strength of the vapour.

I took notice, that it required the same time for a dog, who had not been quite dead, to recover, as it did for one to expire. A viper bore it nine minutes the first time we put it in, and ten minutes the second; when we took it out after the first experiment, it drew up such a vast quantity of air into its lungs, that it swelled twice as big as it was before; when it was taken out the second time, it died within a minute afterwards. This matter is generally believed to be sulphurous; but I can see no grounds for such a supposition, for I borrowed a weather-glass, which I put into it, but the quicksilver did not so much as move. He that dips his head in it, finds

no smell; and though I put a whole bundle of brimstone matches to the smoak, they all were out in an instant, as if immersed in water.

It would be endless to reckon up the number of baths that are to be found in a country so much abounding with sulphur. There is scarce a disease that has not one adopted to it. A stranger is, for the most part, led into what they call a curious bath; and some writers pretend there is a cold vapour issuing from the bottom of it. It is true, the heat is much more supportable to one who stands upright, because the steams of sulphur gather in the hollow of the arach about a man's head, and therefore much quicker and warmer in that part than in the bottom.

But there is nothing near Naples that deserves our attention so much as mount Vesuvius. I must confess the idea I had formed of it did not come up to my expectations when I saw it: but I shall describe it in the most accurate manner I am able.

This mountain stands about six English miles from Naples, though, by reason of its height, it seems much nearer to those who survey it from the town. In our way to it, we passed by what was one of those rivers of burning matter, that ran from it in a late eruption. This looks at a distance like new ploughed land, but as you come near it you see nothing but a long heap of heavy disjointed clods, lying one upon another.

There are innumerable cavities among the several pieces, so that the surface is all broken and irregular. Sometimes a large fragment stands like a rock above the rest; sometimes the whole heap lies in a kind of channel, and in other places has nothing like banks to confine it, but rises four or five feet high in the open air, without spreading abroad on either side. This, I think, is a plain demonstration, that these rivers were not what they are usually represented, that is, so many streams of running water; for how could liquid, that lay running by degrees, settle on such a firm, round, uncorrupt surface? Supposing the river to be composed of a vast number of different bodies, had they been all dissolved, they would have formed one continued crust.

I am, therefore, apt to think that these would, by lumps that now lie one upon another, as if thrown together by accident, have congealed themselves in a natural manner, and remain in the state we now find them: whatever the melting matter was, it now lies at the bottom out of sight.

Having quitted one side of this stream, which was once composed of fire, we came to the root of the mountain, and had a very troublesome march to gain the top of it. It is covered on all sides with a kind of burnt earth, extremely dry, and crumbled into powder, as if it had been actually sifted. It is very hot under the feet, and mixed with several burnt stones and cakes of cinders, which have been thrown out at different times. When we had climbed this mountain, we discovered the top of it to be a wide naked plain, smoking with sulphur in different places, and probably undermined with fire, for we concluded it to be hollowed, by the sound that it made under our feet.

In the midst of this plain is a high hill, somewhat in the form of a sugar-loaf, so very steep that there could be no possibility of ascending or descending it, were it not made up of such loose crumbled earth as I have before described.

The air of this place must be very much impregnated with salt petre, as appears by the specks of it on one side of the mountains, where one can scarce find a stone that is not covered with it on the top.

After we had, with much difficulty, ascended this hill, we saw, in the midst of it, the mouth of Vesuvius, which goes shelving down, on all sides, for above an hundred yards deep, and has about three or four hundred in the diameter. This vast hollow is generally filled with smoke, but by the advantage of a wind, that blew fair for us, we had a very clear and distinct

fight.

fight of it. The sides appeared, all around, covered with mixtures of white, green, red, and yellow, and had several rocks standing out of them, that looked like pure brimstone. The bottom was entirely covered, and, though we looked very narrowly, we could see nothing like a hole in it, the smoke breaking through several impregnable cracks in many places.

The very middle was firm ground when we saw it, as we concluded from the stones we flung upon it: and I question not but we might then have crossed the bottom, and have gone upon the other side of it with very little danger; unless from some accidental breath of wind.

In the late eruption, this hollow was like a vast cauldron filled with glowing and melted matter, which, as it boiled over in any part, run down the sides of the mountain, and made five such rivers as that before mentioned. In proportion, as the heat slackened, this burning matter must have subsided within the bowels of the mountain, and as it sunk very leisurely, had time to cake together, and form the bottom which covers the mouth of that dreadful vault that lies underneath it. The next eruption or earthquake will, probably, break in pieces this false bottom, and quite change the present face of things. This, however, will be the work of time, and although it may probably take place, yet we must wait till the event happens.

This whole mountain, shaped like a sugar-loaf, has been made, at different times, by the prodigious quantity of earth and cinders which have been flung up out of the mouth that lies in the midst of them; so that it increases in bulk at every eruption, the stones still falling down the sides of it, like the sand in an hour-glass. A gentleman at Naples, told me that, in his memory, it had gained twenty feet in thickness; and I question not, but in length of time, it will cover the whole plain, and make one mountain with that on which it now stands.

In those parts of the sea which are not far from the bottom of this mountain, they find sometimes a most fragrant kind of oil, which is sold dear, and makes a very rich perfume. The surface of the sea is, for a little space, covered with its bubbles during the time that it rises, which they skim off, and put into their boats, and afterwards they set them into pots and jars. They say its sources never run out in calm warm weather, and the agitation of the water hinders them from discovering it at other times.

Among the natural curiosities of Naples, I cannot forbear mentioning that method they have of furnishing the town with snow, which they use here instead of ice; because, as they say, it cools or congeals the liquor sooner. There is a great quantity of it consumed yearly, for they drink very few liquors, not so much as water, without either snow or ice. Thus, if there was a scarcity of snow at Naples, it would be apt to create a mutiny among the inhabitants; just as much as a dearth of corn does among those of other countries. To prevent this, the king has sold the monopoly of it to certain persons, who are obliged to furnish the city with it, all the year, at a fixed price.

They have a high mountain, at a small distance from the town, which has several pits dug into it: here they employ many poor people, at a peculiar season of the year, to roll in vast balls of snow, which they ram together, so as to cover them from the sunshine. Out of these reservoirs, they cut several lumps, as they have occasion for them, and send them on asses to the sea-side, where they are carried off in boats, and distributed to several shops at a settled price; and these, from time to time, supply the whole city of Naples.

While the robbers continued their depredations in the kingdom of Naples, it was common with them to lay the snow-merchants under contributions, and threatened them, that if they did not contribute liberally to support them in their extravagancies, and indeed in their wickedness, they would put them all to death.

It would be tedious to give a description of all that the Latin poets have said concerning the places we have already mentioned: Julius Italicus is the most expressive, and therefore we shall conclude our account of the environs of Naples with his description of it.

Averno next he shew'd his wond'rous guest,
Averno now with milder virtues blest'd;
Black with surrounding forests then it stood,
That hung above, and darkened all the flood:
Clouds of unwholsome vapours, rais'd on high,
The fluttering bird, entangled in the sky;
Whilst all around the gloomy prospect spread
An awful horror, and religious dread.
Hence to the borders of the marsh they go,
That mingles with the baleful streams below!
And sometimes with a mighty yawn, 'tis said,
Opens a dismal preface to the dead:
Who pale with fear, the rending earth survey,
And startle at the sudden flush of day.
The dark Cimmerian grotto then he paints,
Describing all its old inhabitants;
That in the deep infernal city dwell'd,
And lay in everlasting night conceal'd:
Advancing still the spacious fields he shew'd;
That with the smother'd heat of brimstone glow'd;
Through frequent cracks, the streaming brimstone
broke,

And cover'd all the blasted plain with smoke:
Imprison'd fires in the close dungeon pent,
Roar to get loose, and struggle for a vent;
Eating their way, and undermining all,
Till with a mighty burst, whole mountains fall;
Here, as 'tis said, the rebel giants lie,
And when to move the mountain load they try,
Ascending vapours on the day prevail,
The sun looks sickly, and the skies grow pale;
Next to the distant isle, his sight he turns,
That o'er the thund'ring stroke Typhoeus burns;
Enrag'd his wide extended jaws expire,
In angry whirlwinds, blasphemies and fire;
Threat'ning, if loosen'd from his dire abodes,
Again to challenge Jove, and fight the gods:
On mount Vesuvius next he fix'd his eyes,
And saw the smoaking tops confus'dly rise.
(An hideous ruin!) that with earthquakes rent,
A second Etna to the view present;
Miseno's cape, and Brinti last he view'd,
That on the seas extensive borders stood.

It is certain, from this description of the beauty of Naples, that it must have been a place of considerable repute in former times, nor is it much less at present, although the circumstances are in a great measure languid. In all our searches into antiquities, we ought to compare the past with the present. We should not, like the ignorant, skim over the surface, but we should endeavour to discern effects from their causes. We should not, like methodist preachers, keep rambling after sinners, to bring them to God; nor should we seek after the ignorant, who have no knowledge in any thing whatever. It is our business to speak the truth, and put the devil to shame. However, a traveller, if he makes a proper use of his time, learns every thing, and should make a proper improvement.

At Naples, I hired a small vessel, which they call a Felucca, to carry me to Rome, that I might not be forced to run over the same lights a second time, and might have an opportunity of seeing many things described by Virgil. It is, indeed, in a manner impossible to mistake Virgil's description of the western coast of Italy, seeing every thing mentioned by him presents itself to public view.

Mount Paufilypo, presents a most beautiful prospect to those that pass by it. At a small distance from it lies the little island of Nisfida, adorned with a great variety of plantations, rising one above another, in so beautiful an order, that the whole island looks like a large terrace garden. It has two little ports, and is not at present troubled with any of those noxious streams that Lucan mentions.

Nefis' high rocks each stygian air produce,
And the blue breathing pestilence diffuse.

From Nifida, we rowed to Cape Miseno. The extremity of this cape has a long cleft in it, which was enlarged and cut into shape by Agrippa, who made this the great port for the Roman fleet that served in the Mediterranean, as that of Ravenna was for the Adriatic.

The highest part of this promontory rises in the form of a sepulchre or monument, to those that survey it from the land. The next morning, I went to see the isle of Ischia, that stands further out into the sea. It used to have eruptions formerly, in the same manner as Mount Vesuvius, but, at present, there are scarce any marks of a subterranean fire, for the earth is cold and over-run with grass and shrubs, where the rocks will suffer it. There are, indeed, several cracks in it, through which there issues a constant smoke; but, it is probable, this arises from the warm springs that feed the many baths with which this island is plentifully stocked.

I observed about one of these breathing passages, a spot of myrtles, that flourish within the steam of these vapours, and have a continual moisture hanging upon them. On the south part of the island is a round lake, of about a quarter of a mile in diameter, separated from the sea by a narrow track of land. It was formerly a Roman port of some repute, but is now fallen to decay.

On the north end of the island stands the town, it is on an exceeding high rock, divided from the body of the island, and inaccessible to an enemy on all sides: this island is larger, but much more rocky and barren than Praita. Virgil makes them both shake at the fall of part of the mole of Baiæ, that stood at a few miles distance from them.

Not with less ruin than the Bayan mole,
(Rais'd on the seas, the surges to controul)
At once comes tumbling down the rocky wall,
Prone to the deep, the stones disjointed fall
Off the vast pile; the scatter'd ocean flies;
Black sands, discolour'd froth, and mingled mud
arise;
The frighted billows roll, and seek the shores:
Trembles high Prochyta, and Ischia roars:
Syphecus roars beneath, by Jove's command,
Astonish'd at the flow that shakes the land,
Soon shifts his weary side, and scarce awake,
With wonder feels the weight pass higher on his
back.

The next morning, going to Cuma, through a very pleasant path, by the Mures Mortuum, and the Elysian fields, we saw in our way a great many ruins of sepulchres and other antient edifices. Cuma is, at present, very destitute of inhabitants; so much is it changed since the time of Lucian, who says:

Where the fam'd walls of fruitful Naples lie,
That may for multitudes with Cuma vie.

They shew the remains of Apollo's temple, which the antiquarians suppose to be the same that Virgil describes in the sixth book of the *Æneiad*.

To the Cumean coast at length he came,
And here alighting, built his costly frame,
Inscrib'd to Phœbus, here he hung on high
The steerage of his wings, that cut the sky;
Then o'er the lofty gate his art emboss'd,
Androgeus' death, and off'rings to his ghost:
Seven youths from Athens, yearly sent to meet
The fate appointed by revengeful Crete;
And next to those the dreadful urn was plac'd,
In which the destin'd names by lot were cast.

There is here the beginning of a passage, leading under the earth, but it has been some time stopped up. It is the opinion of most persons who have visited it, that it led into one end of the Sybils grotto. There are many other conjectures concerning it, but

VOL. II. No. 79.

I was of opinion that it had been made on purpose for the habitation of such as choose to shelter themselves from the heat of the sun.

As for the Mosaic, and other works that may be found in it, they were probably made in the latter ages, according as they thought fit to put the place to different uses. Many have imagined these people to have been the Cimmerians, and Homer's description of them is as follows:

The gloomy race, in subterraneous cells,
Among surrounding shades and darkness dwells;
Hid in th' unwholsome covert of the night,
They shun th' approaches of the cheerful light:
The sun ne'er visits their obscure retreats,
Nor when he runs his course, nor when he sets.
Unhappy mortals! —————

And again in Virgil:

And thou, O matron of immortal fame,
Here dying, to the shore hast left thy name:
Cajeta still the place is call'd from thee,
The nurse of great Æneas' infancy.
Here rest thy bones in rich Hesperia's plains;
Thy name ('tis all a ghost can have) remains.

They shewed us a piece of marble at Cajeta, which is said to have been cleft by that earthquake which happened when our Saviour was crucified. Every one might see that this cleft has not been made with hands, but has happened in consequence of some violent convulsion in the earth, and probably long after the deaths of the Latin poets, otherwise they would have taken notice of it.

The next place we visited was Mount Cicero, a very high mountain, joined to the main land by a narrow tract of earth, that is many miles in length, and almost of a level with the surface of the water. The end of this promontory is very rocky, and mightily exposed to the winds and waves, which probably gave rise to the fables of the howlings of wolves, and the roarings of lions, that are so often mentioned by the poets. I had a lively idea of this, for I was obliged to lie under it all the night, but nothing can equal Virgil's descriptions.

Now, when the prince her funeral rites had paid,
He plow'd the Tyrrhene seas with sails display'd,
From land a gentle breeze arose, by night
Serenely shone the stars, the moon was bright,
And the sea trembled with her silver light. }
Now near the shelves of Circe's shores they run,
(Circe the rich, the daughter of the sun)
A dang'rous coast: the goddess wastes her days
In joyous songs, the rocks rebound her lays:
In spinning, or the loom, she spends her night,
And cedar-brands supply her father's light.
From hence we heard, (rebellowing to the main)
The roars of lions that refuse the chain,
The grunts of bristled boars, and groans of bears,
And herds of howling wolves that stun the sailors
ears.

These from their caverns, at the close of night,
Fill the sad isle with horror and affright.
Darkling they mourn their fate, whom Circe's
pow'r,
(That watch'd the moon, and planetary hour)
With words and wicked herbs, from human kind
Had alter'd, and in brutal shapes confin'd.
Which monsters, lest the Trojan's pious host
Should bear, or touch upon th' enchanted coast,
Propitious Neptune steer'd their course by night
With rising gales, that sped their happy flight.

We landed at Nettuna, where we found nothing remarkable, besides the poverty and laziness of the inhabitants. The ruins of Antium are about two miles from it, and are spread over a large circuit of land. The foundations of the buildings are still to be seen, with many subterraneous grottoes and passages of great length. We saw some remains of the foundations of Nero's port, composed of three moles, running round

it, in a kind of circular figure, except where the ships were to enter, and was about a quarter of a mile in its shortest diameter.

Our stage brought us to the mouth of the Tiber, into which we entered with some danger, the sea being generally very rough in those parts where the river rushes into it. The season of the year, the mildness of the stream, with the many green trees hanging over it, put me in mind of the delightful image that Virgil has given us when Eneas took the first view of it.

The Trojan from the main beheld a wood,
Which thick with shades, and a brown horror
stood;

Between the trees the Tiber took his course,
With whirlpools dimpled, and with downward
force

That drove the sand along, he took his way,
And roll'd his yellow billows to the sea:
About him, and above, and round the wood,
The birds that haunt the borders of his flood:
That bath'd within, or bask'd upon his side,
To tuneful songs their narrow throats apply'd.
The captain gives command, the joyful train
Glide through the gloomy shade, and leave the main.

But the description given us by Juvenal is, in many respects, different.

At last within the mighty Mole she gets,
Our Tyrrhene Pharos, that the mid sea meets
With its embrace, and leaves the land behind;
A work so wond'rous nature ne'er design'd.

From this place, we went to visit Rome, once the mistress of the world, and still the object of a traveller's notice in Italy. I observed, that all the road from the mouths of the Tiber exhibited many remains of ancient Roman grandeur. But the chapels and oratories that are built there, have nothing in them remarkable.

It has been generally observed, that modern Rome stands higher than the ancient; and some have computed it about fourteen or fifteen feet, taking one place with another. The reason given for it is, that the present city stands upon the ruins of the former; and indeed, I have often observed, that wherever any very considerable pile of building stood anciently, one still finds a rising ground, or little kind of hill, which was doubtless made up out of the fragments and rubbish of the ruined edifice. But besides this particular cause, we may assign another that has very much contributed to the raising of several parts of modern Rome.

It cannot be doubted but great quantities of earth have been washed off from the mountains and hills, by the violence of the showers, so that the face of Rome is much altered from what it was formerly. Every thing of antiquity in Rome, engages the attention of a traveller, and inspires those who have read the poets with something like enthusiasm.

There are in Rome two sorts of antiquities, namely, the Heathen and the Christian. The latter, though of fresher date than the former, are obscured by traditions and legends, so that one receives but very little satisfaction in searching into them. The other gives a great deal of pleasure to those who have formerly read of them in ancient authors; for a man can see an object without calling to mind something in the Latin poets. The number of statues to be seen in Rome are incredible, and we find from the following passage, that the Latin poets dwelt much in commendation of the neck and arms.

While Telephus's youthful charms,
His rosy neck, and winding arms;
With endless rapture you recite,
And in the tender name delight;
My heart, enraged by jealous heats,
With numberless resentments beats.
From my pale cheeks the colour flies;
And all the man within me dies;

By fits my swelling grief appears
In rising sighs, and falling tears,
That show too well the warm desires,
The silent, slow, consuming fires,
Which on my inmost vitals prey,
And melt my very soul away.

The Roman soldiers wore always on their helmet, the figure of a wolf, suckling two boys, in memory of Romulus and Remus, who were said to have coins, which were stamped in the reign of Antoninus Pius, as a compliment to that emperor, whom for his excellent conduct and just government, the people regarded him as their second founder, and these had on the reverse a wolf, suckling two boys.

The best poetical description we have of the vestal, the mother of these twins, is in the following lines from Ovid.

As the fair vestal to the fountain came,
(Let none be startled at a vestal's name)
Tir'd with the walk she laid her down to rest,
And to the winds exposed her glowing breast,
To take the freshness of the morning air,
And gather'd in a knot her flowing hair:
While thus she rested on her arms reclin'd,
The hoary willows waving with the wind,
And feather'd quires that warbled in the shade,
And purling streams that through the meadow
stray'd

In drowsy murmurs, lull'd the gentle maid.
The god of war beheld the virgin lie,
The god beheld her with a lover's eye,
And, by so tempting an occasion press'd,
The beautiful maid, whom he beheld, possess'd:
Conceiving, as she slept, her fruitful womb
Swell'd with the founder of immortal Rome.

In the Villa Borghese, is a fine bust of Nero in his youth, which is a very curious piece of antiquity. There are at Rome, figures of a great number of gladiators, and they are dreadful indeed. How, or in what manner could these people boast of their politeness, while they suffered such barbarities to take place within their walls! Nay, while they actually took pleasure in them, and considered them as their finest diversions! The statues and models exhibit just as much of the ancient Roman grandeur, and point out their rites and ceremonies in as plain a manner as could have been done in a pagan ritual.

Though the statues that are found among the ruins of old Rome are already extremely numerous, yet there can be no doubt that many more will be discovered hereafter, for there is a greater treasure of these things under ground, than what has yet been brought to light. They have often dug into lands that are described in old authors, as the places where particular statues stood, and have seldom failed of success in their pursuits. There are still many such promising spots of ground that have never yet been searched into, and which would probably produce many curiosities, were they properly explored.

A great part of the Palatine mountain, which was once the seat of the imperial palace, now lies desolate, nor are there any buildings upon it. If this place was searched into, there can remain no sort of doubt but many curiosities would be found; but the Roman people are too indolent to make such important inquiries.

The poet Claudian has finely described this place in the following lines:

The Palatine, proud Rome's imperial seat,
(An awful pile!) stands venerably great:
Thither the kingdoms and the nations come,
In supplicating crowds, to learn their doom:
To Delphi less th' inquiring worlds repair,
Nor does a greater god inhabit there:
This sure the pompous mansion was design'd
To please the mighty rulers of mankind;
Inferior temples rise on either hand,
And on the borders of the palace stand;

While

While o'er the rest her head she proudly rears;
And lodg'd amidst her guardian gods appears.

Next to the statues in Rome, there is nothing more surprising, than that amazing variety of antient pillars of so many kinds of marble. As most of the old statues may be supposed to have been cheaper to their first owners, than they are to a modern purchaser, several of the pillars are certainly rated at a much lower price at present, than they were of old; so not to mention what a huge column of granite must have cost in the quarry, or in the carriage from Egypt to Rome, we may only consider the great difficulty of hewing it into any figure, and of giving it the due turn, proportion, and polish.

The antients had probably some art to harden the edges of their tools, without recurring to those more than extravagant opinions of their having the art to mollify the stone, or that it was naturally softened at its first cutting from the rocks; or indeed, what is still more absurd, that it was not a natural production, but an artificial composition.

As for the workmanship of the old Roman pillars, it has been observed, that the antients have not kept to the nicety of proportion and the rules of art, so much as the moderns have done in this particular. Some, to excuse the defect, lay the blame on the workmen of Egypt, and of other nations, who sent most of the antient pillars ready shaped to Rome. Others say, that as the antients knew that the art of sculpture was merely designed to please the eye, they only took care to avoid such disproportions as were gross enough to be observed by the light works, regardless whether or not they appeared to a mechanical exactness. Others will have it rather to be the effect of art than any negligence in the architect; for they say, the antients always considered the situation of a building, whether it were high or low, in an open square, or in a narrow street, and deviated more or less from their rules of art, to comply with the several distances and elevations from which their works were to be regarded. However, as there is nothing advanced on this subject but conjecture, it must be left to further inquiries.

There could not have been a more magnificent design than that of Trajan's pillar. Where could the ashes of an emperor have been so nobly lodged, as in the midst of his metropolis, and on the top of so exalted a monument, with the greatest of his actions inscribed underneath?

The figure of Jupiter on this pillar, is one of the noblest pieces of art that can be imagined. Jupiter was the sovereign of the gods, and Virgil alludes to him in the following lines:

The combat thickens, like the storm that flies,
From westward when the show'ry scuds arise;
Or patt'ring hail comes pouring on the main,
When Jupiter descends in harden'd rain,
Or billowing clouds burst with a stormy sound,
And with an armed winter strew the ground.

I have seen a medal, that according to the opinion of many learned men, relates to the same story. The emperor is entitled on it, Germanicus, because it was in the wars in Germany that this circumstance took place, and on the reverse there is a thunderbolt in his hand; for the heathens attributed the same merit to the picts of the emperor, that the Christians ascribed to the prayers of their legion.

Thus the poet says,

So mild Aurelius to the gods repaid
The grateful vows that in his fears he made,
When Latium from unnumber'd foes was freed,
Nor did he then by his own force succeed;
But with descending show'rs of brimstone fir'd,
The wild barbarian in the storm expir'd.
Wrapt in devouring flames the horse-man rag'd,
And spur'd the steed in equal flames engag'd:
Another pent in his scorch'd armour glow'd,
While from his head the melting helmet flow'd;

Swords by the lightning's subtle force distill'd,
And the cold sheath with running metal fill'd:
No human arm its weak assistance brought,
But heav'n, offended heav'n, the battle fought;
Whether dark magick and Chaldean charms
Had fill'd the skies, and set the gods in arms;
Or good Aurelius (as I more believe)
Deserv'd whatever aid the thunderer could give.

It is impossible for a man to form, in his imagination, such beautiful and glorious scenes as are to be met with in several of the Roman churches and chapels; for, having such a prodigious stock of antient marble within the very walls of the city, and, at the same time, so many quarries within the bowels of their country, most of their chapels are laid over with such a rich varnish, and such a variety of incrustations, as cannot possibly be found in any other part of the world.

Having said thus much of Rome, I shall proceed to describe some parts in its neighbourhood, and the first thing that engaged my notice was the small rivulet Salforatta, formerly called Albula, which, at all times, used to emit an offensive smell. This is taken notice of by Martial, in one of his epigrams.

The drying marshes such a stench convey,
Such the rank streams of reeking Albula.

And again,

As from high Rome to Tivoli you go,
Where Albula's sulphureous waters flow.

The little lake that gives rise to this river, with its floating islands, is one of the most extraordinary natural curiosities about Rome. It lies in the very flat of Campania, and, as it is the drain of these places, it is no wonder that it is so impregnated with sulphur. It has at the bottom so thick a sediment of it, that, upon throwing in a stone, the water boils, for a considerable time, over the place which has been stirred up. At the same time are seen little flakes of scurf rising up, that are, probably, the parts that compose the islands; for they often mount of themselves, though the water is not troubled.

It is probable this lake was much larger formerly than it is at present, and that the banks have grown over it by degrees, in the same manner as the islands have been formed on it.

All about the lake, where the ground is dry, we found it to be hollow, by the trampling of our horses feet. I could not discover the least trace of the Sybils temple and grove, which stood on the borders of this lake. Tivoli is seen at a distance, laying along the brow of a hill. I must confess, I was most pleased with a beautiful prospect that none of the antient poets have mentioned, and which lies at about a mile distant from the town.

It opens into the Campania, where the eye loses on a smooth spacious plain. On the other side is a more broken and interrupted scene, made up of an infinite variety of inequalities and shadows, that naturally arise from an agreeable mixture of hills, groves, and vallies. But the most enlivening part of the scene is the river Tevereone, which you see at about a quarter of a mile distant, throwing itself down a precipice, and falling, by several cascades, from one rock to another, till it gains the bottom of the valley, where the sight of it would be quite lost, did not it, sometimes, discover itself through the breaks and openings of the woods that grow about it.

On our way to Palestrina, we saw the lake Regillus, famous for the apparition of Castor and Pollux, who were here seen to give their horses drink, after the battle between the Romans and the son-in-law of Tarquin. Here we left the road, for about half a mile, to see the sources of a modern aqueduct. It was certainly very lucky for Rome, as she had so much need of water to be conveyed by aqueducts, to be situated so near such a number of mountains, from whence streams are continually flowing.

The

The next place we visited was Nenni, which takes its name from Nennius-Diana. The whole country thereabouts is still over-run with woods and thickets. The lake of Nenni lies in a very deep bottom, so surrounded on all sides with mountains and groves, that the surface of it is never ruffled with the least breath of wind; which, perhaps, together with the clearness of its waters, gave it formerly the name of Diana's looking-glass.

Leaving the neighbourhood of Rome, we came to Sienna, situated extremely high, and adorned with a great many towers of brick, which, in the time of the common-wealth, were erected to such of the members as had done any considerable service to their country. These towers gave us a sight of the town a great while before we entered the gates.

The most extraordinary thing in this city is the cathedral, which a traveller may view with pleasure after he has seen St. Peter's, though not like it, it being one of the noblest pieces of Gothick architecture in the world. When a man sees the vast expence and pains our ancestors were at, in raising these buildings, one cannot but fancy to himself what miracles of architecture they would have left us, had they only been instructed in the right way; for when the devotions of those ages was much warmer than it is at present, and the riches of the people much more at the disposal of the priests, there was so much money consumed on those Gothick cathedrals, as would have finished a greater variety of noble buildings than have been raised either before or since that time.

The labour and expence laid out on this cathedral has been amazing indeed! The very spouts are loaded with ornaments; the windows are formed like so many scenes of perspective, with a multitude of little pillars, retiring one behind another. The great columns are finely engraved with fruits and foilage, that run twisting about them from the very top to the bottom. The whole body of the church is chequered with lays of white and black marble, and the pavement has many Scripture histories engraven on it.

Here was once a republic, governed by its own senators and laws, but it is now subject to the grand duke of Tuscany.

From Sienna we went forward to Leghorn, where the two ports, the Bagnio and the Dantelli's statue of the grand duke, amidst the four slaves chained to his pedestal, are very noble sights. The square is one of the largest, and will be the most beautiful one in Italy, when this statue is erected in it, and a town-house built at one end to front the church, which stands at the other.

As Leghorn is a free port, so it draws a vast number of strangers to it. Here is a factory of English merchants, who deal largely in wines, oils, and silks; but there being seldom less than ten thousand Jews here, they run away with great part of the trade.

From Leghorn I went to Pisa, where there is still the shell of a great city, though not half furnished with inhabitants. The great church, baptistry, and burning tower, are very well worth seeing, and are built after the same form as those of Sienna. Half a day's journey more brought me to the republic of Lucca.

It is very pleasant to see how the small territories of this little republic are cultivated to the best advantage; so that one cannot find the least spot that is not made to contribute its best to the owner.

Among the inhabitants, there appears an air of cheerfulness and plenty, not often to be met with in those countries that lie around them. There is but one gate for strangers to enter in at, that it may be known what number of them are in the town. Over it is written, in letters of gold, the words *Libertas*, or liberty.

This little republic is shut up in the grand duke's dominions, who, at present, threatens to seize on their privileges. The occasion is as follows:

The inhabitants plead prescription for hunting in one of the duke's forests, that lies upon their frontiers, which, about two years ago, was strictly for-

bidden them; the duke intending to preserve the forest entirely for himself. Two or three sportsmen of the republic, who had the hardiness to offend against the prohibitions, were seized and kept in a neighbouring prison. Their countrymen, to the number of three-score, attacked the place, and rescued them: the grand duke re-demands his prisoners, and, as a further satisfaction, would have the governor of the town, where the three-score assailants had combined together, to be delivered into his hands; but receiving only a few trifling excuses, he resolved to do himself justice.

Accordingly, he ordered all the inhabitants of Lucca to be seized, that were found in one of his frontier towns on a market-day. These amounted to four-score, among whom were persons of some consequence in the republic. They are now in prison at Florence, and, as it is said, treated severely enough, for there are fifteen of the number who have died within a very short space of time. The king of Spain, who is protector of the commonwealth, received information from the grand duke of what had passed, who approved of his proceedings, and ordered the republic of Lucca to make satisfaction. The republic thinking themselves injured, sent to Prince Eugene, to desire he would intercede for the protection of their republic; offering, at the same time, winter quarters for four thousand Germans. The duke, however, rose in his demands, and obliged them to ask pardon for their insolence.

The whole government of this little republic passed into different hands at the end of two months, which is the greatest security imaginable to their liberty, and wonderfully contributes to the dispatch of public affairs. But in any emergency of the state, like that they are now pressed with, it certainly required longer time to carry their designs into execution for the benefit of the commonwealth.

The next place I visited was Florence, where there are so many curiosities, that the idea of one totally erases the next that presents itself. The palaces here are not only grand, but beautiful; and, as Tuscan pillars first took their rise in this country, the artists always take care to place some of them in their most splendid buildings. The duke's palace is a very noble pile, built after this manner, which makes it look extremely solid and magnificent. It is not unlike that at Luxemburgh, which was built by Mary of Medicis, and for that reason, perhaps, the artists fell into the Tuscan humour.

I found, in the court of the palace at Florence, what I had not met with at Rome, namely, a statue of Hercules, lifting up Antenor from the earth. It was found in Rome; and brought hither during the reign of Leo X. There are, likewise, abundance of paintings in the different apartments, by the most esteemed artists in the world. But the old palace is the greatest glory of the city, where, perhaps, the greatest number of curiosities were collected together that can be met with any where in the world.

It is amazing to behold what number of busts are in this gallery: perhaps the one half of what remains of antiquity is to be found here: art has been, as it were, exhausted in the execution, and generosity displayed in the collection. There is a sculpture of Alexander the Great, casting up his eyes to heaven, and, probably, this alludes to his weeping, because he imagined, foolishly enough, that he could not find any more new worlds to conquer.

In one of the chambers is shewn the famous statue of Venus, which is reckoned one of the greatest curiosities in the world. The statue seems much less than the life, as being perfectly naked, and in company with others of a larger size. It is, notwithstanding, as big as the ordinary size of a woman, as I concluded from the measure of her wrist; for, from the bigness of any one part, it is easy to guess at all the rest, in a figure of such nice proportion. The softness of the flesh, and the delicacy of the shape, air, and posture, with the correctness of design in this statue, are all inexpressible. I have several reasons to believe that

the name of the sculptor, on the pedestal, is not so old as the statue.

After a very tedious journey over the Appenines, we, at last, came to the river that runs at the foot of them; and following the course of the river, we arrived, in a short time, at Bologna. We soon felt the difference between the northern and southern sides of the mountains; as well in the coldness of the air, as in the badness of the wine. This town is famous for the richness of the soil that lies about it, and the magnificence of its convents.

Parma and Modena are little principalities, but there are no people in the world who would live more comfortably, were it not for the horrid oppressive power of the clergy. This usurped power, however, over the consciences of men, reigns predominant in Italy; and will do so, till such time as some sort of a reformation takes place. And thus it happens, that none suffers greater hardships than those who live under small commonwealths.

I left the road of Milan on my right hand, having before seen that city, and after having passed through Asti, the frontier town of Savona, I at last came within sight of the Po, which is a fine river, even at Turin, though within six miles of its source. This river has been made the scene of two or three poetical stories; Ovid has chosen it to throw his Phaeton into, after all the smaller rivers had been dried up in the conflagration.

I have read some botanical critics, who tell us that, the poets have not rightly followed the traditions of antiquity, in metamorphosing the sisters of Phaeton into poplars, who ought to have been turned into laurel-trees; for, it is this kind of tree that sheds a gum, and is commonly found on the banks of the Po. The change of Cycnus into a swan, which closes up the disasters of Phaeton's family, was wrought on the same place where the sisters were turned into trees.

His head above the flood he gently rear'd,
And as he rose his golden horns appear'd,
That on the forehead shone divinely bright,
And o'er the banks diffus'd a yellow light:
No interwoven reeds a garland made,
To hide his brows within the vulgar shade,
But poplar wreaths around his temples spread,
And tears of amber trickled down his head:
A spacious veil from his broad shoulders flew,
That set th' unhappy Phaeton to view:
The flaming chariot and the steeds it show'd,
And the whole fable in the mantle glow'd:
Beneath his arm an urn supported lies,
With stars embellish'd and fictitious skies.
For Titan, by the mighty loss dismay'd,
Among the heav'ns th' immortal fact display'd,
Lest the remembrance of his grief should fail,
And in the constellations wrote his tale.
A swan in memory of Cycnus shines;
The mourning sisters weep in wat'ry signs;
The burning chariot, and the charioteer,
In bright Boötes and his wane appear;
Whilst in a track of light the waters run,
That wash'd the body of his blasted son.

The river Po gives a name to the chief street of Turin, which fronts the duke's palace, and, when finished, will be one of the neatest in Italy for its length. There is one convenience in this city that I never observed in any other, and which makes some amends for the badness of the pavement.

By the help of a river, that runs on the upper side of the town, they can convey a little stream of water through all the most considerable streets; which serves to cleanse the gutters, and carries away all the filth that is swept into them. The manager opens his sluice by night, and distributes the water into what quarter of the town he pleases. Besides the ordinary and necessary conveniences that arise from it, it is of great use when a fire happens to break out; for, at a few minutes warning, they have a little river running by the very walls of the house that is burning.

The court of Turin is reckoned the most splendid and polite of any in Italy, but by reason of its being in mourning, I could not see its magnificence. The common people of this state are more exasperated against the French than any of the rest of the Italians; for the great mischiefs they have suffered from them are still fresh on their memory: and, notwithstanding the interval of peace, one may easily trace out the several marches made by the French armies, and the ruin and desolation left behind them: and all this, at a time when the duke was, from the nature of his connections, obliged to be in alliance with France. It is certain, the French were always perfidious to those with whom they had any connection; and, it may be justly said of them, that they ought not to be trusted. There is not a power in Europe whom they have not betrayed: and we, in this country, have suffered sufficiently from their perfidy.

These two accounts of Italy, by Mr. Addison and bishop Burnet, are the most animated that can be imagined. Indeed, the face of that country differs but little from what it was in those times. The state of that country in ancient and modern times, is more beautifully expressed in the following lines of Mr. Addison, than in any other author whatever.

It was written from Florence, by Mr. Addison, in a letter to that great statesman, Charles Savile, marquis of Halifax, in the year 1701.

While you, my lord, the rural shades admire,
And from Britannia's public posts retire,
Nor longer, her ungrateful sons to please,
For their advantage sacrifice your ease;
Me into foreign realms my fate conveys,
Through nations fruitful of immortal lays,
Where the soft season and inviting clime
Conspire to trouble your repose with rhyme.
For wheresoe'er I turn my ravish'd eyes,
Gay gilded scenes and shining prospects rise,
Poetic fields encompass me around,
And still I seem to tread on classic ground;
For here the muse so oft her harp has strung,
That not a mountain rears its head unsung,
Renown'd in verse each shady thicket grows,
And ev'ry stream in heav'nly numbers flows.
How am I pleas'd to search the hills and woods
For rising springs and celebrated floods!
To view the Nar, tumultuous in his course,
And trace the smooth Clitumnus to his source;
To see the Mincio draw his watry store
Through the long windings of a fruitful shore;
And hoary Albula's infected tide
O'er the warm bed of smoaking sulphur glide!
Fir'd with a thousand raptures, I survey
Eridanus through flow'ry meadows stray,
The king of floods! that rolling o'er the plains
The tow'ring Alps of half their moisture drains,
And proudly swoln with a whole winter's snows,
Distributes wealth and plenty where he flows.
Sometimes, misguided by the tuneful throng,
I look for streams immortaliz'd in song,
That lost in silence and oblivion lie,
(Dumb are their fountains, and their channels
dry)

Yet run for-ever by the muse's skill,
And in the smooth description murmur still.
Sometimes to gentle Tiber I retire,
And the fam'd river's empty shores admire,
That destitute of strength derives its course
From thrifty urns and an unfruitful source;
Yet sung so often in poetic lays,
With scorn the Danube and the Nile surveys;
So high the deathless muse exalts her theme!
Such was the Boyne, a poor inglorious stream,
That in Hibernian vales obscurely stray'd,
And unobserv'd in wild meanders play'd;
'Till by your lines and Nassau's sword renown'd,
Its rising billows through the world resound,
Where-e'er the hero's godlike acts can pierce,
Or where the fame of an immortal verse.

Oh cou'd the muse my ravish'd breast inspire
 With warmth like yours, and raise an equal fire,
 Uncumber'd beauties in my verse should shine
 And Virgil's Italy shou'd yield to mine!
 See how the golden groves around me smile,
 That shun the coast of Britain's stormy isle;
 Or, when transplanted and preserv'd with care,
 Curse the cold clime, and starve in northern air.
 Here kindly warmth their mounting juice ferments
 To nobler tastes, and more exalted scents:
 Ev'n the rough rocks with tender myrtle bloom,
 And trodden weeds send out a rich perfume.
 Bear me, some god, to Baia's gentle seats,
 Or cover me in Umbria's green retreats;
 Where western gales eternally reside,
 And all the seasons lavish all their pride:
 Blossoms, and fruits, and flowers together rise,
 And the whole year in gay confusion lies.
 Immortal glories in my mind revive,
 And in my soul a thousand passions strive,
 When Rome's exalted beauties I descry
 Magnificent in piles of ruin lie.
 An ampitheatre's amazing height
 Here fills my eye with terror and delight,
 That on its public shows unpeopled Rome,
 And held uncrowded nations in its womb:
 Here pillars rough with sculpture pierce the skies:
 And here the proud triumphal arches rise,
 Where the old Romans' deathless acts display'd,
 Their base degenerate progeny upbraid:
 Whole rivers here forsake the fields below,
 And wond'ring at their height through airy chan-
 nels flow.

Still to new scenes my wand'ring muse retires,
 And the dumb show of breathing rocks admires;
 Where the smooth chissel all its force has shown,
 And soften'd into flesh the rugged stone.
 In solemn silence, a majestic band,
 Heroes, and gods, and Roman consuls stand;
 Stern tyrants, whom their cruelties renown,
 And emperors in Parian marble frown;
 While the bright dames, to whom they humbly su'd,
 Still show the charms that their proud hearts sub-
 du'd.

Fain wou'd I Raphael's godlike art rehearse,
 And show th' immortal labours in my verse,
 Where from the mingled strength of shade and light
 A new creation rises to my sight,
 Such heav'nly figures from his pencil flow,
 So warm with life his blended colours glow.
 From theme to theme with secret pleasure tost,
 Amidst the soft variety I'm lost:
 Here pleasing airs my ravish'd soul confound
 With circling notes and labyrinths of sound;
 Here domes and temples rise in distant views,
 And opening palaces invite my muse.
 How has kind heav'n adorn'd the happy land,
 And scatter'd blessings with a wasteful hand!
 But what avail her unexhausted stores,
 Her blooming mountains, and her sunny shores,
 With all the gifts that heav'n and earth impart,
 The smiles of nature, and the charms of art,
 While proud oppression in her vallies reigns,
 And tyranny usurps her happy plains?
 The poor inhabitant beholds in vain
 The red'ning orange and the swelling grain:
 Joyless he sees the growing oils and wines,
 And in the myrtle's fragrant shade repines:
 Starves, in the midst of nature's bounty curst,
 And in the loaden vineyard dies for thirst.
 O liberty, thou goddess heavenly bright,
 Profuse of blifs, and pregnant with delight!
 Eternal pleasures in thy presence reign,
 And smiling plenty leads thy wanton train;
 Eas'd of her load, subjection grows more light,
 And poverty looks chearful in thy sight;
 Thou mak'st the gloomy face of nature gay,
 Giv'st beauty to the sun, and pleasure to the day.
 Thee, goddess, thee Britannia's isle adores;
 How has she oft exhausted all her stores,

How oft in fields of death thy presence sought,
 Nor thinks the mighty prize too dearly brought!
 On foreign mountains may the sun refine
 The grape's soft juice, and mellow it to wine,
 With citron groves adorn a distant soil,
 And the fat olive swell with floods of oil:
 We envy not the warmer clime, that lies
 In ten degrees of more indulgent skies,
 Nor at the coarseness of our heav'n repine,
 Tho' o'er our heads the frozen Pleiads shine:
 'Tis liberty that crown's Britannia's isle,
 And makes her barren rocks and her bleak moun-
 tains smile.

Others with towering piles may please the sight,
 And in their proud aspiring domes delight;
 A nicer touch to the stretcht canvas give,
 Or teach their animated rocks to live:
 'Tis Britain's care to watch o'er Europe's fate,
 And hold in balance each contending state;
 To threaten bold presumptuous kings with war,
 And answer her afflicted neighbour's pray'r.
 The Dane and Swede, arous'd by fierce alarms,
 Bless the wise conduct of her pious arms:
 Soon as her fleets appear, their terrors cease,
 And all the northern world lies hush'd in peace.
 Th' ambitious Gaul beholds with secret dread
 Her thunder aim'd at his aspiring head,
 And fain her godlike sons wou'd disunite
 By foreign gold, or by domestic spite;
 But strives in vain to conquer or divide,
 Whom Nassau's arms defend and counsels guide.
 Fir'd with the name, which I so oft have found,
 The distant climes and different tongues resound,
 I bridle in my struggling muse with pain,
 That longs to launch into a bolder strain.
 But I've already troubled you too long,
 Nor dare attempt a more advent'rous song.
 My humble verse demands a softer theme,
 A painted meadow, or a purling stream;
 Unfit for heroes; whom immortal lays,
 And lines like Virgil's, or like yours, shou'd praise.

From Turin we came directly to the lake of Geneva, having had a very easy journey over Mount Cennis, although it was then about the beginning of December; but the snows had not begun to fall. On the top of this high mountain is a large plain, and, in the midst of the plain, is a most beautiful lake, which would be very extraordinary, were there not several mountains in the neighbourhood seemingly rising over it. The people in the neighbourhood pretend it is unfathomable, and I question not but the waters of it fill up a deep valley, before they come to a level with the surface of the plain.

There is nothing in the natural face of Italy more delightful to a traveller than the several lakes, which are dispersed up and down among the many breaks and hollows of the Alps and Appenines. The ancient Romans took a great deal of pains to hew out passages for these lakes to discharge themselves into some of the neighbouring rivers, in order to make the air the more wholesome. Most of those works were carried on during the reign of the emperor Claudius; and had it not been for the Roman law which tolerated slavery, it would have been impossible to have completed them.

During the whole of our journey through the Alps, as well when we climbed up as when we descended them, we had still a river running along with the road, that, probably, first discovered the passages.

Silius Italicus, a delightful poet, has described the Alps in the following most beautiful lines:

Stiff with eternal ice, and hid in snow,
 That fell a thousand centuries ago,
 The mountain stands; nor can the rising sun
 Unfix her frosts, and teach 'em how to run:
 Deep as the dark infernal waters lie
 From the bright regions of the chearful sky,
 So far the proud ascending rocks invade
 Heav'n's upper realms, and cast a dreadful shade:

No spring nor summer on the mountain seen
Smiles with gay fruits, or with delightful green;
But hoary winter, unadorn'd and bare,
Dwells in the dire retreats and freezes there;
There she assembles all her blackest storms,
And the rude hail in ratt'ling tempests forms;
Thither the loud tumultuous winds resort,
And on the mountains keep their boist'rous court,
That in thick show'rs her rocky summit throwds,
And darkens all the broken view with clouds.

Near St. Julian in Savoy, the Alps begin to enlarge themselves on all sides, and open into a vast circuit of ground. This extent of land with the Lemane lake, would make one of the prettiest and most delightful dominions in Europe, was it all thrown into a single state, and had Geneva for its metropolis. But there are three powerful neighbours, who divide among them this fruitful country. The duke of Savoy has the Chablais, and all the fields that lie beyond Arve, as far as to the Ecluse. The French king is master of great part of the country of Gex, and the canton of Bern has that of the vaud or valley. Geneva and its little territories, lie in the centre of these states. The greatest part of the town stands upon a hill, and has its views bounded on all sides, by several ranges of mountains, which are, however, at so great a distance, that they leave open a wonderful variety of beautiful prospects. I often observed, that the tops of the neighbouring mountains were covered with light above half an hour after the sun was set.

On one side you have a long track of hills, called the Mountains of Jura, covered with vineyards and pastures, and on the other large precipices of naked rocks, rising up in a thousand odd figures, and cleft in some places so as to discover high mountains of snow that lie several leagues behind them. Towards the south, the hills rise more insensibly, and leave the eye a vast uninterrupted prospect for many miles. But the most beautiful of all is the lake.

The lake resembles a sea, in the colour of its waters, the storms that are raised on it, and the ravages it makes on its banks. In the same manner it receives different names from the different parts of its banks or coasts it washes, and in summer has something like an ebb and flow, which arises from the swelling of the snow that falls into it more copiously at noon than at any other time of the day. It has five different states bordering on it, and these are, the kingdoms of France; the duchy of Savoy; the canton of Bern; the bishopric of Sion, and the republic of Geneva. I have seen papers fixed up in the canton of Bern, with the following lofty preface, "Whereas we have been informed of several abuses committed in our ports and harbours on the lake," &c.

The right side of the lake from Geneva, belongs to the duke of Savoy, and is extremely well cultivated. But the greatest entertainment we met with was the agreeable prospect of woods, meadows, and corn-fields, that lie on the borders of it, and run up along the sides of the Alps, where the barrenness of the rocks, and the steepness of the mountains will permit it. The wine, however, on this side of the lake, is not so good as that on the other. We here passed Yvoire, where the duke of Savoy keeps his galleys, and lodged at Torfon, which is the largest town on the lake belonging to the Savoyards. It has four convents, and about six hundred inhabitants.

The lake is here about twelve miles in breadth; and near the town is a convent belonging to the Carthusians. At the very extremity of the lake, the Rhine enters, and brings along with it a vast quantity of water. From the end of the lake to the source of the Rhine, is a valley of about four days journey in length, which belongs to the bishop of Sion. Throughout the whole of this place, there is plenty of all sorts of provisions, and although the people live under a popish government, yet they seem not to feel, or at least not to regard, the iron hand of oppression, the common bane of industry.

The next day we came to the town of Verfory, in the canton of Bern, where Ludlow, author of the memoirs, and one of the judges, who signed the warrant for the execution of Charles I. of England, spent his time in exile, after he had been obliged to leave England, in order to avoid an ignominious death.

It was remarkable of this man, that when the Revolution took place, he applied to king William for a pardon, but he did not consider that he was attainted by an act of parliament; and the attainder itself could not be set aside, but by an act of equal force. King William was the grandson of Charles, and he had married Mary the grand-daughter of that unfortunate prince; but all this would have had no weight with the king, had he not been obliged to please both the whigs and the Tories. He lies buried in one of the churches, and near him is interred one Broughton, who was clerk to the pretended high court of justice; which condemned king Charles.

The next day we spent at Lausanne, the greatest town on the lake next to Geneva. There is one street in this town, where the inhabitants have a right to judge in all criminal matters. Not many years ago, a prisoner being tried, a cobbler had the casting vote, and gave it in favour of the criminal.

I shall not say any thing more concerning the city of Geneva, that being well known already. It is a free republic, situated on the extremity of the lake, where the Rhone which falls in at the other extremity, issues out at this place, and forms a great river.

The next place we visited, was Friburgh, which is but a mean town, although the capital of so large a canton. Its situation is so irregular, that they are forced to climb up to several parts of it by their causeway of a prodigious ascent. This inconvenience, however, is attended with one advantage of a very important nature; for when a fire breaks out in the lower parts, they can easily break open their reservoirs, and let the water down to extinguish the flames.

This is one of the Roman catholic countries, and they have four convents for women, and as many for men; there is likewise here a college of Jesuits, which is esteemed the best in Switzerland. They have a collection of pictures representing many of their brethren, who suffered for high-treason in England.

About two leagues from Friburgh, we went to visit a hermitage, which is reckoned one of the greatest curiosities in that part of Switzerland. It lies in the greatest solitude imaginable, among woods and rocks, which at first sight dispose a man to be serious. There has lived in it a hermit, upwards of five and twenty years, who with his own hands has worked in a rock a pretty chapel, with all other conveniences necessary. His chimney is carried up through the whole rock, so that one sees the sky through it, notwithstanding the rooms are very deep. He has cut the side of the rock into a flat for a garden, and by laying on it the waste earth that he has found in some of the neighbouring parts, has made such a spot of ground of it, as furnishes out a sort of luxury for a hermitage. By the drops of water distilling from several parts of the rock, and following the veins of them, he has made himself two or three fountains, in the bowels of the mountain, that serve his table, and water his little garden.

From Friburgh, we were obliged to travel over very bad roads to Bern, through woods of fir-trees; what pleased me most at Bern was their public walks, besides the great church. They are raised extremely high, and they are built upon arches and pillars. From these walks there is the noblest prospect in the world, for there is a full view of a large range of mountains that lie in the country of the Grisons, and are buried in snow. They are about seventy miles from the town, though by reason of their height they appear much nearer.

The cathedral church stands on one side of these walks, and is perhaps the most magnificent Protestant church in Europe, out of England. It is a very bad work, and an antient piece of Gothic architecture. The tower

tower of Bern is plentifully supplied with water, there being a great multitude of fountains placed at set distances from each other along the streets. There is, indeed, no country in Europe better supplied with water than the several parts of Switzerland that I travelled over. One meets every where in the streets with fountains continually running into huge troughs that stand beneath them, which is wonderfully commodious in a country that so much abounds with horses and cattle. It has so many springs breaking out of the sides of the hills, and such vast quantities of wood to make pipes of, that it is no wonder they are so well stocked with necessaries, which are among the greatest conveniences of human life.

On the road between Bern and Sienna, there is a monument erected to the memory of an Englishman, which is not to be met with in any of our writers. The inscription is in Latin verse on one side of the stone, and in German on the other. I had not time to copy it, but the substance is this :

“ One Cuffinus, an Englishman, to whom the duke of Austria had given his sister in marriage, came to take her from among the Swifs by force of arms, but after having ravaged the country for some time, he was here overthrown by the cantons of Bern.”

Salerno, the next town we visited, seemed to have a greater air of politeness than any one I had hitherto seen in Switzerland. The French ambassador has his residence in this place ; for it is the chief town of one of the popish cantons. The French king has been at the expence of building a fine church for the jesuits in this city, but it was not finished while we were there : when it is completed, it will be one of the noblest structures in that part of the world. The old cathedral stood not far from it, and at the ascent that leads to it are two antient pillars, which belonged formerly to an heathen temple, dedicated to Hermes : they seem to have been of the Tuscan order, from their proportions. The whole fortification of Salerno is paved with marble, but its chief strength consists in the mountains that lie within its neighbourhood, and separate it from the French dominions.

Our next day's journey brought us to Meldingden, which is a small Roman catholic town, with one church, but no convent. It is a republic of itself, under the eight antient cantons, and, besides one hundred magistrates, there are in it about one thousand inhabitants. Their government is modelled on the plan of the other cantons, as near as circumstances will permit in such small extent of territory.

They have a town house, adorned with the arms of the eight cantons, who are their protectors ; and they assume to themselves all the dignity that is claimed by the other states of Switzerland. The chief person in the state is called the avoyer or doge ; and the person who enjoyed that office while I was there, was son to the landlord of the inn where I lodged. His father had enjoyed the same honours before him, and the salary was not more than about thirty pounds a year.

The river that runs through their dominions, puts them to the expence of keeping a bridge in repair, which is made of wood, with a covering over it, like all the bridges in that country. Those that travel over it are obliged to pay a toll, in order to keep it in repair ; and, as the French ambassador has occasion to pass frequently this way, his master allows twenty pounds a year towards defraying the expence.

The next day we arrived at Zurich, prettily situated, near the borders of the lake, and is reckoned the handsomest town in Switzerland. The chief places shewn to strangers are the arsenal, the library, and the town-house : this last is beautifully furnished, and is an exceeding fine building : the frontispiece has pillars of fine black marble, intermixed with white, which is found in the neighbouring mountains. The chambers for the several councils are very neat, and the whole building is so well designed, that it would not make a despicable figure even in Italy.

The walls, however, are spoiled with a variety of childish Latin sentences, that consist often in a jingle

of words. The library is a very large room, pretty well filled ; and over it is another room, filled with several natural and artificial curiosities. I saw in it a large map of the whole country of Zurich, drawn with a pencil ; where they see any particular fountain and hillock in their dominions. I run over their cabinet of medals, but did not meet with any that were extraordinary. The arsenal is much bigger than that at the city of Rome, and they told us that there were arms in it for thirty thousand men, but the truth of this we doubted.

Leaving Zurich, a day's journey brought us into the territories of the abbot of St. Gall. This abbot can raise an army of twelve thousand men, all well armed and exercised. He is sovereign of the whole country, but in some respects subjects to the other cantons. He is always chosen out of the abby of the Benedictines of St. Gall, and every brother in the convent has a vote in the election, which must afterwards be confirmed by the pope. The abbot takes the advice of his cloister before he engages in any matter of importance, such as the levying of taxes or declaring war. This chief officer is the grand master of the household, and he has the management of all secular affairs under him. There are several other judges for the different dioceses of his country, but an appeal lies from their tribunals to the abbot or prince. His residence is generally in the Benedictine convent of St. Gall, notwithstanding the town of St. Gall is a little protestant republic, wholly independent of the abbot, and under the protection of the cantons.

One is surpris'd to see the people so rich in so small a republic, where they are few in number ; especially as they have so few lands to cultivate, and little or no resources besides what arise from their trade. But the great support of this little and rather insignificant republic, is its manufactory in linen, which employs almost all the inhabitants. The whole country around there furnishes them with abundance of flax, out of which they are said to make, yearly, forty thousand pieces of cloth, reckoning two hundred ells to the piece. Some of their cloth is as finely wrought as any that can be found in Holland, for they have excellent artists, and every conveniency for wetting the linen.

All the fields about the town are so covered with their manufactures that, coming in the dark of the evening, we mistook them for a lake. They send their goods, on mules, into Italy, Germany, Florence, Spain, and all the adjacent countries. They reckon, in the town of St. Gall, and the villages that lie adjacent to it, about ten thousand inhabitants, but sixteen hundred of them are only freemen.

About four years ago, the town and the abby would have come to an open rupture, had it not been timely prevented by the interposition of their common protectors. The occasion was this :

A Benedictine monk, in one of their usual processions, carried his cross erected through the town, with a train of three or four thousand priests following him. They had no sooner entered the convent, than the whole town was in an uproar, occasioned by the insolence of the priest, who, contrary to all precedent, had presumed to carry his cross in that manner. The citizens immediately put themselves under arms, and drew down four pieces of their cannon to the gates of the convent. The procession, to escape the fury of the citizens, durst not return by the way it came, but after the devotions were finished, passed out at a back door of the convent that immediately led into the abbot's territories.

The abbot on his part, raised an army and blocked up the town on the side that faced his dominions, and forbid his subjects to furnish the inhabitants with any of the necessaries of life. While things were just ripe for a rupture, the cantons, their protectors, interposed as umpires, in the quarrel, condemning the town, that had appeared too forward in the dispute, to pay a fine of two thousand crowns ; and declaring at the same time, that as soon as any procession entered their walls, the priest should let the cross hang about his neck

without

without touching it with either hand till he came within the porch of the abbey.

The citizens could bring into the field near two thousand men well exercised, and armed to the best advantage, with which they fancy they could make head against above fifteen thousand peasants, for so many the abbot could easily raise in his territories. But the Protestant subjects of the abby, who, they say, make up one thousand of the people, would probably, in case of a war, abandon the cause of their prince, for that of their religion.

The town of St. Gall has an arsenal, likewise a town house, and churches in proportion to the number of the inhabitants. It is well enough fortified to resist any sudden attack, and to give the cantons time to come to their assistance. The abby is by no means so magnificent as one would imagine it might be from the value of its endowments. The church is a high nave of Gothic architecture, with a double aisle to it, and at each end is a large choir. The one of them is supported by vast pillars of stone, cased over with a composition that looks the most like marble that any one can imagine.

On the walls and ceiling of the church, are lists of saints, martyrs, popes, and priests, many of whom perhaps never had any existence. I have often wished that some traveller would take the pains to gather in one point of view all the inscriptions that are to be met with in Roman catholic countries and churches. Had we but two or three volumes of this nature, without any of the collector's own reflections, I am sure there is nothing in the world could give a truer idea of the Roman catholic religion, nor expose more the pride, vanity, and self-interest of convents, the abuse of indulgences, the folly and impertinence of votaries, and in short, the superstitious credulity and childishness of the Roman catholic religion.

From St. Gall I set out on horseback for the lake of Constance, which lies at two leagues distance from that once celebrated city. This is the only lake in Europe that disputes for greatness with that of Geneva. It appears more beautiful to the eye, but wants the fruitful fields and vineyards that border upon the other. It receives its name from Constance, the chief town on its banks.

We crossed the lake to Lindaw, and in several parts of it observed abundance of pebbles and bubbles that came washing out from the bottom of the lake. The watermen told us, that these bubbles are observed always to rise in the same places, from whence they conclude them to be so many springs that break out of the bottom of the lake. Lindaw is an imperial town, situated on a little island, that lies at about three hundred paces from the terra-firma, or firm land, to which it is joined by a high bridge of wood.

The inhabitants were all in arms when we passed through it, being under great apprehensions from the duke of Bavaria, after his having fallen upon Ulm and Memmingen. They flatter themselves, that by cutting their bridge, they could hold out against the Bavarian army. But in all probability, a shower of bombs would quickly induce them to surrender. They were formerly bombarded by the great Adolphus, king of Sweden, and obliged to surrender.

We were advised, by the merchants here, by no means to venture ourselves into the duke of Bavaria's country, so that we had the mortification to lose the sight of Munich, Augsburgh and Ratisbon, and were forced to take our way to Venice through the Tyrol, where we had very little to entertain us, besides the natural face of the country.

After having coasted the Alps for some time, we at last entered them by a passage, which leads into the long valley of Tyrol, and following the course of the river Inn, we came to inspect that place which receives its name from that river, and is the capital city of the country.

Inspbruk is a handsome town, though not a large one, and was formerly the residence of the arch-dukes, who were lords of Tyrol. The palace where they

kept their court, is rather convenient than magnificent. The great hall is indeed a very noble room; the walls of it are painted in fresco, and represent most of the achievements of Hercules. Many of them still look well, though one of them has been cracked by earthquakes, which are very frequent in this country.

There is a little wooden palace on its borders, whither the court used to retire at the first shock of an earthquake.

In one of the rooms of the palace, which is adorned with the pictures of several illustrious persons, they shewed us the picture of Mary queen of Scots, who was beheaded in the reign of queen Elizabeth.

The gardens about the house are large, but kept in bad order. There is in the middle of them a beautiful statue of brass, of an arch-duke Leopold, on horseback. There are near it twelve other figures of water-nymphs and river gods, well cast, and as big as the life. They were designed for the ornaments of a water-work, as appears evident from the whole of the construction.

The late duke of Lorrain had the government of Tyrol assigned him by the emperor, and his lady the queen dowager of Poland lived here twenty years after the death of the duke her husband. There were covered galleries that lead from the palace to five different churches. I passed through a very long one, which reaches to the church of the capuchin convent, where the duke of Lorrain used often to resort after midnight devotions.

They shewed us, in this convent, the apartments of Maximilian, who was arch-duke and count of Tyrol, about the beginning of the seventh century. This prince, at the same time that he kept the government in his hands, lived in the convent with all the rigour and austerity of a capuchin. This anti-chamber and room of audience, are little square chambers wainscotted. His private lodgings are three or four square rooms, faced with a kind of fretwork, that makes them look like hollow caverns in a rock.

They preserve this apartment of the convent uninhabited, and show in it the altar, bed, and stove, as likewise a portrait of this devout prince.

The church of the convent of the Franciscans is famous for the tomb of the emperor Maximilian I. which stands in the midst of it. It was erected by his great grandson Ferdinand I. who probably looked upon this emperor as the founder of the Christians greatness. For as by his own navy he annexed the low countries to the house of Austria, so by marrying his son to Joan of Arragon, he settled on his posterity the kingdom of Lorrain, and by the marriage of his grandson Ferdinand, got into his possession the kingdom of Bohemia and Hungary.

This monument is only honorary, for the ashes of the emperor lie elsewhere. On the top of it is a brazen figure of Maximilian on his knees, and on the sides of it a most beautiful bas-relief, representing the actions of this prince. His whole history is digested into twenty-four pannels of sculptures in bas-relief. The subject of two of them is his confederacy with Henry VIII. of England, and the wars they carried on against France. On each side of this monument, is a row of very noble brazen statues, much bigger than the life, most of them representing such as were some way or other related to Maximilian.

Among the rest, is one that the fathers of the convent told us represented Arthur, the old British king. But what relation could Arthur have to Maximilian? The truth seems to be, it was erected in honour of Arthur prince of Wales, and eldest son of Henry VII. who had married Catherine sister of Maximilian.

In this church, one sees something that has the appearance of modern architecture; but at the same time that the architect has shown his dislike of the Gothic manner, one may see that he did not know the just proportion. The portal, for example, consists of a composite order, unknown to the antients. The ornaments indeed are taken from them, but so put together, that the Corinthian, Ionic, and Doric, seem

all mixed on one capital. The rest of the church has a great number of very odd figures upon it, especially on the inside of the roof, but there is no beauty in them.

There are some other churches in the town, and two handsome palaces, of a modern date, and built with a good fancy. I was shewn a church dedicated to the Virgin Mary, for having, as they imagined, defended the country against the Swedes; who could not enter this part of the empire, after having overrun the rest. Almost half a league distant from Inspruck, stands the castle of Amfas, furnished with a prodigious quantity of medals, and many other forts of rarities, both in nature and art.

From Inspruck we came to Hall, that lies at a league distant on the same river. This place has been long famous for its salt-works; and there are in the neighbourhood vast mountains of a transparent kind of rock, not unlike alum, extremely solid, and as poignant in taste to the tongue as salt itself. Four or five hundred men are always at work in these mountains, where, as soon as they have hewn down any quantities of the rock, they let in their springs and reservoirs among their works. The water eats away, and dissolves the particles of salt which are mixed in the stone, and is conveyed, by long troughs and canals, to the town of Hall, where it is received in vast cisterns, and boiled off from time to time.

They make after the rate of eight hundred loaves a week, each loaf being four hundred pounds in weight. This would raise a great revenue to the emperor, were there such a tax on salt as there is in France. At present, he clears only two thousand crowns a year, after having defrayed the expences of working it. There are in Switzerland, and other parts of Italy, several of these quarries of salt that turn to very little account, by reason of the great quantities of wood they consume.

The salt-works at Hall have a great convenience for fuel, which swims down to them on the river. This river, during its course through Tyrol, is generally shut up between a double range of mountains, that are most of them covered with woods of fir-trees, which, after they are cut into a proper shape, are tumbled down from the mountains into the stream of the river, which conveys them to Inspruck and Hall; many of the peasants are employed in these works.

There is so much trade carried on at this town, that it has become as populous as Inspruck, although the other is the capital. There is, likewise, a mint in Hall, the design of which is to work off the metals which are found in the neighbouring mountains; where, we were told, there were several thousand men in constant employ. At Hall, we took a boat to carry us to Vienna, and lay the first night at Roffenburg, where there is a strong castle above the town. Count Serini is still close prisoner in this castle, who, as they told us in the town, had lost his senses by his long imprisonment and afflictions.

The next day we dined at Ruff-Stain, where there is a fortress on a high rock, above the town, almost inaccessible on all sides, it being a fortress on the frontiers of Bavaria, where we entered, after an hour's rowing from Ruff-Stain. It was the pleasantest voyage in the world, to follow the windings of the river through such a variety of pleasant scenes as the course of it naturally leads to; we had sometimes, on each side of us a vast extent of naked rocks and mountains, broken into a thousand irregular steepes and precipices: in other places, we saw a long forest of fir-trees, so thick set together, that it was impossible to discover any of the soil they grew upon; and rising up so regularly, one above another, as to give us the view of a whole wood at once.

The season of the year, that had given the leaves so many colours, completed the beauty of the prospect. But, as the materials of a fine landscape are not always the most profitable to the owners of them, so we met but with very little corn or pasturage, for the proportion of earth that we passed over. This long

valley of Tyrol is inclosed on all sides by the Alps, though its dominions shoot out into several branches that lie among the breaks and hollows of the mountains.

Here are three magistrates appointed by the emperor: one judges in all criminal matters, the other in civil affairs, and the third determines every thing relating to the taxes: but appeals frequently lie from them to Vienna. The inhabitants have many particular privileges above those of the other hereditary countries of the emperor; for, as they are naturally well fortified among the mountains, and, at the same time, bordering upon many different governments, a severe treatment might tempt them to set up as a republic, or, at least, throw themselves under the milder government of some of their neighbours. Besides that, the emperor draws considerable sums from them, although their country is far from being rich.

The emperor has forts and citadels at the entrance of all the passes, which are so advantageously placed upon rocks and mountains, that they command all the vallies and avenues that lie near or about them. Besides that, the country itself is cut into so many hills and irregularities, as would render it defensible by a very small army against a numerous enemy.

Such is the account given of these parts by the ingenious Mr. Addison; and now we shall proceed with an account of Dr. Tobias Smollet's travels through France, and some parts of Italy not yet described. The character of Dr. Smollet is well known in the literary world; so that we need not take up much of the reader's time with it.

About the beginning of the present reign, Dr. Smollet commenced a political writer, in favour of the ministry, which raised him many powerful enemies; and as for the statesmen, they kept their word and promise to him as usual, that is, they totally abandoned him. Under those circumstances, in 1762, he, with his wife and daughters, set out from London, in a hired coach, for Dover, in order to visit the south of France.

When he arrived at Dover, he hired a boat, at the rate of six guineas, to carry them either to Calais or Boulogne:

“ We embarked (says the Dr.) between six and seven in the evening, and found ourselves in a most wretched hovel, on board what is called a Folkstone cutter. The cabin was so small, that a dog could hardly turn in it; and the beds put me in mind of the holes described in some catacombs, in which the bodies of the dead were deposited; being thrust in with the feet foremost. There was no getting into them but end-ways; and, indeed, they seemed so dirty, that nothing but extreme necessity could have obliged us to use them.

We sat up all night in a most uncomfortable situation, tossed about by the sea, cold, cramped, and weary, and languishing for want of sleep. At three in the morning, the master of the vessel came down, and told us we were within sight of the harbour of Boulogne; but the wind blowing off shore, he could not possibly enter, and therefore advised us to go on shore in the boat.

I went on deck to visit the coast, when he pointed to the place where Boulogne stood; declaring, at the same time, we were within a short mile of the harbour's mouth. The morning was cold and raw; and I knew myself extremely subject to catch cold; nevertheless, we were all so extremely impatient to get on shore, that I resolved to take his advice. The boat was already hoisted out, and we went on board of it, after I had paid the captain and gratified his crew.

We had scarce parted from the ship, when we perceived a boat coming towards us from the shore; and the master told us it was coming to conduct us into the harbour. When I objected to the shifting from one boat to another in the open sea, which, at this time, was a little rough, he said, it was a fixed privilege the watermen of Boulogne had, to carry all passengers

sengers on shore, and that this privilege he durst not venture to infringe.

There was neither time nor place to remonstrate on such duplicity of conduct. The French boat came along side, half filled with water, and we were handed from the one to the other: we were then obliged to lie upon our oars till the captain's boat returned to the ship, to bring a packet of letters. We were afterwards rowed above three miles, in a rough sea, against wind and tide, before we reached the harbour; where we landed benumbed with cold, and the women excessively sick. From our landing-place, we were obliged to walk very near a mile to the inn where we proposed to lodge, attended by six or seven men and women bare-legged, carrying our baggage.

This boat cost me a guinea, besides paying exorbitantly the people who carried our things; so that the inhabitants of Dover and Boulogne seemed to be of the same kidney, and indeed they understand one another pretty well. It was our honest captain that made the signal for the shore-boat, before I went upon deck; by which means he not only gratified his friends, the watermen of Boulogne, but also saved about fourteen shillings portage, which he must have paid had he gone into the harbour, and thus he found-himself at liberty to return to Dover, which he reached in four hours. These circumstances are mentioned with this view, that other passengers may be on their guard.

When a man hires a boat from Dover to Calais, the stated price is five guineas, and it is the same to Boulogne; and let him insist on being carried into the harbour in the boat, without the least regard to the representations of the master, who is, in general, a little dirty knave: when he tells you it is low water, or that the wind is against you, answer him, that you will stay on board till it is high tide, and the wind has changed. If he finds you are resolute, he will find means to bring his vessel into the harbour, or, at least, to convince you, without a possibility of deception, that it is not in his power. But notwithstanding this trick put upon us, the fellow was a loser; for had he gone into the harbour, he would have had another fare immediately back to Dover; as there was a Scotch gentleman waiting at the inn for such an opportunity.

Knowing the weakness of my own constitution, I took it for granted that this morning's adventure would cost me a fit of illness; and what added to my chagrin, when we arrived at the inn, all the beds were occupied; so that we were obliged to sit in a cold kitchen above two hours, till some of the lodgers should get up. This was such a bad specimen of French accommodation, that my wife could not help regretting even the inns of Rochester, and other places on the road from London to Dover. Bad as they are, they certainly have the advantage of those in France, where one meets with nothing but imposition and nastiness. One would think the French were always at war with the English, for they pillage them without mercy.

Among the strangers whom we met with at this inn, was a physician, just returned from Italy. Understanding that I intended to winter in the south of France, he strongly recommended the climate of Nismas, which, indeed, I had often heard extolled. I found that what he said had all the appearance of truth, so that I resolved to go thither, and from thence to try the air of Naples.

After having been very ill accommodated three days at our inn, we at last found commodious lodgings, through the means of an obliging French gentleman, to whom we were recommended by her husband, who was a countryman of mine, and, at that time, on some business of importance to his family in London.

The custom-house officers at Boulogne are as alert as those in England, but they put on a greater air of politeness. I brought no plate along with me but a dozen and a half of table spoons, and a dozen of tea-

spoons. The first being found in my portmanteau when it was searched, cost me seventeen livres, but the other being in my servants pockets, escaped duty free. All wrought silver imported into France pays a particular duty; and therefore, those who have any considerable quantity of plate will do well to leave it behind them, unless they can confide in the dexterity of the ship-masters, some of whom will undertake to land it without the formality of examination.

The laws of France are so unfavourable to strangers, that they oblige them to pay at the rate of five per cent. for all the bed and table-linen which they bring into the kingdom, even though it has been used. When my trunks arrived in a ship from the river Thames, I was obliged to undergo this trial; but what gave me most vexation, was, my books being stopped till they were examined, and then I was obliged to pay an additional expence before I could recover them. This is a species of oppression that one would not expect to meet with in France, which piques itself on its politeness and hospitality. But the truth is, I know no country, in which strangers are worse treated, with respect to their essential concerns.

If a foreigner dies in France, the king seizes all his effects, even though his heir should be upon the spot. And this tyranny is founded upon a pretension that what the deceased died possessed of had been acquired in France, so that it would be unjust to carry it into another kingdom.

If an English protestant goes to France for the benefit of his health, and dies possessed of a thousand guineas, even supposing his wife and children to be along with him, the whole is seized by the king, and he is denied the privilege of Christian burial. The Swiss protestants are exempted from this, in consequence of a former treaty and alliance between the two nations. For the recovery of my books, I was obliged to have recourse to the husband of the good lady who had provided us lodgings, and who was just then returned from London: he was a handsome young gentleman about twenty-five, and kept a good house along with his wife and five maiden sisters, whom we found to be professed devotees; the brother was rather of the libertine turn, but extremely good-natured and obliging: his vanity, however, was in a manner unbounded, and he considered himself as endowed with a thousand qualities which he did not possess.

He had an inconsiderable place under the government, in consequence of which, he was permitted to wear a sword, a privilege which he does not fail to use. He was likewise receiver of the tythes of the clergy in this district, an office that gives him a temporary command of money, and he dealt in the wine trade; when I came to his house, he made a parade of all those advantages; he displayed his bags of money and some old gold which his father had left him; he discoursed of his country house, and dropped some hints concerning the fortunes that were settled on his sisters; he boasted of his connexions at court, and assured me that it was not for my money that he let his lodgings, but altogether with a view to enjoy the pleasure of my company.

The truth, when stripped of all embellishments, was this, The gentleman had a small place of about fifty pounds a year, and his sisters had about one hundred and forty pounds apiece fortune. His connexions at court were no more than a clerk's place, to correspond with the clerks in the secretary of state's office. He piqued himself much upon his gallantry and success with the fair sex.

He kept a girl of pleasure, and made no secret of his amours; he told an English lady in our company, that he had had six bastards in one year; he owned at the same time that he had sent them all to the hospital, but now his father was dead, and he would for the future take care of himself; but this was no more than an empty boast, or what the French call a gasconade.

One day, while we were in the house, there was a dreadful

dreadful uproar indeed; the curate of the parish came to wait on our landlord, a sempstress had been delivered of a child, and the young one was sent home to him in a basket, and it was immediately transmitted to the Foundling Hospital at Paris in the basket by the bearer.

But to hasten from this digression, my landlord sent for an authority to draw up a memorial for me, in order to regain my books; and when he came, I found he was a perfect sot: he composed the petition in my name, which was very judicious; and although it might have done very well for a native, yet it was beneath the dignity of a British subject. I offered to pay him, but he would take nothing for his trouble, offering at the same time to send it to the chancellor of France; but I proposed sending it to the English ambassador, accompanied by a letter to the dukes of Douglass, who was then at Paris; my landlord shook his head, to think that I considered the English ambassador as a greater man than the chancellor of France: I was not, however, to be trifled with, and therefore abode by the resolution I had formed.

While these things were transacting, I was seized with a violent cold, and the pain I suffered, drove me to a state of madness, to take a very desperate remedy. I hired a chaise and road out to the beech, where I plunged myself headlong into the sea. By this desperate affair, I got a fresh cold in my head, but my fever and stitches vanished the very first day, and by a daily repetition of the bath, I received, in some measure, both my health and spirits.

Boulogne is a very large agreeable town, with broad streets well paved, and the houses built of stone are commodious. The number of inhabitants may amount to about sixteen thousand. It is the capital of a district, extending about twelve leagues, ruled by a governor independent of the governor of Picardy, of which province however it forms a part.

The town of Boulogne is the see of a bishop, subject to the archbishop of Rheims, and his revenue amounts to about one thousand pounds sterling. Here is also a court of justice in all criminal and civil matters, but an appeal lies from its judgment to the parliament of Paris, and thither all condemned criminals are sent to have their sentence either confirmed or reversed. Here is likewise a court of admiralty, and another of an inferior nature, for regulating all suits of small debts, between the inhabitants of the town. The military jurisdiction belongs to a commandant appointed by the king, and it is generally bestowed upon some old officer.

Boulogne is divided into the upper and lower towns. The former is a kind of citadel, about a mile in circumference, situated on a rising ground, surrounded by a high wall and ramparts, and planted with rows of trees, which form a delightful walk. It commands a delightful view of the country and lower town; and in clear weather, the coast of England, from Dover to Folkestone, appears so plain, that one would imagine it was within four or five leagues of the French shore. The upper town was formerly fortified with outworks, which are now in ruins.

There is a square, a town house, the cathedral, and three convents for nuns, in one of which several English girls are educated. The smallness of the expence encourages parents to send their children abroad to those seminaries, where they never learn any thing useful, besides the French language; but they never fail to imbibe the most inveterate prejudices against the Protestant religion, and generally return converts to the church of Rome.

This conversion always creates an aversion, if not a contempt for their own country; indeed it cannot reasonably be expected that young people of weak minds, addicted to superstition, should ever love or esteem those whom they are taught to consider as reprobated heretics. Ten pounds a year is the usual pension in these convents; but I was informed by a French lady, who had her education in one of them, that nothing can be more wretched than their entertainment.

The lower town is continued from the gates of the

upper town down the slope of a hill, as far as the harbour, stretching on both sides to a large extent, and is much more considerable than the upper, with respect to the beauty of the streets, the covering of the houses, and the number and wealth of the inhabitants. These, however, are all merchants or tradesmen, for the gentry live in the upper town, and never mix with the others.

The harbour is at the mouth of the small river, or rather rivulet Lione, which is so shallow, that the children wade through it at low water. As the tide makes, the sea flows in, and forms a pretty extensive harbour, which, however, admits but small vessels. The harbour is contracted at the mouth by two stone piers, which seems to have been contrived by some engineer, very little acquainted with this branch of his profession; for they are carried out in such a manner, as to collect a bank of sand, just at the entrance of the harbour. The road is very open, but unsafe; and the surf very high when the wind blows from the sea. There is no fortification near the harbour, except a paltry fort mounting twenty guns, built in the last war by the prince de Cruy, upon a rock about a league to the northward of the town.

It appears to be situated in such a manner, that it can neither offend nor be offended. If the depth of water would admit a forty or fifty gun ship to lie within cannon shot of it, then it might soon be put to silence; but in all probability there will be no remains of it left, when another war breaks out. It is surrounded every day by the sea, at high water, and when it blows a fresh gale towards the shore, the waves break upon the top of it, to the terror and astonishment of the garrison.

Upon the top of a high rock, which overlooks the harbour, are the remains of an old fortification, where there was formerly a light house, built by the emperor Claudius, but no vestiges of this Roman work now remain, for what we see are only the ruins of an old castle, built by Charlemagne. I know of no other piece of antiquity at Boulogne, except an old vault in the upper town, now used as a magazine, which is said to have been part of a temple dedicated to Isis.

On the other side of the harbour, opposite to the town Juvén, there is a house built, at a considerable expence, by a general officer who lost his life in the last war. Never was situation more unpleasant and unhealthy: it stands on the borders of an ugly morass, surrounded by the stagnated waters left by the tide in its retreat. The very walks of the garden are so moist, that in the driest weather no person can walk a turn of it without being in danger of catching the rheumatism. Besides, the house is in every respect inaccessible, except at low water, and even then the carriage must cross the river, with the wheels up to the traces in mud. Nay, the tide rushes in so fast, that unless you seize the time to a minute, you will be in danger of perishing. The apartments of this house are elegantly fitted up, though extremely small; but the garden, notwithstanding its unfavourable situation, affords most excellent fruit.

In the lower town of Boulogne there are several religious houses, particularly a convent of capuchins, and another of cordeliers; the capuchin convent fell into decay some years ago, but was repaired at the expence of Mr. Graham, a native of North Britain, who had been an officer in the army of James II. and is said to have been a monk in the convent, by way of penance for having killed his friend in a duel. Be that as it may, he was a well-bred sensible man, of a very exemplary life and conversation, and his memory is much revered in the place. Being superior of the convent, he caused the British arms to be put up in the church, as a mark of gratitude for the benefactions he had received from our country.

I walked often in the garden, and at the bottom of it is a little private grove, separated from it by a very high wall, with a door of connexion; and hither the capuchins retire, when they are dressed, for contemplation. About two years ago, this place was
said

said to be converted into a very different use. There was, among the monks, one father Charles, of whom the people tell strange stories: some young women of the town were seen mounting over the wall by a ladder of ropes, in the dusk of the evening, and there were an unusual crop of bastards that season. In short, father Charles and his companions got such scandal, that the whole fraternity was changed, and, when I was there, the nest was occupied by another flight of birds of passage.

If one of our privateers had kidnapped a capuchin during the war, and exhibited him in his habit in London, he would have proved a good prize to the captors; for I know not a more grotesque and uncouth animal, than an old capuchin in the habit of his order. A friend of mine, a Swiss officer, told me, that a peasant, in his country, used to weep bitterly whenever a certain capuchin mounted the pulpit to hold forth to the people. The good father took notice of this man, and believed that, like some people in this country, he was touched by a messenger from heaven. He exhorted him to encourage these accessions of grace, and, at the same time, to be of good comfort, as having received such marks of the divine favour. The man still continued to weep as before, every time the monk preached; and, at last, the capuchin insisted on knowing whether it was in his discourse or appearance, that made such an impression on his heart.

“ Ah, father! (said the peasant) I never see you but I think of a venerable goat I lost at Easter; we were bred up together in the same family: he was the very picture of your reverence—one would declare you had been brothers. Poor Bamducin! he died of a fall—rest his soul! I would willingly pay for a couple of masses, to pray him out of purgatory.”

Among other public edifices in Boulogne, there is an edifice or workhouse, which seems to be established on a very good foundation. It maintains several hundreds of poor people, who are kept constantly at work according to their age and abilities, in making thread, all sorts of lace, a kind of catgut, and in knitting stockings. It is under the direction of the bishop, and, when I was there, the see was filled by a prelate of great piety and benevolence, though a little inclining to bigotry and fanaticism. The churches in the town are but indifferently built, and poorly ornamented. There is not one picture in the place worth looking at, nor does there seem to be the least taste for the liberal arts.

The air of Boulogne is cold and moist, and I believe, of consequence, unhealthy. Last winter, the frost which continued six weeks in London, lasted here eight weeks without the least intermission; and the cold was so intense, that, in the garden of the capuchin, it split the bark of several elms from top to bottom. On our arrival here, we found all kinds of fruits more backward than in England. The frost, in its progress to Britain, is much weakened in crossing the sea. The atmosphere, impregnated with saline particles, resists the operation of freezing. Here in severe winters, all places near the sea side are less cold than more inland districts. This is the reason why the winter is often more mild at Edinburgh than at London. A very great degree of cold is required to freeze salt water; indeed it will not freeze at all until it is cleared of all its salt.

The air of Boulogne is not only loaded with a great evaporation from the sea, increasing by strong gales from the west and south-west, which blow almost continually during the greatest part of the year; but it is also subject to putrid vapours, arising from the low marshy ground in the neighbourhood of the harbour, which is every tide overflowed with sea water. This may be one of the causes of the scurvy and rickets, which are here so prevalent among the children. But I believe the former is more owing to the water used in the lower town, which is very hard and unwholesome.

It curdles with soap, gives a red colour to the meat

that is boiled in it, and when drunk by strangers, never fails to occasion pains in the stomach and bowels. In all appearance it is impregnated with nitre, if not with something more mischievous.

There is a well of purging water within a quarter of a mile of the upper town, to which the inhabitants resort in the morning, as the people in London go to the Dog and Duck in St. George's-fields. There is likewise a fountain of excellent water, hard by the cathedral in the upper town, from whence we were daily supplied at a small expence.

Living here is pretty reasonable, and the markets are tolerably well supplied. The beef is neither fat nor firm, but very good for soups, which is the only use the French make of it. The veal is not so white, nor so well fed as the English veal; but it is more juicy and better tasted. The mutton and pork are very good, and the people buy the poultry alive, and fatten them at home. Here are excellent turkies, and no want of game. The hens in particular are very young and high flavoured. The best fish caught on this coast, are sent to Paris by a company of contractors, like those of Hastings in Sussex.

They have excellent soals, skait, flounders, whittings, and sometimes mackarel; but their oysters are large, coarse, and rank. There are but few fishes caught on the French coast, because the shallows run a great way from the shore, and the fish live chiefly in deep water. For this reason the fishermen go a great way out to sea, sometimes even as far as the coast of England.

The wine commonly drunk at Boulogne, comes from Auxerne, is very small and meagre, and may be had from five to eight sols a bottle, that is, from two-pence halfpenny to four-pence. The French inhabitants drink no good wine; nor is there any to be had, unless it is bought from the British merchants, which are established here, and carry on a trade with Bourdeaux, in order to supply the London merchants.

We had very good claret at the rate of fifteen-pence sterling a bottle, and excellent small beer as reasonable as in England.

All the brandy I met with in Boulogne was new, fiery, and still-burnt. This is the trash which the smugglers import into England. They have it for about ten-pence a gallon. Butchers meat is sold for five sols, or two-pence halfpenny per pound, and the pound at Boulogne consists of eighteen ounces. A young turkey costs us no more than fifteen-pence, a hare a shilling, and a couple of chickens ten-pence.

Before we left England, we were told there was no fruit at Boulogne, but we found ourselves agreeably disappointed in that particular. The place was well supplied with strawberries, cherries, gooseberries, currants, peaches, apricots, and excellent pears. There are many agreeable gardens near the town, and there was one belonging to our landlord, where we drank tea in the afternoon, and from it there was a most delightful prospect of the sea. They use wood for their common fuel, but had I been to settle any considerable time in the place, I would have mixed it with coals, of which there is plenty in the neighbourhood. Both the wood and the coals are reasonable enough; and I am certain that a man must keep house in London at double the expence of what it would cost him in Boulogne, and yet it is said to be one of the dearest places in France.

The adjacent country is very agreeably diversified with hills, dales, corn-fields, woods, and meadows. There is a forest of a considerable extent, that begins about a short league from the upper town. It belongs to the king, and is farmed out to different individuals.

In point of agriculture, the people in this neighbourhood seem to have profited by the example of the English. Since I was last in France, fifteen years ago, a great number of enclosures and plantations have been made in the English fashion. There are several tolerable country houses within a few miles of Boulogne, but most of them are empty. I was offered a compleat house, with a garden of four acres well laid out, and two fields

for grafs or hay, about a mile from the town, for about feventeen pounds a year. It was prettily furnished, and flood in an agreeable fituation, with a fine profpect of the fea, and had been fome time occupied by a Scotch nobleman, who was then in the fervice of France. This nobleman had been concerned in the rebellion, in 1745, and was obliged to take fhelter there.

To judge from appearances, the people of Boulogne are defcended from the Flemings, who formerly poffeffed this country; for a great many of the prefent inhabitants have fine fkins, fair hair, and florid complexions; very different from the natives of France in general, who are diftinguifhed by black hair, brown fkins, and fwarthy faces.

For reafons that I am not able to account for, many barbarous murders have been committed in the neighbourhood of this place; and the peafants, from motives of envy and refentment, often fet fire to each others houfes: feveral instances of this kind happened while we were there. The interruption that is given, in arbitrary governments, to the adminiftration of juftice, by the interpofition of the great, has always a bad effect on the morals of the common people. The peafants too, are often rendered desperate and favage, by the cruel oppreffions which they fuffer from the tyranny of their landlords.

In this neighbourhood, the working people are ill lodged, wretchedly fed, and they have no idea of cleanliness. There is a rich tradesman in the town, who was, fome years ago, convicted of a moft barbarous murder. He was fentenced to be broke alive upon the wheel, but was pardoned through the interpofition of the governor, and now carries on bufinefs with impunity, in the face of all the inhabitants there.

I fhall mention another circumftance. A young gentleman, who had left the univerfity, being refufed orders by the bifhop, on account of his irregular life, took the opportunity to ftab the prelate with a knife, one Sunday, as he was coming out of the cathedral. The good bifhop defired he might be permitted to efcape; but it was thought proper to punifh, with the utmoft feverity, fuch an atrocious attempt. He was accordingly apprehended; and though the wound was not mortal, he was condemned to be broke alive on the wheel.

When this dreadful fentence was executed, he cried out that it was hard he fhould undergo fuch torments for having wounded a worthlefs prieft, by whom he had been injured; while fuch a one (naming the tradesman above-mentioned) lived in eafe and fecurity, after having brutally murdered a poor man, and a helpless woman big with child, who had not given him the leaft provocation.

The gentry here are very vain, proud, and flothful; very few of them have above two hundred and fifty pounds, of our money, annually; and many of them have not half as much. They have not the common fenfe to refide at their country houfes, where, by farming their own grounds, they might live at a fmall expence, and improve their eftates at the fame time. They fuffer their country houfes to go to decay, and their gardens and fields lay wafte, while they refide in dark holes, in the upper town of Boulogne, without any fort of convenience.

There they ftarve within doors, that they may have wherewithal to purchafe fine cloaths, and appear drefsed once a day in the church or on the rampart. They have no education, no tafte for reading, no houfewifery, nor indeed any earthly occupation but that of drefsing their hair or adorning their bodies. They hate walking, and would never go abroad if they were not ftimulated by the vanity of being feen. I ought to except, indeed, thofe who turn devotees, and fpend the greateft part of their time with the prieft, either at church or in their own houfes. Thefe devotees, however, are moftly females, to whofe paffions falfe religion is moft acceptable.

Nothing can be more parfimonious than the eco-

nomy of this people. They live upon foup made with vegetables, which our porters would turn up their nofes at. They never think of giving dinners, or entertaining their friends; they even fave the expence of coffee and tea, though both are very cheap at Boulogne. They prefume that every perfon drinks tea at home, immediately after dinner, which is always over by one o'clock; and inftead of tea in the afternoon, they treat with a glafs of çapillaire. In a word, I know not a more insignificant fet of mortals in the world: Helpless in themfelves, and ufelefs to the community; without dignity, fenfe, or fentiment; contemptible from pride, and ridiculous from vanity. They pretend to be jealous of their rank, and will keep no company whatever with the tradesman or merchant, whom they ignorantly term plebeians.

They likewise keep at a great diftance from ftrangers, on pretence of a delicacy in the article of punctilio. But this ftatelinefs is in a great meafure affected, in order to conceal their poverty, which would appear to greater difadvantage, if they admitted of a more familiar connection. Considering the vivacity of the French people, one would imagine they could not poffibly lead fuch an infipid life, altogether unanimated by fociety or diverfion. True it is, the only diverfions in this place are puppet-fhews, and the tricks of thofe impoftors whom we call mountebanks; but then their religion affords a perpetual comedy. Their high mafles, their feafts, their proceffions, their pilgrimages, confefions, images, tapers, robes, incenfe, benedictions, fpatulas, representations, and innumerable ceremonies, which revolve almoft constantly, furnifh a variety of entertainments from one end of the year to the other.

If fuperftition implies fear, never was a word more mifapplied than it is to many of the Romifh religion. The people are fo far from being impreffed with awe and religious terror by this fort of machinery, that it amufes their imagination in the moft agreeable manner, and keeps them always in good humour. A Roman catholick longs as much for the return of a feftival, as a fchool boy, in England, does for Punch and the Devil: and there is generally as much laughing at one farce as the other.

Even when the defcent from the crofs is acted, in the holy week, with all the circumftances that ought naturally to infpire people with fentiments of gravity, if you caft your eye among the multitude that crowd the place, you will not difcover one melancholy face. All is prattling, tittering, or laughing; and ten to one but you perceive a number of them employed in kiffing the female that perfonates the Virgin Mary.

And here it may not be amifs to obferve, that the Roman catholics, not content with the infinite number of faints who really exifted, have not only perfonated the crofs, but made two female faints out of a piece of linen. Such nonfenfe, however, fhould not be afcribed to all the Roman catholics, becaufe many of them have written learnedly againft it. Tillemont confiders many of thefe ftories as fables, and yet, it is well known, that gentleman was ftrongly attached to the church of Rome. The truth is, many of the Roman catholics are now afhamed of the ftories contrived by their devotions, and would be glad to part with them, if they could do it with propriety.

One day we made an excursion to the village of Somens, on the Paris road, about eight miles from Boulogne. Here is a venerable abbey of Benedictines, well endowed, with large gardens, prettily laid out. The monks are well lodged, and well entertained, though reftained from eating flefh, by the rules of their order: they are allowed to eat wild ducks and teal, as a fpecies of fifh; and when they long for a partridge, they have no more to do than to fay they are not well. In that cafe, the appetite of the perfon is indulged in his own apartment. Their church is elegantly contrived, but kept in a very dirty condition. The greateft curiofity I faw here, was an Englifh boy, about eight or nine years old, from

Dover,

Dover, whose father had sent him hither to learn the French language. In less than eight weeks, he became master of the boys of the place, spoke French perfectly well, and had almost forgot his mother tongue. But to return to the people of Boulogne :

The town's-people here, as in other towns, consist of merchants, shop-keepers, and artisans : some of the merchants have acquired fortunes by fitting out privateers during the wars. A great many single ships were taken from the English, notwithstanding the good look out of our cruizers, who were so alert, that the privateers were often taken in four hours after they had sailed from the French coast. They were fitted out at a very small expence, and used to run over in one night to the coast of England, where they hovered as English fishing-smacks, until they kidnapped some coaster, with which they made the best of their way across the channel.

If they fell in with a British cruizer, they surrendered without resistance ; the captain was soon exchanged, and the loss of the property was not great. If they brought their prize into the harbour, the advantage was considerable.

In time of peace, the merchants of Boulogne deal in wines, brandy, and oil ; imported from the south, and exported, with the manufactures of France, to Portugal and other countries ; but the trade is not great. Here are two or three considerable houses of wine-merchants from Britain, who deal in Bourdeaux wine, with which they supply London and other parts of Britain and Ireland. The fishery of mackarel and herrings is so considerable on this coast, that it is said to yield annually eight or nine hundred thousand livres, which is about thirty-five thousand pounds sterling.

But the great trade of this place consists in dealing with the English smugglers, whose cutters are almost the only vessels one sees in the harbour. The smugglers from the coasts of Kent and Sussex pay English gold for great quantities of French brandy, tea, coffee, and small wine, which they run from this country. They likewise buy glass, trinkets, toys, and coloured prints, which they sell in England, for no other reason, but that they come from France ; for they may be had as cheap, and much better finished, in our own country. They likewise take off ribbons, laces, linen, and cambricks, though this branch is chiefly in the hands of traders that come from London ; and make their purchases at Dunkirk, where they pay no duties. It is certainly worth while for any traveller to lay in a stock of linen, either at Dunkirk or Boulogne, for the difference of the prices at those two places is not great. Here I bought shirts for one half of the price I could have procured them in London.

Undoubtedly, the practice of smuggling is very detrimental to the fair trader, and carries considerable sums of money out of the kingdom to enrich our rivals and enemies. The custom-house officers are very watchful, and make a great number of seizures ; but for all this, the smugglers find their account in continuing this contraband commerce, and are said to indemnify themselves if they save one cargo out of three. After all, the best way to prevent smuggling, is to lower the duties on commodities which are thus introduced.

I have been told, that the revenue upon tea has increased ever since the duty upon it was diminished. By the bye, the tea smuggled on the coast of Sussex, is the most execrable stuff that can be imagined. While I was at Hastings, for the benefit of bathing, I must have exchanged my breakfast if I had not luckily brought tea with me from London : yet we had as good tea, at Boulogne, for seven shillings a pound, as that which sells for fourteen in London.

The town's-people, in this place, live at their ease, in consequence of their trade with the English. Their houses consist of the ground floor, one story above, and a garret. In those which are well furnished, you see pier-glasses and marble slabs, but the chairs are

either paltry things, made with straw bottoms, which cost about a shilling a piece, or old fashioned high-backed seats of needle-work, stiffened very clumsily, and are incommodious. The tables are high square boards, that stand on edge in the corners, except when they are used, and then they are set upon cross legs, that open and shut occasionally. They have, however, plenty of table linen ; and the poorest tradesman in the town has a napkin on every corner, and silver forks, with four prongs, which are used with the right-hand, there being very little occasion for knives, for the meat is boiled or roasted to rags.

The French beds are so high, that sometimes one is obliged to mount them by the help of steps, and this is also the case in Flanders. They very seldom use feather-beds, but lie upon bags filled with straw, over which are laid two, and sometimes three mattresses. Their testers are high and old fashioned, and their curtains generally of thin baize, red or green, covered with tawdry yellow, in imitation of gold. In some houses, however, one meets with furniture of stamped linen ; but there is no such thing as a carpet to be seen, and the floors are in a dirty condition.

They have not even the implements of cleanliness in this country. Every chamber is furnished with a cloaths-press and a chest of drawers, of very clumsy workmanship : every thing shews a deficiency in the mechanical arts. There is not a door or a window, that shuts close : the hinges, locks, and latches, are of iron, coarsely made, and ill contrived. The very chimnies are built so open, that they admit both rain and sun, and all of them smoke intolerably.

If there is no cleanliness among these people, much less shall we find delicacy, which is the cleanliness of the mind : indeed they are utter strangers to what we call common decency. There are certainly some very mortifying vices of human nature, which ought to be concealed, as much as possible, in order to prevent giving offence. And nothing can be more absurd, than to plead the difference of customs in different countries, in deference to those usages which cannot fail giving disgust to the organs and senses of all mankind. Will custom, in any sense, exempt from the imputation of indecency a French lady, who shifts her frousy smock in the presence of a male visitant, and talks to him of different remedies she has used for particular disorders ? An Italian singer makes no scruple to tell you, that he is going through a regular course of physick for the cure of the venereal disease.

I have known a lady handed to the house of office by her admirer, who stood at the door and entertained her with jests, all the time she was within. But I should be glad to know whether it is possible for a fine lady to speak and act in this manner, without exciting ideas to her own disadvantage, in the mind of any man who has any imagination left, and enjoys the entire use of his senses, howsoever he might be authorized by the customs of her country ? There is, indeed, nothing so vile or repugnant to those, but you may plead prescription for it in the customs of some nation or other.

A Parisian likes mortified flesh : a native of Legiboli will not taste fish till it is putrified : the civilized inhabitants of Ramascota get drunk with the urine of their guests, whom they have already intoxicated : the Nova Zemblars make merry on train oil : the Greenlanders eat in the same dish with their dogs : the natives of the Cape of Good Hope piss upon those whom they delight to honour ; and feast upon a sheep's intestines, with the contents, as the greatest dainty that can be presented.

A true bred Frenchman dips his fingers, covered with snuff, into his plate filled with ragout ; and between every two or three mouthfuls, he produces his snuff-box, and takes a fresh pinch, with the most graceful gesticulations. Then he displays his handkerchief, which may be called the flag of abomination ; and, in the use of both, he scatters his favours among those who have the happiness to sit near him.

It may be answered, however, that a Frenchman will not drink out of a tankard in which, perhaps, a dozen of filthy mouths have flabbered, as is the custom in England. Here, every individual has his own goblet, which stands before him, and he helps himself occasionally with wine or water, or both, which likewise stand upon the table. But I know of no custom more beastly than that of using water-glasses, in which practice, company squirt and spew the filthy scourings of their gums in the eyes of each other.

I know a lover cured of his passion by seeing this nasty cascade discharged from the mouth of his mistress. I do not doubt but I shall live to see the day, when the hospitable custom of the antient Egyptians will be revived, when a conveniency will be placed behind every chair in company, with a proper provision of waste paper, that individuals may make themselves easy without parting company. I insist upon it, that this practice would not be more indelicate than that which is now in use.

What then, will you say, must a man fit with his chops and fingers up to the ears in grease? No, let them who cannot eat without defiling themselves, step into another room provided with basons and towels. But I think it would be better to institute schools where youth may learn to eat their victuals without daubing themselves, or giving offence to the eyes of one another.

The town's people of Boulogne have commonly soup at noon, and a roast with sallad in the evening, and at all their meals there is a desert of fruit: this indeed is the practice all over France. On fast days they eat fish, fried beans, fricasees of eggs and onions, with burnt cream. The tea which they drink in the afternoon is rather boiled than infused, it is sweetened all together with coarse sugar, and drank with an equal quantity of boiled milk.

October 12th, we left Boulogne, and preceeded on our journey to Paris. The weather was favourable, and the roads were in tolerable order. We found good accommodation at Montreuil and at Amiens, but we had not time to take a proper view of the places. The abbey church of St. Dennis is the lightest piece of Gothic architecture I ever saw, and the air within seems perfectly free from the damp and moisture so perceivable in all our old cathedrals. This must be owing to the nature of its situation.

There are some fine noble statues that adorn the tombs of certain individuals here interred; but they are mostly in the French taste, which is quite contrary to the simplicity of the antients. Their attitudes are affected, unnatural and desultory, and their draperies fantastic; or as one of our English orators, expressed himself, "they are all in a flutter." As for the treasures that are shewn on certain days to the populous gratis, they are contained in a vast number of presses, and if the stones are genuine, they must be invaluable, but this I could not believe. Indeed I have been told, that what they shew as diamonds, are no more than a composition. But exclusive of these, there are some rough stones of very great value, and many curiosities worth seeing. The monk that shewed them was a person of a very disagreeable aspect, and make one of the most ignorant fellows I had ever conversed with. His face was marked with the small-pox, he was tall, robust, and ugly; his hands were like a shoulder of mutton, and his mouth was so big, that, as bp. Burnet says of the duke of Lauderdale, he frightened all those whom he conversed with, and, take him all in one word, he was a man of a blundering understanding.

I have one thing very remarkable to take notice of, concerning the French inns on the road from Boulogne to Paris, which seems rather contrary to the general character of that nation.

The landlords, hostesses, and servants of their inns have not the least degree of complaisance in their behaviour to strangers. Instead of coming to the door to receive you as in England, they take no manner of notice of you, but leave you to find or inquire your

way into the kitchen, and there you must ask several times for a chamber, before they seem willing to conduct you up stairs.

In general, you are served with the appearance of the most mortifying indifference, at the very time they are laying schemes for fleecing you of your money. It is a very odd contrast between France and England; in the former, all the people are complaisant, but the publicans: in the latter there is hardly any thing like complaisance, but among the publicans. When I said all the people in France, I ought to have excepted those vermin who examine the baggage of travellers in different parts of the kingdom. Although our portmantuas were sealed with lead, and we were provided with a pass, our coach was searched at the gates of Paris by which we entered, and the women were obliged to get out and stand in the open street, till this operation was performed.

I had desired a friend to provide lodgings for me at Paris, in the Fauxbourg St. Germain, and accordingly we found ourselves accommodated at the Hotel de Montmorency, with a first floor, which cost me five livres a day. I should have put up with it had it been less polite, but as I had only a few days to stay in the place, and some visits to receive, I was not sorry that my friend had exceeded his commission.

Besides the article of visiting, I could not leave Paris without taking my wife and the girls to see the most remarkable places in and about this capital. I thought the difference in point of expence would not be great, between a coach hired for the day, and a hackney one. The first are elegant, if not too much ornamented; the last are very shabby and disagreeable. Nothing gave me more chagrin, than being obliged to hire a valet, for my own servant could not speak French. Those rascally fellows, the French valets, do every thing in their power to pillage strangers. There is always one ready in waiting on your arrival, who begins by assisting your own servant to unload your baggage; and interests himself in your affairs with such artful officiousness, that you will find it difficult to shake him off, even though you have declared beforehand against hiring any such fellow as a domestic.

He produces recommendations from his former masters, and the people of the houses vouch for his honesty. The truth is, those fellows are very hardy, useful, and obliging, and so far honest that they will not steal in the usual way. You may safely trust one of them to bring you any sum from your banker, but they fleece you without mercy in every article of expence. They lay all your traders under contributions, and even the person who owns your coach pays them about ten-pence a day. They demand an exorbitant sum in wages, and I believe that the fellow who attended me had not less than ten shillings every day besides his victuals, which he had no right to demand.

Living at Paris, I found it to be twice as dear as it was in London fifteen years ago, and indeed it is so in most of the capital cities of Europe; a circumstance that must be owing to the raising of taxes, for I did not find that in the articles of eating and drinking the French people were more luxurious than they had been before.

I was told that the duties upon provisions imported into Paris were very heavy. All manner of butchers meat and poultry are very cheap in this place, and their beef is excellent. The wine that is generally drunk, is a very thin kind of Burgundy. I can by no means relish their cookery; but one breakfasts deliciously upon their bread and butter, both of which are delicate. The common people at this season live chiefly on bread and grapes, which is undoubtedly very wholesome. If the same simplicity of diet prevailed in England, we should certainly reduce the French at all their foreign markets; for they are very slothful, with all their vivacity.

The great number of their holy days encourages this lazy disposition, but at the same time actually robs them of one half of what their labour would otherwise produce; so that if our common people were not

so expensive in their living, that is, in their eating and drinking, labour might be afforded cheaper in England than in France.

While I was at Paris, there were three young lusty huffeys, daughters of a blacksmith, that lived just opposite to my window, who did nothing from morning till night. They feasted on grapes and bread from seven till nine, from nine till twelve they dressed their hair, and were all the afternoon gaping at passengers. I did not perceive that they gave themselves the trouble either to make their beds, or clean their apartments. The same spirit of idleness and dissipation I have observed in every part of France, and among all classes of people.

Notwithstanding the gay dispositions of the French, their houses are all gloomy. In spite of all the ornaments that have been lavished on Versailles, it is a dismal habitation. The apartments are dark, ill furnished, dirty, and irregular. Take the castle, chapel, and garden altogether, they make a most unnatural composition of magnificence and littleness, taste and foppery. After all, it is in England only that we must look for cheerful apartments, gay furniture, neatness, and convenience. There is a strange incongruity in the French genius, with all their volubility, prattle, and fondness for jokes; they delight in a species of drawling, resembling melancholy church musick. Their most judicious dramatic pieces are at most incident, and the dialogue of their comedies built of moral insipid apophthegms, entirely destitute of wit or repartee. I know there are some criticks who will find fault with this, but at the same time I know I have spoken the truth.

The French boast that Paris is fifteen miles in circumference, and were it really so, it would be much more populous than London, for the streets are very narrow, and houses very high, with a different family on every floor. But I have measured the best places of these two royal cities, and am certain that Paris does not take up near so much ground as London and Westminster. We reckon between six and seven hundred thousand persons within the bills of mortality in London, but the French say they have eight hundred thousand in Paris. That the French account is exaggerated, cannot be doubted; for though their streets are crowded with houses, yet their palaces take up a vast deal of room with their court yards and gardens, and so do their convents and churches.

It is remarkable of the French, that they follow the English only in such things as are worthy of imitation. Formerly they never went abroad but in full dress, let it be ever so early in the morning; but now I found that, like the people in London, they were beginning to wear frocks. They have likewise set on foot a penny-post-office, similar to that in London; and they had a scheme on foot for supplying every house with water, from the river Seine, by making of leaden pipes. Both these they have learned from the English, and the latter would do well to imitate what is praise worthy in the former.

At the village of Chailot, in the neighbourhood of Paris, they make beautiful carpets and screen-work; and this is the more extraordinary, as there is hardly any carpets used in this kingdom. In almost all the lodging-houses, the floors are of brick, and have no other kind of cleaning, but that of being sprinkled with water and swept once a day. Their brick floors, the stone stairs, the want of wainscoting in the rooms, and the thick party walls of stone are, however, good preservatives against fire which seldom does any damage in this city. Instead of wainscoting, the walls are covered with tapestry, or damask. The beds in general are very good, and well ornamented with testers and curtains.

About fifteen years ago (1748) the river Seine, within a mile of Paris, was as solitary as if it had run through a desert. But when I was last there, the banks of it were adorned with a number of elegant houses and plantations, as far as Marli. I need not mention the machine at this place for raising water;

because it is well known to every one who has been at Paris.

The gardens at Versailles are not so agreeable as many have represented them to be. Instead of gravel, the walks are covered with a loose sand, which is very offensive, by blowing into the eyes of passengers. And yet this inconvenience could be easily removed, for there is plenty of gravel to be had in the neighbourhood, as well as in many other parts of France; but the French, who are more fond of shadows than of substances, think sand is more gay and agreeable; one would think they did not feel the burning reflection from the white sand, which in summer is almost intolerable.

In the character of the French, considered as a people, there are undoubtedly many circumstances truly ridiculous. Thus when they go a hunting, they are equipped with their jack-boots, swords, and pistols; but a few days after my arrival in Paris, I saw something more grotesque.

On the road to Chosi, a hackney coach stopped, and out came five or six men armed with musquets, who took post each behind a separate tree. I asked our French servant who they were? For I believed them to be officers going in quest of some notorious criminals. But guess my surprise, when the servant told me they were gentlemen of the chace, who had come from Paris to take the benefit of hare hunting; that is, shooting from behind a tree at the hares that might chance to pass. Indeed, if they had nothing more in view than to destroy the game, this was a very effectual method, for the hares are in such plenty in this neighbourhood, that I have seen a dozen together in one field.

I think this way of hunting in a coach, or chariot, might be properly adopted at London, in favour of those aldermen of the city, who are too unweildy to follow the hounds on horseback.

The French, however, with all their absurdities, preserve a certain ascendancy over us in what is very disgraceful to our nation, and this appears in nothing more than in the article of dress. We are contented to be thought their apes in fashion; but in such we are slaves to their taylor, mantua-makers, hair-dressers, and other tradesmen.

One would be apt to imagine that our own tradesmen had formed themselves into a combination against us. When the natives of France come to London, they appear in all public places, with cloaths made according to the fashion of their own country, and this is generally admired by the English. Why therefore do not we follow it implicitly? No: we pique ourselves upon a most ridiculous deviation from the very modes we admire, and please ourselves with thinking this deviation is a mark of our spirit and liberty. But we have not spirit enough to persist in this deviation, when we visit their country. If we had, then perhaps they would come to admire and follow our example; for certainly, in point of true taste, the fashion of both are equally absurd.

When an English gentleman arrives in Paris, the first thing he does is to send for a taylor, barber, hatter, shoe-maker, and indeed every other tradesman concerned in the equipment of the human body. He must even change his buckles and his ruffles; and although it should be at the risque of his life, he must suit his dress to the fashion. The women are still more subject to the caprice of fashion; and as the articles of their dress are more manifold, it is enough to make a man's heart ache, to see his wife surrounded by half a score milliners and tire women. All her sacques and negligees must be altered and new trimmed, she must have new caps, new laces, new shoes, and her hair new cut. She must have her tuffatees for the summer, her flowered silks for the spring and autumn, and her sattins and damasks for the winter.

This variety of dress is absolutely indispenfable for all those who pretend to any rank above the common tradesman: on his return to England, all this frippery is found to be unnecessary. He cannot appear in London

until he has undergone a thorough metamorphosis, so that he will have some reason to think that the tradesmen of Paris and London have combined to lay him under contribution. And there is no doubt but they are the directors who regulate the fashions in both capitals; the English, however, in a subordinate capacity. The puppets of their making will not pass at Paris, nor indeed in any other part of Europe; whereas a French little master is reckoned to be a complete figure, even London not excepted.

Since it is so much the humour of the English, at present, to run abroad; I wish they had antipapal spirit enough to exhibit themselves in their own genuine English dress, and treat the French modes with the same philosophical contempt which was shewn by an honest gentleman, distinguished by the appellation of Wig Middleton. That unshaken patriot still appears in the same kind of scratch perriwig, skimming-dish hat, and slit sleeve, which were worn five and twenty years ago, and has invariably persisted in this garb, in defiance of all the revolutions of the mode.

I remember a student in the temple, who, after a long and learned investigation of the *beautiful*, or *τοκαλου*, had resolution enough to let his beard grow, and wore it in all public places, until his heir at law applied for a commission of lunacy against him; then he submitted to the razor, rather than run any risque of being found *non compos*.

The most respectable tradesmen and shopkeepers in Paris think it no disgrace to commit the most shameful impositions. I, myself, knew an instance of one of the most creditable merchants in that capital, who demanded six francs an ell for lutestring, laying his hand upon his breast at the same time, and declaring on his conscience, that it had cost him within three sols of the money; yet in less than three minutes he sold it for four and a half: and when the buyer upbraided him with his former declaration, he shrugged up his shoulders, and said it was the fault of merchandize. I do not mention this as a particular instance; the same dissimulation is to be met with all over France.

The hideous mask of painting was, undoubtedly, first used to conceal some sort of natural deformity; but now it is used by the females of all ranks. It is, however, a most abominable practice, and often attended with fatal consequences; for it prevents the particles of porous matter from discharging the animalculæ, by which means the interior parts of the body are filled with corruption, and the skin is shrivelled and dried up.

From the nursery, the young women are allowed, and even encouraged, to say every thing that comes uppermost; by which means they acquire a volubility of speech, and a set of phrases, which constitutes what is commonly called polite conversation. At the same time they obtain an absolute conquest over all sense of shame; or rather, they avoid regarding this troublesome sensation; for it is certainly no innate idea. Those who have not governesses at home, are sent, for a few years, to a convent, where they lay in a fund for superstition, that serves them for life. But I never heard that they had the least opportunity of cultivating their minds, of exercising the powers of reason, or of imbibing a taste for letters, or any relish for useful accomplishments.

After being taught to dance, to prattle, and to play at cards, they are deemed sufficient to appear in the gay world, and to perform all the duties of every high rank and station. In mentioning cards, I ought to take notice, that they seem to play not barely for the sake of amusement, but also with a view of advantage; and indeed, you seldom meet with a native of France, whether male or female, who is not a complete gamester, well versed in all the subtleties and finesses of the art. This is, likewise, the case all over Italy.

A lady of great honour, in Piedmont, having four sons, makes no scruple to declare that the first shall represent the family, the second enter into the army, the third into the church, and she will make the fourth

a gamester. The noble gamesters devote themselves, in a particular manner, to the entertainment of travellers from our country, because the English are supposed to be full of money, rash, incautious, and utterly ignorant of play: but such a sharper is most dangerous when he meets with a couple of females. I have known a French count and his wife, who found means to lay the most unwary under contribution. He was smooth, supple, officious, and attentive: she was young, handsome, and in all respects unprincipled. If the Englishman, marked for prey, was found upon his guard against the designs of the husband, then madam plied him on the side of gallantry. She displayed all the attractions of her person, she sung, danced, ogled, sighed, complimented, and complained. If he was insensible to all her charms, she flattered his vanity, and piqued his pride, by extolling the wealth and generosity of the English; and if he proved deaf to all these insinuations, she, as her last stake, endeavoured to interest his humanity and compassion.

She expatiated, with tears in her eyes, on the cruelty and indifference of her great relations, represented that her husband was no more than the cadet of a noble family, that his provision was by no means suitable either to the dignity of his rank, or the generosity of his disposition; that he had a law-suit of great consequence depending, which had drained all his finances; and finally, that they should be both ruined, if they could not find some generous friend who would accommodate them with a sum of money to bring the cause to a determination, so as he could get possession of that estate to which he was by law entitled.

Those who do not act from such scandalous motives, become gamesters from mere habit; and having nothing substantial to engage their thoughts and employ their time, consume the best part of it in this worst of all dissipations. I am not ignorant that there are exceptions to this general rule: I know that France has produced some of the greatest men in the world; but I would no more deduce the character of the French ladies from these examples, than I would call a field of hemp a flower-garden, because there might be in it a few lilies, planted there by mere accident.

Woman has been defined a weaker man; but, in this country, the men are, in my opinion, more ridiculous and insignificant than the women: they are certainly very disagreeable to a rational Englishman, because they are more troublesome. Of all the coxcombs on the face of the earth, a French little master is the most ridiculous; and they are all little masters, from the marquis who struts in his lace to the hairdresser who is covered with flour, who struts in his queue, and his hat under his arm.

I have already observed, that vanity is the great and universal mover among all ranks of people in France; and as they take no pains to conceal or controul it, they are carried by it into the most ridiculous, and, indeed, intolerable extravagance.

When I talk of the French nation, I must again except a great number of individuals from the general censure. Though I have a hearty contempt for the ignorance, folly, and presumption, which characterize the generality, I cannot but respect the talents of many great men, who have eminently distinguished themselves in every art and science. These I shall always revere, and esteem as creatures of a superior species, produced for the wise purposes of providence, among those of some of the lower order of mankind. It would be ridiculous, and equally absurd, to conclude that the Welch and Highlanders are a gigantic people, because those mountains may have produced a few individuals near seven feet high. It would be equally absurd, to suppose that the French are a nation of real philosophers, because their country has given birth to many men who justly deserved that character.

I shall not even deny, that the French are by no means

means deficient in natural capacity; but they are, at the same time, remarkable for an unmanly levity, which hinders their youth from cultivating their rational faculties. This is increased by the most preposterous education, and the example of a giddy people, engaged in the most frivolous pursuits.

A Frenchman is, by some priest or other monk, taught to read his mother tongue, and to say his prayers in a language he does not understand; he learns to dance and to fence by the masters of those noble sciences; he becomes a complete connoisseur in dressing hair, and in adorning his own person, under the hands and instructions of his barber and valet chamber: if he learns to play upon the flute or the fiddle, he is altogether insupportable: but he piques himself upon being polished above the natives of any other country, by his conversation with the fair sex: in the course of his conversation, with which he is indulged from his tender years, he learns, like a parrot, by rote, the whole circle of French compliments, which are a set of phrases ridiculous even to a proverb; and these he throws out, indiscriminately, and without distinction, to all women in the exercise of that kind of address which is here distinguished by the name of gallantry, but very improperly. It is no more than his making love to every woman who will give him the hearing. It is an exercise, by the repetition of which, he becomes very pert, very familiar, and very impertinent. Modesty or diffidence is utterly unknown to them, and, indeed, I wonder there should be a word in their language to express the quality

If I was obliged to define politeness, I should call it the art of making one's self agreeable. I think it an art that implies a sense of decorum, and a delicacy of sentiment. Those, however, are qualities of which a Frenchman has no idea; therefore he never can be deemed polite, except among those persons by whom they are as little understood.

His first aim is, to adorn his own person with what he calls fine cloaths, that is, the frippery of the fashion. It is no wonder the heart of a female, unimproved by reason, and unenlightened by good sense, should flutter at the sight of such a gaudy thing among the number of her admirers. This impression is enforced by vain, fulsome compliments, which her own vanity interprets in a literal sense, and still more confined by the assiduous attention of the gallant, who, indeed, has nothing else to mind.

A Frenchman, in consequence of his mingling with females from his infancy, naturally becomes acquainted with all their customs and humours; and, at the same time, grows wonderfully alert in performing a thousand little offices which are overlooked by other men, whose time hath been spent in making more valuable acquisitions. He enters, without ceremony, a lady's bed-chamber, while she is in bed; reaches her whatever she wants; airs her shift, and helps her to put it on; he stands at her toilet, regulates the distribution of her patches, and advises where to lay on the paint: if he visits her when she is dressed, and perceives the least impropriety, he insists on adjusting it with his own hands: if he sees a curl, or even a single hair amiss, he produces his comb, his scissors, and pomatum, and sets it to rights with the dexterity of a hair-dresser.

He squires her to every place she visits, either on business or pleasure, and by dedicating himself so, he becomes necessary to all her occasions. This I take to be the most agreeable side of his character; let us view him on the side of impertinence.

A Frenchman prys into all your secrets with the most impudent and importunate curiosity, and then discloses them without remorse. If you are indisposed, he questions you concerning the nature of your disorder, with more freedom than your own physician would presume to use; and sometimes in the grossest terms. He then proposes his remedy, for they are all quacks, and prepares it without your knowledge; he then worries you with solicitations

to take it, without paying the least regard to those who have undertaken to promote your health.

Let you be ever so ill, or averse to company, he forces himself, at all times, into your bed-chamber; and if it is necessary to give him a peremptory refusal, he is affronted. I have known one of those little masters insist upon paying regular visits twice a day to a gentleman who was delirious, and he conversed with him till he was in his last agonies. This attendance is not the effect of attachment or regard, but of mere vanity, that he may afterwards boast of his charity and humane disposition. Thus, of all the people I have ever known, I think the French are the least capable of feeling for the distresses of their fellow creatures: their hearts are not in the least susceptible of deep impressions; and such is their levity, that the imagination has not much time to brood long over any disagreeable idea or feeling. As a Frenchman piques himself on his gallantry, he no sooner makes a conquest of a female heart, than he exposes her character for the gratification of his vanity. Nay, if he should miscarry in his addresses, he will forge letters and stories to the ruin of the lady's reputation. This is a species of perfidy which, one would think, would render them odious and detestable to the whole sex. But women are never better pleased than when they hear each other exposed, and this is, perhaps, one of the reasons why some religious women hate each other.

If a Frenchman is admitted into your family, and distinguished by repeated marks of your friendship and regard; the first return he makes for your civilities, is to make love to your wife or daughter. If he suffers a repulse from your wife, or attempts in vain to debauch your sister or daughter, he will, rather than not play the traitor with his gallantry, make his addresses to your grandmother; and ten to one but, in one shape or another, he will find means to ruin the peace of a family in which he has been so kindly entertained.

What he cannot accomplish by dint of compliment and personal attendance, he will endeavour to effect by reinforcing these with billet-doux, songs, and verses, of which he always makes a sufficient provision for that purpose. If he is detected in these efforts of tricking, and reproached with his ingratitude, he impudently declares that what he had done was no more than simple and common gallantry, considered in France as an indispensable duty on every man who pretends to good breeding. Nay, he will even affirm, that his endeavours to corrupt your wife, or debauch your daughter, are the most genuine proofs he can give of his regard for your family.

If a Frenchman is capable of real and pure friendship, it must certainly be the most disagreeable present he can possibly make to a man of a true English character: we are soon tired of impertinence, and much subject to fits of disgust. Your French friend intrudes upon you at all times; he stuns you with his loquacity; he teazes you with impertinence about your domestic affairs; he attempts to meddle in all your concerns, and forces his advice upon you with the most unreserved importunity; he asks the price of every thing you wear, and, so soon as you tell him, he undervalues it without hesitation; he affirms it is in a bad taste, ill contrived, ill made, that you have been imposed on, both with the fashion and the price; that the marquis of this, or the countess of that, has one that is perfectly elegant, quite in the high taste, and yet it cost her little more than you gave for a thing that nobody would wear.

If there were five hundred dishes at table, a Frenchman would eat of all of them, and then complain he has no appetite: this I have several times remarked. A friend of mine gained a considerable wager upon an experiment of this kind: the little master eat of fourteen different plates, besides the deserts: he then disparaged the cook, declaring he was no more or no better than a turnspit.

The French have a most ridiculous fondness for their hair, and this I believe they inherit from their

remote ancestors. The first race of the French kings were distinguished by their long hair, and certainly the people of this country consider it as an indispensable ornament. A Frenchman would rather part with religion than his hair, which, indeed, no consideration will induce him to forego. I knew a gentleman afflicted with a continual head-ach, and a defluxion in his lungs and eyes; who was told by his physician, that the best chance he had for being cured, would be to have his head close shaved, and bathed every day in cold water. "How, (cried he) cut my hair! Mr. doctor, your most humble servant!" He dismissed his physician, lost his eye-sight, and almost his senses; and walked about with his hair in a bag, and a piece of green silk hanging, like a screen, before his face. Count Saxe, and other military writers, have demonstrated the absurdity of a soldier's wearing a long head of hair; nevertheless, every soldier in this country has a long queue, which makes a delicate mark on his white cloathing; and this ridiculous foppery has descended even to the lowest class of the people. The shoe-blacks have their tail wigs hanging down to their rumps; and even the peasant who drives a jack-ass loaded with dung, though perhaps he has neither shirt nor breeches, yet this is the ornament upon which he bestows much time and pains, and, in the exhibition of which he finds full gratification for his vanity. Considering the harsh features of the common people in this country, their awkward looks, and their grimaces, they appear like baboons walking upright; and, perhaps, this similitude has helped to entail upon them the ridicule of their neighbours.

A French friend tires out your patience with long visits, and far from taking the proper hints to withdraw, when he perceives you uneasy, he observes you are low spirited, and therefore declares he will keep you company. This perseverance shews that he must either be void of all penetration, or that his disposition must be truly diabolical. Rather than be tormented with such a friend, a man had better turn him out of doors, even though at the hazard of being run through the body.

The French are generally counted insincere, and taxed with want of generosity: but I think these reproaches are not well founded. High flown professions of friendship and attachment constitute the language of common compliments in this country; and are never supposed to be understood in the literal acceptance of the words: and if their acts of generosity are but very rare, we ought to ascribe that rarity not so much to a deficiency of generous sentiments, as to their vanity and ostentation, which, engrossing all their funds, utterly disables them from exerting the virtues of friendship. Vanity, indeed, predominates so much among all ranks of people, that they are the greatest talkers in the world; and the most insignificant individual discourses in company, with the same conceit and arrogance as a person of the greatest importance.

Neither common poverty nor disgrace will restrain him in the least either from assuming his full share of the conversation, or making his addresses to the finest lady whom he has the smallest opportunity to approach; nor is he restrained by any other consideration whatever. It is all one to him, whether he himself has a wife of his own, or the lady a husband; whether she is designed for the cloyster, or to be the wife of his dearest friend. He takes it for granted, that his addresses cannot but be acceptable, and if he meets with a repulse, he condemns her taste, but never doubts his own qualifications.

In one of our excursions, we visited the manufactory for porcelain, which the French king has established at the village of St. Cloud, on the road to Versailles; and which is, indeed, a noble monument of his munificence. It is a very large building, both commodious and magnificent, where a great number of artists are employed, and where this elegant superfluity is carried to as great perfection as ever it was at London. After all, I know not whether

the porcelains made here may not vie with either the production of Dresden or St. Cloud. If they fall short of either, it is not in the design, enamel, or colouring, nor indeed of any of the other ornaments, but only in the composition they are made from, and the method of managing it in the furnace.

There are three methods of travelling from Paris to Lyons, which by the shortest road is a journey of three hundred and sixty miles. One is by the stage coach, which is performed in five days, and every passenger pays about four pounds ten shillings, in consideration of which, he has not only a seat in the carriage, but has his expences paid on the road.

The inconveniences attending this way of travelling are these. You are crowded into the carriage to the number of eight persons, so as to sit very uneasy, and sometimes to run the risque of being stifled, among very indifferent company: you are hurried out of bed at any hour the coachman thinks proper, and you are obliged to eat in the French way, which is very disagreeable to an English palate; and at Chalons you must embark on the Soane, in a boat which conveys you to Lyons, so that the two last days of your journey are by water.

All these were unsurmountable objections to me, because my state of health was very bad, being troubled with an asthmatic cough, spitting, slow fever, and restlessness, which demand a continual change of place as well as free air, and room for motion.

At this time I was visited by two young gentlemen, sons of Mr. Guastald, late ambassador from Genoa to London. I had seen them at Paris, at the house of the duchess of Douglas; and they came here with their conductor in the diligence. They complained much of their disagreeable situation in the carriage, and declared, that if they had known in what manner they were to have been treated, they would have hired a carriage for themselves.

Another way of travelling in this country, is, to hire a coach and four horses; and this method I was inclined to take, but upon enquiry, I found that it would cost me six and twenty guineas, and travel so slow, that we would be ten days on the road.

These carriages are let by the same persons who farm the diligence, and for this they have an exclusive privilege, which makes them very saucy and insolent. When I mentioned my servant, they gave me to understand that I must pay two Louis-d'ors more for his seat on the coach-box. As I could not agree to these terms, nor brook the thoughts of being so long upon the road, I had recourse to the third method, which is, going post.

In England, I should have had nothing to do but to hire a couple of post-chaises from stage to stage, with two horses in each; but in France the case is quite otherwise. The post is farmed from the king, who lays travellers under contribution for his own benefit, and has published a set of oppressive ordinances, which no stranger nor native dares transgress.

The post-master finds nothing but horses and guards, for the passenger must provide the carriage himself. There are four persons within the carriage, you are obliged to have six horses and two postillions; and if your servant sits on the outside, either before or behind, you must pay for a seventh. You pay double for the first stage from Paris, and twice double for passing through Fontainebleau, when the court is there, as well as at coming hither to Lyons, and at leaving that city. These are called royal posts, but they are most scandalous impositions.

There are two post roads from Paris to Lyons, one of sixty-five posts by the way of Moulins, the other of fifty-nine by the way of Dijon in Burgundy. This last I chose partly to save sixty livres, and partly to see the wine harvest of Burgundy, which I was told was a season of mirth and jollity among all ranks of people.

I hired a very good coach for ten louis-d'ors to Lyons, and set out for Paris on the thirteenth of October, with six horses, two postillions, and my own servant

vant on horseback. We made no stay at Fontainebleau, though the court was there; but lay at Moret, which is one stage further, a very pretty little town, where, however, we found good accommodation.

The forest in which the castle of Fontainebleau is built, is the best for the chase of any in France; it is beautifully wild, and romantic, well stored with game of all sorts, and abounding with excellent timber. It puts me in mind of the new forest in Hampshire; but the hills, rocks, and mountains, with which it is diversified, renders it more agreeable.

The people of this country dine at noon, and travellers always find an ordinary prepared at every public house on the road. Here they sit down promiscuously, and dine at so much a head. The usual price is thirty sols for dinner, and forty for supper, including lodging; and for this moderate expence they have two courses and a desert. If you eat in your own apartment, you pay, instead of forty sols, three, and sometimes four livres a head.

I and my family could not well dispense with our tea and toast in the morning, and had no stomach to eat at noon. For my own part, I hated the French cookery, and the abominable garlick with which all their ragouts in this part of the country were highly seasoned. We therefore formed a different plan of living upon the road. Before we left Paris, we laid in a stock of tea, chocolate, neat's tongues dried, with sausages, which we found to be extremely good, and indeed better than any I had ever tasted before.

About ten in the morning, we stopped to breakfast at a public house, where we always found some bread, butter, and milk. In the mean time we ordered a pullet or two to be roasted; and these, wrapped up in a napkin, were put into the boot of the coach, together with bread, wine, and water. About two or three in the afternoon, while the horses were changing, we laid a cloth upon our knees, and producing our store with a few earthen plates, discussed our short meal without further ceremony. This was followed by a desert of grapes, and other fruits, which we had also provided. I must own I found these natural refreshments much more agreeable than any regular meal I ate upon the road.

The wine commonly used in Burgundy is so weak and thin, that no person in England would drink it. The very best they sell at Dijon, the capital of the province, for three livres a bottle, is in strength, and even in flavour, greatly inferior to what I have drunk in London. I believe all the first growth is either consumed in the houses of the nobility, or sent abroad to foreign markets. I have drunk excellent Burgundy at Brussels for a florin a bottle, that is little more than twenty-pence sterling.

The country, from Fontainebleau to Lyons, through which we passed, is rather agreeable than fertile, being part of Champagne and the duchy of Burgundy, watered by these pleasant, pastoral rivers, the Seine, the Yone, and the Saone. The flat country is laid out chiefly for corn, but produces more rye and wheat. Almost all the ground seems to be ploughed up, so that there is little or nothing lying fallow. There are very few inclosures, scarce any meadow ground, and so far as I could observe, a great scarcity of cattle. We sometimes found it very difficult to procure half a pint of milk for our tea. In Burgundy, I saw a peasant ploughing with a jack-ass, a lean, half-starved cow, and a he-goat joined together.

It is generally observed, that a great number of black cattle are bred and fed on the mountains of Burgundy, which are the highest lands in France; but I saw very few of them. The peasants in France are so wretchedly poor, and so much oppressed by their landlords, that they cannot afford to inclose their grounds, or give a proper respite to their lands, or to stock their farms with a sufficient number of black cattle to produce the necessary manure, without which agriculture can never be carried to any degree of perfection. Indeed, whatever efforts a few individuals may make for the benefit of their own estates, husbandry in France

will never be generally improved, until the farmer is free and independent.

From the frequency of town and villages, one would imagine this country to be very populous; but then it might be considered that the towns are very thinly inhabited. I saw a large number of country-seats and plantations, near the banks of the rivers on both sides, and a great many courts, pleasantly situated on rising grounds, where the air is most pure, and the prospect most agreeable. It is really surprising to think how happy the founders of these religions have been in the choice of their situation all over the world.

In passing through this country, I was very much struck with the sight of large, ripe clusters of grapes, enlivened with the briars and thorns of common hedges on both sides of the roads. The mountains of Burgundy are covered with vines from the top to the bottom, and seem to be raised by nature, on purpose to extend the surface, and to expose it the more advantageously, to the rays of the sun. The vintage was but just begun, and the people were employed in gathering the grapes, but I saw no signs of festivity amongst them. Perhaps their joy was a little damped by the bad prospect of their harvest; for they complained that the weather had been so unfavourable as to hinder the grapes from ripening. I thought indeed, there was something uncomfortable in seeing the vintage thus retarded till the beginning of winter, for in some parts I found the weather extremely cold, particularly at one house where we lay, and where the waters were frozen up.

My personal adventures on the road were such as will not bear a recital: they consisted of paltry disputes with landlords, postmasters, and postillions. The highways seemed to be perfectly safe, and we did not find that robberies had been frequently committed. Indeed, the internal policy of the French government is such, that it is no easy matter for a highwayman to escape from justice, because there are troops planted at every stage, who are always ready to apprehend them.

At Sens, in Champagne, my servant, who had rode on before to bespeak fresh horses, told me that the domestick of another company had been provided before him, although it was not his turn, as he arrived later at the post. Provoked at this partiality, I resolved to chide the postmaster, and accordingly addressed myself to a person who stood at the door of the inn. He was a jolly figure, fat and fair, dressed in an old kind of garb, with a gold laced cap on his head, and a cambrick handkerchief pinned to his middle.

The sight of such a fantastic little master, in the character of a postmaster, increased my spleen: I called to him with an air of authority mixed with indignation; and when he came to the coach, asked in a peremptory tone, if he did not understand the king's ordinance concerning the regulation of the posts: He laid his hand upon his breast; but before he could make any answer, I pulled out the post-book, and began to read with great vociferation, the article which orders that the traveller who comes first shall be first served.

By this time, the fresh horses being put to the carriage, and the postillions mounted, the coach set off all on a sudden, with uncommon speed. I imagined the post-master had given the fellow a signal to be gone; and in this persuasion, thrusting my head out at the window, I bestowed some epithets upon him, which must have sounded very harsh in the ears of a Frenchman.

We stopped, for a little refreshment, at a small town, called Joigne Ville, where I was scandalously imposed on, and even abused by a virago of a landlady; then proceeding to the next stage, I was given to understand we could not be supplied with fresh horses. Here I perceived, at the door of the inn, the same person whom I had reproved at Sens. He came up to the coach, and told me, that, notwithstanding what the guides had said, I should have fresh horses in a few minutes. I imagined that he was master

both of this house and the other at Sens, between which he passed and repassed constantly, and that he was now desirous of making me amends for the affront he had put upon me at the other place.

Observing that one of my trunks behind was a little displaced, he assisted my servant in adjusting it. Then he entered into conversation with me, and gave me to understand that, in a post chaise he had passed, was an English gentleman on his return from Italy. I wanted to know who he was, and when he said he could not tell, I asked him, in a very abrupt manner, why he had not inquired of his servant. He shrugged up his shoulders, and returned to the inn door.

Having waited about half an hour, I beckoned to him, and when he approached, upbraided him with having told me that I should be supplied with fresh horses in a few minutes. He seemed shocked, and answered, that he thought he had reason for what he said: observing that it was as disagreeable for him as for me to wait for a relay. As it began to rain, I pulled up the glass in his face, and he returned to the door, seemingly ruffled at my behaviour. In a little time the horses arrived, and three of them were immediately put to a very handsome post chaise, into which he stepped, and set out, accompanied by a man in a rich livery on horseback.

Astonished at this circumstance, I asked the ostler who he was, and he replied that he was a French nobleman. I was much mortified to think that I had treated a nobleman in such an indignant manner, and scolded my own people, for not having more penetration than myself. I dare say he did not fail to descant on the brutal behaviour of the English, and that my mistake served with him to confirm the national reproach of bluntness and ill-breeding, under which every Englishman lies in France.

The truth is, I was that day more than usually pressed from the bad weather, as well as from the dread of a fit of the asthma, with which I was threatened. And I dare say my appearance seemed as odd and uncouth to him, as his travelling dress did to me. I had a grey morning frock under a wide great coat, a bob-wig without powder, a very large laced hat, and a meagre, wretched, discontented countenance. All these circumstances altogether could not be much in my favour; but the French nobleman seemed to have a soul superior to every thing that was mean, notwithstanding the unworthy manner in which I treated him.

The fourth day of our journey, we lodged at Maion, and the next day passed through the Lyonnais, which is a country full of towns, villages, and gentlemen's houses. Here we saw many fields of Indian corn, which grows to the height of six or seven feet. It is made into flour for the use of the common people, and goes by the name of Turkey wheat. Here likewise, as well as in Dauphiny, they raise a vast quantity of very large pompions, with the contents of which they make their soups and ragouts.

As we travelled only while the sun was up, on account of my bad state of health, and the post horses in France being in bad order, we seldom exceeded twenty leagues a day.

I was directed to a lodging-house at Lyons, which being full, they shewed us to a tavern, where I was led up three pair of stairs to an apartment, consisting of three paltry chambers, for which the people demanded about twelve livres a day. For dinner and supper, they asked thirty-two, besides three for my servant; so that my daily expence would have amounted to about forty-seven livres, exclusive of breakfast and coffee in the afternoon.

I was so provoked at this extortion, that without answering one word I drove to another tavern, where I paid at the rate of thirty-two livres a day, for which I was very badly lodged, and but very indifferently entertained. I mention these circumstances to point out an idea of the impositions which strangers are subject to in this country. It must be owned, however, that in the article of eating I might have saved half the money by going to the public ordinary, but this

was a scheme of economy which my circumstances, as I had a family with me, and my ill state of health, would not permit of.

From Paris, our baggage was not examined till we came to Lyons, at the gate of which we were questioned by one of the searchers, who being tipped with half a crown, allowed us to proceed without further inquiry.

The city of Lyons has been so often described, and is so well known, that I need not say much concerning it: indeed I know but very little of it, excepting what I have read in books, as I had but one day to make a tour in the streets, squares, and other remarkable places. The bridge over the Rhone seems to be so lightly built, that I should imagine it would be one day carried away by the rapidity of the stream, especially as the arches are so small, that after great rains they are sometimes stopped up, that is, they do not admit of a sufficient passage for the increased body of the water.

In order to remedy this dangerous defect in some measure, they found an artist, some time ago, who removed a middle pier, and threw two arches into one. This alteration they looked upon as a master-piece in architecture, though there is many a common mason in England, who would have undertaken and performed the work, without valuing himself much upon the enterprize.

This bridge is not built in a straight line across the river, but with a curve which forms a causeway, to oppose the current. Such a bend is certainly calculated for the better resisting the general impetuosity of the stream, and has no bad effect on the eye.

Lyons is a great, populous, and flourishing city, but I am surprised to find it is counted a healthy place, and that the air of it is esteemed very favourable. It is situated on the confluence of two large rivers, from which there must be a great evaporation, as well as from the low marshy grounds which these rivers often over-run. This must render the air moist, frowly, and even putrid, if it was not for the refreshing breezes of wind from the mountains in Switzerland, and in the latter end of autumn it must be subject to fogs.

The morning we set out from thence, the whole city and adjacent plains were covered with so thick a fog, that we could not distinguish from the coach the head of the foremost mule that drew it. Lyons is said to be very hot in summer, and very cold in winter, and this is the reason why it abounds with inflammatory and intermitting disorders in the spring and fall of the year.

My reasons for going to Montpellier, which is out of the straight road to Nice, were these: having no acquaintance nor correspondents in the south of France, I had desired my credit might be sent to the same house, to which my baggage was consigned. I expected to find my baggage at Cette, which is the sea-port of Montpellier, and there I hoped also to find a vessel, in which I might be transported by sea to Nice, without further trouble. I longed to try what effect the boasted air of Montpellier would have upon my constitution, and I had a great desire to see the famous monuments of antiquity, in and about the antient city of Nismes, which is about eight leagues short of Montpellier.

At the inn where we lodged, I found a return berline, belonging to Avignon, with three mules, which are the animals commonly used for carriages in this country. This I hired for five louis-d'ors; it was large, commodious, and well fitted; the mules were strong and in good order, and the driver, whose name was Joseph, appeared to be a sober, sagacious, intelligent fellow, perfectly well acquainted with any place in the south of France.

He told me he was owner of the coach, but I afterwards learned he was no other than a hired servant. I likewise detected him in some knavery, in the course of our journey; and plainly perceived he had a fellow-feeling with some innkeepers on the road; but in other respects, he was very obliging, serviceable, and even entertaining. There are some knavish practices of this kind, at which a traveller will do well to shut his

his eyes, for his own ease and convenience. He will be lucky, if he has to do with a sensible knave, like Joseph, who understood his interest too well to be guilty of very flagrant pieces of imposition.

A man impatient to be at his journey's end, will find this a most disagreeable way of travelling: in summer it must be quite intolerable. The mules are very sure, but very slow: the journey seldom exceeds eight leagues, or twenty-four miles in a day; and as those people have certain fixed stages, you are sometimes obliged to rise in the morning before day; a circumstance very grievous to persons in a bad state of health.

We no sooner quitted Lyons, than we entered into summer weather, and travelling through a most romantic country, visited the banks of the Rhone.

The rapidity of the Rhone is, in a great measure, owing to its being confined within steep banks on each side: these are formed almost through its whole course, by a double chain of mountains, which rise with an abrupt ascent from both banks of the river. The mountains are covered with vineyards, interspersed with small summer houses; and, in many places, they are crowned with churches, chapels, and convents, which add greatly to the romantic beauty of the prospect.

The high road, as far as Avignon, lies along the side of the river, which runs almost in a strait line, and affords great convenience for inland commerce. Travellers, bound for the south of France, generally embark at Lyons, and glide down the river with a great velocity, passing towns and villages on each side, where they find ordinaries every day at dinner and supper.

In good weather, there is no danger in this method of travelling, till you come to the port St. Esprit, where the stream runs through the arches with such rapidity, that the boat is sometimes overset. But those passengers who are under any apprehensions, are landed above the bridge, and taken in again, just in the same manner as at London Bridge. The boats that go up the river, are drawn against the stream by oxen, which swim through one of the arches of the bridge, the driver sitting between the horns of the foremost beast.

We set out from Lyons early on Monday morning, and, as a robbery had been committed a few days before in that neighbourhood, I ordered my servant to load my blunderbuss with a charge of eight balls. By the bye, this piece did not fail to attract the notice of the people in every place through which we passed: the carriage no sooner halted, than a crowd immediately surrounded the man, to view the blunderbuss, which they dignified with the title of a little cannon.

At Nuys, in Burgundy, he fired it in the air, and the whole mob dispersed, and scampered off like a flock of sheep.

In our journey hither, we generally set out in the morning at eight o'clock, and travelled till noon, when the mules were put up and rested a couple of hours. During this halt, Joseph went to dinner, and we went to breakfast, after which, we ordered provision for our refreshment in the coach, which we took about three or four in the afternoon; halting, for that purpose, by the side of some transparent brook, which afforded excellent water to mix with our wine.

In this country, I was almost poisoned with garlick, which they mix in their ragouts, and all their sauces; nay, the smell of it taints the very chambers, as well as every person you approach. I was likewise sick of a sort of little birds, which are served up at their ordinaries twice every day.

The peasants in the south of France are poorly clad, and look as if they were half starved, diminutive, swarthy, and meagre, and yet the common people, who travel, live luxuriously on the road; every carman and mule-driver has two meals a day, each consisting of a couple of courses and a desert, with tolerable small wine. That which is called hermitage,

and grows in the province of Dauphiny, is sold on the spot for three livres a bottle. The common draught you have at meals, in this country, is generally strong, though, in flavour, much inferior to that of Burgundy.

The accommodation is tolerable, though they demand, even in this cheap country, the most exorbitant price of four livres a head for every meal, from those who chuse to eat in their own apartments. I insisted, however, upon paying them but three, which they received, though not without murmuring, and seemingly discontented. In this journey, we found plenty of good mutton, pork, poultry, and game, including the red partridge, which is twice as big here as the partridges are in England: their hares are likewise very large and juicy, and they have large flocks of turkies.

One day, perceiving a meadow on the side of a rock, full of flowers, I desired my servant to pull some of them. He delivered the blunderbuss to Joseph, who began to tamper with it, and off it went, with a prodigious report, augmented by an echo from the mountains that skirted the road. The mules were so frightened that they went off on a gallop, and Joseph, for some minutes, could neither manage the reins nor open his mouth. At length, he recollected himself, and the cattle were stopped by the assistance of a servant, to whom he delivered the blunderbuss, with a significant shake of his head. Then alighting from the box, he examined the heads of his three mules, and kissed each of them in its turn. Finding they had received no damage, he came up to the coach with a pale visage and staring eyes, and said it was God's mercy he had not killed his beasts. I told him it was a greater mercy he had not killed his passengers; for the muzzle of the piece might have been directed our way as well as the other; and, in that case, Joseph might have been hanged for murder. "I had as good be hanged for murder (said he) as ruined by the loss of my cattle."

This adventure made such an impression upon him, that he recounted it to every one he met with on the road, nor would he ever touch the blunderbuss from that day.

I was often diverted with the conversation of this fellow, who was very arch, and very communicative. Every afternoon he used to stand on the foot-board, at the side of the coach, and discourse with us an hour together. One day, passing by the gibbet of Valencia, which stands very near the high road, we saw one body hanging quite naked, and another lying broken on the wheel. I recollected that Mandrin, the famous smuggler, had suffered in this place, and calling to Joseph to mount the foot-board, asked if ever he had seen that famous adventurer. At mentioning the name of Mandrin, the tear started in Joseph's eye; he discharged a deep sigh, or rather groan, and told me he was his dear friend. I was a little startled at this declaration; however, I concealed my thoughts, and began to ask questions about the character and exploits of a man who had made such a noise in the world.

He told me Mandrin was a native of Valencia, of mean extraction; that he had served as a soldier in the army, and afterwards acted as a tax-gatherer; that at length he turned smuggler, and, by his superior qualities, raised himself to the command of a formidable gang, consisting of five hundred persons, well armed with carbines and pistols: he had fifty horse for his troopers, and three hundred mules for the carriage of his merchandize. His head quarters were in Savoy; but he made incursions into Dauphiny, and set the revenue officers at defiance.

He fought several bloody battles with the officers, as well as with some regular detachments; and in all those actions signalized himself by his courage and conduct. Coming up, one time, with fifty of the revenue officers, who were in quest of him, he told them, very calmly, he had occasion for their horses and accoutrements, and desired them to dismount.

At

At that instant, his gang appeared, and the officer complied with his command, without making the least opposition.

Joseph said he was as generous as he was brave, and never molested travellers, nor did the least injury to the poor; but on the contrary, relieved them very often. He used to oblige the gentlemen in the country to take his goods; such as tobacco, brandy, and muslin, at his own price; and, in the same manner, he laid the open houses under contribution. When he had no goods, he borrowed money upon his own credit, and repaid it when he returned with a fresh cargo.

He was at last betrayed by a girl, whom he kept, to the colonel of a French regiment, who went with a detachment in the night to the place where he lay in Savoy, and surpris'd him in a wood-house, while his people were absent in different parts of the country. For this intrusion, the French court made an apology to the king of Sardinia, in whose territories he was taken. Mandrin being conveyed to his native place, Valencia, was for some time permitted to go abroad under a strong guard, with chains upon his legs; and then he conversed freely with all sorts of people, flattering himself that he would obtain a pardon, in which, however, he was disappointed. An order came from court to bring him to his trial, when he was found guilty, and condemned to be broke on the wheel. Joseph said he drank a bottle of wine with him the day before his execution.

He bore his fate with great resolution, observing that if the letter he had written to the king had been delivered, he certainly should have obtained his majesty's pardon. His executioner was one of his own gang, who was pardoned on performing this office. Criminals in France are executed according to the literal words of the sentence. Thus in some cases they are first strangled, and then broke upon the wheel; where instances of very atrocious cruelty have been connected with their crimes, they are broke alive. As Mandrin had not been guilty of cruelty in the course of his delinquency, he was indulged with strangling. Speaking to the executioner, he told him, that he was not to mangle his body till he was quite dead.

Joseph, our driver, had no sooner uttered these words, than he was struck with a suspicion that he himself was the executioner of his friend Mandrin. On that suspicion I exclaimed, "Mr. Joseph!" The fellow blushed up to the eyes, and said, there were more Joseph's than one. I did not think proper to prosecute the enquiry, but did not much relish the nature of Joseph's connections. The truth is, he had very much the looks of a ruffian, though I must own his behaviour was very obliging and decent.

On the fifth day of our journey we passed the famous bridge at St. Esprit, which, to be sure, is a great curiosity, from its length, and the number of its arches; but these arches are too small, the passage above is too narrow, and the whole appears to be too slight, considering the force and impetuosity of the river. It is not comparable to the bridge at Westminster, either for beauty or solidity.

Here we entered Languedoc, and were stopped to have our baggage examined; but the searcher being bribed with a nine livre purse, allowed it to pass. Before we came down hence, I must observe, that I was not a little surpris'd to see figs and chefnuts growing in the open fields, to be pulled at the discretion of every passenger.

The first place we arrived at in Languedoc was Bagnale, where we breakfasted. It is a little paltry town, from whence, however, there is an excellent road, cut through a mountain, made at a great expence, and extending four leagues. About five in the afternoon I had the first sight, at a distance, of the famous port Du Garde, which stands on the right-hand, about the distance of a league from the post-road to Nismes, and about three leagues from that city. I would not willingly pass for a false en-

thusiast in taste, but I cannot help observing, that from the first distant view of this noble monument, till we came near enough to see it perfectly, I felt the strongest emotions of impatience that I had ever known; and obliged our driver to put his mules to the full gallop, in the apprehension it would be dark before we reached the place.

I expected to find the building in some measure ruinous, but was agreeably disappointed to see it look as fresh as the bridge at Westminster. The climate is either so pure and dry, or the free-stone with which it is built so hard, that the very angles of them remain as entire as if they had been cut last year. Indeed some large stones have dropped out of the arches; but the whole is admirably preserved, and presents the eye with a piece of architecture so unaffectedly elegant, so simple and majestic, that I will defy the most stupid or phlegmatic spectator to behold it without admiration.

It was reared in the Augustan age, by the Roman colony of Nemaufis, to convey a stream of water between two mountains, for the use of the city. It stands over the river Gardon, which is a most beautiful pastoral stream; meandring among rocks, which form a number of pretty little islands, and overshadowed on each side with trees and shrubs, which greatly add to the rural beauty of the scene. It is, perhaps, one of the greatest beauties that art has produced in the world, and is the admiration of all those who travel to the south of France.

This work consists of three bridges, or line of arches, one above another; the first of six, the second of eleven, and the third of thirty-six. The height, comprehending the aquaduct on the top, amounts to one hundred and seventy-four feet three inches; and the length between the two mountains, by which it unites the islands, to seven hundred and twenty-three feet.

The order of architecture is the Tuscan, but the symmetry of it is inconceivable. By surveying the bases of the pillars of the second line of arches, the head made a passage for foot travellers; but though the antients far excelled us in beauty, they certainly fall short of the moderns in point of conveniency. The citizens of Avignon have in this particular improved the Roman work, by a new bridge of apposition, constructed on the same plan with that of the lower line of arches, of which, indeed, it seems to be a part, affording a broad and commodious passage over the river for horses and carriages of all kinds. The aquaduct, for the continuance of which this work was raised, conveyed a stream of fresh water from the fountain of Eune, near the city of Uzes, and extended near six leagues in length.

In approaching Nismes, you see the ruins of a Roman tower, built on the summit of a hill, which overlooks the city. It seems to have been intended at first as a watch-tower, though in the sequel it was used as a fortress. What remains of it is about ninety feet high, and the architecture is in the Doric order. I no sooner alighted at the inn, than I was presented with a pamphlet, containing an account of Nismes, and its antiquities, which every stranger buys. There are persons too who attend to shew all the curiosities in the place, and you will always be accosted by some shabby antiquary, who presents you with medals for sale, assuring you (if you can believe him) that they are genuine remains of antiquity, and were dug out of the ruins of the baths and temples formerly belonging to the Romans. All those fellows are cheats, and they have often laid under contributions several English travellers, who had more money than discretion. To such they sell the vilest and most common trash; but when they meet with a connoisseur, they produce some medals which are really valuable and curious.

Nismes, originally called Nemaufes, was a colony of the Romans, settled by Augustus Cæsar, after the battle of Actium. It is still of considerable extent, and said to contain twelve thousand families; but the

the number seems, by this account, to be greatly exaggerated. Certain it is the city must have been formerly very extensive, as appears from the circuit of the antient walls, the remains of which are still to be seen. Its present state is not one half of its former extent. Its temples, baths, statues, towers, and amphitheatre, prove it to have been a city of great opulence and magnificence. At present the remains of these antiquities are all that serve to make it respectable, or remarkable; though there are manufactories of silk and wool carried on with good success.

The water necessary for these works is supplied by a source at the foot of the rock, upon which the tower is placed; and here were discovered the ruins of Roman baths, which had been formed and adorned with equal taste and magnificence. Among the rubbish they found a vast profusion of columns, vases, capitals, cornices, inscriptions, medals, statues, and, among other things, the finger of a colossal statue, in bronze, which, according to the rules of proportion, must have been fifteen feet high.

From these particulars, it appears that the edifice must have been spacious and magnificent; and part of a grand pavement still remains. The antient pavement of the bath is still entire; all the rubbish has been cleared away; and the baths, in a great measure, restored to their original state of beauty, though they are not, at present, used for any thing but ornament. The water is collected into two vast reservoirs, and a canal built with hewn stone. There are three handsome bridges thrown over this vast canal, and it contains a great body of excellent water, which, by pipes and other conveniences, serves the whole town; and is converted to many purposes of vacancy and manufacture, according as the circumstances of the inhabitants require it.

Between the Roman bath, and these great canals, the ground is agreeably laid out in plain walks, for the recreation of the inhabitants. Here are, likewise, ornaments of architecture, which favour much more of the French foppery than of the simplicity and greatness of the antients. It is very surprising this fountain should produce such a large body of water as fills the basin of the source, the Roman basin, two large deep canals, three hundred feet in length; two vast basins, that make part of the great canal, which is eighteen hundred feet long, eighteen deep, and forty-eight broad. When I saw it, there was in it about eight or nine feet of water, transparent as crystal. It must be observed, however, for the honour of French cleanliness, that, in the Roman basin, through which this noble stream of water passes, I perceived two washermen at work upon children's cloths and dirty linen. Surprised and much disgusted at this filthy sight, I asked by what means, and by whose permission, those dirty wretches had got down into the basin, in order to contaminate the water at its fountain head; and found they belonged to the commandant of the place, who had the keys of the subterraneous passage.

Fronting the Roman baths are the ruins of an antient temple, which, according to tradition, was dedicated to Diana; but it has been observed by the connoisseurs, that all the antient temples of this goddess were of the Ionic order, whereas this is partly Corinthian, and partly Composite. It is about twenty feet long, and six and thirty in breadth, arched above, and built of large blocks of stone, joined together without any cement. The walls are still standing, with three great tabernacles at the further end, fronting the entrance. On each side, there are arches in the intercolumniation of the walls, together with pedestals, shafts of pillars, cornices, and an entablature; all of which indicates the former magnificence of the building. The other parts of it were destroyed during the civil war that raged in the reign of Henry the third of France.

It is amazing that the successive irruptions of barbarous nations, such as the Huns, Goths, Vandals,

and Moors, and even the fanatic Crusaders, still more sanguinary and illiberal than these barbarians, should have spared this temple, as well as two other still more grand, magnificent monuments of architecture, that, to this day, adorn the city of Nîmes; I mean the amphitheatre, and the edifice, called the Maison Carrée.

The former of these is reckoned the finest and richest monument of antiquity now extant, and was built in the reign of Antoninus Pius, who contributed a large sum of money towards its erection. It is of an oval figure, one thousand and eighty feet in circumference, capacious enough to hold twenty thousand spectators. The architecture is of the Tuscan order, sixty feet high, composed of two open galleries, built one over another, consisting each of three stone arcades.

The entrance into the rooms was by four great gates, with porticoes, the seats of which consisted of great blocks of stone, many of which still remain. Over the north gate, are the figures of two bulls, extremely well executed; emblems which, according to the custom of the Romans, signified that the theatre was erected at the expence of the people. There are, on other parts, some figures and beasts, very indifferently executed. It stands in the lower part of the town, and strikes the spectator with awe and veneration.

The external architecture is almost entire in its whole circuit, but the area is filled up with houses. This amphitheatre was fortified as a citadel, by the Visigoths, in the beginning of the sixth century. They raised within it a castle, two towers of which are still standing, and they surrounded it with a broad and deep fosse, which was filled up in the thirteenth century. In all the subsequent wars to which this city was exposed, it served for the last resort of the inhabitants, and sustained a great number of successive attacks, so that its preservation is almost miraculous.

It is likely, however, to suffer much more from the Gothic avarice of its own citizens, some of whom are mutilating it every day, for the sake of the stones, which they use in their own private buildings. It is surprising, that the king's authority has not been exerted, to put an end to such horrid violation of the remains of antiquity.

If the amphitheatre strikes you with an idea of greatness, the Maison Carrée enchants you with the most exquisite beauties of architecture and sculpture.

This is an edifice, supposed to have been formerly built by the emperor Adrian, who had a great regard for this place, because he stopped at it when he returned from Britain, where his name will ever be remembered in our annals. This edifice stands upon a pediment six feet high, and is eighty-two feet long, thirty-five broad, and thirty-seven in height, without reckoning the pediment. This serves to point out the just notions which the antients had of architecture in general, when they were so exact in the rules of proportion.

The body of it is adorned with twenty columns, fixed to the walls, and all these are of the Corinthian order, fluted, and embellished with capitals of the most exquisite sculpture; the frieze and cornices are newly added, and the foilage is reckoned inimitable. The proportions of the building are so happily situated, as to give it an air of majesty and grandeur, which the most indifferent spectator cannot behold without emotion. A man need not be a connoisseur in architecture to enjoy these beauties; they are, indeed, so exquisite, that you may return to them every day, with a fresh appetite, for seven years together. What renders them the more curious, they are still entire, and very little affected either by the ravages of famine, or the horrors of war. Cardinal Alberoni declared, that it was a jewel that deserved a cover of gold, to preserve it from external injuries. An Italian painter, perceiving a small part of the roof replaced by modern French masonry, tore his hair, and exclaimed in a rage, "Zounds! what do I see! the hat of Harlequin fixed on the head of Augustus?"

Without all manner of doubt, it is extremely beautiful; the whole world cannot produce any thing equal to it; and I was surpris'd to see it standing entire, as if it had been the effect of enchantment, after such a succession of ages, every one more barbarous than another. The history of the Antiquities of Nismes, takes notice of a grotesque statue, representing two female bodies and legs, united under the head of an old man; but I did not see it.

The whole country of Languedoc is shaded with olive-trees, the fruit of which begins soon to ripen, and appears as black as sloes: these they preserve, pulled green, and steeped for some time in a lye, made of quick lime or wood ashes, which extracts the bitter taste, and makes the fruit tender: without this preparation it is not eatable.

Under the olive and fig-trees they plant corn and vines, so that there is not an inch of ground left, or cattle to be seen. The ground is overloaded, and the produce of it crouded to such a degree, as to have a bad effect on the eye; impressing the traveller with the ideas of indigence and rapacity.

The heat in summer is so excessive, that cattle can find no green forage, every blade of grain being parched up and destroyed. The weather was extremely hot when we entered Montpellier, and we put up at the best inn in the city, although we found it to be a very wretched one; the habitation of dirt, and of the grossest imposition.

Here I was obliged to pay four livres a meal for every one in my family, and two livres at night for every bed, though all in the same room. One would imagine that, the further we advanced to the southward, the living is the dearer; though in each, every article of housekeeping is cheaper in Languedoc than in many other of the French provinces. This horrid imposition is owing to the vast concourse of English people who come here, and, like simple birds of passage, suffer themselves to be plucked by the people of the country, who know their weak side, and make their attack accordingly.

They affect, or rather pretend, to believe that all the travellers from our country are men of vast fortunes, and scarcely know in what manner they can squander away their money: and many of us are silly enough to encourage this vain opinion, by submitting quietly to the most unjust and rigorous extortions; as well as by committing acts of the most absurd extravagance. This folly of the English, together with a concourse of people from other parts, who come hither for the re-establishment of their health, has made Montpellier one of the dearest places in the south of France. This will always be the case where men have more money than wit, and do not consider in what manner they ought to conduct themselves through life. They go on in an unthinking state, and return greater fools than when they left their native country.

This city, which is but small, stood upon a rising ground, facing the Mediterranean, which is about three leagues to the southward. On the other side, is an agreeable plain, extending about the same distance to the mountains or the Cevennes. The town is well built, but the streets are, in general, narrow, and the houses dark. The air is considered salutary for all those who are troubled with consumptions, but in some other disorders it is rather too sharp.

It was at Montpellier that we first saw those scenes of gaiety and mirth for which the people of this country are so much celebrated. In all other places through which we passed, in our way to Lyons, we saw nothing but marks of poverty and misery.

We entered Montpellier on a Sunday, when the people were all dressed in their best apparel. The streets were crouded, and a great number of the better sort of both sexes sat upon stone seats, at their doors, conversing with great mirth and familiarity. These conversations lasted the greatest part of the night, and many of them were improved with music, both vocal and instrumental.

Next day we were visited by all the English who resided in the place, who always pay this mark of respect to new comers. They consisted of about four or five families; among whom I could have passed the winter very agreeably, if the state of my health had not called me away.

Two days before I arrived, I found that a dear friend of mine had come there for the same disorder I then laboured under: he told me he had been in quest of me ever since I left England. Upon comparing notes, I found he had stopped at the door of a country inn in Picardy, and drank a glass of wine and water, while I was at dinner up stairs; nay, he had even spoke to my servant, and asked who was his master, and the man not knowing him, replied, a gentleman from Chelsea. He had walked by the door of the house where I lodged, at Paris, twenty times, while I was in that city; and the very day before he arrived at Montpellier, he had passed our carriage on the road.

The garrison of this city consists of two battallions, one of which was the Irish regiment of Berwick, commanded by Lieutenant-Colonel Jenks, a gentleman with whom he had contracted a very particular acquaintance at Boulogne. He treated us with great politeness, and, indeed, did every thing in his power to make the place agreeable to us. The duke Fitz-James was every day expected in the place, for he was, at that time, governor of the city.

We had here a tolerable concert twice a week, and sometimes we were entertained with a comedy.

The states of Provence assemble in winter, so that about the Christmas season, the city of Montpellier is always full of good company. These very circumstances would have been sufficient to induce me to leave the place, for I had not health to enjoy these pleasures: I could not bear a croud of company, which flowed in upon us at all times; and I found that, in staying at Montpellier, I should be led into an expence which I could not afford. This was a circumstance the more necessary to be attended to, as the French are such arrant thieves, that there is no such thing as placing any confidence in them.

The day after our arrival, I procured myself lodgings in the high street, for which I paid about two shillings a day; and we were furnished with two meals a day for ten livres, but the landlord found neither the wine nor the desert; and, indeed, we were but indifferently served. Those families who reside here, find their account in keeping houses, and every person who comes to this, or any other town in France, with a design to stay longer than a day or two, ought to write beforehand to his commandant, to procure furnished lodgings, to which he may be driven as soon as he arrives at the place, without being under the necessity of lodging in an execrable inn; for all the inns of this country are execrable. I flattered myself with much amusement while I was at Montpellier—The university; the Botanic garden; the state of physick in this part of the world; and the information I received of a curious collection of manuscripts, promised a rich fund of entertainment; which, however, I could not enjoy.

A few days after my arrival, it began to rain, with a southerly wind, and continued, without ceasing, the best part of a week, leaving the air so loaded with vapours, that there was no walking after sun-set, without being wetted by the exhalation to the skin. I always found a cold atmosphere the most unfavourable to my constitution, so that I knew how to act.

My asthmatic disorder, which had troubled me so much at Boulogne, now returned upon me, and became extremely troublesome, attended with a severe fever and a cough, spitting, and lowness of spirits, and I wasted visibly every day.

I was favoured with the advice of Dr. Fitz-Maurice, a very worthy, sensible, and polite physician; who visited me every day; but I received little benefit in consequence of his prescriptions.

I conceived a prejudice against the man, in consequence

quence of the account I had heard of his character from several English gentlemen who resided on the spot. I resolved to consult with him on paper, but this did not answer my end. I sent to him a state of my case, drawn up in Latin, but I found he did not properly understand it. He sent me, however, an answer in French, but it was very trifling.

I thought it was a little extraordinary, that a professor should reply his mother-tongue to a case I sent in Latin; but I was much more surpris'd at reading his answer, from which I was oblig'd to conclude, that he did not understand Latin, or that he had not taken the trouble to read my memoir. This prescription was one of the vilest things that ever could have been received, but I shall not make any remarks upon it. But I could not but in justice to myself, point out to him the passages in my case which he had overlooked. Accordingly, when I answered his letters, I mentioned every thing that I thought worth notice. This was the more necessary, because I found that an altercation was likely to have been carried on betwixt us, and as I was vain enough to believe that I knew the nature of physic, so I would not be dictated to by this pedagogue.

The inhabitants of Montpellier are sociable, gay, and good tempered. They have a spirit of commerce, and have erected several considerable manufactures in the neighbourhood of the city. People assemble every day to take the air on the Esplanade, where there is a very good walk just without the gates of the citadel.

But on the other side of the town, there is a walk still more agreeable, from whence there is a view of the Mediterranean on the one side, and the Cevennes on the other. Here is a good equestrian statue of Lewis XIV. fronting one gate of the city, which is built in form of a triumphal arch, in honour of the same monarch. Adjoining to this gate is the physic garden, and near it an arcade just finished, for an aqueduct to convey a stream of water to the upper parts of the city. Perhaps I should have thought this a great piece of work, if I had not seen the Pont du Garde; but after having view'd the Roman arches, I could not look upon this but with pity and contempt. It is a wonder how the architect could be so fantastically modern, having such a noble model, as it were, before his eyes.

There were many Protestants at this place, as well as at Nismes, and we could not find that they were much molested on account of religion. They held their meetings in the country, where they assembled privately for worship. These meetings were well known, and every Sunday an officer was sent out with a detachment against them; but he had always orders to go another way. The civil power humoured the priests by sending out the detachment, but the officer had his private instructions not to molest them. It is probable, that the Protestants pay some money for this indulgence; for, according to the laws of France, every Protestant minister found exercising his office is guilty of a capital offence; and one was hanged about two years before I went there, in the neighbourhood of Montauban.

The markets in Montpellier are well supplied with fish, poultry, butchers' meat, and game, at very reasonable prices. The wine is strong and harsh, and never drunk but when mixed with water.

Burgundy is dear, and so is the sweet wine of Frontignac, though made in the neighbourhood of Cethee. Cethee is the sea-port town, and is about twelve miles from the city; but the canal of Languedoc runs up within a mile of it, and is indeed a great curiosity, and in all respects worthy of a Colbert, under whose auspices it was finished.

When I find such a general respect and veneration paid to the memory of that great man, I am astonished to see how few monuments of public utility are left by the other ministers. One would imagine, that even the desire of praise would prompt a much greater number to exert themselves for the glory and advantage of their country. Yet in my opinion, the French have

been ungrateful to Colbert, in the same manner as they have over-ruled the character of his master. Through all France, one meets with statues, and triumphal arches, erected to Louis XIV. in consequence of his victories, for which he also received the title of Louis le Grand.

But how were these victories? Not by any merit in Louis. It was Colbert who improved his finances, and enabled him to pay his army. It was Louvois that provided all the necessaries of war. It was a Condé, a Turenne, a Luxemburg, a Vendosme, who fought his battles; and his first conquests, for which he was deified by the pen of adulation, were obtained almost without blood, over weak, dispirited, divided, and defenceless nations.

It was Colbert that improved the marine, instituted manufactures, encouraged commerce, undertook works of public utility, and patronized the arts and sciences. But it will be objected that Louis had the merit of choosing and supporting those ministers and those generals. I answer, No: he found Colbert and Louvois already chosen. He found Condé and Turenne in the very zenith of military reputation. Luxemburg was Condé's priest, and Vendosme a prince of the blood, who at first obtained the command of armies in consequence of his high birth, and happened to turn out a man of genius.

The same Louis had the sagacity to revoke the edict of Nantz, to entrust his armies to a Tallard, a Villeroy, and a Marfin. He had the humanity to ravage the country, burn the towns, and massacre the inhabitants of the Palatinate. He had the patriotism to impoverish and depopulate his own kingdom, in order to prosecute schemes of the most lawless ambition. He had the consolation to beg a peace from those he had provoked to war by the most outrageous insolence, and he had the glory to espouse Mrs. Maintenon in her old age, the widow of the Buffoon Scarron. From all these circumstances, one would naturally imagine, that the title *Le Grand*, or the Great, was bestowed upon him by way of irony.

Having received a letter from the English consul at Nice, and recommended the care of my heavy baggage to a gentleman who undertook to send it by sea from Cethee to Villafranca, I hired a coach and mules for seven louis-d'ors, and set out from Montpellier on the thirteenth of November, the weather being agreeable, though the air was cold and frosty. In other respects, there were no signs of winter, the olives were now ripe, and appeared on each side of the road as black as sloes, and the corn was already half a foot high.

On the second day of our journey, we passed the Rhone, on a bridge of boats at Buccaire, and lay on the other side at Tarrascone. Next day we put up at a wretched place, called Orgon, where, however, we were regaled with an excellent supper, and among other delicacies, with a dish of green pease.

Provence is a pleasant country, well cultivated, but the inns are not so good as in Languedoc, and few of them are provided with a certain convenience, which an English traveller cannot well dispense with the want of. Those you find, are generally on the tops of houses, extremely nasty, and so much exposed to the weather, that a valetudinarian cannot use them without hazarding his life. At Nismes, in Languedoc, where we found the temple of Cloacina in a very nasty and shocking condition; the servant maid told me her mistress had caused it to be made on purpose for English travellers; but now she was very sorry for what she had done, as all the French, who frequented the house, instead of using the seat, left their offerings on the floor, which she was oblig'd to have cleaned three or four times a day. This is a degree of beastliness which would appear detestable even in the capital of North Britain.

On the fourth day of our pilgrimage, we lay in the suburbs of Aix, but did not enter the city, which I had a great curiosity to see. The asthma balked me of that satisfaction. I was pinched with the cold, and impatient

impatient to visit a warmer climate. Our stage brought us to a paltry village, where we were poorly entertained. I looked so ill in the morning, that the good woman of the house, who was big with child, took me by the hand at parting, and even shed tears, praying fervently that God would restore me to my health. This was the only instance of sympathy, compassion, or goodness of heart, that I had met with among the publicans of France. Indeed, at Valencia, our landlady understanding that I was travelling to Montpellier for my health, would have dissuaded me from going thither, and exhorted me, in particular, to beware of the physicians, who were no better than a pack of murderers. She advised me to eat fricassées of chickens, and to take a good bouillon every morning.

A bouillon is an universal remedy among the good people of France, insomuch that they have no idea of a man's dying after he has swallowed one. One of the English gentlemen who were robbed and murdered, in 1731, between Calais and Boulogne, being brought to the post-house with some signs of life, this remedy was immediately administered; "What surprised me greatly," said the post-master, speaking of this melancholy story to a friend of mine, about two years after it happened, "I made an excellent bouillon, and forced it down his throat with my own hands, and yet he did not recover." Now, in all probability, it was this bouillon that stopped his breath. When I was a very young man, I remember to have seen a person suffocated by such an imprudent act of officiousness.

A young gentleman of uncommon parts and erudition, very well esteemed at the university of Glasgow, was found, early one morning, in a subterranean vault, among the ruins of an old archiepiscopal palace, with his throat cut from ear to ear. Being conveyed to a public house in the neighbourhood, he made signs for pen, ink, and paper, and in all probability would have explained the cause of this terrible catastrophe, when an old woman seeing the wind-pipe, which was cut, sticking out of the wound, and mistaking it for the gullet, by way of giving him a cordial to support his spirits, poured into it, through a funnel, a glass of burnt brandy, which strangled him in the tenth part of a minute, whereas his life might have been saved, had not this imprudent step been taken.

At Brignolles, where we dined, I was obliged to quarrel with the landlady, and threaten to leave her house, before she would indulge us with any sort of flesh meat. It was one of their fast days, and she had made her provision accordingly. She even expressed some dissatisfaction at having hereticks in her house: but as I was not disposed to eat stinking fish, with ragouts of eggs and onions, I insisted on having a leg of mutton, and a brace of fine partridges I found in the larder.

Next morning when we set out, it blew a strong westerly wind, so extremely cold and pinching, that even a flannel wrapper could not keep me tolerably warm in the coach. Whether the cold had put our coachman in a bad humour, or he had some other cause of resentment I know not; but we had not gone above a quarter of a mile, when he drove the carriage full against a garden wall, and broke the axle-tree so, that we were obliged to return to the inn on foot, and wait a whole day, till a new piece could be made and properly adjusted.

At this inn we met with a young French officer, who had been a prisoner in England, and spoke our language tolerably well. He told me, that this cold wind did not blow above two or three times in the winter, and was never of long continuance—That, in general, the weather was very mild and agreeable during the winter months—that living was very cheap in this part of Provence, which afforded great plenty of game. Here too, I found a young Irish monk, of the Recollect order, in his way from Rome to his own country. He complained that he was almost starved, by the inhospitable disposition of the French

people; and that the regular clergy, in particular, had treated him with the most cruel disdain. I relieved his necessities, and gave him a letter to a gentleman of his own country, at Montpellier.

When I arose in the morning, and looked into the garden, I thought myself either in a dream, or bewitched. All the trees were clothed with snow, and all the country covered, at least, a foot deep. "This cannot be the south of France, (said I to myself) it must be the highlands of Scotland."

At a wretched town, called Muy, where we dined, I had a warm dispute with our landlord, which, however, did not terminate to my satisfaction. I sent on the mules before, to the next stage, meaning to take post horses; and bespoke them accordingly of the inn-keeper, who was post-master at the same time. We were ushered into the common eating-room, and had a very indifferent dinner; after which, I sent a louis-d'or to be changed, in order to pay the reckoning. The landlord, instead of giving full change, deducted three livres a head for dinner, and sent in the rest of the money by my servant.

Provoked more at his ill manners than at his extortion, I ferretted him out of a bed-chamber, where he had concealed himself, and obliged him to restore the full change, from which, I paid him at the rate of two livres a head. He refused to take the money, which I threw down on the table, and the horses being ready, I stepped into the coach, and ordered the postillions to drive on. Here I found I had reckoned without my host, for the fellows refused to go one step till I had paid their master his full demand; and, as I threatened to horsewhip them, they alighted, and disappeared in a moment.

I was now so incensed, that, although I could hardly breathe, I walked to the consul of the town, and made my complaint in form. This magistrate, who seemed to be a taylor, accompanied me to the inn, where, by this time, the whole town was assembled, and endeavoured to persuade me to compromise the affair. I said, as he was the magistrate, I would stand to his award. He answered, he would not presume to dictate to me what I was to pay. "I have already paid him a reasonable price for his dinner (said I), and now I demand post horses according to the king's ordonnance." The inn-keeper said the horses were ready, but the guides were run away, and he could not find others to go in their place. I argued with great vehemence, offering to leave a louis-d'or for the poor of the parish, provided the consul would oblige the rascal to do his duty. The consul shrugged up his shoulders, and declared it was not in his power; but this was a lye.

But I perceived he had no mind or inclination to disoblige the publican. If the mules had not been sent away, I should, certainly, not only have paid what I thought proper, but corrected the landlord into the bargain, for his insolence and extortion; but now I was entirely at his mercy; and, as the consul continued to exhort me, in very humble terms, to comply with his demands, I thought proper to acquiesce. Then the postillions immediately made their appearance: the crowd seemed to exult in the triumph of the publican, and I was obliged to travel in the night, in very severe weather, after all the mortifications I had undergone.

We lay at Frejas, which was the Forum Julianum of the antients, and still boasts of some remains of antiquity; particularly the ruins of an amphitheatre, and an aquaduct.

The first we passed in the dark, and next morning the weather was so cold, that I could not walk abroad to see it. The town is at present very inconsiderable, and, indeed, in a ruinous condition. Nevertheless, we were very well lodged at the post-house, and treated with more politeness than we had met with in any other part of France.

As we had a very high mountain to ascend in the morning, I ordered the mules on before, to the next post, and hired six horses for the coach. At the east

end of Frejas, we saw, close to the road on our left hand, the arcades of the antient aquaduct, and the remains of some Roman edifices, which seemed to have been temples. There was nothing at all striking in the architecture of the aquaduct: the arches were small and low, without either grace or ornament; and they seemed to have been calculated more for utility than grandeur.

The mountain of Esterelles, which is eight miles over, was formerly frequented by a desperate gang of banditti, who are now happily exterminated. The road is good, but in some places very steep, and bordered by precipices. The mountain is covered with pines; and the citrons were so large, that, at first, I took them for dwarf oranges. I think they are accounted poisonous in England, but here the people eat them without hesitation. In the middle of the mountain is the post-house, where we dined in a room so cold, that the bare remembrance of it makes my teeth chatter.

After dinner, I chanced to look into another chamber that fronted the south, where the sun shone, and opening a window, perceived, within a yard of my hand, a large tree loaded with oranges, many of which were ripe. You may judge what my astonishment was, to find winter, in all its rigour, reigning on one side of the house; and summer, in all her glory, on the other. Certain it is, the middle of this mountain seemed to be the boundary of the cold weather. As we proceeded slowly in the afternoon, we were quite enchanted. This side of the hill is a natural plantation, of the most agreeable evergreens, pines, firs, laurels, cypress, sweet myrrh, box, and juniper, intermixed with sweet marjorum, lavender, thyme, and sage. On the right-hand, the ground shoots up into agreeable cones, between which you have a delightful view of the Mediterranean, which washes the foot of the rock; and, between two caverns of the mountain there is a bottom watered by a charming stream, which greatly adds to the rural beauties of the scene.

This night we passed at Cannets, a little fishing-town, agreeably situated, on the banks of the Seide and in the same place lodged M. de Etrucit, the unfortunate governor of Guadaloupe, who was imprisoned for life, because he delivered up that island to the English.

Next day we journeyed by the way of Antibes, a small maritime town, tolerably well fortified; and, passing the little river Louin, over a stone bridge, arrived, about noon, at the village of St. Laurence, the extremity of France, where we passed the Var, after our baggage had undergone examination. From Cannets to this village, the road lies along the seaside, and sure nothing can be more delightful. Though, in the morning, there was a frost upon the ground, the sun was as warm as it is in May in England; the sea was quite smooth, and the beach formed of white polished pebbles. On the left-hand, the country was covered with green olives, and the sides of the road planted with large trees of sweet myrtle, growing wild, like the hawthorns in England; but this is not much to be wondered at, when we consider the nature of the climate.

From Antibes, we had the first prospect of Nice, laying on the opposite side of the bay, and making a very agreeable appearance. The Var, which divides the country of Nice from Provence, is no other than a torrent, fed chiefly by the snow that melts on the maritime Alps, from which it takes its origin. In the summer, it is swelled to a dangerous height, and this is also the case after heavy rains: but when I was there, the water was quite dried up in the middle, only that there were some small streams at each side. This river has been, absurdly enough, supposed to be the Rubicon; whereas, in fact, the Rubicon runs between Ravenna and Rimini.

But to return to the Var, famous for its muscadine wines, there is a set of guides always in waiting, to conduct you in your passage over the river. Six of

these fellows tucked up above their middle, with long poles in their hands, took charge of our coach, and, by many windings, guided it safe to the opposite shore. Indeed there was no occasion for any guides, but it is a sort of perquisite, and I did not chuse to run any risque, however small it might be, for the sake of saving half a crown, with which they were satisfied. If you do not gratify the searchers at St. Laurence with the same sum, they will rummage your trunks, and turn all your cloaths topsy turvy.

And here, once for all, I would advise every traveller, who consults his own ease and convenience, to be liberal of his money to all that sort of people; and even to wink at the impositions of inn-keepers on the road, unless they be very flagrant. So sure as you enter into disputes with them, you will be put to a great deal of trouble, and fret yourself to no manner of purpose. I have travelled with œconomists in England, who declared they would rather give away a crown, than suffer themselves to be cheated of a farthing. This is a good maxim, but requires a great share of resolution and self-denial, to put it in practice in one excursion.

My fellow-traveller was in a passion, and of consequence very bad company from one end of the journey to the other. He was incessantly scolding either the landlords or landladies, waiters, hostlers, or postillions; we had bad horses and bad chaises; set out from every stage with the curses of the people; and, at this expence, I saved about ten shillings in a journey of a hundred and fifty miles. For such a paltry consideration, he was contented to be miserable himself, and to make every other person unhappy with whom he had any connection. When I came last from Bath, it rained so hard, that the postillion who drove the chaise was wet to the skin before we had gone a couple of miles. When we arrived at the Devizes, I gave him two shillings instead of one, out of pure compassion: the consequence of this liberality was, that, in the next stage, we seemed rather to fly than to travel upon solid ground.

I continued my bounty to the second driver, and, indeed, through the whole journey, and found myself accommodated in a very different manner from what I had experienced before. I had elegant chaises, with excellent horses; and the postillions, of their own accord, made such diligence, that, although the roads were broken by the rain, I travelled at the rate of twelve miles an hour, and my extraordinary expence amounted to six shillings.

The river Var falls into the Mediterranean a little below St. Sacrament, about four miles to the westward of Nice. Within the memory of persons now living, there have been three wooden bridges thrown over it, and as often destroyed, in consequence of the jealousy subsisting between the kings of France and Sardinia; this river being the boundary of their dominions on the side of Provence. However, this is a consideration that ought not to interfere with the other advantages that would arise to both kingdoms from such a convenience.

If there was a bridge over the Var, and a post-road made from Nice to Genoa, I am confident that all those strangers who pass the Alps, in their way to and from Italy, would chuse this road, as much more safe, commodious, and agreeable. This would also be the case with all those who hire vessels from Antibes to Marseilles, and expose themselves to the dangers, and the numerous inconveniences of sailing by sea in an open boat.

In the afternoon we arrived at Nice, and were hospitably received by the British consul. He had been at Nice about a month before us, with his lady and child: he had travelled with his own post-chaise and horses, and, at that time, lodged without one of the gates of the city, for which he paid five louis-d'ors a month. I could have one in the neighbourhood of London for much less money. This extortion, however, must be submitted to, otherwise no ready furnished lodgings are to be found at Nice.

After having slept above a week in a paltry inn, I took a ground-floor for two months, at the rate of four hundred livres a year, that is nearly twenty pounds sterling, for the Piedmontese livre is exactly an English shilling. The apartments were large, lofty, and commodious enough, with two small gardens, in which there was plenty of fallad, and a great number of oranges and lemons. But, as it required some time to procure proper inns here, the consul, who was one of the best natured men in the world, lent us lodgings; which were charmingly situated, by the sea-side, and open upon a terrace, that runs parallel upon the beach, forming part of the town wall.

The consul lived at Villa Franca, which is divided from Nice by a small mountain, on the top of which there is a small fort, called the castle of Montalban. Immediately after our arrival, we were visited by Mr. Martines, a most agreeable young fellow, a lieutenant in the Swiss regiment, which lay here in garrison. He was a Protestant, and extremely fond of our nation, and understood our language tolerably well. He was strongly recommended to us, by a person of great worth in England, and we were extremely happy in his conversation. We found him wonderfully obliging, and extremely serviceable on many occasions. We likewise became acquainted with other individuals, particularly M. St. Pierre, junior, who is a considerable merchant, and consul for Naples. He is a well bred, sensible young man, speaks English, is an excellent performer on musical instruments, and has a pretty collection of books. Indeed we had very good company, which, in some measure, made our time agreeable.

The county of Nice extends about fourscore miles in length, and is, in some places, thirty miles broad. It contains several small towns, and a great number of villages, all of which, excepting the capital, are situated among mountains; the most extensive plain of the country being that where Nice stands. The length of it, however, does not extend two miles, and, in the broadest place, not above one mile. It is bounded by the Mediterranean on the south. From the sea-shore, the maritime Alps begin with hills of a gentle ascent, rising with a sweep, in the form of an amphitheatre, ending at Montalban, which overhangs the town of Villa Franca.

On the west side of this mountain, and on the eastern extremity of the amphitheatre, stands the city of Nice, wedged in between a steep rock and the little river Paglion, which descends from the mountains, and washing the town walls on the west side, falls into the sea, after having filled some canals for the use of the inhabitants. There is a stone bridge, of three arches, over it, by which those who come from Provence enter the city. The channel of it is very broad, but generally dry in many places; the water, as in the Var, dividing itself into many small streams.

The Paglion being fed by melted snow and rain in the mountains, is quite dry in summer, but it is sometimes swelled by sudden rain to a very formidable torrent. This was the case in the year 1744, when the French and Spanish armies attacked eighteen battalions belonging to the king of Sardinia, which were posted on the side of Montalban. The assailants were repulsed with the loss of four thousand men, some hundreds of whom perished in repassing the river, which had swelled to a surprising degree before the battle, in consequence of a heavy continued rain. This rain was of great service to the Piedmontese, as it prevented one half of the enemy from passing the river to sustain the other. Two hundred were taken prisoners; but the Piedmontese seeing that they should be surrounded next day by the French, who had penetrated behind them, by a pass in the mountains, retired in the night. Being received on board the English fleet, which lay at Villa Franca, they were conveyed to Oneglia.

In examining the bodies of those that were killed in the battle, the inhabitants of Nice perceived that a great number of them had been circumcised; a cir-

cumstance from which they concluded, that a great many Jews had engaged in the service of his catholic majesty.

I was of a different opinion; for the Jews, whatever they were formerly, are at this time the least addicted to a military life. I rather imagine, they were of the Moorish race, who have subsisted in Spain since the expulsion of their brethren; and though they conform externally to the rites of the catholic religion, still retain in private their attachment to the law of Mahomet.

The city of Nice is built in the form of an irregular triangle, the base of which fronts the sea. On the west side it is surrounded by a wall and rampart; on the east it is over-hung by a rock, on which we see the ruins of an old castle, which, before the invention of artillery, was counted impregnable. It was taken and dismantled by Marshal Catinat, in the time of Victor Amadeus, the father of his Sardinian Majesty. It was afterwards solely demolished by the duke of Berwick, towards the latter end of Queen Anne's war. To repair it, would be altogether unnecessary, and besides that, it would be attended with a considerable expence.

The town of Nice is altogether indefensible, and therefore without fortifications. There are only two iron guns, upon a bastion that fronts the beach; and here the French had formed a considerable battery against the English cruizers, in the war of 1744, when the duke de Belleisle had his head quarters at Nice. This little town, situated in the bay of Antibes, is at an almost equal distance from Marseilles, Genoa, and Turin; the first and last being about thirty leagues, and the other not much more. It lies directly opposite to Capo di Ferro, on the coast of Barbary, and the islands of Sardinia and Corsica are about two leagues to the eastward, and exactly south of Genoa.

This little town, hardly a mile in circumference, is said to contain twelve thousand inhabitants. The streets are narrow; the houses are built of stone; and the windows, in general, have paper instead of glass. This expedient would not answer in a country subject to rain and storms; but here there is very little of either; so that the paper answers tolerably well. Some of them, however, begin to use glass in their windows, which, probably, will soon be imitated by all those who can afford to pay for it.

Between the town wall and the sea, the fishermen haul up their boats upon the open beach; but on the other side of the rock, where the castle stood, is the port or harbour of Nice, upon which some money has been expended. It is a small basin, defended on the side leading towards the sea by a mole of free-stone, which is much better contrived than executed: for the sea has already made three breaches in it; and, in all probability, in another winter, the extremity of it will be carried quite away.

It would require the talents of a very skilful architect to lay the foundation of a good mole on an open bank, like this; exposed to the swell of the whole Mediterranean, without any island or rock in the offing, to break the force of the waves. Besides, the shore is bold, and the bottom foul. There are seventeen feet high water in the basin; sufficient to float vessels of one hundred and fifty tons; and this chiefly supplied by a small stream of very fine water; another great convenience for the shipping. On the side of the mole, there is a constant guard of soldiers, and a battery of seven cannon, pointing to the sea. On the other side, there is a curious manufactory for twisting or winding of silk; a tavern, a coffee-house, and several other buildings, for the convenience of the sea-faring people.

Without the harbour is a lazaretto, where persons coming from infected places are obliged to perform quarantine. The harbour has been deemed a free port; and it is generally full of small vessels, that come from Spain, Italy, and Sardinia, loaded with salt, wines, fish, and other commodities; but still the trade is but small.

The city of Nice is provided with a senate, which administers justice, under the auspices of an advocate-general, sent hither by the king. The internal œconomy of the town is managed by four consuls; one for the nobility, another for the merchants, a third for the burgeses, and a fourth for the peasants. These are chosen, annually, from the town council, and keep the markets in order, the streets in proper repair, and superintend the publick works.

There is also an intendant, who takes care of his majesty's revenue; but there is a discretionary power lodged in the person of the commandant, who is always an officer of rank in the service, and has, under his immediate command, the regiment which is quartered here in garrison. The regiment which was there while I was in the place, was a Swiss battalion, of which, the king has five or six in his service. There is, likewise a regiment of Milan, which is examined once every year, but they do not make a very respectable appearance.

When I stood upon the rampart, and looked around me, I could not help thinking myself enchanted. The small extent of the country which I saw, was all cultivated like a garden. Indeed, the plain presents nothing but gardens full of green trees, loaded with oranges, lemons, and citrons, which make a most delightful appearance. If you examine them more nearly, you will find plantations of green pease ready to pull, with all sorts of fallading and pot-herbs in perfection. Presents of carnations are sent from hence in winter to Turin and to Paris, nay, some are sent as far as London. They are packed up in wooden boxes, without any sort of preparation, one being pressed upon another. The person who receives them, cuts off a little bit of the stalk, and steeps them for two or three hours in vinegar and water. When they recover their full bloom and beauty, they place them in bottles, filled with water, in an apartment where they are screened from the severities of the weather, and they will continue fresh and unfaded for the best part of a month.

Amidst the plantations in the neighbourhood of Nice, appear a vast number of country houses, which are very pretty to view, because they are painted white. Some few of these are grand villas belonging to the gentry of the country, and others are for the town's-people, but, in general, they are the habitations of the peasants, and contain nothing but misery and vermin. They are all built square and large, whitened with lime or plaister. The hills are shaded, to the tops, with olive-trees, which are always green; and those hills are over-topped with more distant mountains, covered with snow, all which serves to heighten the beauty of the landscape.

When I turned myself towards the sea, the view was bounded by the horizon; yet, on a clear morning, one can behold the high lands of Corsica. On the right-hand, it is terminated by Antibes, and a vast variety of other mountains. Though Nice itself retains but few marks of antient splendour, yet there are considerable monuments of antiquity in its neighbourhood. About two miles from the town, upon the summit of a high hill, are the ruins of the antient city Cemenelion, now called Cimia, which was once the metropolis of the maritime Alps, and the seat of the Roman president. With respect to situation, nothing could be more agreeable or salubrious: it stood upon the gentle ascent and summit of a hill, fronting the Mediterranean, from the shore of which it is distant about a mile and a half, and, on the other side it overlooked a bottom, or narrow vale, through which the Paglion runs towards the walls of Nice. It was inhabited by a body of people called the Vedantii; and these were undoubtedly mixed with a Roman colony, as appear by the monuments that still remain: I mean the ruins of an amphitheatre, a temple of Apollo, baths, aquaducts, sepulchral and other stones, with inscriptions, and a great number of medals which the peasants have found by accident, in digging and labouring in the vineyards and corn-

fields, which now cover the ground where the city stood.

The remains of the amphitheatre are but very small, when compared with that of Nismes. The Arena is ploughed up and bears corn. Some of the seats remain, and part of two opposite porticoes; but all the cellars, and external parts of the building are taken away; so that it is impossible to judge of the architecture. All that we can perceive is, that it was built in an oval form. About two hundred paces from the amphitheatre, stood an antient temple, supposed to have been dedicated to Apollo. The original roof is demolished as well as the portico, the vestiges of which may still be traced. The part called the bastion and about one half of the Cella Sanctior remains, and are converted in the dwelling-house and stable of the peasant who takes care of the governor's gardens, in which this monument stands. In this place, I found a lean cow, a he-goat, and a jack-ass, the very same conjunction of animals which I had seen drawing a plough in Burgundy, as has been already mentioned.

Several statues have been dug up from the ruins of this temple, and a great number of medals have been found in the different vineyards, which now occupy the space upon which this antient city stood. These were of gold, silver, and brass. Many of them were presented to Charles Emanuel I. duke of Savoy. The prince of Morocco has a good number of them in his collection, and the rest are in private hands.

The peasants, in digging, have likewise found many urns, and sepulchral stones with inscriptions upon them, but most of these are now dispersed among private families and convents. All this ground is a rich mine of antiquities, which, if properly worked, would produce a great number of valuable curiosities. Just by the temple of Apollo, were the ruins of a bath, composed of great blocks of marble, which have been taken away for the purpose of a modern building. In all probability, many other noble monuments of this city have been dilapidated by the same barbarous œconomy.

There are some subterranean vaults through which the water was conducted to this bath, still extant in the governor's garden; of the aquaduct which conveyed water to the town, I can say very little, but that it was scooped through a mountain. This subterranean passage we discovered only a few years ago, by removing the rubbish which choked it up; and the people penetrating by a different way, found a very plentiful stream of water flowing in an aquaduct as high as an ordinary man, arched over, and lined with a sort of cement. They could not, however, trace this stream to its source, and it is now stopped up with earth and rubbish.

There is not a man in this country fit to conduct an enquiry of this kind, so far are they sunk beneath the dignity of their own illustrious ancestors.

Hard by the amphitheatre, is the convent of Recollects, built in a very romantic situation on the brink of a precipice; on one side of their garden, they ascend to a rising ground, which, according to tradition, was part of the antient city. It is planted with cyprus trees and flourishing shrubs: one of the monks told me that it was vaulted below, as they can plainly perceive by the sound of their instruments. A very small expence would bring all these secrets to light. They have nothing to do but to make a breach in the wall.

A few days ago I crossed Montalban on horseback, with some Swiss officers, to visit the British consul, who at that time lived at Villa Franca, about half a league from Nice. It is a small town built upon the side of a rock, at the bottom of the harbour, which is a fine basin, surrounded with hills on every side, except to the south, where it lies open to the sea. If there was a small island in the mouth of it, to break off the force of the waves, when the wind is southerly, it would be one of the finest harbours in the world; for the ground is exceeding good for the harbourage of ships; and there is room enough to contain the whole navy of England. On the right hand, as you enter the port,

port, there is an elegant light-house kept in good repair.

Opposite to the mouth of the harbour is the fort, which can be of no manner of service, but in defending the shipping and town by sea: for by land it is commanded by Montalban, and all the hills in the neighbourhood. In the war of 1744, it was taken and retaken; but at present it is in tolerable good repair.

On the left of the fort, is the basin for the galleys, with a kind of dock in which they are built, and occasionally laid up to be refitted. This basin is formed by a pretty stone mole, and here his Sardinian majesty's two galleys lie perfectly secure, moored with their sterns close to the jetty.

I went on board one of these vessels, and saw about two hundred miserable wretches chained to the banks, on which they sit and row, when the galley is at sea. This is a sight which a British subject, sensible of the blessings he enjoys, cannot behold without horror and compassion.

However, when we consider the nature of the case with coolness and deliberation, we must acknowledge the justice, and even sagacity, of employing for the service of the public those malefactors who have forfeited their title to the privileges of the community.

Among the slaves at Villa Franca, we found a Piedmontese count condemned to the galleys for life, in consequence of having been convicted of forgery. He was permitted to live on shore, and got money by employing the other slaves to knit stockings. He appears always in the Turkish habit, and is in a fair way of raising a better fortune than that which he has forfeited.

It is a great pity, however, and a manifest outrage against the law of nations as well as of humanity, to mix with those banditti the Moorish and Turkish prisoners, who are taken in the prosecution of open war. It is certainly no justification of this barbarous practice, that the Christian prisoners are treated as cruelly at Tunis and Algiers. It would be for the honour of Christendom to set an example of generosity to the Turks; and if they would not follow it, to join their naval forces, and extirpate at once those nests of pirates, who have so long infested the Mediterranean. Certainly, nothing can be more shameful than the treaties which France and the maritime powers have concluded with those barbarians. They supply them with artillery, arms, and ammunition, to disturb their neighbours.

They even pay them a sort of tribute, under the denomination of presents, and often put up with insults tamely, for the sordid consideration of a little gain in the way of commerce. They know that all the princes, whose dominions border on the western side of the Mediterranean, are at perpetual war with those Mahometans; that while Algiers, Tunis, and Salée maintain armed cruisers at sea, those Christian powers will not run the risk of trading in their own bottoms, but rather employ as carriers the maritime nations who are at peace with the infidels. It is for our share of this advantage, that we cultivate a friendship with the piratical states in Barbary, and meanly purchase passports of them, thus acknowledging them masters of the Mediterranean.

The Sardinian galleys are mounted with five and twenty oars, and six guns, six pounders of a side. The accommodation on board for the officers is wretched. There is a paltry cabin in the poop for the commander, but all the other officers live below, the slaves in a dungeon, where they have neither light, air, nor any degree of quiet, half suffocated by the heat of the place, tormented by bugs, fleas and lice, and disturbed by the insignificant noise over head.

The slaves lie upon the naked planks, without any other covering besides the tilt. This, however, is no great hardship, in a climate where there is scarce any winter. They are fed with a very scanty allowance of bread, and about fourteen beans a day, and twice a week they have a little piece of cheese. Most of them, while they are in the harbour, knit stockings, or do

some other kind of work, which enables them to make some tolerable addition to their wretched subsistence. When they happen to be at sea in bad weather, their condition is truly deplorable. Every wave breaks over the vessel, and not only keeps them continually wet, but comes with such force, that they are dashed against the sides of the vessel, with surprising violence. Sometimes their limbs are broke, and sometimes their brains are dashed out. It is certainly impossible to keep such an irregular people under any sort of government, without some kind of severity, and indeed, such as is shocking to humanity. It is also next to impossible to maintain any degree of cleanliness, where such a number of wretches are crowded together, without conveniences, or even the necessaries of life. They are ordered twice a week to strip, clean, and bathe themselves in the sea; but notwithstanding all the precautions of discipline, they swarm with vermin, and the vessel smells like an hospital, or a jail crowded full of prisoners. They seem nevertheless quite insensible of their misery, like so many convicts in Newgate; they laugh and lie, swear, and get drunk when they can. When you enter by the stern, you are welcomed by a band of music selected from the slaves, and these expect a gratification. If you walk forwards, you must take care of your pockets. You will be accosted by one or other of the slaves, with a brush and blacking ball, for cleaning your shoes, and if you undergo this operation, it is ten to one but your pocket is picked. If you decline his service, you will find it almost impossible to avoid a colony of vermin, which these fellows have a very dextrous method of conveying to strangers. Some of the Turkish princes were allowed to go on shore, under the care of some guides, who were such as had served the greatest part of the time for which they had been condemned. There are several other sorts of punishments inflicted upon these creatures here, such as raising ballast, and other things for the shipping, but upon the whole, their lives must be miserable.

The galleys go to sea only in the summer; for in tempestuous weather they could not be out of port. Indeed, they are good for nothing but in smooth water, during a calm, when by dint of rowing they make good way. The king of Sardinia is so sensible of their inutility, that he intends to let his galleys rot; and in lieu of them has purchased two large frigates in England, one of fifty, and another of thirty guns, which lay in the harbour of Villa Franca. He has also procured an English officer, who is second in command on board of one of them, and has the title of captain Consultader, that is the director to the first captain, who at that time was an Italian marquis, and knew as much of the art of navigation as the man in the moon.

We were told that the king intended to have two or three more frigates, and then he will be more than a match for the Barbary Corsairs, provided care be taken to man his fleet in a proper manner. But this will never be done, unless he invites foreigners into his service, officers as well as seamen; for his own dominions produce neither at present. If he is really determined to make the most of the maritime situation of his dominions, as well of his alliance with Great Britain, he ought to supply his ships with English masters, and put a British commander at the head of his fleet.

He ought to erect magazines and docks at Villa Franca, or if there is not conveniency for building, he may at least have pits and wharfs for heaving down and careening, and these ought to be under the direction of Englishmen, who best understand all the particulars of marine œconomy. Without all doubt, he will not be able to engage foreigners without giving them liberal appointments, and their being engaged in his service, will give umbrage to his own subjects; but when the business is to establish a maritime power, these considerations ought to be sacrificed to reasons of public utility. Nothing can be more absurd, and unreasonable, than the murmurs of the Piedmontese officers,

ficers, at the preferment of foreigners, who execute those things for the advantage of their country, and of which they know themselves to be incapable.

When the English officer, mentioned above, was first promoted in the king of Sardinia's service, he met with great opposition, and numberless mortifications, from the jealousy of the Piedmontese officers, and was obliged to hazard his life in many rencounters with them before they would be quiet. Being a man of uncommon spirit, he never suffered the least insult, or affront to pass unchastised. He had repeated opportunities of signaling his valour against the Turks, and by dint of extraordinary merit, and long services, not only attained the chief command of the galleys, with the rank of lieutenant-general, but also acquired a very considerable share of the king's favour, who appointed him commandant of Nice.

The king, in promoting this gentleman, discovered a large share of political wisdom, and found his account in it. He made the acquisition of an excellent officer, of tried courage and fidelity, by whose advice he conducted his marine affairs. This gentleman was perfectly well esteemed at the court of London. In the war of 1744, he lived in the strictest harmony with the British admirals, who commanded our fleets in the Mediterranean. In consequence of this good understanding, a thousand occasional services were performed by the English ships for the benefit of his master, which otherwise could not have been done without a formal application to our ministry, in which case the opportunities would have been lost.

I know our admirals had general orders and instructions to co-operate in all things with his Sardinian majesty; but I know also by experience, how little these general instructions avail, when the admiral is not cordially invested in the service.

Were the king of England engaged in a war with France, and had a squadron stationed in the Mediterranean, particularly on this coast as formerly, he would find a great difference in this particular. In this case, the king of Sardinia should carefully avoid having at Nice a Savoyard commander, entirely ignorant of sea affairs, unacquainted with the true interests of his master; proud and arbitrary, reserved to strangers, from a prejudice of natural jealousy, and particularly averse to the English.

The present town of Villa Franca was built and settled in the thirteenth century, by order of Charles II. king of the Sicilies, and count of Provence, in order to defend the harbour from the descents of the Saracens, who at that time infested the coast. The inhabitants were brought here from another town, situated on the top of a mountain in the neighbourhood, which these pirates had destroyed. Some ruins of the old town are still extant, but these have nothing in them remarkable.

In order to secure the harbour still more effectually, Emanuel Philibert, duke of Savoy, built the fort in the beginning of the last century, together with the mole, where the galleys are moored.

As for the manners of the people in this country, I need not say much, for they are well known; and it may be justly said of them, that they are composed of folly, impertinence, and even vices; and merciless duels are sanctified among them as virtues, although they are real crimes. I need not give examples of friends, who have murdered each other, in compliance with this savage custom, even while their hearts were melting with natural tenderness; nor will I particularize the instances which I myself know, of whole families ruined, of women and children made widows and orphans, of parents deprived of only sons, and of valuable lives lost to the community by duels, which had been produced by an unguarded expression uttered without intention of giving offence, in the heat of dispute and altercation.

I shall not insist on the hardships of a worthy man's being obliged to devote himself to death, because it is his misfortune to be insulted by a brute, a bully, a drunkard, or a murderer. Neither will I enlarge upon

this side of the absurdity, which, indeed, amounts to a contradiction in terms; I mean the dilemma to which a gentleman in the army is reduced, when he receives an affront. If he does not challenge, and fight his antagonist, he is broke with infamy by a court martial; if he fights, and kills him, he is tried by the civil power, convicted of murder, and, if the royal mercy does not interfere, he is hanged. All this, exclusive of the risque of his own life in the duel, and his conscience being burthened with the blood of a man whom, perhaps, he has sacrificed to a false punctilio, even contrary to his own judgment; these are reflections, which every man of sense will make. But I will be bold to propose a remedy for this gigantic evil; which seems to gain ground every day. Let a court be instituted, to take cognizance of all things relating to titles of honour, with power to punish by fire, pillory, or imprisonment; and let all persons who seek personal reparation with sword, pistol, or otherwise, be declared infamous, and banished the kingdom. Let every man convicted of having used a sword or pistol, or other mortal weapon, against another, either in duel or rencounter, occasioned by any previous quarrel, be subject to the same penalties.

If any man is killed in a duel, let his body be hanged upon a public gibbet for a certain time, and then given to the surgeons. Let his antagonist be hanged as a murderer, and dissected, and let some mark of infamy be set upon both.

I think such regulations would put an effectual stop to the horrid practice of duelling; which nothing but the fear of infamy can support. For I am persuaded that no being, capable of reflection would prevent the trade of assassination at the risk of his own life, if this hazard was, at the same time, reinforced by the certain prospect of infamy and ruin.

Every person, in that case, would allow that an officer, who robs a deserving woman of her husband, a number of children of their father, a family of its support, and the community of a fellow-citizen, has as little merit to plead as the highwayman or house-breaker; which, indeed, is none at all.

I think it was from the Buccaneers of America that the English have learned to abolish one solecism in the practice of duelling. Those adventurers decided their personal quarrels with pistols; and this improvement has been adopted in Great Britain with good success, though in France, and in other parts of the continent, it is looked upon as a species of barbarity. It is, however, the only circumstance of duelling, which favours of common sense; as it puts all mankind on a level; the old with the young, the weak with the strong, the unwieldy with the nimble, and the man who knows not how to hold a sword with the person who has practised fencing many years.

What glory is there in a man having vanquished an adversary over whom he has a manifest advantage? To abide the issue of a combat, in this case, does not even require that moderate shew of resolution which nature has bestowed upon her common children. Accordingly, we have seen many instances of a coward's provoking a man to fight, while he knew, at the same time, he had not courage to go through with the rencounter, supposing he had been brought to the trial. In the reign of our Charles II. when duelling flourished in all its absurdity, and the seconds fought while their principals were engaged, Villier, duke of Buckingham, not content with having debauched the countess of Shrewsbury, and publishing her shame, took all opportunities of provoking the earl to single combat, hoping he should have an easy conquest, his lordship being a puny little creature, quite inoffensive, and every way unfit for such personal contests.

He ridiculed him on all occasions, and at last declared, in public company, that there was no glory in cuckolding Shrewsbury, who had no spirit to resent the injury. This was an insult which could not be overlooked: the earl sent him a challenge, and they agreed to fight at Barn Elms, in presence of two gentlemen, whom they chose for their seconds. All the

four met together, and engaged at the same time: the first thrust was fatal to the earl of Shrewsbury, and his second killed the duke's second at the same instant. Buckingham, elated with his success, set out immediately for the earl's seat, at Clifedun, where he lay with his wife, after having boasted that he had murdered her husband, whose blood he shewed her upon his sword, as a trophy of his prowess: and yet this duke of Buckingham was no better than a coward; for when he found there was a person capable of engaging with him in combat, he was sure to decline the contest. Great minds, enlarged with knowledge, triumph over little things; and dignity in virtue, joined to humility in piety, become grand ornaments indeed, to those who can use them in a proper manner. The duke of Buckingham lived despised, and died in misery without pity.

One day I rode out with two gentlemen for the air; a stream of water, which was formerly conveyed in an aquaduct to the antient city of Camenelion, from whence this place is distant about a mile, though separated by abrupt rocks and deep hollows, which last are here honoured with the name of vallies, the water, which is exquisitely cool, light, and pure, gushes from the middle of a rock, by a hole which leads to a subterraneous aquaduct, carried through the middle of the mountain.

This is a Roman work, and the more I considered it, the more stupendous it appeared. A peasant, who lived upon the spot, told us that he had entered this hole by eight in the morning, and advanced so far, that it was four in the afternoon before he came out. He said he walked in the water, through a regular canal, formed of a hard stone, lined with a kind of cement, and vaulted over head; but so high, in most parts, that he could stand upright, yet, in others, the bed of the canal was so sullied with earth and stones, that he was obliged to stoop in passing.

He said that there were air-holes at certain distances, and, indeed, I saw one of these not far from the entrance. There were, likewise, some openings, and stone seats, on the sides, and here and there figures of men, formed of stone, with hammers and working-tools in their hands. I am apt to believe the fellow romanced a little, in order to render his adventure the more marvellous. But I was certainly informed that several persons had entered this passage, and proceeded a considerable way by the light of torches, without arriving at the source, which, according to the tradition of the country, is at the distance of eighty leagues from this opening; but this is altogether incredible.

The stream is now called the Natural Fountain, and is carefully conducted, by different branches, into the adjacent vineyards and gardens, for watering the ground. On the side of the same mountain, more southerly, at the distance of half a mile, there is another, still more curious, discharge of the same kind of water, called the Source of the Temple. It was conveyed through the same kind of passage, and put to the same use as the other. I should imagine they are both from the same source, which, though hitherto undiscovered, must be at a considerable distance, as the mountain is covered, for several leagues to the westward, without exhibiting the least signs of water in any other part. But exclusive of the subterraneous conduits, both these streams must have been conveyed through aquaducts, extending from hence to Camenelion, over steep rocks and deep ravines, at a prodigious expence. The water issues from a stone building, which covers the passage in the rock. It serves to turn several corn, olive, and paper-mills; being conveyed through a modern aquaduct, raised upon a paltry arcade, at the expence of the public, and afterwards is branched off in very small streams, for the benefit of this parched and barren country.

The Romans were so much used to bathing, that they could not do without a great quantity of water; and this, I imagine, is one reason that induced them to spare no labour and expence in bringing it from a

considerable distance, where they had not plenty of it at home. But besides this motive, they had another; they were so nice and delicate in their water, that they took great pains to supply themselves with the purest, and lightest, from afar, for drinking, bathing, and other uses; even while they had plenty of an inferior sort, for their common domestic purposes.

There are springs of good water on the spot, where the antient city of Camenelion stood; but there is a hardness in all well-water; which quality is taken away by running a long course, especially if exposed to the influence of the sun and air. The Romans, therefore, had good reason to soften and meliorate this element, by conveying it a good length of way in open aquaducts. What was used in the baths of Camenelion, they probably brought in leaden pipes, some of which have very lately been dug up by accident.

A few days afterwards, I made a second excursion to these antient ruins, and measured the area of the amphitheatre with packthread. It is an oval figure, the longest diameter extending to about one hundred and thirteen feet, and the shortest to eighty-eight; but I will not answer for the exactness of the measurement. In the centre of it, there was a square stone, with an iron ring, to which I suppose the wild beasts were tied, to prevent their springing upon the spectators. Some of the seats were with two opposite entrances, consisting each of one large gate, and two small doors, arched. There is also a considerable portion of the external wall, but no columns nor other ornaments of architecture. Hard by, in the garden of the count de Gubernulis, I saw the remains of a booth, fronting the portal of the temple, which I took notice of before; and here were some shefts of marble pillars, particularly a capital of the Corinthian order, beautifully cut, of white alabaster. Here the count found a large quantity of fine marble, which he converted to various uses, and here likewise he found some defaced statues.

The peasant shewed me some brass and silver medals, which he had picked up at different times in cultivating the ground, together with several oblong beads of coloured glass, which were used as ear-rings by the Roman ladies, and a small seal of agate, very much defaced. Two of the medals were of Maximilian, and Gallienus, the first were so much defaced, that I could not read the letters. It is certain, however, that they were of very great antiquity, and, probably, in the beginning of the third century.

I saw some subterranean passages, which seemed to have been common sewers; and a great number of old walls still standing, along the brink of a precipice which overhangs the bastion. The peasants told me that they never digged above a yard in depth, without finding vaults or cavities. All the vineyards and garden-grounds, for a considerable extent, are vaulted under ground; and all the ground that produces their grapes, fruits, and vegetables, is no more than the crumbled rubbish of old Roman buildings, mixed with manure brought from Nice.

This antient town commanded a most noble prospect of the sea, but is altogether inaccessible by any wheel-carriage. If you make shift to climb up to it on horseback, you cannot descend again to the plain, without running the risk of breaking your neck.

About seven or eight miles on the other side of Nice, there is another Roman monument, which has suffered greatly from the barbarity of succeeding ages. It was a trophy erected by the senate of Rome, in honour of Augustus Cæsar, when he had totally subdued all the ferocious nations of the maritime Alps. It stands upon the top of a mountain, which overlooks the town of Monaco, and now exhibits the appearance of an old ruined tower. It appears to have been a beautiful edifice, of two stories, adorned with columns and trophies, with a statue of Augustus Cæsar on the top. On one of the sides was an inscription, some words of which are still legible, upon a pillar of marble, found close to the old building.

This noble monument of antiquity was first of all destroyed by fire; and afterwards, in Gothic times, converted into a kind of fortification. The marble belonging to it, was either employed in adorning the church of the adjoining village, or converted into tomb-stones, or carried off to be deposited in two churches of Nice.

At present, the work has the appearance of a ruinous watch tower, with Gothic battlements, and, as such, stands undistinguished by those who sail from hence to Genoa, and other forts of Italy.

This was formerly a considerable town, called *Villa Mentis*, and pretends to have given the honour of birth to Aulus Helvius, who succeeded Commodus as emperor of Rome, by the name of Pertinax, which he acquired from his obstinate refusal of that dignity, when it was forced upon him by the soldiers. This man, though of very low birth, possessed many excellent qualities, and was basely murdered by the Prætorian guards, at the instigation of Didius Julianus. He was certainly a very great man, and here we may observe with the learned Mr. Rollin, that obscurity of parentage, and meanness of birth, are no obstacles to true greatness, wherein solid glory and real merit consists. There are some catacombs near this place, but they do not contain any thing remarkable, only that they seem to have been built in very early times.

But of whatever antiquity these catacombs were, it is probable, that in former times, they were used as places for the people to take shelter in, from the fury of the Goths and Vandals, when in amazing swarms they over-ran those nations which had long groaned under Roman tyranny. They were likewise viewed in latter times, when the Saracens frequently landed on this coast; and whatever vulgar historians may have advanced, we are certain that these subterranean dwellings were not designed as receptacles of the deceased.

In the ages soon after the time of Tarquin, some sort of catacombs were cut out of the rock; but soon after that period, most of the human bodies after death, were burned to ashes; of this we have many instances, witness the emperor Severus, who died at the city of York in England, and his body, after having been consumed, the ashes were put into an urn, and sent to Rome. That these catacombs have been the work of great industry and expence, cannot be doubted; but we can never imagine that they were designed for funeral sepulchres. The history of the times points out the contrary, and it is by history that we are to be directed. There can remain no manner of doubt, but that in the most barbarous ages, they were designed to screen the people from their merciless foes. These might be afterwards used as the depositories of dead bodies, and yet during the irruption of the Goths and Vandals, they might return back to their original institution.

The city of Nice was originally peopled from *Marseilles*, which according to Justin was a flourishing place long before Rome knew her own greatness. Nay, it flourished to such a degree, that long before the Romans were in a condition to extend their dominions, *Marseilles* sent out colonies along the coast of *Liguria*. Of these, Nice was one of the most remarkable, so called, in all probability from a catch word, which signifies victory, in consequence of some important victory, obtained over the *Sallii* and *Liguris*, who are the antient inhabitants of this country.

Nice, with its mother city, being in the sequel subdued by the Romans, fell afterwards successively under the dominion of the Goths, Burgundians and Franks, the kings of Arles, and the kings of Naples, as the counts of Provence. In the year 1388, the city and county of Nice being but ill protected by the family of *Durazzo*, voluntarily surrendered themselves to *Amadeus*, surnamed the Red, duke of Savoy, and since that period they have continued as a part of that potentate's dominions, except at such times as they have been over-run by the French, who have always been troublesome to them.

The castle was begun by the Arragonian counts of Provence, and afterwards enlarged by several successive dukes of Savoy, so as to be deemed impregnable, until the modern method of besieging began to take place. A fruitless attempt was made upon it in 1544, by the French and Turks in conjunction; but it was reduced several times after that period, and is now in ruins.

The celebrated engineer, *Vauban*, being commanded by *Lewis XIV.* to fortify Nice, proposed that the river *Paglion*, should be turned into a new channel, so as to surround the north, and fall into the harbour; that where the *Paglion* now runs, to the westward of the city walls, there should be a deep ditch, to be filled with sea water, and that a fortress should be built to the westward of this fosse. These particulars might be executed at no very great expence; but I apprehend they would be ineffectual, as the town is commanded by every hill in the neighbourhood, and the exhalations from the stagnating sea water would infallibly render the air unwholesome.

Notwithstanding the undoubted antiquity of Nice, yet few antiquities are to be found near it. The inhabitants say they were either destroyed by the Saracens, in their successive descents upon the coast, by those barbarians in their repeated incursions, or they were used in fortifying the castle, as well as in building other edifices. The city of *Camenelian*, however, was subject to the same disasters, and even entirely ruined, and yet we find some remains of its antient grandeur. There have been likewise a few stones found at Nice, with antient inscriptions, but there is nothing of this kind standing, unless we give the name of antiquity to a marble cross, on the road to Provence, about half a mile from the city. It stands upon a pretty high pedestal, with steps, under a pretty stone cupola, or dome, supported by four Ionic pillars, on the spot where *Charles V.* emperor of Germany, *Francis I.* of France, and pope *Paul II.* agreed to have a conference, in order to determine all their disputes. The emperor came hither by sea, with a powerful fleet; and the French king by land, at the head of a numerous army. All the endeavours of his holiness, however, could not effect a peace, but they agreed to a truce of ten years.

Mezerai affirms, that these two great princes did not see one another on this occasion, and that his shyness was owing to the management of the pope, whose private designs might have been frustrated, had they come to a personal interview. In the front of the colonade, there is a small stone with an inscription in Latin, but so high, and so much defaced, that I could not read it.

In the sixteenth century, there was a college erected at Nice, by *Emanuel Philibert*, duke of Savoy, for granting degrees to students of law, and in the year 1614, *Charles Emmanuel I.* instituted the senate of Nice, consisting of a president, and a certain number of senators, who are distinguished by their purple robes, and other ensigns of authority. They administer justice, having the power of life and death, not only through the whole country of Nice, but likewise hear appeals from *Oneglia*, and some other places, but no appeal lies from their judgment.

The commandant, however, by virtue of his military power and unlimited authority, takes upon him to punish individuals, by imprisonment, corporal pains, and banishment, without consulting the senate, or indeed observing any form of trial. The only redress against unjust exercise of this absolute power, is by complaint to the king, and it is well known what chance a poor man has for being redressed in this manner.

With respect to religion, I may safely say, that here superstition reigns under the darkest shades of ignorance and prejudice. I think there are ten convents for men, and three for women, within and without the walls of Nice, and among them all, I never could hear of one man who had made any tolerable advances in any kind of human learning.

All the ecclesiasticks here, are exempted from the exertions of the civil power; being under the immediate protection of the bishop or his vicar. The bishop of Nice is suffragan to the archbishop of Ambrun, in France, and the revenues of the see amounts to between five and six hundred pounds a year. They have likewise an office of inquisition here, though I did not find that it exercised any jurisdiction, without a special commission from the king.

All the churches are sanctuaries for all sorts of criminals, except those guilty of high treason; and the priests are extremely jealous of their privileges. They receive, with open arms, murderers, robbers, smugglers, fraudulent bankrupts, and fellows of every denomination, and never give them up, until first having stipulated for their lives and liberty.

I need not enlarge upon the pernicious consequences of this infamous prerogative, calculated to raise and extend the power of the Roman church, on the ruins of morality and good order. I saw a fellow who had, three days before, murdered his wife, in the last month of her pregnancy, taking the air, with great composure and serenity, on the steps of a church: and nothing is more common, than to see the most execrable villains diverting themselves in the cloisters of convents.

Nice abounds with a great number of marquises, counts, and such other sham nobility, as are rather a disgrace than an honour to society. A man, in this country, may buy any title beneath that of the sovereign; and nothing is more common than to meet with the son of a shoe-black raised to the dignity of count. In Savoy, there are above six hundred of these families, most of whom have not above one hundred crowns a year, to maintain their marks of dignity.

However, in the mountains of Piedmont, and even in the country of Nice, there are some representatives of very antient families, reduced to the condition of common peasants; but they still retain the antient pride of their houses, and boast of the noble blood that runs in their veins. A gentleman told me that, in travelling through the mountains, he was obliged to pass a night in the cottage of one of these pretended nobles, who called to his son, in the evening, to make a good bed for the gentleman in the stable.

This, however, is not the case with the nobility of Nice, some of whom have above five hundred pounds a year, which arises from the sale of their wine, oil, silk, and oranges, produced in their small plantations; where they have also country houses. Some few of these are well built, commodious, and agreeably situated; but for the most part they are miserable enough.

These nobility (if we may call them so) are extremely tenacious of their privileges; and they keep at a stately distance from those, to whom they are under the greatest obligations; namely, the merchants and tradesmen. How they live in their families, I shall not say; but in public, madame appears in her robe of gold, or silver stuff, with her powder, perfume, paint, and patches; while the count struts about her in his lace and embroidery. I have likewise observed that the females are, for the most part, big bellied; a circumstance owing, I believe, to the great quantity of vegetable trash which they eat. All the horses, mules, asses, and other cattle, which feed upon grass, have the same distension. This sort of food produces such kind of acid juices in the stomach, as excites a perpetual sense of hunger. I have been often amazed at the voracious appetites of these people. Our consul, who is a very honest man, told me he had lived four and thirty years in the country, without having once eat or drank in any of their houses.

These mock nobility dare not quit the country without express leave from the king; and this leave, when obtained, is for a limited time, which they dare not exceed on pain of incurring his majesty's displeasure. They must, therefore, endeavour to find

amusements at home; and this, I apprehend, would be no easy task for people of an active spirit or restless disposition.

There is one thing to be observed, that the religion of the country supplies a never failing fund of pastime to those who have any relish for mechanical devotion; and this is here a prevailing taste. We have had transient visits of a puppet-show, strolling musicians, and rope-dancers; but they did not like their quarters, and decamped without beat of drum.

In summer, about eight or nine at night, part of the gentry may be seen assembled in a place, called the Parc, which is, indeed, a sort of a street, formed by a row of very paltry houses on one side, and on the other by a part of the town-wall, which screens it from a prospect of the sea, the only object that could render it agreeable.

Here we could see their nobility stretched out, as it were, upon logs of wood, like so many seals upon the rocks, by moon-light, each having his lady of pleasure along with him; for this Italian fashion prevails at Nice, as well as in other parts of Italy. Jealousy seems not to be known among them, except on very particular occasions. The wife and the mistress embrace each other in the most seemingly cordial manner. I do not choose to enter into particulars; I cannot open the scandalous chronicle of Nice, without offending modesty and decency.

But the Parc is not the only place of public resort for these noblemen in a summer's evening. Just without one of the gates you may find them scattered, near ditches, beside the highway, surrounded with the croaking of frogs, and the bellowing and braying of mules and asses, continually passing in a perpetual cloud of dust. Besides these entertainments, they frequently meet at the governor's house in the evening, to play for a farthing a game.

In carnival time, there is also at the governor's house a kind of ball and masquerade, which is carried on by subscription. No individual can give a ball, without obtaining a permission, and a guard from the governor; and then his house is open to all persons, without distinction, who are provided with tickets, which tickets are sold by the governor's secretary, at five sols apiece, and delivered to the guard at the door.

Though the king of Sardinia takes all opportunities to distinguish the subjects of Great Britain with particular marks of respect, yet I have seen enough to be convinced, that our nation is looked upon with an evil eye by the people of Nice, and this arises partly from religious prejudices, and partly from envy, occasioned by a ridiculous notion of our superior wealth. For my own part, I owe them nothing on the score of civilities, and therefore I shall say nothing more on the subject, lest I should raise my temper, and break out into irregular passion.

In the town of Narvo there are no ready furnished lodgings to be found for a whole family in one single house, except without one of the gates, where there are generally two houses to be lett, ready furnished, for about five louis-d'ors a month. As for the country houses in the neighbourhood; they are generally very damp in winter, without chimnies; and in summer they cannot be inhabited, on account of the heat and vermin.

If you have a tenement in Narvo, it must be for a year certain, and this will cost you about twenty pounds sterling. For this price I had a ground-floor, paved with brick, consisting of a kitchen, two large halls, a couple of good rooms, with chimnies, three large closets that seemed for bedchambers and dressing-rooms, a butler's room, and three apartments for servants, lumber, or wines, to which we ascended by narrow wooden stairs. I had, likewise, two small gardens, well stocked with oranges, lemons, peaches, figs, grapes, salad, and pot-herbs. It was supplied with a draw well of good water, and there was another in the house, extremely cool, for the use of the family.

One may live some time in such a tenement for about two guineas a month; but, for my own part, I rather chose to purchase what I wanted, and this cost me about sixty pounds. When I left the place, I got above one-third of the money for it.

It is very difficult to find a tolerable cook at Nice. A common country girl will not live there with an English family for less than ten livres a month. They are all slovenly, slothful, and most unaccountable cheats. The markets at Nice are tolerably well supplied, and their beef, which comes from Piedmont, is very good; and in such plenty, that they have it all the year. In the winter, they have excellent pork, and delicate lamb, but the mutton is indifferent. Piedmont also affords them delicious capons, fed with maize; and this country produces excellent turkeys, but very few geese. Chickens and pullets are extremely poor; and although I tried to fatten them, yet it was without success. In summer they are subject to some disorders, of which they die in great numbers. Autumn and winter are the seasons for game, which are here found in great abundance. Wild boars are sometimes found in the mountains, and they have a most delicious taste, not unlike that of the wild hog in Jamaica; but they are best in the beginning of winter. Pheasants are very scarce, and consequently dear, so that we did not often purchase them.

As for the heath game, I never saw but one cock, which my servant bought in the market, and brought home; but the governor's cook came into my kitchen and carried it off, after it was half plucked, saying, his master had company to dinner. The hares are large, plump, and juicy. The partridges are generally of the red sort, large as pullets, and of a good flavour. There are also some grey partridges in the mountains, and another sort, of a white colour, that weigh four or five pounds each. They have a bird here called beccaficas, and these are smaller than sparrows, but they are very fat; and eaten half raw. The best way of dressing them, is to stuff them into a roll, scooped of its crum; to baste them well with butter, and roast them until they are brown and crisp. The ortolans are crammed in cages until they die of fat, and then are eaten as rarities. The thrush is presented with the trail, because that bird feeds on olives. They may as well eat the trail of a sheep, because it feeds on the aromatic herbs of the mountains.

In the summer, they have beef, veal, and mutton, chickens and ducks, which last are very fat, and very flabby. All the meat is tough in this season, because the excessive heat, and great number of flies, will not admit of its being kept any time after it is killed. Butter and milk, though not very delicate, they have all the year, and their tea and sugar is brought from Marseilles, at a very reasonable price.

Nice is not without variety of fish, though they are not counted good in their kinds. Soals and flat fish are in general scarce, but here are mullets both grey and red. One of the best fish in this country, is called le loup, about two or three pounds in weight, white finned, and well-flavoured. Another, not very inferior to it, is the mouffel, about the same size, of a dark grey colour, and short blunt snout, growing thinner and flatter from the shoulders downwards, so as to resemble a soal at the tail. Here too is found the fish which, in England, is called the weaver, remarkable for its long sharp fins, so dangerous to the fingers of the fishermen. There are likewise abundance of what is commonly called cattley fish, of which the people of the country make excellent ragouts.

The market at Nice sometimes affords a sort of lobsters without claws, of a sweetish taste; and there are a few rock oysters, very small and very rank. Sometimes the fishermen find, under water, pieces of hard cement, like plaister of Paris, which contain a kind of muscle. These petrifications are commonly of a triangular form, and weigh about twelve or fifteen pounds each; and one of them contains about a dozen of these muscles, which have nothing extraordinary in the taste or flavour, though reckoned ex-

remely curious, as they are found alive and juicy in the heart of a rock almost as hard as marble, without any connection with the air or water. In order to reach the muscles, this cement must be broke with hammers; and, it may be truly said, that the kernel is not worth the breaking of the shell.

Rome is between four and five hundred miles from Nice, and one half of the way I was resolved to travel by water. Indeed there is no other way of going from hence to Genoa, unless you take a mule and clamber along the mountains at the rate of two miles an hour, and at the risque of breaking your neck every minute. The Appenine mountains, which are no other than a continuation of the maritime Alps, form an almost continued precipice from Villa Franca to Lerici, which is almost forty-five miles on the other side of Genoa; and as they are generally washed by the sea, there is no beach or shore, consequently the road is carried along the face of the rocks, except at certain small intervals which are occupied by towns and villages. But as there is a road for mules and foot passengers, it might certainly be enlarged and improved so as to render it practicable by chaises and other wheel carriages, and a toll might be erected, which in a little time would defray the expence.

The most agreeable carriage from hence to Genoa, is a felucca, or open boat, rowed by ten or twelve stout mariners. A felucca is large enough to take in a post-chaise, and there is a tilt over the stern sheets, to protect the passengers from rain. The distance between Nice and Genoa, when measured on the east, does not exceed ninety miles; but the people of the feluccas insist upon its being one hundred and twenty.

We embarked the beginning of September in a hired gondola, which is a boat smaller than a felucca. I was provided with a proper pass, signed and sealed by our council. The weather was fine, and the voyage extremely agreeable. About noon of the same day, we entered the harbour of Monaco. This small town is inhabited by about eight or nine hundred souls, besides the garrison; it is built on a rock which projects into the sea, and makes a very romantic appearance. The prince's palace stands in a most conspicuous part, with a walk of trees before it. The apartments are elegantly furnished, and adorned with some good pictures. The fortifications are in good repair, and the place is garrisoned by two French battalions; the harbour is well sheltered from the wind, but has not water sufficient to admit vessels of any great burthen. Towards the north, the king of Sardinia's territory extends to within a mile of the gate, but the prince of Monaco can go upon his own ground along shore about five or six miles to the eastward, as far as Menton, another small town which also belongs to him, and is situated on the sea side. His revenues are computed at a million of French livres, amounting to something more than forty thousand pounds sterling; but the principality of Monaco, consisting of three small towns, and an inconsiderable tract of barren rock, is not worth above seven thousand a year; the rest arises from his French estate. This consists partly of the duchy of Matignon, and partly of the duchy of Valentinori, which last was given to the ancestors of this prince of Monaco, in the year 1640, by the French king, to make up the loss of some lands in the kingdom of Naples, which were confiscated when he expelled the Spanish garrison from Monaco, and threw himself into the arms of France; so that he is duke of Valentinori as well as Matignon in that kingdom.

The Genoese territories begin at Ventimiglia, another town lying on the coast, at the distance of twenty miles from Nice, from which circumstance it borrows its name. Having passed the towns of Monaco, Menton, Ventimiglia, and several other places of less consequence that lie along this coast, we turned the point of St. Martin with a favourable breeze, and were put ashore at St. Remo. We ascended by a dark, narrow, steep stair, into a kind of public room, and after waiting there a considerable time amongst watermen and muleteers, we were miserably accommodated up stairs,

for which at our departure we paid as much as if we had been elegantly entertained in the best auberge of France and Italy.

St. Remo is a pretty considerable town, well built upon the declivity of a gently rising hill, and has a harbour capable of receiving small vessels, a good number of which are built upon the beach: but ships of any burthen are obliged to anchor in the bay, which is far from being secure. The people of St. Remo form a small republic, which is subject to Genoa.

On the third day we reembarked and rowed along shore, passing by Porto Mauricio, and Oneglia; then turning the promontory called Capo di Melle, we proceeded by Alberga, Finale, and many other places of inferior note. Porto Mauricio is seated on a rock washed by the sea, but indifferently fortified with an inconsiderable harbour, which none but very small vessels can enter. About two miles to the eastward is Oneglia, a small town, with some fortifications, laying along the open beach, and belonging to the king of Sardinia. This small territory abounds with olive-trees, which produce a considerable quantity of oil, counted the best of the whole Riviera. Albenga is a small town, the see of a bishop, suffragan to the archbishop of Genoa: it lies upon the sea, and the country produces a great quantity of hemp. Finale is the capital of a marquisate belonging to the Genoese; the town is pretty well built, but the harbour is shallow, open, and unsafe; nevertheless, they build a good number of tartans, and other vessels, on the beach; and the neighbouring country abounds with oil and spice, particularly with those excellent apples called pomi-carli.

In the evening, we reached the Capo di Noli, counted very dangerous in blowing weather. It is a very high perpendicular rock, or mountain, washed by the sea, which has eaten into it in divers places, so as to form a great number of caverns. It extends about a couple of miles, and in some parts is indented into little creeks or bays, where there is a narrow margin of sandy beach between it and the water.

On this side of the cape, there is a beautiful strand, cultivated like a garden; the plantations extend to the very tops of the hills, interspersed with villages, castles, churches, and villas. The whole Riviera is ornamented in the same manner, except in those places which admit of no building nor cultivation.

We passed the cape, and landed at the town of Noli. This is a small republic of fishermen, subject to Genoa: the town stands on the beach, tolerably well built, defended by a castle, situated on a rock above it, and the harbour is of little consequence. The auberge was such, as made us regret even the inn we left at St. Remo. The next day we rowed by Vado and Savena; which last is a large town, with a strong citadel and a harbour, which was formerly capable of receiving large ships, but is now otherwise; the Genoese having partly choaked it up, on pretence that it should not afford shelter to the ships of war belonging to those states which might be at enmity with the republic.

Then we passed Albisola, Sestri di Ponente, Novi, Voltri, and a great number of villages, villas, and magnificent palaces belonging to the Genoese nobility, which form almost a continued chain of buildings along the strand for thirty miles.

About five in the afternoon, we skirted the fine suburbs of St. Petro D'Arena, and arrived at Genoa, which makes a dazzling appearance when viewed from the sea, rising like an amphitheatre, in a circular form from the water's edge, a considerable way up the mountains, and surrounded on the land side by a double wall, the most exterior part of which is said to extend fifteen miles in circuit. The first object that engages your attention, is a very elegant pharos, or light-house. Turning the light-house point, you find yourself close to the Mole, which forms the harbour of Genoa. We met with good entertainment in this city, which determined us to stay some days.

The city of Genoa is stately, and its nobles are

very proud, though their fortunes are in general very small: they live with great parsimony in their families, and wear nothing but black in public: however, the pride of the Italians takes a more favourable turn than that of the French. A Frenchman lays out his whole income on tawdry suits of cloaths, or in furnishing a magnificent repast of fifty or a hundred dishes. His wardrobe goes to the fripier, his dishes to the dogs, and himself to the devil, and after his decease no vestige of him remains. A Genoese, on the other hand, lives abstemiously with the money he saves; he builds palaces or churches, which perpetuate his memory, as monuments of his taste, piety, and munificence, and, in the mean time, gives employment to the poor and industrious.

The commerce of this city is not very considerable, though it has the appearance of much business: the streets are crowded with people, the shops are well furnished, and the markets abound with all sorts of excellent provision. The wine made here is very indifferent, and all that is consumed must be bought at the public eantime, where it is sold for the benefit of the state. Their bread is the whitest and the best I have tasted any where, and the beef which they have from Piedmont is juicy and delicious. The expence of eating is much the same in Italy as in France, about three shillings sterling a head for every meal.

The few days we stayed at Genoa, we employed in visiting the most remarkable churches and palaces. In some of the churches, we found a profusion of ornaments which had more magnificence than taste: a great number of pictures, but very few capital ones. I had heard much of the Ponte Carignano, but it did not answer my expectation: there is nothing curious in its construction, except the height of the piers from which the arches are sprung.

The only remarkable circumstance about the cathedral, which is Gothic and gloomy, is the chapel where the pretended bones of John the baptist are deposited, and in which thirty silver lamps are continually burning. The other curiosities I postponed seeing till my return.

"I provided myself (says Smollet) with letters of credit for Florence and Rome, and hired the same boat which brought us hither, to carry us forward to Lerici, which is a small town, about half way between Genoa and Leghorn. We passed several pretty towns, villages, and castles, or little white houses, scattered among woods of olive-trees, that cover the hills, and these are the habitations of the velvet and damask weavers.

Turning Capo Fino, we entered a bay, where stand the towns of Porto Fino, Lavagna, and Sestri di Levante, at which last we took up our night's lodging. Accommodations terrible, and uncivil usage. Sestri di Levante is a little town, pleasantly situated on the sea-side, but has no harbour. The fish caught here is mostly carried to Genoa: this is the market for their oil, and the paste called macaroni, of which they make a large quantity.

The next day we skirted a very barren coast, consisting of almost perpendicular rocks, on the faces of which we saw many peasants' houses, and hanging terraces for vines, made by dint of incredible labour.

In the afternoon we entered, by the Porto di Venere, into the bay, or gulph of Spetia, or Spezza, which was the Portus Luna of the ancients. This bay, at the mouth of which lies the island Palmaria, forms a most noble and secure harbour, capacious enough to contain all the navies in Christendom. At the bottom of the bay is the town of Spetia on the left, and on the right that of Lerici, defended by a castle of very little strength or consequence.

At Lerici (say the doctor) we found the accommodation intolerable. We then travelled by land to Florence, by the way of Pisa, which is seven posts distant from Lerici. About three miles from Lerici, we crossed the Magra, and, at half a mile farther, arrived at Sarzana, a small town, at the extremity of the Genoese territories. We then entered the principalities

cipalities of Massa and Canara, belonging to the duke of Modena, and passed Lavenza, which seems to be a decayed town, with a small garrison. Massa is an agreeable little town, where the old duchess of Modena resides.

From Sarzana to Tuscany, the country is a narrow plain, bounded on the right by the sea, and on the left by the Appenine mountains. After entering the dominions of Tuscany, we travelled through a noble forest of oak-trees, of a considerable extent.

Pisa is a fine old city; the houses are well built, the streets open and well paved, the shops well furnished, and the markets well supplied: there are some elegant palaces, and the churches are built with taste. There is a beautiful wharf of free-stone on each side of the river Arno, which runs through the city, and three bridges thrown over it; that in the middle is of marble, and is a beautiful piece of architecture.

The air in summer is reckoned unwholesome, by the exhalations arising from stagnant water in the neighbourhood of the city. The Arno is not navigable for vessels of any burthen. The university of Pisa is very much decayed. Very little commerce is here carried on, and the inhabitants live on the produce of the country, which consists of corn, wine, and cattle.

They are supplied with excellent water by an aqueduct, consisting of above five thousand arches, begun by Cosimo, and finished by Ferdinand I. grand dukes of Tuscany; it conveys the water from the mountains at the distance of five miles.

This noble city, formerly the capital of a flourishing and powerful republic, and contained above one hundred and fifty thousand inhabitants, is now so desolate, that grass grows in the open streets, and the number of its people does not exceed sixteen thousand.

The Campanile, a hanging tower, is a beautiful cylinder of eight stories, each adorned with a round of columns, rising one above another. In the cathedral, which is a large Gothic pile, there is a great number of massy pillars of porphyry, granite, jasper, and verde antico, with some good pictures and statues: but the greatest curiosity is that of the brass gates, designed by John of Bologna, representing, embossed in different compartments, the history of the Old and New Testaments.

The Campo Santo, which is a burying-ground, so called from its being covered with earth brought from Jerusalem, is an oblong square, surrounded by a very high wall, and is always kept shut. It is ornamented with the most capital paintings, the subjects of which are taken from the bible.

The road from Pisa to Florence, which lies along the Arno, is very good and pleasant. Florence is a noble city, and retains the marks of a majestic capital: the churches are magnificent, and the paintings incomparable. There is a considerable number of fashionable people, and many of them in good circumstances: they affect a gaiety in their dress, equipage, and conversation, and stand very much on the punctilio with strangers.

The nobles of Florence are humble enough to enter into partnership with shop-keepers, and even to sell their wine by retail. Though it is tolerably populous, there seems to be but little trade of any kind. There is a tolerable opera for the entertainment of the best company, though they do not seem very fond of music: here is also a wretched troop of comedians for the common people. What seems to suit the general taste is, the exhibition of church pageantry, in which they excel particularly.

Every Italian lady has her *cecifbeo*, or *serviente*, who attends her every where, and on all occasions; upon whose privileges the husband dares not encroach, without incurring the censure and ridicule of the whole community. This office is a disagreeable one, considering the haughtiness and insolence of the Italian ladies.

One of the greatest curiosities you meet with in Italy, is the *improvvisatore*; such is the name given to

certain individuals, who have the surprising talent of reciting verses extempore on any subject you propose.

Having seen all the curiosities in Florence, which are needless to recite, as the account has been given already, the doctor proceeds thus; I set out post for Rome, by the way of Sienna; where we lay the first night. The country through which we passed is mountainous, but agreeable. The city of Sienna is large and well built, the inhabitants pique themselves upon their politeness, and the purity of their dialect; the mosaic pavement of the cathedral is admirable, as well as the history of Oneas Sylvius painted on the walls of the library.

On the third day we entered the pope's territories, some parts of which are delightful. Having passed Aqua Pendente, a beggarly town, situated on the top of a rock, we travelled by the side of the lake Rolfena, a beautiful piece of water, about thirty miles in circuit, with two islands in the middle, the banks covered with plantations of oak and cypresses.

Rolfena is a paltry village; and Montepiascone, famous for its wine, is a poor decayed town. The mountain of Viterbo is covered with beautiful plantations and villas belonging to the Roman nobility who come here in summer. Viterbo is the capital of that country which Matilda gave to the Roman see. It is well built, adorned with public fountains, and a great number of churches and convents.

We then skirted part of another lake near Viterbo, passed a few inconsiderable places, and descended into the Campania of Rome, which is almost a desert. The Via Cassia or Cymina is paved with broad, solid, flint stones; I am clearly of opinion that we excel the antient Romans, in understanding the conveniences of life.

The city of Rome, notwithstanding all the calamities it has undergone, maintains an august appearance. It stands on the further side of the Tiber, which we crossed at the Ponte Molle, formerly called Pons Milvius, about two miles from the gate by which we entered. The space between the bridge and Porta del Porta, on the right hand, which is now taken up with gardens and villas, was part of the antient Campus Martius, where the comitia were held, and where the Roman people inured themselves to all manner of exercises.

Nothing of the antient bridge remains but the piles. I have not seen any bridge in France and Italy, equal to those over the Thames. The Tyber is, in comparison of the Thames, an inconsiderable stream, foul, deep, and rapid; navigable only by small boats, barks and lighters. There is a handsome quay by the new custom-house; at the Porto di Ripetta.

The Porta del Popolo by which we entered Rome, is an elegant piece of architecture, adorned with marble columns and statues; here is a capital fountain, and at the beginning of the two principal streets are two very elegant churches fronting each other.

We lodged in the Piazza d'Espagna, which is open, airy, pleasantly situated, and adorned with two fine fountains; the number of fountains with which Rome abounds has a very pleasing effect, especially in hot weather; but notwithstanding this profusion of water, the modern Romans are not cleanly. The Piazza Novana has four magnificent fountains, yet is almost as dirty as West Smithfield in London.

Modern Rome does not cover more than one third of the space within the walls. From the Capitol to the Coliseum, including the Forum Romanum and Boarium, there is nothing entire but one or two churches, built with the fragments of antient edifices. The churches and palaces of these days are crowded with petty ornaments which distract the eye, and by breaking the design into a variety of little parts destroy the effect of the whole.

The only appearance of a fortification in this city, is the castle of St. Angelo, situated on the further bank of the Tyber, to which there is access by a handsome bridge; but this castle could not hold out half a day against a battery of ten pieces of cannon properly directed,

rected. It is, however, respectable as a monument of antiquity, and though standing in a low situation is one of the first objects that strike the eye of a stranger approaching Rome. On the opposite side of the river, are the wretched remains of the Mausoleum Augusti. Part of the walls are standing, and the terraces are converted into a garden ground. The Italians understand, because they study, the excellencies of art, but they have no ideas of the beauty of nature; the Roman gardens are an eminent proof of this remark.

The piazza of St. Peter's church is very sublime, but I shall not give a particular or methodical account of the various curiosities of Rome, as it has already been done by much abler hands.

There is nothing in this famous structure so worthy of admiration, as the symmetry of its parts; I was rather disappointed at the sight of the pantheon, which looks like a cock-pit open at the top.

The magnificence of the Romans was not so conspicuous in their temples, as in their theatres, amphitheatres, circusses, naumachia, aqueducts, triumphal arches, porticoes, basilica, but especially their bathing places. The amphitheatre, built by Flavius Vespasian, is the most stupendous work of the kind which antiquity can produce. He employed thirty thousand Jewish slaves in the work; near one half of the external circuit still remains, and strikes the beholder with awe and veneration.

The vatican library contains about forty thousand volumes, and is very magnificent, as is the *libreria caranante*, belonging to the convent of the church called S. Maria Sopra Minerva.

The doctor proceeds thus; after having satisfied my curiosity at Rome, I returned to Florence, by the way of Terni; great part of the road lies over steep mountains, or along the side of precipices, which rendered the journey dreadfully dangerous; the accommodations on the road, miserably bad. We passed the Nar, celebrated in antiquity for its white foam, and the sulphurous quality of the waters. It is a small but rapid stream which runs into the Tiber. Passing Utricoli and Nami, we arrived at Terni, and went to see the famous Cascata delle Marmore which is at the distance of three miles from Terni. This is a large body of water rushing down the mountain; the smoky vapour, and thick white mist which it raises, the double rainbow which these particles exhibit while the sun shines, the deafening sound of the cataract, the vicinity of a great number of other stupendous rocks and precipices, with the dashing, boiling and foaming of the two great rivers below, produce altogether an object of tremendous sublimity.

Terni is an agreeable town, pretty well built, and situated in a pleasant valley, between two branches of the river Nera. Here is an agreeable piazza, where stands a church that was of old an heathen temple, where are some valuable paintings. The people are civil, and the provisions cheap. We passed through part of Spoleto, the capital of Umbria, which is a pretty large city; the road from hence to Foligno is in good order, and lies through a delightful plain.

Foligno is a small pleasant town, lying in the midst of mulberry plantations, vineyards and corn-fields, and built on both sides of the little river Topino. We stayed one day and night at Perugia, which is a considerable city built upon the acclivity of a hill, adorned with elegant fountains and handsome churches. The next stage is on the banks of the lake, which was the *Thrasimere* of the ancients, a beautiful piece of water about thirty miles in circumference, having three islands abounding with excellent fish; upon a peninsula of it, there is a town and castle. It was in this neighbourhood, where the consul Flaminius was totally defeated with great slaughter by Hannibal.

We passed Commoce, Arezzo, Ancisa, &c. and at length reached Florence through miserable roads, and entered the city late at night. The season was far advanced, I therefore made only a short stay at Florence, and set out for Pisa, determining to take the nearest road to Lerici; we afterwards returned to Nice by the

same way, therefore it is unnecessary to give a farther account of the country and accommodations.

As I passed a second winter at Nice, I think myself fully qualified to make proper observations on the climate. In the short period of four months, we had fifty-six days rain; which I take to be a greater quantity than generally falls during the six worst months of the year in the county of Middlesex, and it was, for the most part, a heavy continued rain. The south winds generally predominate in the wet season at Nice: but this winter, the rain was accompanied with every wind that blows, except the south; though the most frequent were those that came from the east and north quarters. Notwithstanding these great rains, such as were never known before in the memory of man, the intermediate days of fine weather were delightful, and the ground seemed perfectly dry: the air itself was perfectly free from moisture.

As the heat increases, the humours of the body are rarefied, and of consequence, the pores of the skin are opened: while the east wind, sweeping over the Alps and Appenines, covered with snow, continues surprisingly sharp and penetrating. Even the people of the country who enjoy good health, are afraid of exposing themselves to the air at this season; the intemperature of which may last till the middle of May, when all the snow on the mountains will probably be melted: then the air will become mild and balmy, till, in the process of summer, it grows disagreeably hot, and the strong evaporation from the sea makes it so saline, as to be unhealthy for those who have a scorbutic habit. When the sea-breeze is high, this evaporation is so great, as to cover the surface of the body with a kind of volatile brine, as I plainly perceived last summer. This inconvenience may be prevented by retiring to a summer retreat; and an agreeable one presents itself on the other side of the Var, at or near the town of Grasse, which is pleasantly situated on the ascent of a hill in Provence, about seven English miles from Nice. This place is famous for its pomatum, gloves, wash-balls, perfumes, and toilet boxes, lined with bergamot. It affords good lodging, and is well supplied with provisions. This I would make my summer residence, though I would spend my winter in Nice, which are in general very mild and agreeable.

Dr. Smollet says, "We are now preparing for our journey to England. I leave nothing behind me but the air, which I can possibly regret."

In our way to Turin, we passed through Coni, which is situated between two small streams, and, though neither very large nor populous, is considerable for the strength of its fortifications. It is honoured with the title of the Maiden Fortrefs, because, though several times besieged, it was never taken. The prince of Conti invested it in the war of 1744, but he was obliged to raise the siege, after having given battle to the king of Sardinia. The place was gallantly defended by the baron Lentium, a German protestant, the best general in the Sardinian service: but what contributed most to the miscarriage of the enemy, was a long series of heavy rains, which destroyed all their works, and rendered their advances impracticable.

Piedmont is one of the most fertile and agreeable countries in Europe, and this is the most agreeable part of all Piedmont.

We passed through Sabellian, which is a considerable town, and arrived in the evening at Turin. We entered this fine city by the gate of Nice, and passing through the elegant piazza di San Carlo, took up our quarters at the Bona Fama, which stands at one corner of the great square called La Piazza Castell.

From Turin, we travelled to Aix en Provence, and from thence to Antibes, which is the Antipolis of the ancients, said to have been built, like Nice, by a colony from Marseilles. In all probability, however, it was later than the foundation of Nice, and took its name from being situated directly opposite to that city.

At present it is the frontier of France, towards Italy, pretty strongly fortified, and garrisoned by a battalion of soldiers. The town is small and inconsiderable, but the basin of the harbour is surrounded seaward by a curious bulwark, founded upon piles driven into the water, consisting of a wall, rampart, casemates, and quay. Vessels lie very safe in this harbour, but there is not water at the entrance of it to admit ships of any burthen. The shallows run so far off from the coast, that a ship of force cannot lie near enough to batter the town, but it was bombarded in the late war. Its chief strength, by land, consists in a small quadrangular fort, detached from the body of the place, which, in a particular manner, commands the entrance of the harbour. The wall of the town, built in the sea, has embrasures and salient angles, on which a great number of cannon may be mounted.

I had embarked my heavy baggage on-board a London ship, which happened to be at Nice, ready to sail; as for our small trunks and portmanteaus, they were examined very superficially at Antibes, as tipping the seacher half a crown is a wonderful conciliator of all difficulties.

Cannes is a neat village, charmingly situated on the banks of the Mediterranean, exactly opposite to the Marguerites, where state prisoners are confined. It is a fine air, and well supplied with all sorts of fish.

The amphitheatre at Frejas is nearly of the same dimensions with that at Nismes, but shockingly dilapidated. The stone seats arising from the arena are still extant, and the cells under them, where the wild beasts were kept: all the external architecture, and the ornaments, are demolished.

From hence the country opens to the left, forming an extensive plain between the sea and the mountains, which are a continuation of the Alps, that stretch through Provence and Dauphiny. This place, watered with pleasant streams, and varied with vineyards, corn-fields, and meadow-ground, affords a most agreeable prospect. Although this has much the appearance of a corn country, I am told it does not produce enough for the consumption of the inhabitants, who are obliged to have annual supplies from abroad, imported at Marseilles. A Frenchman, at an average, eats three times the quantity of bread that satisfies an Englishman; it is undoubtedly the staff of his life. It is rather wonderful, therefore, that the Provençaux do not convert part of their vineyards into corn-fields; for they may boast of their wine as they please, but that which is drank by the common people, not only here, but also in all the wine countries of France, is neither so sharp, nourishing, nor, in my opinion, so pleasant, as the small beer in England. It must be owned that all the peasants, who have wine for their ordinary drink, are of a diminutive size, less robust and healthy than those who use milk, beer, or even water.

Between Luc and Toulon, the country is delightfully parcelled out into inclosures. Here is plenty of rich pasturage for black cattle, and a greater number of pure streams and rivulets than I have observed in any other parts of France.

Toulon is a considerable place, exclusive of the basin, docks, and arsenal. The quay, the jetties, the docks, and magazines, are contrived and executed with precision, order, solidity, and magnificence. I counted fourteen ships of the line lying unrigged in the basin, besides the Tonant of eighty guns, which was in dock repairing, and a new frigate on the stocks.

Part of the road from hence to Marseilles lies through a vast mountain. Marseilles is a noble city, large, flourishing, and populous: the streets are open, airy, and spacious; the houses well built, and even magnificent; the harbour is an oval basin, surrounded on every side, either by the buildings or the land, so that the shipping lies perfectly secure; and here is generally an incredible number of vessels. On the city side, there is a semicircular quay of free-stone, which extends thirteen hundred paces; and the space between

this and the houses that front it, is continually filled with a surprising croud of people. The galleys, to the number of eight or nine, are moored with their sterns to one part of the wharf, and the slaves are permitted to work for their own benefit, at their respective occupations, in little shops or booths, which they rent for a trifle. Here are tradesmen of all sorts sitting at work, chained by one foot, shoe-makers, taylor's, silversmiths, watch and clock-makers, barbers, stocking-weavers, jewellers, pattern-drawers, scribes, book-sellers, cutlers, and all manner of shop-keepers. They pay about two sols a day to the king for this indulgence; live well, and look jolly; and can afford to sell their goods and labour much cheaper than other dealers and tradesmen.

Notwithstanding the great appearance of business at Marseilles, their trade is very much on the decline; which is owing in a great measure to the English, who, at the last peace, poured such a quantity of European merchandize into Martinique and Guadeloupe, that when the merchants of Marseilles sent over their cargoes, they found the markets overstocked, and were obliged to sell for a considerable loss. Add to this, the French colonies had such a stock of sugars and coffee, and other commodities, lying by them during the war, that, upon the first notice of peace, they shipped them off in great quantities for Marseilles.

The expences of living at an hotel here is enormous: the best and cheapest way is to take ready furnished lodgings. Imposition on strangers prevails, in a great degree, all over the south of France, though it is the cheapest and most plentiful part of the kingdom.

Marseilles is a gay city, and the inhabitants indulge themselves in a variety of amusements. They have assemblies, a concert spirituel, and a comedy. Here is a spacious and shady walk, to which, in the evening, there is a great resort of well dressed people.

Aix, the capital of Provence, is a large city, watered by the small river Aire. It was a Roman colony, said to be founded by Caius Sextus Calvinus, above a century before the birth of Christ. From the source of mineral water found here, added to the consul's name, it was called Aqua Sextia. It was here that Marius, the conqueror of the Teutones, fixed his head quarters, and embellished the place with temples, aqueducts, and bathing-places, of which nothing now remains.

The city is well built, though the streets are narrow. It has a noble walk, planted with double rows of tall trees, and adorned with three or four fine fountains, the middlemost of which discharges hot water, supplied from the source of the baths. On each side, there is a row of elegant houses, inhabited chiefly by the noblesse, of which there is here a considerable number.

The parliament is held here, and brings a great resort of people. As many of the inhabitants are persons of fashion, they are well bred, gay, and polite. The Duc de Villars, who is governor of the province, resides on the spot; and keeps an open assembly, where strangers are admitted without reserve, and made very welcome if they will engage in play, which is the sole occupation of the whole company.

Aix is situated in a bottom, almost surrounded by hills, which, however, do not screen it from the north wind, which blows very sharp in the winter and spring, rendering the air almost insupportably cold. The contrary is the case in summer, for then it is insufferably hot. Aix, though pretty well supplied with butchers' meat, is not so with respect to garden stuff, and they have no poultry but what comes a vast distance. Their oil is good and cheap; their wine indifferent: but their chief care seems employed on the culture of silk, the staple commodity of Provence: which is every where shaded with plantations of mulberry-trees, for the nourishment of the worms.

The eruptions of the barbarians have entirely demolished the baths of Aix, so famous in antiquity.

Some of the springs still remain, which are found serviceable in many disorders.

I passed the Durance in a boat which lay at Avignon. This river, the *Druentia* of the antients, is a considerable stream, extremely rapid, which descends from the mountains and discharges itself into the Rhone. After violent rains, it extends its channel, so as to be impassable, and often overflows the country to a great extent.

Avignon is a large city belonging to the pope. It was the *Aveno Cavarum* of the antients, and changed masters several times. The pope holds it by a precarious title; at the mercy of the French king. It is governed by a vice legate from the pope, and the police of the city is regulated by the consuls. It is a large place, situated in a fruitful plain, surrounded by high walls built of hewn stone, which, on the west side, are washed by the Rhone: here was a noble bridge over the river, but it is now in ruins. On the other side, a branch of the Sague runs through part of the city. This is the river antiently called *Sulga*: it is a charming transparent stream, abounding with excellent trout and craw-fish.

Orange, the *Arausio Cavarum* of the Romans, is still distinguished by some monuments of antiquity; such as a circus, an aqueduct, a temple, and a triumphal arch, which last is a magnificent edifice, adorned on all sides with trophies and battles, in basso relievo. Next day we passed two very impetuous streams, the *Drome* and the *Ifore*. These rivers take their rise from the mountains which are continued through Provence and Dauphiny, and fall into the Rhone. The country yields a considerable quantity of corn, and a good deal of grass: it is well watered with streams, and agreeably shaded with wood: the weather was pleasant, and we had a continued song of nightingales from Aix to Fontainebleau.

Vienne was antiently called *Vienna Allobrogum*: it was a Roman colony, and a considerable city: it is still a large town, standing among several hills on the banks of the Rhone, though all its former splendor is eclipsed, its commerce decayed, and most of its antiquities are buried in ruins. The church of *Notre Dame de la Vie* was undoubtedly a temple. On the left of the road, as you enter it, is a handsome obelisk, about thirty feet high, which is a Roman work.

As nothing material occurred in the doctor's travels from this place till he again set foot at Dover, we shall take leave of him, and proceed to our next traveller.

As it is our intention to afford the reader as much improvement and entertainment as possible, we will beg leave to introduce him into the company of Mr. Brydone, a fellow of the Royal Society, and a gentleman of much learning and probity, who was induced to make the tour of Sicily and Malta, in the year 1770. We are induced to do this, because there are so many travels published through Italy and France, when there are a variety of objects not less interesting, which lie buried in oblivion, in Sicily and Malta.

Naples is an eligible situation in summer, as the air is constantly refreshed by the sea breeze, and, by all accounts, their winter is more agreeable and healthy than ours. The most disagreeable part of the Neapolitan climate is the south-east wind, which is very common. This is very relaxing, and gives the vapours in a much higher degree than the worst of our rainy months: if it continues any length of time, it is sure to blow away all our gaiety and spirits. It is not surprising that it should have this effect upon an English phlegmatic constitution; but all the mercury of France will sink under the load of this horrid, leaden atmosphere. A Neapolitan lover avoids his mistress with the utmost care, in the time of this south-east wind; and the indolence it inspires, is almost sufficient to extinguish every passion. Mr. Brydone says, I have been endeavouring to enquire into the cause of this singular quality, but the people here never think of accounting for any thing. Sea bathing is the best antidote against its effects.

The country round Naples abounds so much in every thing that is curious, both in art and nature, and affords so ample a field of speculation, for the naturalist and antiquary, that a person of any curiosity may spend some months here very agreeably.

This delightful coast, the garden of all Italy, and inhabited only by the rich, the gay, and luxurious, is now abandoned to the poorest and most miserable of mortals. Perhaps there is no spot on the globe that has undergone so thorough a change, or that can exhibit so striking a picture of the vanity of human grandeur.

We set sail for Messina on the fifteenth of May. The melancholy south wind has left us, and we have got a fine brisk north wind in its stead. We soon found ourselves in the middle of the bay of Naples, which is surrounded by the most beautiful scenery in the world. The bay is circular, in most places upwards of twenty miles in diameter; the circumference is more than sixty miles; all this space is wonderfully diversified with the riches of nature and of art. The bay is shut out from the Mediterranean by the island of Capre, famous for the abode of Augustus, and afterwards infamous for that of Tiberius.

What with the celebrated islands and promontories, classic fields and burning plains; the great and opulent city of Naples, with its three castles and its harbour full of ships; the rich country from thence to Portici, covered with the houses and gardens of the noblesse, which appear only as a continuation of the city; the king's palace and many others surrounding it, all built over the roofs of those of Herculaneum, buried near a hundred feet by the eruptions of Vesuvius; the black fields of Cava that have run from that mountain, intermixed with gardens, vineyards and orchards; Vesuvius itself in the back ground of the scene, emitting volumes of fire and smoke; a variety of beautiful towns and villages, with many extensive and romantic coasts; these altogether exhibit such a picture which no one ever saw, except those who have been in the bay of Naples; and what is more astonishing, is, that all this prodigious country, covered with verdure, and loaded with the richest fruits, is all the produce of subterraneous fire. Strange, yet true it is, that nature makes use of the same agent to create, as to destroy.

On the eighteenth, we were off Strombolo, which is a mountain that rises from the sea; it is about ten miles, and not of that exact canonical form supposed to be common to all volcanoes. We should have landed, but the pilot assured us, that the crater was inaccessible, we therefore proceeded on the voyage, not without much regret at leaving so great a curiosity unexplored.

On the nineteenth, we found ourselves on the coast of Sicily, which is low but finely navigated. The opposite coast of Calabria is very high, and the mountains are covered with verdure; the approach to Messina is the finest that can be imagined; the quay is built in the form of a crescent, and is surrounded by a range of magnificent buildings. The streets betwixt these and the sea is about an hundred feet wide, and forms one of the most delightful walks in the world. It enjoys the freest air, and commands a most beautiful prospect.

In the centre of this enchanting semicircle we cast anchor, the beauty of which greatly delighted us. The harbour of Messina is formed by a small neck of land that runs off from the east end of the city, and though one of the safest harbours in the world after ships have got in, yet it is one of the most difficult of access. The whirlpool of Charybdis lies near it, and often occasions such an irregular motion in the water, that the helm loses most of its power, and ships get in with great difficulty, even with the fairest wind.

On the quay is a fine fountain of white marble representing Neptune holding Scylla and Charybdis chained, under the emblematical figures of two sea monsters. The neck of land forming the harbour is strongly fortified; the citadel is built on that part which connects it with the main land. The farther-

a public procession to excite the
Compassion of the Charitable.

most point which runs out to sea is defended by four small ports, which command the entrance into the harbour; between these there is a light-house to warn sailors of their approach to Charybdis.

In this beautiful harbour are a number of galleys and galliots, which cruise round the island to protect it from the sudden invasions of the barbarians.

On the twentieth, we went to see several convents, and were received by the nuns with great affability and politeness. They all pretended to be happy and contented, and said they would not change their prison for the most brilliant situation in life; however, some of them had a soft melancholy in their countenances that gave the lye to their declarations; and I am persuaded, in a *tete-a-tete*, and on a more intimate acquaintance they would have told a very different story; some of them are very handsome. To see an amiable, unaffected, and unadorned person that might have been an honour and an ornament to society, make a voluntary resignation of her charms, and give herself up to a life of mortification, moves the soul to pity, and pity melts the mind to love. No studied embellishment can produce half so strong, or so pleasing an effect, as the modest and simple attire of a pretty young nun, placed behind a double iron grate.

We were lucky enough to be at the celebration of a great festival in honour of St. Francis, and just arrived as the saint made his appearance. He was carried through the crowd with vast ceremony, and received the homage of the people with becoming dignity; after which he was again lodged in his chapel, where he performs a number of miracles every day, to all those who have abundance of money, and abundance of faith.*

On all sides of Messina, there are fine shady walks, which are always fanned by the cooling breeze from the straits. The houses are large, and most of the articles of life are cheap and plenty. The hire of lodgings is remarkably reasonable, and I think no country is so proper for that swarm of Valetudinarians, which every autumn leaves our country with the swallows, in search of warm climates.

At Messina there are many pleasant walks, at Naples there are none; the truth is, they have no occasion for them any more than they have for legs, for walking there is little less infamous than stealing. Any person who makes use of his limbs is looked upon as a black-guard, and not fit company for any but such.

On the twenty-first, we had an audience of the prince of Villa Franca; he received us politely, but with a good proportion of state. We craved his protection in our intended journey, and he granted it.

Our guards consisted of the banditti of the kingdom, who had been punished for enormous crimes, but are here publicly protected and universally feared. The prince is their declared patron, and they are secure in his service, they enjoy the most unbounded confidence, which, in no instance, they have ever yet made an improper or dishonest use of; they are clothed in the prince's livery, yellow and green, with silver lace, and have besides a badge of their order.

On the twenty-second, we left Messina early in the morning, with six mules for ourselves and servants, and two for our baggage. Our guards looked terrible indeed, and they entertained us all the way with recounting the most shocking murders and robberies ever heard of, and which it is not possible they could give so particular an account of, unless they themselves had been accomplices. From this present profession, we esteem ourselves perfectly safe, and we find them very useful in preventing our being imposed on.

The sea coast of Sicily is very rich, the sides of some

* The reader's curiosity will be amply gratified, by perusing the Religious Rites and Ceremonies of all Nations, and of every religious persuasion that ever existed from the creation of the world to the present æra; now publishing in sixty weekly numbers, by Mr. HOGG, No. 16, Pater-noster-Row; and written by the Rev. Dr. HURD, an eminent divine of the established church. This useful work is ornamented with perhaps the most elegant and curious set of copper-plates ever presented to the public in any periodical work.

of the mountains are highly cultivated, and present the most agreeable aspect; corn, wine, oil and silk, are here mixed together in the greatest abundance; but there is a very considerable tract of land totally uncultivated. The sides of the road are covered with a variety of flowers, and flowering shrubs; the inclosures are fenced with hedges of the prickly pear or the Indian fig.

The once famous city of Taurominum is now reduced to an insignificant burgh, but the remains give an high idea of its former magnificence. The theatre is esteemed the largest in the world. The seats front Mount *Ætna*, which makes a glorious appearance from this place. It rises from an immense base, and mounts equally on all sides to the summit.

We examined the Naumachia, and the reservoirs for supplying it with water, and on the twenty-third climbed Mount *Ætna*. About half a mile from Giardini, a small village near Taurominum, is the first region of Mount *Ætna*; and here they set up the statue of a saint, for having prevented the lava from running up the mountain of Taurominum, and destroying the adjacent country. We would have visited the Chestnut-tree of a hundred horse, which has been looked upon as one of the greatest wonders of Mount *Ætna*. We had likewise proposed, if possible, to have gained the summit of the mountain by this side, and to descend by the side of Catania, but we were obliged to relinquish this intention, from the impossibility of fulfilling it.

We passed through some beautiful woods of cork and ever green oak, growing out of the lava. The vast quantity of nitre contained in the ashes of *Ætna* very probably contributes greatly to increase the luxuriance of its vegetation. The city of Jacir or Aci, and indeed all the towns on this coast, are founded on immense rocks of lava, heaped one above another to an amazing height; for it appears that these flaming torrents, as soon as they arrived at the sea, were hardened into rock, which not yielding any longer to the pressure of the liquid fire behind, the melted matter continuing to accumulate, formed a dam of fire, which in a short time run over the solid front, pouring a second torrent into the ocean; this was immediately consolidated, and succeeded by a third, and so on till it had formed these immense rocks.

The road from Jaci to Catania is entirely over lava, which is very fatiguing and troublesome. There are eight mountains formed by eruptions near that place, with each its crater, from whence the burnt matter was discharged. It is very evident, that by the eruptions of mount *Ætna* the sea has been considerably driven back, and the whole of this coast has been formed.

Sicilian authors give an account of the conflict between these two adverse elements, and it is tremendous indeed. A torrent of fire ten miles in breadth, heaped up to an enormous height, rolling down the mountain and pouring its flames into the ocean, the noise more dreadful than thunder, the water retiring and diminishing before it, confessing its superiority, yielding up its possessions and contracting its banks, the clouds of salt vapour darkening the face of the sun, covering up this scene under a veil of horror, laying waste every field and vineyard in its way, the fish on the coast destroyed, and the colour of the sea itself changed, must exhibit such a scene which no words can fully describe.

In Catana we could not find an inn, although it is a noble and beautiful city. We were obliged to lodge in a convent. The house and museum of the prince of Biscaris, in point of antiquities, is inferior to none; they would be too numerous to give a description of. We were very much astonished at the extreme magnificence of a convent of Benedictine monks, who are determined to make sure of a paradise in this world, if not in the other. These sons of humility, temperance, and mortification, entertained us with great civility and politeness. This museum is little inferior to that of the prince of Biscaris, and the apartments that contain it are much more magnificent.

Catania is one of the most ancient cities in the island. Their legends relate, that it was founded by the Cyclops, or giants of *Ætna*, supposed to have been the first inhabitants of Sicily after the deluge. It is now reckoned the third city in the kingdom: it contains upwards of thirty thousand inhabitants, has an university and a bishoprick. A great part of the bishop's revenues arise from the sale of snow on Mount *Ætna*; this is a considerable branch of commerce: for the peasants in these hot countries regale themselves with ice during the summer heats. It is a common observation among them, that without the snows of Mount *Ætna* their island could not be inhabited; so essential has this article of luxury become to them.

Catania was nearly destroyed by an eruption in the year 1669, and was totally ruined by the fatal earthquake in 1693; yet the infatuation of the inhabitants is so great, that they could never be prevailed upon to leave the situation. The whole city was soon rebuilt, and they are in perfect security, thinking that the Virgin and St. Agatha are engaged to protect them; and under their banner they hold *Ætna*, with all the devils it contains, at defiance.

Early in the morning of the twenty-seventh, we began to ascend this respectable father of mountains, which is divided into three regions, the fertile region, the woody region, and the barren region, which are as different in climate and production as the three zones of the earth. At Nicolosi, which is twelve miles up the mountain, the weather was moderate, and the corn was yet green, whereas; at Catania, the heat was insupportable, and the harvest over.

The fruit of this region is remarkably fine, and particularly the figs, of which they have a great variety. Our landlord here, gave us an account of the singular fate of the beautiful country near Hybla, and the change of names it underwent in proportion to the degrees of eruption, which at length finally destroyed it.

About an hour and half after we left Nicolosi, we arrived on the confines of the temperate region. The air here was cool and refreshing, and every breeze was loaded with a thousand perfumes, the whole ground being covered over with the richest aromatic plants. Here are some of the most beautiful spots upon earth; and if Mount *Ætna* resembles hell within, it certainly resembles Paradise without.

If you cast your eyes upward, you behold in perpetual union the two elements that are at continual war; an immense gulph of fire existing in the midst of snow, which it has not power to melt; and immense fields of snow and ice for ever surrounding this gulph of fire, which they have not power to extinguish.

The next morning we were conducted over places where human foot scarce ever trod, in order to complete our expedition. Sometimes through gloomy forests, which by day-light were delightful; but when universal darkness prevailed, the rustling of the trees, the heavy dull bellowing of the mountain, and the vast expanse of ocean, stretched at an immense distance before us, inspire us with a kind of awful horror. We at last got above the regions of vegetation: we beheld a vast expanse of snow and ice, that alarmed us exceedingly, and almost staggered our resolution. After holding a council of war, we climbed the snows, which our guides assured us were little more than seven miles high, and that we certainly should be able to pass it before sun-rise. Accordingly, taking each of us a dram of liquor, which soon removed every objection, we began our march.

The ascent for some time was not steep, and as the surface of the snow sunk a little, we had tolerable footing; but, as it soon began to grow steeper, we found our labour greatly increase. We determined to persevere, calling to mind, in the midst of our labour, that the emperor Adrian, and the philosopher Plato, had undergone the same, and from the same motive too, to see the sun rise from the top of *Ætna*. After incredible labour and fatigue, mixed with a great deal of pleasure, we arrived, before dawn, at the ruins

of an ancient structure, called St. Torre del Filosofo, supposed to have been built by the philosopher Empedocles, who took up his habitation here; the better to study the nature of Mount *Ætna*. Here we rested ourselves for some time, and made a fresh application to our liquor bottle, which I am sure Empedocles, had he been here, would have greatly approved of, after such a march.

Nature now called upon us to pay our adorations to her divine Author. The immense vault of heaven appeared in awful majesty and splendor, and the sky was remarkably clear; the number of stars appeared considerably increased, and their light was more resplendent; the milky way was like a pure flame that shot across the heavens. We had traversed at least twelve thousand feet of gross vapour, that dims the sight, and totally obstructs it in many cases. It is no wonder that vision here should be more distinct: Jupiter was not visible, or we should have been able to discover some of his satellites with a naked eye.

When we had finished our contemplations on these sublime objects, we proceeded, and soon reached the foot of the great crater of the mountain, which is of an exact conical form. In about an hour's climbing, we arrived at a place where there was no more but a warm vapour issued from the mountain: from hence, it was no more than three hundred yards to the summit. We arrived there in time to satisfy our curiosity with a sight the most wonderful in the world.

No imagination can conceive, much less can pen describe, the infinite grandeur of the scene, so glorious, so magnificent! An elevation so great, raised on the brink of a bottomless gulph, as old as the world, often discharging rivers of fire, and throwing out burning rocks with a report which shakes the island! Added to this, the most unbounded extent of prospect, comprehending the greatest variety, and the most beautiful scenery in nature: and, to illuminate the wondrous view, lo! the sun arises in the east with uncommon magnificence. By degrees the whole atmosphere was lighted up; land and sea looked dark and confused, as if a new creation was taking place, and, at the command of their God, was again emerging from its original chaos! At length the stars are extinguished, and the shades totally disappear: all nature caught life and beauty from every increasing beam, and the scene was enlarged as the horizon appeared to widen and expand itself on every side. The sun, like its almighty Maker, appearing in the east, now shines with full splendor. Enchantment seems to take place, and we can scarce believe we are still upon this globe of earth! Unaccustomed to the sublimity of such a scene, the senses seem bewildered. The whole island of Sicily, as well as the circumjacent ones, appear like a map under your feet. The view is entirely boundless, nor is there any one object in the circle of vision to interrupt it. The visible horizon from the top of *Ætna* cannot be less in circumference than two thousand miles; for at Malta, which is near two hundred miles distant, they perceive all the eruptions from the second region, and that island is often discovered from about one half the elevation of the mountain. Indeed the view is too unbounded for the senses to grasp.

The first object that demands your attention is the frigid zone of Mount *Ætna*, which is marked out by a circle of snow and ice, and extends on all sides at the distance of about eight miles. The great crater of the mountain rears its burning head in the centre of this circle. The regions of intense cold and intense heat seem here to be united in one point. This is succeeded by the woody region, which forms a circle of the most beautiful green, and presents a striking contrast with the closest region: and this again is every-where succeeded by the corn-fields, vineyards, and orchards, which compose the fertile region. The mountain is bounded by the rivers Semetus and Alcantara almost on all sides, and by the sea to the south and south-east.

The crater of this astonishing volcano is at present
three

Engraved for Messrs. Boyagen & Hancock.

View of MOUNT VESUVIUS in Naples with the eruption of Smoke, Fire, Lava, &c.

three miles and a half in circumference, and goes shelving down on each side, forming a vast amphitheatre. The volume of sulphureous smoke which issues from this space, being much heavier than the circumambient air, instead of rising in it, rolls down the side of the mountain like a torrent, till it meets with that part of the atmosphere of the same specific gravity with itself; it then shoots off horizontally, and forms a large track in the air, according to the direction of the wind, which, fortunately for us, carried it to the directly contrary side of the mountain to that on which we were placed; indeed all circumstances combined to make our observations and remarks as complete as possible.

We beheld the tremendous gulph, so celebrated for ages, with awe and horror, and were not surpris'd that the superstition of mankind had considered it as the repository of the damned. In short, its dreadful appearance is undecipherable, and can only be guessed at from circumstances attending it. It must be allowed, that the most enthusiastic imagination, in the midst of all its terrors, never forms an idea of a hell more dreadful.

From the gathering of the clouds below us, we were in hopes of seeing a thunder storm, but were disappointed, as the wind soon scattered them. I discharged a gun on the top of *Ætna*, but was surpris'd to find the report almost reduced to nothing; it founded only like the stroke of a stick on a door.

In our descent, we came again to the Torre del Filosofo, and it is astonishing that the ruins of this structure have remained uncovered by the lava for so many ages. We left the summit of *Ætna* about six in the morning, reached our mules at the place we left them, and arrived at Catania about eight in the evening. Pleasure and pain were intermixed in the change of climate as we descended. From the regions of the most rigid winter, we soon arrived at those of the most delightful spring. When we got out of the woods, and entered the torrid zone, the heats were insupportable, and we suffered dreadfully before we reached the city.

When we arrived at Catania, we went immediately to bed, being considerably oppress'd with the heat and fatigue of the journey. A journey in which I enjoyed a great degree of pleasure, and suffered a great degree of pain.

The melting of the snows upon Mount *Ætna* certainly gives rise to the river of Alcantara. There are several periodical springs on the mountain, which only flow in the day, and stop in the night. This is occasioned by the snow melting in the day and freezing in the night, which it does in the hottest seasons.

In the woody regions of *Ætna*, there are the wild boar, the roebuck, and a kind of wild goat. The race of stags and bears is now extinct. The horses and cattle are esteemed the best in Sicily. We did not meet with any porpoises or land tortoises, nor did we see any eagles or vultures.

In the cathedral of Catania is a curious painting of the great eruption in 1669: though it is but indifferently executed, it gives us a dreadful idea of the work. An account of it was sent to Charles II. by Lord Winchelsea, who was returning from his embassy at Constantinople. We wish his lordship had taken more pains to examine. His curiosity was satisfied in one day, and he only looked at the lava at a considerable distance.

The mighty Syracuse was the next object of our attention; we embarked at Catania the 31st of May. The third book of Virgil's *Æneid* gives a good description of the voyage from Catania to Syracuse. The coast lies loose, and, except *Ætna*, there are no very striking objects.

It fell a dead calm before we landed at Syracuse: we spied a fine turtle fast asleep on the surface of the water: profound silence was ordered: we rowed gently, that we might surpris'e him: two men were placed at the prow to seize him: we moved on slowly, and the turtle lay still: no alderman ever beheld his turtle

upon the table with more pleasure and security: we only thought of the various ways in which he should be dressed; when, alas, he made a plunge, slipped through the mens fingers, and disappeared in a moment! A gentleman asked me if I would chuse a little of the calipash or the calipee: the two men shrugged up their shoulders, and said, "pazienza:" we were of opinion that all the pazienza on earth was not equal to a good turtle.

In Syracuse, we were miserably accommodated; we saw all the ruins that were worthy of attention. The principal remains of antiquity are a theatre and amphitheatre, many sepulchres, the Latomie, the catacombs, and the famous ear of Dionysius, which it was impossible to destroy. This is a huge cavern, cut out of the hard rock, in the form of a human ear: it was so contrived, that every sound made in it was collected into one point. Exactly opposite to it, the tyrant made a small hole, which communicated with a little apartment, where he used to conceal himself. To this hole he applied his own ear, and is said to have heard distinctly every word that was spoken in the cavern below. No sooner was this apartment finished, but Dionysius put to death all the workmen who were employed in it. He afterwards confined all whom he suspected to be his enemies; by over-hearing their conversation, he judged of their guilt, and pass'd sentence upon them as they were found innocent or otherwise.

The theatre is pretty entire, but the amphitheatre is much ruined. The catacombs are a great work, little inferior to those of Rome or Naples. A few fine columns of the temple of Jupiter Olympus still remain, and that of Minerva is almost entire.

We examined the fountain of Arethusa; as it has always been looked upon as one of the greatest curiosities of Syracuse. It was dedicated to Diana, who had a magnificent temple near it, where great festivals were annually observed. We found a number of nymphs up to the knees in the fountain, washing their garments, and we almost dreaded the fate of Actæon and Alpheus; but if these were of Diana's train, they are not so coy as they were of old, and no man in his senses would run the risk of being turned into a stag or a river, for the best of them.

The fountain is astonishing, and rises at once out of the earth into the size of a river. Many believe to this day, that it is the identical river Arethusa, that sinks under ground near Olympia in Greece, and, continuing its course for five or six hundred miles below the ocean, rises again in this spot. How this story should gain such credit among the antient natural historians and philosophers, is really amazing.

There are two harbours in Syracuse, the largest of which is reckoned six miles round. We were soon tired of Syracuse: the inhabitants are extremely poor and beggarly, and exhibit a dismal contrast to their former magnificence. *Sic transit gloria mundi.*

On the second of June, we left this mighty Syracuse, and set sail in a Maltese spononaro, and landed at Capo Papero, called by the antients Pachinus. It is the remotest and southerly part of Sicily: it is a wretched barren island, of a mile round: it has a fort, and a small garrison, to protect the neighbouring country from the depredations of the barbarian corsairs. In this place we found a small cavern, where we made a comfortable dinner. The country here produces neither corn nor wine. Here are plenty of capers, and, if we had vinegar, we could pickle hogs-heads of them. We were obliged, in the evening, to row our little boat about a hundred yards out to sea, where we cast anchor. This was necessary, on account of the savage disposition of the inhabitants, who might possibly, in the night, have come down and murdered us.

At length, after some tedious sailing, not without sickness and languor, we discovered the island of Malta, and soon reached the city of Valetto. The approach of the island is very fine, though the shore is rather low and rocky. It is every where inaccessible

by an enemy, and the rock is, in many places, sloped into the form of a glacis, with strong parapets and intrenchments behind it.

We found ourselves in a new world on getting ashore. Well dressed people were in crowds walking the streets. It is the very contrary to Syracuse: there nothing but poverty and wretchedness is visible, here nothing but splendor and magnificence. We were conducted to an inn, which had more the appearance of a palace; had an excellent supper, and plenty of Burgundy. This is the fourth of June, and the king's birth-day. We have done him honour, by getting almost tipsy in drinking his health.

The next day we visited the principal villas of the island, particularly those of the grand master, and the general of the galleys, which lie contiguous to each other. The orange-groves are very fine, and the fruit they bear most excellent.

The whole island is a great rock of white free-stone, and the soil that covers it is not, in most places, more than six inches deep; notwithstanding this, the crop in general is very abundant. This is accounted for by the copious dews that fall, and the inhabitants say there is a moisture in the rock below the soil. The whole island only produces corn sufficient for the consumption of five months. The cotton-plant in this island, they say, produces better cotton than the tree; but Mr. Brydone says, "I did not find it so upon the comparison." They manufacture this cotton into a great variety of stuffs. Their stockings are very fine: their blankets and coverlets are esteemed all over Europe: the sugar-cane is here cultivated, but not in any great quantity.

The oranges are the finest in the world; the season continues for seven months, during which period the trees are covered with this beautiful fruit, and make a charming appearance.

The Maltese are very industrious in cultivating their little island; they have brought over great quantities of soil from Sicily, where there is not sufficient depth. They are obliged to inclose their grounds with free-stone, otherwise the floods to which they are subject would carry away most of their soil.

There are only two cities on the island, though they call them seven; viz. Valetta, and the Citta Vecchia. The whole island is covered over with country houses and villages: every little village has a noble church, ornamented and adorned with various statues. The place is wonderfully strong; both nature and art having contributed their respective shares to accomplish it. The fortifications of Malta are a most stupendous work: all the boasted catacombs of Rome and Naples are nothing in comparison of these.

The inhabitants assure us, that upon the eruption of Mount *Ætna*, which is two hundred Italian miles off, the whole island of Malta is illuminated; and, from the reflection in the water, there appears a great track of fire in the sea all the way from Sicily to Malta: the thundering of the mountain is also distinctly heard. How dreadful then must it be at the place itself!

Valetta is built upon an hill; none of the streets are level except the key. The inhabitants are remarkably weak sighted, owing to the reflection of the sun upon the white free stone. The principal buildings are the palace of the grand master, the infirmary, the arsenal, the hotels of the seven tongues, and the great church of St. John. The latter is very magnificent, and is reckoned the richest in the world: it is entirely composed of sepulchral monuments of the finest marble. The heirs of the grand masters have long vied with each other in the magnificence of the monuments.

Their church service seems to be more overloaded with pomp and parade than I have ever observed before. The language of the common people of Malta is Arabic, so we did not reap much benefit from their conversation. We viewed the antient city of Melita, which is situated near the centre of the island; in clear weather there is a very extensive prospect: this city is

strongly fortified. The governor received us very politely, and shewed us the old palace. The cathedral is entirely hung with crimson damask, laced with gold, although it is of a considerable bulk. The catacombs here are also very admirable, and are said to extend fifteen miles under ground.

We went to see the forest where the grand master keeps his game. We were disappointed; as we expected to see much wood and plenty of deer: it was quite the contrary. This is the only wood in the island, and is therefore esteemed a great curiosity.

Near this place is a grand aqueduct of some thousand arches, which conveys the water to the city; which was completed at the sole expence of one of the grand masters. Not far from hence is a church dedicated to St. Paul, and a miraculous statue of the saint, holding a viper in his hand, supposed to be placed on the spot of ground on which the house stood where he was received after his shipwreck on this island, where he shook the viper off his hand into the fire. The Maltese say, that he cursed all the venomous animals of the island, and banished them for ever. However this be, it is a certain fact, that there are no venomous animals in Malta. They go farther, and say, that vipers have been brought from Sicily hither; but they instantly died on their landing. Near the church, is the grotto in which St. Paul was imprisoned, and is looked upon with the utmost reverence. There is a very fine statue of St. Paul in the middle of the grotto, to which they ascribe the working of many miracles.

The garrison of Malta is equal to the number of men in the island fit to bear arms. They have about five hundred regulars belonging to the ships of war, and one hundred and fifty compose the guard of the prince. The two islands of Malta and Gozzo contain about one hundred and fifty thousand souls: they are exceedingly robust.

Four galleys, three galliots, four sixty gun ships, one frigate of thirty-six guns, besides a number of quick-sailing vessels, compose their sea force.

The spirit of toleration is here exercised in an eminent degree: they have even a Turkish mosque, who are their declared enemies: the slaves are permitted to enjoy their religion in peace: the police is very well regulated: assassination and robberies are very uncommon. This is the only country, I believe, where duelling is permitted by law: the establishment is founded on the romantic notions of chivalry. If the legislature, in other countries, was to punish those who do fight, with the same rigour that the Maltese punish those who do not, a speedy end would be put to duelling.

They have horse-races at Malta, but they are of an uncommon kind. They are performed without saddle, bridle, whip, or spur. Notwithstanding this, their horses run with full speed, and afford great diversion.

Perhaps Malta is one of the best academics for politeness in the world. They have very high notions of honour, and upon the least breach of it satisfaction is instantly demanded.

We departed; coasted along the island of Malta, and sailed for Agrigentum. The celebrated island of Calypso is supposed to be at Gozzo: it must either be very much fallen off since she inhabited it, or historians have greatly flattered it. We could see nothing like the grotto of the goddess as we went along the coast, nor could we discover those verdant banks so celebrated in antiquity. We bid adieu to the island of Calypso, and once more were at the mercy of the waves. The rowers sung their evening song to the virgin, which was acceptable, for we had very fine weather. We arrived at Sicily a little before sun-set, and landed near the ruins of the little Hybla. We supped on shore, and again launched into the sea. We had our nightly serenade as usual, and the next day, by twelve o'clock, we reached the port of Agrigentum.

We had a polite reception by the captain of the port.

port. The city stands near the top of a mountain, and is four miles distant from the harbour. The road, on each side, is bordered by a row of exceeding large American aloes. The city is irregular and ugly; though from a few miles distance at sea, it makes a noble appearance. The houses are mean, and the streets dirty, crooked and narrow. It contains about twenty thousand people. The ruins of the antient city lie about a mile from the modern one; but, like the ruins of Syracuse, are converted into corn-fields, vineyards, and orchards. There are the remains of four temples, that of Venus, of Concord, of Hercules, and of Jupiter Olympus, which remain pretty perfect: besides the remains of many more temples and other great works.

All the ruins of Agrigentum, and the mountain on which it stands, are composed of a concretion of sea-shells run together, and cemented by a kind of sand or gravel, and are now become as hard as marble. By what means they have been lifted up to this immense height, and so inseparably mixed with the substance of the rock, I leave others to determine.

Plato, when he visited Agrigentum, was so struck with its luxury and magnificence, that he said, they built as if they were never to die, and eat as if they had not an hour to live. Agrigentum has been much abused for its drunkenness, and as much celebrated for its hospitality. It is pretty common to find this vice and virtue shaking hands with each other. The Swifs, the Scots, and the Irish, are at present the most drunken people in Europe, and are the most hospitable. In Spain, Portugal, and Italy, hospitality is very little known, or any other virtue but sobriety. This may arise from the dread of the inquisition; for as inebriety generally unlocks the heart, and when that is open the tongue is pretty fluent, they are therefore fearful that their genuine sentiments should be known.

Mr. Brydone says, I have been making many excursions round Agrigentum. The country is delightful, producing corn, wine, and oil, in great abundance: fruits, such as oranges, lemons, pomegranates, almonds, pistachio nuts, &c. are here in vast plenty. We were curiously entertained by the bishop, and were very merry. The Sicilians were very fond of the punch we made, they had never before tasted that liquor, and preferred it to all the wines on the table; they drank so plentifully of it, that the effects were soon visible. The desert consisted of a great quantity of fruit, and a greater of ices, disguised in various shapes.

About six o'clock, we took a cordial leave of our jolly friends, and embarked on board our sponararo at the new port. The bishop and his company went into a large barge, and sailed round the harbour; we saluted them, and they returned the compliment. We were overtaken by a terrible storm, and with great difficulty got into port, between one and two in the morning. We engaged mules to carry us over the mountains to Palermo, determining to have nothing more to do with sponararos. We travelled about twenty miles before we halted: here we made tea. Our tea-table was a round stone in the field, and as the moon shone bright, we had no occasion for any other luminary. Here we staid but a short time, and after much fatigue arrived safely at the great capital of Sicily.

Palermo is large, regular, uniform and neat; the people have an air of affluence and gaiety; the approach to it is fine; the alleys are planted with fruit trees and large American aloes in full bloom. We were but indifferently lodged there, there being only one inn in the place. We were every day more delighted with the city. The two great streets intersect each other in the centre of the city, where they form a handsome square. From its centre, you see the whole of these noble streets, and four beautiful gates that terminate them. The city is bounded on one side by a wall, and on the other by the sea. They have an excellent concert, which finishes about two in the morning. Their other amuse-

ments consist chiefly of conversaciones, and there are a variety of these every night; and they answer to their names, for here the people really converse, whereas in Italy they only go to play at cards and eat ices; besides this, there are a number of private conversations held every night, and these in the apartments of lying-in ladies; for in this happy climate child-bearing is divested of all its terrors, and is considered only as a party of pleasure. We paid our personal respects to the princess Paterno, who was brought to bed only the night before; she sat up in her bed in an elegant undress, with a number of her friends round her; she conversed as usual, and seemed perfectly well. The ladies here marry at fourteen, and are sometimes grandmothers by the time they are thirty. I was presented to the princess Partana, who has had a great number of children, she told me she was often indisposed during the time of her pregnancy, but that she got rid of all her pains immediately on delivery. I expressed my surprise at the happiness of the climate, but she expressed more surprise when I told her of the pain and anguish attendant upon ladies in that condition in our country.

The Sicilians are frank and sincere, and their politeness is not like that of other nations on the continent, which consists in shew and grimace. The cookery is a mixture of the French and Spanish, and the Olio still preserves its rank and dignity in the centre of the table. The nobility are very magnificent in their entertainments; they are temperate in drinking; they have always had the character of being very amorous, and not without reason; the whole nation are poets, and a man stands but a poor chance for a mistress who cannot celebrate her praise in verse. Music as well as poetry they excel in; gallantry is pretty much on the same footing as in Italy, and the establishment of Cicisbeo's is pretty general. A breach of the marriage vow is not looked upon as a deadly sin, and the confessors easily absolve them. The husbands are contented, and like able generals make up for the loss by reprisals. Notwithstanding this, there is a good deal of domestic happiness in Palermo; such fights are very rare on the continent.

The country palaces of the nobility are situated in two small countries, the one to the east and the other to the west of this city, and they are very magnificent. We went to see a celebrated convent of capuchins, about a mile from the city, which contains nothing remarkable but the burying-place, and that is a great curiosity. It is a vast subterraneous apartment, divided into large commodious galleries, the walls on each side are hollowed into niches, and in each of these is placed a dead body set upright on their legs, and fastened to the back of the nich. These people are dressed in the same garments they wore when living, and exhibit a striking spectacle; none of them are reduced to skeletons, though some have been here these two hundred years. They have a certain preparation which makes the skin and muscles as dry and hard as stock fish. Their number amounts to upwards of three hundred; the people come here to pay visits to their deceased friends and relations, by which means they familiarize themselves to their future condition. Strictly speaking, this is only a vast gallery of original portraits drawn after the life, by the justest and most unprejudiced hand. It is the pencil of truth, and not mercenary.

After having visited the convent, our coach broke down. Walking here, as well as at Naples, is esteemed very disgraceful; but what could be done? No other coach was to be had; our Sicilian servant took care that our characters should not be blasted by this unfortunate circumstance. He made such a noise and clatter about it, swearing that there never was any thing in the world so infamous, that in a city like Palermo, the capital of Sicily, Signori of our rank and dignity should be obliged to walk on foot.

The churches at Palermo are extremely rich and magnificent; the cathedral is a large, venerable Gothic building, it is supported within by eighty columns of oriental

oriental granite, and divided into a great number of chapels. The relics of St. Rosalia, the patroness of Palermo, are held in great veneration, even more so than the Virgin herself. This saint gained so much credit by preserving them from the plague of Messina, though it is two hundred miles distance, that they have out of gratitude erected a monument to her memory. Here are several monuments of their Norman kings, they are of the finest porphyry, and are very antient.

The Jesuits church is very magnificent. It is endless to give an account of all the churches, they are upwards of three hundred in number; the city has been preparing these ten days for the great feast of St. Rosalia. The number of pyramids and arches prepared for the illuminations, exceed two thousand; the whole of the Marino is to be decorated. They are building an enormous engine, which they call St. Rosalia's car. The illumination of the great church is most splendid, and is said to exceed St. Peter's.

The superstition of the vulgar is here held in very much contempt by the people of fashion. Deism is most prevalent in those countries where the people are the wildest and most bigotted.

Palermo is generally supposed to be the most antient city in the island; some people think it beyond a doubt, that the city was built by the Chaldeans in the very early ages of the world. Catching tunny fish is a principal part of Sicilian amusements during the summer months, and the curing and sending them to foreign markets makes one of the greatest branches of their commerce. The poor Sicilians labour under great difficulties, owing to the oppression of their government; the sugar cane is much cultivated, but the duties imposed on it are enormous. The crops of wheat alone, where they under a free government, would make this little nation one of the richest in the world. The Sicilians retain some of the Spanish customs, but none of their gravity. Their luxury consists chiefly in their equipages and horses. All but the viceroy, the prætor, the archbishop, and president of the parliament, are obliged to drive their carriages with only two, the viceroy alone may drive six, the rest four.

The natural history of this island would afford a vast field for speculation. I am not disposed to write it at present; suffice it to say, we returned safely to Naples.

We shall next present the reader with major Dalrymple's travels through Spain and Portugal; the major set out from Gibraltar in the year 1774 without any other motive than curiosity, to visit the countries, and completed the tour in five months. In which the state of their different governments, their military establishments, the customs and manners of the people, and many other transient particulars are noticed. We with the greater pleasure give the major's account, as he is a gentleman of undoubted veracity, and universal knowledge.

Major Dalrymple says, I obtained the proper passports from the Spanish general at San Roque, and set out on the 21st of June, accompanied by the courier. The verdant banks of the river, the Indian corn in the vallies, the little hills rising here and there, cultivated with wheat and barley, and some covered with trees and shrubs, made the travelling very agreeable, till the sun became troublesome, and made our inn the best prospect on the road.

When we arrived there, our landlady spread the report that we were English, and though this is so small a distance from Gibraltar, most of the inhabitants flocked to see us. Our inn was none of the best, and we were obliged to put up with many inconveniences. We ascended the hill of Gaucin, which took us two hours in performing, on a very rough road, and like steps of stairs. Here the Moors had formerly a fort, that commanded the entrance to the pass of the mountains of Ronda. There is now a church built amidst the ruins of the fort, where miracles are said to be wrought, and they are recounted with great minuteness by the inhabitants of the village; this fort commands an extensive prospect.

At five the next morning we pursued our journey, which from what we experienced the day before was rather disagreeable and made us regret leaving Gibraltar. This day we went over many very high mountains, and saw many vines, many corn-fields, and passed several villages, and at length arrived at Ronda, here our accommodations were no better than at Gaucin. The town is situated on a hill, in a small plain almost surrounded by stupendous mountains. The river Guadiaro, which divides the new from the old town, takes its course through a chasm formed in the hill, and on the west side makes a most beautiful cascade. The city has been strongly fortified, but the walls are now lying in ruins. The streets are narrow and irregular; it is populous, though there is no manufacture of any sort and very little trade. The annual fair which is kept in May, is much frequented; the women in the houses sit on mats upon the floor cross legged, exactly like the Moors.

On our departure from Ronda the next day, about two miles from that place we missed our way, and were set right by an old man whom we saw upon the road; we travelled several miles, and night began to approach without our discovering the place of our destination, which was Alcala del Valie. We thought it best to halt, and not proceed any further; we accordingly refreshed ourselves with what provisions we had, and, wrapping ourselves as warm as we could, lay down in a wood, after taking care of our cattle. Aurora was a pleasing sight to us, and we continued our journey; we went through a country very little improved, and saw very fine inhabitants, and but little cultivation.

After some time, we arrived at the town, but were again miserably accommodated. We met with a travelling pedlar at the inn, who had more civility than all the people put together, since we left Gibraltar; he was a man of infinite humour, and entertained us very well the whole evening. Alcala is a village situated in a beautiful little valley, surrounded with trees and plenty of corn.

We left our inn at five the next morning, and travelled the whole day without getting any thing to drink, either for man or beast; we espied a rivulet, and congratulated ourselves upon it, but to our great disappointment when we came to it, the water both bitter and salt. We passed two villages, a great deal of wood, waste land, some corn, and many vines. On our arrival at Offuna, we found the inhabitants employed in torturing a bull; bull-baiting is a principal diversion here; the manner of their performing this brutal business is singular, they tie the bull by a long rope, and lead him about the town; many hundreds of men hooting and hollowing, with their cloaks on their arms, tease the poor creature to attack them, and then wound him with a dart, fork, or lance, which enrages him very much. This sport sometimes proves fatal to his tormentors, though no accident happened at this time.

The town of Offuna is situated on an extensive plain; there are many nobles live here, and the duke of Offuna has a palace, but never resides in it. The fountains and public buildings are handsome; and the shambles, which is a new stone edifice, is a great curiosity; it is divided into a number of stalls, about six feet high, on which the butchers are mounted with the meat placed behind them, and the scales before; to prevent imposition, the price of each commodity is regulated by the magistrate, and put in the front of each stall, and they are very exact in weighing their meat.

The cultivation about this country is superior to any thing I have seen yet in Spain, the habitations are neat and the people decent; there are some remains of a Moorish castle, in a rising ground just above the town.

Our landlord endeavoured to impose upon us, but I contested the matter with him, and made him produce the established prices, which he is obliged to do if required.

The mode of their getting in the harvest is singular; after cutting down the corn, it is brought in carts drawn by oxen, yoked by the head to different spots of ground: every proprietor brings his corn to these places, where it is trod out by mares, six or eight tied together, a man working them in a circle; the mares, on this occasion are shod with circular rough shoes; this method breaks the straw to pieces, but that is no disadvantage, as the cattle are fed with it; the grain is then lodged in granaries.

We travelled from Offuna to Ezija, which is five leagues distance; the country is entirely flat, and at this season covered with immense quantities of wheat and barley. The city is situated on the Xenel, over which there is a stone bridge: it is famous for having the finest breed of horses in Andalusia: we got into the great high road to Madrid, and pursued our journey to Carlotta, where we passed an agreeable evening after a delightful ride. The Carlotta is a colony of Germans, which was established about eight years ago. The town is small, but well designed, and is seated in the midst of the colony; there is a church for the emigrants, and a German Franciscan friar for their pastor.

We left this place on the 27th, and went for a few miles through a country little cultivated; we crossed a rivulet called Guadalhorce, over which there is a stone bridge; we had, from a height, a most beautiful prospect of the city of Cordova, and, after five hours travelling, put up at an inn in that city opposite the cathedral, where we were dirtily lodged, but well supplied with provisions.

The city of Cordova is very antient, and situated on a beautiful and extensive plain. On the north side of the town runs the Sierra Morena, which is a noted chain of mountains, that stretch themselves from the sea above two hundred miles inland. This place is celebrated in the Roman annals; and when the Moors ruled, this land was a capital of great consideration. The walls are pretty entire, partly Roman and partly Moorish. It is at present a considerable city, but badly built; the streets are narrow and irregular, and in many of them are to be seen Roman ruins. The houses are chiefly stone, and built in the Moorish taste, on each side of a square court yard. People of condition inhabit the lower rooms in summer, and the upper ones in winter: in the hot season, they keep the sun and air out of their apartments in day time, which renders them cool and agreeable, though it has a very odd effect, to make a visit in a dark room, where you must be some time before you can discover the person you visit.

Some of the nobility who reside here, have from two to three thousand a year; they live in handsome apartments, but the furniture is by no means adequate; we found elegant looking-glasses with silk hangings and matted bottom chairs in their principal rooms. These families have all of them assemblies; I was at that of the Condessa de Villa Nova, who had lately lost a near relation; the company appeared in mourning; every female, on entering the assembly, after paying her respects to the mistress of the house, went round the whole circle, took each lady by the hand, muttered some compliments, and then sat down; when all the company was assembled, servants came in dressed also in mourning, with glasses of iced water and sugared biscuits, afterwards with chocolate, cakes, sweetmeats, and more iced water. These are the chief entertainments of the natives: they seldom sup or dine together, except on a marriage, the birth of a first son, or some other festive occasion. The etiquette of these assemblies are extremely tiresome, though they are polite enough, to make allowances for strangers.

The equipages of the nobles are very costly, gaudy, and over-loaded with ornaments, but they make their appearance only on state days: they are drawn by mules.

The Alameda, or a walk planted with trees, is shewn as a great effort of human skill. I did not think it so admirable.

The theatre is but indifferent, and the actors are very bad. We had two bull-fights here, but they were very indifferent. The people are passionately fond of this diversion, and will use every means to spare money in order to go to one. A gipsy woman signalized herself by attacking one of the bulls, but she was thrown by him, and was much bruised; at this circumstance, the whole amphitheatre rang with applause. To reward her resolution, the marquis of Cabrignani called out, "Viva la Louisa," and threw her a handful of hard dollars.

The churches here are rich and gaudy, but are without much taste. The cathedral is magnificent, and it is imagined that the columns were originally taken from the temple of Janus, and other Roman buildings. Roman sculpture is as visible in their capitals, as Moorish is in their superstructure; they are of jasper and various other fine marbles. There are twenty canons in this cathedral, who have considerable revenues: the town is very famous for fine houses. The king keeps stallions, and breeds for his own use. The Barbary breed, which is peculiar to this province, is still preserved by societies formed at Seville, Granada, Ronda, and Valencia. Every man of fortune has a riding-house, where he amuses himself for an hour or two every day.

Cordova has always been famous for its leather, and there is a considerable manufacture of silk carried on here. The imports here are considerable, and the people complain much of them. By going two or three leagues out of the town, bread is considerably cheaper, and this is the chief aliment of the Spaniards.

We left Cordova on the third of July, and travelled two leagues through a flat and fertile country, and arrived at an inn near an old bridge; after dinner we reached the village of Carpio, which is situated on a rising ground, and near it are several oil-mills. In the evening, several youths from the village were assembled before the door of a small house; amongst them was a young woman, who touched the guitar and sang agreeably. The evening was mild and serene, and thus the company amused themselves till eleven o'clock, when they broke up.

We left this place on the fourth, and travelled through a hilly country (on the top of these hills grow corn and olives in abundance), and arrived in the evening at Andujar, which is situated on a rising ground, about a quarter of a mile from the bridge. Here there is a manufacture of coarse cloth. After leaving Andujar early in the morning, we passed through a country much the same as that we passed the day before; abounding with corn and olives. We went through Baylin, which is but an indifferent town, and near it are some lead-mines. After this we passed a poor uncultivated country, for about a league, and entered upon the new settlements, which were established about eight years ago. Emigrants from Alsace, French Flanders, Lorraine, &c. were transported hither to populate, cultivate, and improve this inhospitable country; but for want of previous preparation, and proper knowledge of colonization, many of the first settlers perished a little after their arrival, and many of the remainder have been since destroyed by the climate. However, there has been a second and third migration, besides a number of Catalans, to carry on the project, who have been more successful, especially the latter, who are inured to the climate, and remarkably diligent and laborious.

The town is handsomely disposed, and is situated on a rising ground; the road leading to it is planted with trees; there is a foot-path, and the ground without it is laid out in gardens; the streets meet each other at right angles, with the market-place in the middle of the town, and the church at the extremity of the principal street. They have built a handsome hexagon, which is to serve for a bull-baiting place. The soil is not so favourable for cultivation as at Carlotta, though the lands are much improved. There is a silk manufacture here, and they are about to establish

blish a manufacture for coarse cloth, with a view to cloath all the troops in the province.

There is a change of the manner of threshing in this colony: instead of mares treading out the corn, there is a machine composed of three pieces of wood, joined together by the side of each other, and made full of holes, in which are placed small sharp-pointed stones; at one end a mule is put, and a person sitting on the machine, to press it on the grain, drives the mule in a circle; this, as in the other manner, breaks the straw into pieces.

Early in the morning of the eighth of July, we set out from the Cardina, and passed a most mountainous and uncultivated country. On the summit of one of the mountains we saw a little shed, in which were placed two images of saints, with inscriptions, which informed us, that the archbishop of Toledo granted eighty, and the bishop of Valencia forty days indulgence to those who said a prayer before each of them. We observed two good Christians taking the advantage of their dispensing power. There the jurisdictions of the prelates, and the boundaries of the provinces were ascertained. We pursued our journey through the mountains, which having passed, and descending into the plains, saw some olive-trees, a little cultivation, and a great number of sheep-folds.

We arrived at El Viso, where we saw an old man seated at the door of the inn, dressed in a dark coloured cloth waistcoat and breeches; the breeches tied at the knees, and hanging over the tie to the calf of the leg, black stockings and cap, with a cloak of the same coloured cloth of his waistcoat: he had a thin face, fallow complexion, long black hair, and a grisly beard, of three weeks growth at least; his deportment was grave and solemn, and his countenance pensive and severe; though he was the landlord of the inn, he paid little attention to us; and it was with some trouble we got him to enter into conversation. At length, we found him conversant in the village, which seemed entirely to bound his knowledge. Most of the town's-people were clothed in the same manner, with dark coloured cloth, which is made of the undyed wool of black sheep; each family making a sufficient quantity for its own use. The women wore jackets and aprons of the like stuff, with a kind of linsley, wolfey petticoat, red stockings, beads, and many trinkets about their necks, with their black hair tied behind, the smarter girls wearing silver combs.

The magistrate of the town sent us word, that, if we would do him the favour, he would shew us the marquis's palace: we embraced his offer, and went to see it: he is marquis of Santa Cruz. The palace is a large square edifice, and has been very handsome, but is now going to ruins; it was originally decorated by Italian artists, and, in the inside, is much in the same taste of the palaces at Genoa.

Numerous flocks of fine wooled sheep come to this village to feed: there are large tracts of land round the town, which are let for pasture. Here they pass their winter, and set out again on their summer migration the beginning of May. The houses of this village are low and poorly built: they are chiefly of clay, tiled, and are in general very clean. There grows a good deal of barley round the village.

From El Viso, we passed through a fruitful corn country, and arrived at Val de Penas. In this town there is the best bread that can be eaten, and the wine is remarkably good. The people and houses appear much the same as at the last town we halted, and there is a manufacture of woollen cloth established here. The water is bad, which, together with the great heat of the weather, and the poverty of the inhabitants, concur to give them a most ghastly appearance. We pursued our journey through a country so flat, that we had the horizon before us, the same as at sea in a profound calm.

At Manzanares were quartered three companies of the brigade of Carabineers. This brigade is composed of twelve troops, of fifty men each: the captains have the rank of colonel, the lieutenants of captains, and

the ensigns of lieutenants. The non-commissioned officers had the appearance of butchers and cheefemongers; the horses in general were very good; there is no great spirit of discipline among them, and they are very much rusticated.

We left this place at four in the afternoon of the tenth instant; we stopt and drank at the Venta Quenda, but it by no means answers the description of it. We pursued our journey through a country not very much improved, and arrived at Villa Hasta, which is a poor village. There is a morass on the north side of the town, which renders it unhealthy in summer.

Little and indifferent cultivation till we passed the Puerto; afterwards we saw a great deal of barley and some olives. Every person we met asked an alms. We pursued our journey, after dining at Camunas, which is a poor village, and passed through a country abundant in barley. The horizon very flat.

Temblequer is a large town, situated in a hollow way. Here is a kind of manufacture of silk and thread stockings, which are very indifferent and very dear; here we slept, and pursued our journey the next day, through a very flat country, which brought us to a hollow way; along this we travelled; it is chiefly chalky land. We came to La Guardia, which is a village curiously situated; it was originally a fort on the point of a conical rock, to defend the entrance of this pass.

Afterwards we found the country more irregular; we descended into a hollow way, and rode in it till we came to Aranjuez. From Occana to Aranjuez is a royal road, very fine and well made: stones are erected at every half league.

At this town, the court resides from a little after Easter till the latter end of June, and is an entire flat, the palace is of brick, with some stone pilasters of the Tuscan order. There are many handsome looking-glasses in the palace, a few good portraits, and some marble slabs. The floor is paved with coarse tiles, and covered over with matting; the wood-work of the doors, windows, &c. is very clumsily executed. There is a room in it decorated with porcelain, of the king's fabric at Madrid: it is quite overloaded with ornaments, and entirely in the Spanish taste. The channel of the Tagus is turned round the gardens, and two cascades are made. As true taste in gardening has not reached this part of the world, the only things for which these are admirable, are the coolness of the running river, and the shade which the elms afford.

The people here are very subject to the ague, and it is altogether an unhealthy place. The town is well laid out: the houses are only one story high with garrets, and are all pointed on the outside. After we left Aranjuez, we passed over the Tagus, and entered on the great royal road: there are several villages on each side of it. We arrived, at eight o'clock, at Madrid.

The capital of Spain is situated on several little hills, at the foot of which runs the Manganares, which is an inconsiderable rivulet, and is now almost dry. The town is surrounded with a kind of mud wall, with gates of different avenues: the streets are spacious and handsome. The police is very well regulated, and the town is divided into a number of districts. There is a chief magistrate over each district, who decides and punishes smaller crimes. The new palace is magnificent, though rather too heavy. The approach to it is very indifferent, as it is not seen till close upon it: the entrance and stair-case are handsome; the great saloon of state is very sumptuous; the ceiling is painted in fresco, with large figures as big as life; the walls are hung with crimson velvet, elegantly embroidered with gold, and adorned with most elegant looking-glasses. There is a good collection of paintings, and many other particulars, well worth the attention of the curious. The chapel is a complete and elegant piece of workmanship.

There are some good paintings in the Retiro, which is at the west end of the town: it is but an indifferent palace: the gardens are spacious, a great part of which

is inclosed, and kept entirely for the king's sport. Here is a fine equestrian statue of Philip IV. and a large piece of water; the palace across the Manzanares, called the Casa del Campo, is but a hovel for a prince. In the king's armoury are many antient weapons of war, and suits of armour, which are kept in good order. His library is good, and every person has free access to it, under certain restrictions.

There are few houses in Madrid that have a splendid appearance, notwithstanding the large fortunes of the noblesse; the houses in general are brick, those of the nobility are plastered or painted; some of the houses are very lofty, particularly in the great square where the royal bull feasts are held. The middling people live on separate floors, as they do at Edinburgh, which makes the common entry very disagreeable. The portals are the receptacles for every kind of filth; and the Spaniard performs the offices of nature behind them. The vestiges of jealousy are very disagreeable in this city; the iron grates to the windows are an eminent proof of it. The custom-house and post-office are new and handsome buildings: the churches are tawdry and overloaded with ornaments. The capuchins, though a beggarly race, are building a most enormous church, that has, and will, cost an immense sum of money. The clergy by saps and cunning, and the prince by storm and violence together, ravage and plunder the whole commonalty. There are two churches in this town, that are asylums for rogues and murderers; this was a point the clergy carried, when the same privileges were taken from every other church.

The power of the clergy has been very considerably reduced of late years. The edict to prevent the admission of noviciates into the different convents, without special licence, has, and will considerably reduce the monastic orders. It is computed there are now in this kingdom fifty-four thousand friars, thirty-four thousand nuns, and twenty thousand secular clergy. The environs of Madrid are not very agreeable; there are no villas or country houses; no place of recreation around it. A public walk at the east end of the town, is the chief summer evenings amusement.

All the royal family dine publicly in separate rooms at court, and it is the etiquette to visit each apartment while they are at dinner; which is a most tiresome employment for those who are obliged to be there, and it would be thought particular if the foreign ambassador did not constantly attend.

Since the accession of Philip V. the privileges of the *grandees* have been very much abridged. There are many who are possessed of very considerable fortunes. The late duke of Medina Cœli had, on the death of his father, an income of eighty-four thousand pounds sterling a year, with six millions of hard dollars in ready money. All the great families have pages, who are gentlemen, for whom they provide either in the army or navy. The custom of keeping buffoons still prevails here; the duke of Alba has one covered with ribbons of various orders; he attends his master in the morning, and the instant he wakes, is obliged to relate some facetious story to bring his grace into good humour. The duke requires so much wit from him, that he is eternally on the scamper in the search of it. If once a servant is admitted into any of these great families, it is certain magnificence for him during his life, unless he is guilty of some enormous crime; and even his descendants are taken care of. Women here are a very considerable expence; the conjugal bed is not held very sacred by men of fashion; and since the Bourbon family have been seated on the throne, jealousy has lost its sting. The ladies are not behind hand with their husbands; every dame has one *cortejo* at least, and often more; the cadets of the guard are employed in this agreeable office.

The nobility are very expensive in their carriages, which are loaded with a profusion of ornaments. None but the lower sort of people wear cloaks, they in general have adopted the French taste in their dress. The civil and criminal jurisdiction extends itself for five leagues round the town, with an appeal to

the royal council of Castile; but the distribution of justice here is very venal and dilatory. Many of the principal departments, and first employments of state, are filled with foreigners, French, Italians, and Irish, whom the Spaniards detest, as they have no other object in view than to pamper the follies, vices, and extravagance of the prince. The town swarms with French and Italian manufacturers and shop-keepers. Here is a manufactory of tapestry, that was established by Ferdinand VI. and also a porcelain manufactory, but no one is admitted to see it.

Superstition and bigotry prevail here in a great degree; not a woman gets into a coach, nor a postillion on his horse, without crossing themselves. The tops of taverns, bills and sign posts, as well as the direction of letters, are marked with crosses. The prince of Asturia's son was very ill and given over by the physicians; the bones of a saint were sent for from Alcola; but the saint was not in the humour to perform the miracle, and the infant died.

The hospitals are in general very clear, and well attended; during our stay, there were two bull feasts: the amphitheatre contains about ten thousand people; the rage for this amusement is very great, the first attack of the bull is fine, and the resistance of the man on horseback gives most manly ideas; but the conclusion or butchering part is very disagreeable and unpleasant.

Refined comedy has no place upon the theatres here, neither is the tragic muse supported by the performers; distress and joy in long and tedious speeches are alike repeated with a composed countenance. Buffoonery has its full force, it is equally mixed with the serious and comic. The farces that are represented between the acts of the principal piece, are sometimes humorous, though often low.

The court resides from the middle of January, till a little before the holy week, at the Pardo; then at Madrid till after easter, assisting at the religious ceremonies of the holy week; at Aranjuez till the middle of June, again at Madrid for three weeks or a month; at San Ildelphonso till October, at the Escorial till December; once more at Madrid till January, and so on annually. On the twenty-sixth they set out for San Ildelphonso; the troops were under arms, lining the road from the palace as far as they could reach; exclusive of the horse and foot guards, there were three regiments of infantry and one of cavalry. The coaches were attended by the *guardia de corps*, and drove as hard as they could go.

There are about two hundred and fifty thousand inhabitants in this town; there is a weekly gazette published, in which the news of other countries are pretty exactly related; but they are very silent about their own, except it is the church and army promotions, or the movement of the court.

We left Madrid on the thirtieth of July, at five in the morning; the royal road is planted with high trees for about two leagues. Escorial is not quite seven leagues from Madrid; great part of the country through which we passed is inclosed for the king's sport; the rest is indifferently cultivated, and but thinly inhabited.

On the mountains called Guadarrama, is situated the convent of Escorial, which being very rocky and uncultivated, renders its sight more wild than agreeable. We passed the poor little village of Escorial, and then ascended the hill of the convent; when we came near it, we were surpris'd to find it such a stupendous work: it was founded by Philip II. from a religious motive, on his victory at the battle of Quintin, to which saint it is dedicated. The prospect from it is very extensive, though not pleasant; there is very little wood or water in view, and no object to bound it agreeably. The church and cloister are the most magnificent, the royal apartments are nothing extraordinary, the floors of them are covered with tapestry of the Madrid manufacture. In the convent are some of the finest paintings in Europe, it is also rich in treasure. The pantheon is a most beautiful work, it is composed

of jasper and other fine marble, adorned with gilt brass, &c. Around it, in recesses are placed sepulchral urns, in some of which, the bodies of the deceased kings and queens of Spain are deposited.

The principal library is a very fine room, in which is a numerous collection of books; the ceiling and walls are painted in fresco. To see the works of magnificence arise, the liberal donations of a free, industrious and flourishing people, affect the generous breast; but when the extensive power of tyranny racks a whole nation to gratify the folly or vanity of one man alone, such spoils of splendor have a very different effect.

After leaving the Escorial in the evening, we passed the mountains and came to Larezada, which is a very poor village; after that we arrived at Navas del Marques, an indifferent village, where there is an old castle lying in ruins. They carry on here an inconsiderable woollen cloth manufactory; the next morning we left this place, and in about six hours arrived at Avila. This is a very antient city, and formerly had many privileges; it is situated on a rising ground, is inclosed by an antient wall with towers, and forms an oblong square. The streets are narrow and the houses are indifferent; there are many old palaces going to ruins; there is only one nobleman resident here at present, the rest are all gone to the court; the cathedral is very old, and contains many monuments.

The military academy here is in its infancy: they scrupulously examined my passport, and affected to be very mysterious. The officers in this kingdom, from a long peace, are very inexperienced, there is a native indolence, which nothing can overcome. The progress of knowledge in this country must be very slow; there are many restrictions laid upon it, which must retard its course. In the land of liberty, the way to science is smooth and unrestrained, here it is rugged and confined; a man with the abilities of Cæsar, durst not openly avow them, they would only retard his advancement.

After we left Avila, we went through a very stony country, and very poorly cultivated. The people in general have an indigent appearance, and are prodigiously sun burnt: we slept at Penaranda, and travelled the next day through a very fruitful country, and went through a wood of cork trees, about half a league in length, we journeyed by the side of the river Tormes, and soon arrived at Salamanca, which is a large city in the kingdom of Leon, situated on the Tormes, over which there is a stone bridge; this river empties itself into the Duero, on the frontiers of Portugal. This town is famous for its university, which was formed by Don Alonzo in the year 1209; it is the first in the kingdom, but has not a very flourishing aspect; most of the colleges appear as if they had been lately wasted by a ravaging army.

Among the monastic orders, there are schools where the extent of education is bounded by the knowledge of writing and reading only, and to say masses, though not to understand Latin. The pupils only study the lives of the saints, and such nonsense. This ignorant and illiterate set become the pastors of mankind, and are appointed to shew the way to heaven! The nobility educate their sons at home, under the tuition of some pedantic or artful priest. The women have no education but what they receive from their parents. The course of philosophy taught in this university is that of Gaudin, a French Dominican friar; they have three professors of it; they have likewise a chair of moral philosophy, and are now establishing one of experimental.

In divinity, they study Melchor Cane's sum of controversy; the first year and the four following years, they study St. Thomas's course of divinity; for this purpose there are eight professors to give lectures morning and evening. There is a professor to explain the scripture, and another of moral divinity. There are several professors of the common law, and many eminent ones of the civil law. There are also professors of medicine, Greek, Hebrew, Latin, rhetoric, algebra, and music; mathematical science is but at a low state.

Like most other Spanish towns, this has a gloomy appearance; narrow and irregular streets, with very antique houses. The college that did belong to the Jesuits is a very extensive building; it is so large, that six thousand French were lodged in it on their march to Portugal, last war. The cathedral is old and magnificent; there are twenty-six canons belonging to it, who are well provided for: the chapel in the college is neat and elegant. In the convent of Espiritu Santo are only nuns of family; none are admitted who cannot prove their nobility. Two squadrons of the regiment of Banda are quartered here.

After we left Salamanca, we travelled through a flat country, which is very fruitful; we passed a convent, which is situated in a beautiful vale. Zamora is a very antient city: it was called Scitica by the Romans; its situation on the Druro, being placed on a height above the river, renders it strong. The old walls are kept complete: the town is gloomy, and the streets are narrow and confined. It is now a place of arms, and is a frontier to Portugal.

Driego del Camino was the first place we arrived at after we left Zamora. Nothing particular attracted our notice, and we passed on to Astorga, which is situated on a rising ground, and was originally a place of much strength: it is now inclosed by its antient walls, which take up about a mile and a half. The dialect of the common people is so corrupt, that it is very difficult to understand them.

We left Astorga on the sixteenth of August, in company with a muleteer, who was going into Galicia with tobacco. The several villages we passed had a very poor and dirty appearance: the houses were of stone, and thatched. The people here thresh out their corn with a flail, as in England. We went on through a miserable country, and arrived at Arezo, which is a poor village. The next day we came to Pon Ferrada. This place has been of considerable strength, and is situated on the confluence of two rivers: here are the remains of a large castle. We left Pon Ferrada on the twentieth, and travelled through a plain covered with pebble stones, which extended for above a league; saw a good deal of corn, and a wood of oak, and arrived at Villa Franca, which is situated in a little vale, with some high mountains on the Galicia side, at the foot of which runs the river Valcarfe. Here is an old castle belonging to the marquis of Villa Franca, and commands the pass into Galicia. There is some wine made here. The fair sex here are fair and handsome.

There are no made roads in this country, except at the Cardina, and a few leagues about Madrid. Left the Camino Rial, and came into an abominable road, but very pleasant, at the banks of a most refreshing stream, the mountains rising on each side of us. We passed a great many villages, where the houses are built substantially, and strongly thatched. Passed the Herrerias, the Puerto, and village of Cebrero, on the summit of the mountain, where it was very bleak and cold.

Fonfria is a poor and bleak village. Lugo is a large and antient city, situated on a rising ground, surrounded with a river and hollow way. The walls are two miles round, and are in many places entire: the town is much depopulated. The cathedral is an old Gothic building, and the ornaments very ill chosen.

Arrived at Rotanzos on the market-day, where many people were assembled from the country. The women here have much better countenances than in the other parts of the kingdom; fresh complexions, with fine black eyes and hair. Here is an excellent market. We pursued our journey after dinner, and entered on a royal road lately made: we arrived at Corunna in four hours and a half.

This place is a sea-port, and is situated on the western ocean, and is what we improperly call the Groine. It is divided into the old and new town: the former is the citadel, and the latter the trading part. Here is held the tribunal of justice for this province, with an appeal to the council of Castile. There are a great many

many foreigners resident here, particularly French, who are encouraged and protected. It is said, that this province contains two millions of inhabitants, which is a proportion very unequal to the rest of the kingdom. A packet-boat sails from hence every month to the Havannah; and another, every two months, for Buenos Ayres. The importation of sugar from the Havannah, since the peace, has been encreasing annually. The trade from England to these parts, for tanned leather, coarse cloth, &c. is much dwindled. The Newfoundland trade is still considerable. The Americans import here Indian corn, rice, &c. for which they receive specie in return. Fort St. Anthony, a little island in the bay, is a state prison for superior criminals. The light-house is ancient and stupendous, and is said to have been built by the Romans.

On the thirty-first, embarked for Ferrol in a passage-boat, having left the horses behind. There were in company a priest, a doctor, a cadet, a soldier, a drummer, a Maxo, and two females. The priest and the doctor secured the best places in the bark. We became free and jocular; the wind was contrary, and there was a great swell in the sea. We were all sick, except the doctor and the drummer. In the bay of Bctanzos, which we were to pass, there stands a rock about a mile from the shore, that we could not weather; the boatmen resolved to go between it and the land. It was esteemed a dangerous passage, and the company exclaimed against the measure; the priest intreated them to return, but sued in vain; took out his breviary, and began to mutter the service of the day with the utmost energy and expedition. The women applied to their rosaries, and said their *aves* and *pater noster*s with all diligence. The cadet, though he did not carry the appearance of affluence, offered to pay the whole freight if they would go back: finding his generosity did not avail, he threatened to throw the patient over-board; the doctor interfered, and endeavoured to moderate the passion of the hero, but seemed inclinable to return. The Maxo had been so sick, that it seemed immaterial to him whether he lived or died. The military slept in the bottom of the boat. The man at the helm often appealed to me, assuring me there was no danger, as he knew the channel, and had often passed it: he was determined at all events to pursue the voyage. Just as we came abreast the rock, which had a very unpleasant appearance, owing to the waves dashing against it, the wind ceased, and laid us at the mercy of the swell, which rolled in directly upon it. The whole company were in a consternation. The women prayed and cried alternately: the priest shut his eyes, but still kept his lips going: the boatmen threshed the sides of the bark with ropes, calling upon St. Anthony to send them wind; who not heeding their requests, the reverend father proposed that every body in the boat should go to prayers: our petitions did not avail; we were tossed and tumbled about, to the horror of us all: at length, an arch boy taking advantage of our distress, came around with his greasy cap, and collected money for the souls in purgatory: every one bestowed liberally, except the priest and cadet; the former keeping his eyes shut, closed his ears also; the latter pretended still to be in a passion, and gave the supplicant a box on the ear. Immediately after the collection, a breeze sprung up, which was imputed to our offerings and supplications. We returned thanks in form; the whole company assumed a different countenance; the priest, who was the most alarmed, was severely rallied: he bore the sneers with a very good grace, recruited his spirits with some wine and cold ham, and then went quietly to sleep. We arrived at Ferrol at ten o'clock at night.

Ferrol is the finest marine arsenal in the kingdom. The site of this port renders it extremely strong, as, to approach it by sea, it is necessary to pass a river, no where above five hundred yards broad, defended by several small forts, and where a boom may be placed occasionally. On the land side it may easily be secured against any hostile attempts.

VOL. II. No. 83.

The basin is a magnificent work: great sums of money have been expended upon it. The marine barrack here is a most handsome and commodious building. The marine establishment of this kingdom is about eight thousand men.

Ferrol was only a small dirty fishing town before the year 1752, and the alteration has taken place since that period: it is said to contain near thirty thousand souls. We returned to the Corunna on the sixth, and on the eighth left Corunna, and travelled on a new made road to Carral, through Seguero, and arrived at St. Jago, which place has been rendered famous for the pretended discovery of St. James the apostle. The town is situated among uncultivated hills, is large, and swarms with priests, who enjoy great incomes. They live in luxury and dissipation, preying upon the weakness and folly of their fellow creatures. The cathedral is nothing extraordinary. The cloyster, in the convent of St. Martin, is a neat and elegant piece of architecture. At this place is an university, but there are but few students, and it is not in great repute.

We left St. Jago on the eleventh of September, and went through Caldes, which is a poor town, and arrived at Pontevedra; the town is large, and was taken by the English in 1719. We afterwards travelled through a mountainous country, and came to Ridondella, in the basin of which Sir George Rooke, with the confederate fleet, destroyed the galleons in 1702. It is a most noble harbour. We went forward to Vigo. From St. Jago to this place, the roads were crowded with little saints and altars.

Vigo is a large fishing-town; it is a most excellent port, and well defended at the entrance. We left this place on the fifteenth, and arrived at Tuy, which is a fortress, and is seated on a rising ground, menacing Valenca in Portugal on the opposite side of the river, which is also situated on an eminence. We crossed the river Minho, and put up at Valenca. This is the most northern frontier of Portugal, and is beautifully situated on the banks of the river. The prospects from it are very fine; all without is pleasant, but within it is wretched indeed. The dress of the people here was much changed; the women wore handkerchiefs about their heads, and a short blue cloak: the men brown cloaks, and smart cocked hats.

Puente de Lima is a good town, and originally defended the passage of the river. Here is a convent of San Benito, delightfully placed on a height that overlooks the river, and is very conspicuous from the town. The road from hence to Braga is through a most populous, pleasant, and inclosed country: it is a Metropolitan see. The city is pleasantly situated on a height, above the river Bebedo: it is large and well built; the streets are spacious, clean, and well paved, and there are many fountains. A manufacture of beaver hats is here carried on, and they seem very busy. There are some shewy churches and large houses; but they are loaded with so many ornaments, that they have a most Gothic appearance. We left Braga on the twentieth, and arrived at Oporto, after travelling through a most fertile country.

Oporto is agreeably situated, and was originally a place of considerable strength: the ancient fortifications still environ a great part of the town. Many of the streets are wide, handsome, and clean. The quay, to which ships of burthen come close, is spacious and pleasant; the depth of the river, with the rapid torrents that occasionally pour down, and swell it considerably, prevent a bridge from being built across it at this place. The shops are filled with baizes and coarse cloths, and every person is clad with some of the manufactures of Great Britain. The wine monopoly affects the country exceedingly. A man possessed of a vineyard, in the wine country, is obliged, if required, to sell its produce to the company, and repurchase it from the monopolizers at an advanced price.

The people of this kingdom have adopted many of the English customs and manners. The sedans are drawn

drawn by mules. An hospital is here begun on a most magnificent and extensive plan: the work is so great, that it can never be completed here, for the wealth of the place is not equal to it. There are some gaudy churches, but none of them are conspicuous for the beauty of the architecture. The supreme court of judicature for the northern provinces is held here, with an appeal to the superior court at Lisbon. It is said there are thirty-six thousand inhabitants in this city, and the whole appear busily employed.

We crossed the river to the Villa Nova, where the merchants have their wine-vaults, which are very spacious. We went to Sardaon, Mehallada, and arrived at Coymbra, which is pleasantly situated on the side of a hill, near the river Mondego, over which there is a stone bridge; the prospects from the town, both up and down the river, are extensive and beautiful. The convent of Santa Clara, where the unfortunate Agnes de Castro was murdered and interred, is an extensive building, seated on the opposite side of the river. This was a strong fortification when possessed by the Moors.

At Coymbra is the most famous university in the kingdom. Charities are established here for the different sciences, but the salaries of the professors are small. Thomas Aquinas, and the school divinity, are here exploded. They have an excellent collection of instruments for experimental philosophy, which are lately arrived from England.

The power of the clergy is here very eminent; there are no less than seven convents of Franciscans in this town, and above twenty, of one sort or another, who possess the country all around. The gardens of the monastery of Santa Cruz are very extensive, cool, and pleasant, and contain a profusion of orange and lemon-trees. This monastery is richly endowed. There is a museum and observatory building here; which works are going on with great spirit, and are planned with excellent taste. The town is famous for horn-work, and little wooden tooth-picks.

From Coymbra we travelled to Pombal, on a fine stone causeway. This place gives title to the marquis of Pombal, and there is an old castle situated on an height. There is a considerable hat manufacture carried on here, under the direction of a Frenchman. We travelled through Marinha, and arrived at Batalha. At this place, there is a very handsome church belonging to the convent of Dominicans, in the Gothic stile. The chapter-house is a very handsome building. Near the church are some works in the Moorish taste. We left Patalha, and came to Alcoberg. When Alphonso Henriquez passed this place, in his way to the siege of Santarem, he made a vow that, if successful, he would establish a monastery of monks on the spot: accordingly, having taken it by a scalade, he founded with the spoils this convent, about the twelfth century, and richly endowed it. It derives its name from standing between the two rivers Alcoa and Raca: it is a most extensive pile of building, in the Gothic taste. The church is rich in chalices, plate, &c. The convent is inhabited by one hundred and thirty friars, of the order of St. Raymond; their income is twenty thousand a year, and they live most sumptuously. Here is a cambric manufactory, established under the direction of some Scotch and Irishmen. Here is an old Moorish tower, but of no great consequence.

Caldes is famous for its salubrious waters, which are hot, and are of a sulphureous quality. From thence, we passed through a pleasant country to Clidos, which is situated on an eminence, and is surrounded by an antient fortification. We passed a considerable aquaduct, that extends itself to the town from a neighbouring hill. We then went through a mountainous, and rather an uncultivated country, to Torres, which is a village seated on the side of a hill, and from hence to Mafra. At this place is an amazing structure, a palace, and convent, founded by the late king. It is a most stupendous work; it is very much decorated, and is very rich in marble; the vestry, consistory, and refectory, are handsome. The

convent was originally intended for the Franciscans. In the palace are prodigious suits of apartments; the library is very spacious and handsome.

On the tenth we went from Massa to Cintra, where there is a small royal palace, situated near the north side of a hill, near that promontory which the English sailors call the rock of Lisbon. Here was originally a castle of the Moors, taken from them by the Christians. This place, from its situation, draws a number of the inhabitants from the suffocating heat of Lisbon, to enjoy the cool and refreshing sea air. The inhabitants of Lisbon sing of the delights of Cintra, as if it were a terrestrial paradise. After we left this place, we arrived at Lisbon in six hours.

Lisbon is situated on several hills; the devastation of the earthquake in 1755 is still discernible. A handsome city is now rising out of the ruins of one very much deformed. The court here is not elegant; the king and royal family live in a barrack, where there is not much taste nor magnificence. As few of the first rank are wealthy, there cannot be any private buildings of consequence. The arsenal is large and handsome: the aqueduct of Alcantara is a noble work, and is composed of two different kinds of arches. Upon the ruins of the old town which the earthquake demolished, a new and beautiful city is now rising, and great attention is paid to uniformity: the streets are not lighted, and the old town is remarkably dirty. The fish and corn markets are worth notice; in the latter, to prevent imposition, the price of every kind of grain is regulated, and fixed up at each stand. The harbour is a good one, but is not sheltered from the easterly winds, though they seldom prevail very strongly; it is by no means well defended from the hostile attempts of a naval force.

The fortifications of the Moors, which are now in ruins, exhibit a proof of the military knowledge of that people. In the church of St. Rocco is a chapel, very rich in marble, jasper, verd antique, and Ægyptian granite, &c. In it are three pictures brought from Rome, of the Annunciation, the Baptism of Christ, and the Pentecost. This city is divided into a certain number of districts, each division being under the particular government of a magistrate.

Subordination is natural to a Portuguese, and they make very good soldiers, especially when they are employed against the Spaniards, who are their natural enemies. The military and naval force of this kingdom is inconsiderable, and by no means adequate to the description given. The parade of religion still remains, but the force of bigotry from the resort of foreigners, particularly English, is much broken; at least it is so in Lisbon. Now the inquisition only prosecutes, it can neither condemn nor punish without the royal sanction. A priest guilty of a crime against civil society, is pursued by the civil law, which exerts itself over the ecclesiastic. The monastic orders will be considerably reduced in the course of time, as noviciates are not admitted without particular licence. There are about fifty convents in this city, and about three hundred in the whole kingdom. Since the establishment of gold and silver lace manufactories, laced cloaths are very much worn. The carriages chiefly in use here are two-horse chaises; which have not a very elegant appearance; the principal people have other carriages, but as these are few in number, they are not very conspicuous. Some persons ride on horseback from one end of the town to the other. The theatre is not very refined; plays in the Portuguese language were not allowed till about seventeen years ago. Here is an Italian opera, and the king has a company of Italians who perform at the palace.

The Portuguese are an ignorant people, which is owing to the despotism of the country; the common people are obliged to be very industrious, in order to defray the taxes, which are enormous, as well as to support themselves. They are in general very revengeful, but stabbing is not so much in fashion as formerly. Love is the darling passion of both sexes, and their perseverance in obtaining an object is wonderful. Jealousy

lously prevails, but does not prevent frequent intrigues; when discovered, the revenge is severe. The people in general are temperate in their diet; elegance does not prevail, even at the tables of people of rank. They are very familiar with their servants, and some will go so far as to take a principal servant into a party at cards in order to make up the set; yet they would not keep company with a bourgeois, and pique themselves much on their birth.

Major Dalrymple says, "We had a disagreeable journey from Lisbon to Seville; we embarked in the ferry to cross the Tagus. The prospect of the city from the river is fine, we were five hours on our passage to Aldea Gallieja. Around this place is but a poor soil, but there are plenty of vines: we went through Ventas Novas, and passed a palace of no great consequence. We came to Mentemor, which was originally a Moorish port; on the summit of the hill on which the tower stands are the ruins of a fortress.

Evora is a most antient city, and according to a Portuguese writer, gave birth to Cicero and Virgil. Here is an old building called the tower of Sertorius; there are likewise the remains of the temple of Diana; seven entire pillars are standing of the Corinthian order. In the waste of devouring time, this temple has undergone many revolutions. From a Pagan place of worship it was changed into a Moorish mosque, and is now converted into butchers shambles. There are very many Roman vestiges and inscriptions remaining. It is an archbishop's see; it is large, but nearly depopulated, and is going to ruin. A modern fortification was begun, but never completed. We left Evora on the thirtieth, and passed to Venta de Cergones and to Estremos, which is situated two leagues from Evora al Marte.

Estremos is surrounded with a modern fortification, but is going to ruin. Near this town is the place rendered famous for a victory obtained over the Castilians, by the Portuguese; this happened in the year 1663. We pursued our journey through a fertile country, passed an aqueduct of four tiers of arches, and came to Elvas, which is a frontier town, irregularly fortified. Here is a cistern which contains eleven thousand pipes of water, it is annually cleaned and filled again. Three regiments of foot and one of cavalry are generally quartered here. When an officer in this service gets leave of absence, his pay is stopped, and it is looked upon as a great indulgence to have it renewed upon his return; by this means all the officers are in general immured in barracks. This place was unsuccessfully besieged by the Spaniards in 1658. The governor was very civil in every thing but permitting us to see Fort la Lippe, which was our only view for taking this route. From the best accounts we could get of this fortress, it is a most singular work, it has cost government an immense sum of money, and the projector hopes to raise a monument to his fame. It is composed of four bastions, with many other works, the parapets are contrived for a second defence, the upper part of them is of tapia, the lower of brick; the batteries are covered, and bomb proof; on the top of these are lodging houses for the officers, in time of peace; but in time of war they are to be thrown down, and the materials are to erect an upper parapet for wall pieces, &c. The mechanism of the draw-bridges, &c. are equally curious and well contrived. An attack upon Fort la Lippe would, in all probability, be unsuccessful.

Badajon is a frontier town, and is very antient; the fortifications are not complete. It was besieged by the Portuguese in 1651, but the siege was raised at the approach of Don Lewis de Haro, with the whole army of Spain. It is a bishop's see, and is under the metropolitan of St. Jago; went through Albuera, Santa Maria, Zafra, Fuente de Cantos, and Santa Aballa. All the people from Badajon hither seem as if they had the yellow jaundice; they are much subject to the fever and ague, all through this province of Estramadura, which gives them this unhealthy appearance. Passed on to Castel Blanco, and arrived at Seville, which was possessed by the Moors, at the time they in-

habited this country. This city, including the suburbs, is three leagues and a half in circumference, but round the walls it is not more than six miles. It is situated on the Guadalquivir, over which there is a bridge of boats. The streets of the city are in general very narrow and irregular, but there are many capital houses, though their outward appearance is not very conspicuous. It is said, that there are fourteen thousand private houses, which are estimated to contain three hundred thousand inhabitants. In the city and its neighbourhood are twenty-nine convents of nuns, and forty-six of friars. The cathedral church is a very fine building, and is immensely rich. The Giralda, built by the Moors, is a square tower, and serves as a belfry to the church, from the top of which is a very extensive prospect. It is an archbishop's see, with a most enormous annual revenue; there are forty canons belonging to it, who have great incomes. The archbishop's annual revenue is said to be three hundred thousand dollars, which are equal to fifty thousand six hundred and twenty-five pounds sterling.

In Seville there are many hospitals where the poor sick are received, and great care is taken of them. The royal palace built by the Moors is not very magnificent; the gardens belonging to it are laid out in the antient taste, and are ornamented with gigantic figures. Here are many public edifices which are visited by strangers. The golden tower is worthy notice on account of its antiquity; it is said to have been built by the Phœnicians. The place where they manufacture tobacco, is a large handsome fabric in the Moorish taste; there are from fifteen hundred to two thousand people, and two hundred horses constantly employed in it. From this place, the whole kingdom is supplied with tobacco, and it brings in an amazing revenue to the crown.

The amphitheatre is large, and built with stone; the public walk is handsome; there are two Roman columns of the Corinthian order placed at the end of it, with two antique statues of Hercules and Julius Cæsar. The university is not in a very flourishing state. There are but few students in any other science but theology. Here is likewise a mint and a royal treasury. Many people of consequence live here. Valencia has become its rival in the silk manufactory; the worms do not thrive so well as in that province. A great deal of fruit is exported hence, such as lemons and oranges for the London market. This city is privileged with a tribunal of justice, which extends its jurisdiction five leagues round it, from whence there is no appeal but to the council of Castille. It is exempted from having troops quartered in it, on account of its loyalty to Philip V.

We left Seville on the tenth of November, and went on to Las Pallacier, which was antiently a country seat of the Moorish kings. Arrived at Las Cabezas de San Juan, and drew near Xeres, which is a large, well built, and populous town, about three miles from which is a Carthusian convent of very great note. We passed over the river Guadalete, and made the circuit of the bay of Cadiz; passed the Isla de Leon where there is a marine academy.

Cadiz is situated on a peninsula, rising as it were out of the ocean; it is a very antient and noted sea port. From hence almost the whole trade of the kingdom is carried on to the West-Indies and America. The town is large, and is said to contain between seventy and eighty thousand inhabitants, who consume fifty-four thousand pound of bread every day. The streets are narrow and confined, yet there are many large and handsome houses. The fortification is strong on the land side, which is of small extent; towards the sea, there is a line wall and other works, dispersed around. The portico of the city is well regulated. The city is amply supplied with all kinds of provisions; it is furnished with water from the other side of the bay; this is the only place in Europe where the venders of that commodity think it worth their while to adulterate it, which is done by mixing it with rain water.

Here are a number of Irish catholics, and great swarms

swarms of French, who are greatly protected, and carry on a considerable trade. Here is an elegant French theatre, which is supported at a considerable expence: there is also an Italian opera, and a Spanish comedy. In the church of the Capuchins is an unfinished painting of Murillo, in executing which, it is said, he fell from the scaffold, and thereby lost his life.

We left Cadiz on the nineteenth, and pursued our journey along the Isthmus, and arrived at the river St. Pedro, where we crossed a ferry. This river, communicating with the bay of Cadiz, forms the town and neck of land into an island. Here, it was said, was placed the famous temple of the Ægyptian Hercules. We arrived at Veger, which was originally a Moorish port: there are some Moorish vestiges still to be seen in the town, which is situated on the top of a hill that rises abruptly from the plain: a river runs at the foot of it, over which there is a Roman bridge of three arches. On the twentieth, we came to the Campo de Toriffa and Algeciras, which last is situated at the bottom of the bay of Gibraltar, which we reached on the twenty-first, exactly five months and a day from the time of our setting out.

As the travels through Spain and Portugal have been so very numerous, we will not detain our readers with a repetition of dull circumstances, such as, on this day I set out, that day I was wet through, here I got nothing to eat, there I slept on straw, and such like circumstances, which possibly might have been of great consequence to the travellers, for the time being, but cannot administer either instruction or entertainment to others: we will, for the present, alter our mode of proceeding for the sake of variety, and take it up again by and by. The following account of Spain and Portugal is extracted from the newest, best, and most approved authors, such as Swinborne, Twiss, &c. &c. Every thing worthy notice, in the travels of these different gentlemen, shall be faithfully inserted.

La Junquera, which is a Spanish town, was once a considerable city, a colony of the people of Marfeilles, and afterwards an episcopal see. It is now very much fallen from its pristine grandeur, and is become a paltry village: the people subsist upon the money spent in it by strangers partly, and principally upon the produce of the cork woods. These trees cover the mountains which surround the city, and are of a great size, having stood many years. About this country, and between the town and Figuera, the plains are in fine cultivation, and the hills are covered with perpetual green. Both men and women have an appearance of cleanliness, and look well. Near Figuera is an unfinished fortress, which was begun by Ferdinand the sixth. Figuera is an ugly straggling town.

Girona is but poorly inhabited, and is very gloomy; the streets are large and clean, and the churches are very dark; the cathedral is Gothic, and the canopy and altar are of massive silver. Part of the road from hence is through a most savage country, where there are an innumerable number of mountains covered with pines: the castle of Hatalfic commands the outlet of this desert. The Catalans hereabout have a singular way of drinking: they hold a broad-bottomed bottle at arm's length, and let the liquor run out of a long neck upon their tongues: they are expert at it, which must arise from frequent practice. The prospects on each side of the road, between this and Barcelona, are very extensive and fine: multitudes of Gothic steeples appear in view, rising above each other, and tower above the dark pine-groves.

The Spanish theatre at Barcelona is much degenerated from its former glory, though the house is handsome, and well lighted up. Barcelona appears to be a thriving town, and the inhabitants are very industrious: as to the origin of it, the accounts various writers have given are mostly fabulous. It has often been the seat of civil war, owing to the violent

spirit of the Catalans, and their enthusiastic ardor for liberty. In the time of Ferdinand the fifth, the inhabitants rose in arms, in order to deliver themselves from the oppression of the nobles, which was very burthensome. Under Philip the fourth, they made a struggle for independence, but did not carry their point; they were reduced to obedience, which was the more strict and obligatory, for their repeated struggles against it, by Don John of Austria. They made another effort to become a free nation, under Philip the fifth, in the year 1706: Barcelona then sustained a siege, which Philip was obliged to raise, owing to the necessity of withdrawing his army to another quarter. The Catalans persisted in the revolt, and resolved on independence, and the establishment of a commonwealth. The French king sent a formidable army, under the command of the duke of Berwick, to reduce them to obedience, and a powerful fleet at sea, to prevent their receiving any succours: they withstood an astonishing blockade, and endured all the miseries of famine, pestilence, and war, a considerable time: the ardor of the very priests was amazing, and the cries of the women and children all tended to increase their resolution. At length, absolutely overpowered by numbers, they made a kind of capitulation, in which their persons were to be protected. Since that time, they have borne the Spanish yoke with a fullen subjection.

The boasted climate of Montpellier does not equal Barcelona for mildness and purity; the situation of the town is beautiful; and the prospects, both by sea and land, are wonderfully fine: they have green pease all the year round, except in the dog days. The form of the city is almost circular; the ancient Roman walls are still visible in many places; the port is large and handsome, and the mole is all of hewn stone; there is a platform for carriages; above and below are vast magazines, with a broad quay, reaching from the city gates to the light-house. The Marquis de la Mina has made very great improvements in the city, and the inhabitants are under great obligations to him. Here is a rampart on the walls, which extends the whole length of the harbour. The citadel has six strong bastions, which are calculated to over-awe the inhabitants, and prevent their venturing on any further struggles for independence, and likewise serve to prevent the attempts of a foreign enemy. The streets are narrow, but are well paved; the drains for filth and rain-water are covered; the houses are lofty and plain, and the town is tolerably well lighted.

The exchange, the cathedral, Santa Maria, and the general's palace, are the principal edifices. A new exchange, to the south part of the palace, is now erecting, out of the ruins of an old habitation of the Earls of Barcelona. The architecture of the cathedral is a light Gothic, which is very airy: Santa Maria is also a Gothic pile. The general's palace is square and low, with gardens: here is an elegant ball-room.

There are many Roman antiquities in this city, such as a Mosaic pavement, many vaults and pillars of Roman construction, the palace of the prætor, a Roman governor, a beautiful Sarcophagus, which now serves as a watering-place for mules, and many excellent busts and medallions are still preserved in an ancient house, which was almost buried in ruins by the bombardment of the city.

From Saria, which is a convent of Capuchin friars, situated on the hills, there is a fine view of the city, and part of Barcelona; they are collected into an excellent landscape. The duke of Berwick razed the convent of Jesus to the ground in 1714, as a punishment for the revolt of the friars, when they encouraged the inhabitants of Barcelona in their scheme of independence.

The castle of Monjuich is a mountain which stands single; it intercepts the putrid exhalations which arise from the ponds on the other side, so that they are not perceived in the city. The corn that grows on the north and south side of the mountain is peculiarly good in its kind, and is all of it preserved for feed.

About

About half way up the mountain is the burial-place of the Jews, where are many large stones with Hebrew inscriptions. Every human Barcelona is exposed to view, and there is a command of the coast, plain, and harbour; the main body of the place is bomb proof, very well finished. This castle is almost impregnable, it has cost immense sums, and there are now three hundred men employed on the works.

About five or six miles between this and Marterel, the road is as magnificent as any in France, but it afterwards degenerates considerably. The country is well cultivated, but is subject to frequent depredations: Marterel is a large town, where much black lace is manufactured. The mountain of Montserrat is very singular for situation, shape, and composition, and stands alone, commanding an hilly country: the convent is placed in a rock of the mountain, fifteen hermitages are placed among the woods: the convent is one of the religious houses established by order of St. Benedict. The possessions are great; they are bound to feed and harbour all pilgrims, who come to do homage to the virgin; these pilgrims are not very elegantly entertained, for their allowance is only a luncheon of bread in the morning, another with broth at noon, and a third quantity of bread only at night. Indeed they have the privilege of drinking water when they like it. The number of monks is seventy-six, of lay brothers twenty-eight, and of singing boys twenty-five. The church is gloomy, and the gilding much sullied, which is owing to the smoke of a vast number of lamps which are continually lighted. The chair is decorated with the life of our Saviour Christ, in wooden carving. The church is rich, and contains many images of gold and silver: here are two crowns for the virgin and her son, which are of inestimable value, besides many other curiosities.

The hermits in their various cells appear to have no worldly ideas, they are clad in brown habits, and wear long beards; their way of life is uncomfortable, and their separate limits very much confined. They rise by two every morning; they are allowed bread, wine, salt, oil, one pair of stockings, and one pair of shoes annually, with twenty-five rials a month, for other necessaries; they never eat meat, or hold any conversation with each other.

The whole of Catalonia is mountainous, and the inhabitants are hardy, active, and industrious; notwithstanding the rigour constantly exercised over them, and the debarring them from all missile weapons, it is impossible to stifle their independent spirit which breaks out upon every stretch of arbitrary power. It is at present one of the most flourishing provinces of Spain, though their taxation is very high. They are forbidden the use of slouched hats, white shoes, and large brown cloaks. You may safely walk all hours in the night at Barcelona, without the least danger. The soldiers are averse to discipline, though they make excellent light infantry: the sailors are good, and are distinguished by a red woollen cap, which they constantly wear. The corn harvest here is early, about May or June. They pay great attention to the cultivation of the vines, which they plant even on the summit of the highest mountains; their vintages are generally plentiful; sometimes corn is very scarce, and was it not for the importation of that article, the country would be famished. Barcelona contains about one hundred and fifty thousand inhabitants, their exportation consists in wines, brandies, salt and oil; there are mines of lead, iron, and coal in the mountains, but they do not answer very well. Their manufactures are of much more importance; this city supplies Spain with most of the cloaths and arms for the troops, and they equip the military with these articles with great expedition; they trade largely in silk handkerchiefs, which are very much valued in London; they also deal considerably in woollen and various silk manufactures, printed linens, &c. &c. They import great quantities of corn, Newfoundland fish, beans, conger eels, English bale goods, and many foreign articles of luxury. The provisions here are but indifferent,

except the vegetables, which are most excellent. The devotion of the inhabitants is not so ardent as in many other parts of Spain. They have one very odd practice, which is this: on the eve of All Souls they run about from house to house to eat chestnuts, and believe, that in every chestnut they eat with faith and unction, they are sure to deliver a soul out of purgatory.

Notwithstanding this, and some other glaring absurdities, the faculties of these people are considerably improved, and they have made much progress of late in natural philosophy; this is owing to the influx of strangers, the increase of commerce, and the protection which is here granted to the liberal arts. The proceedings of the inquisition here are very mild, and there are but few churches in the city that have the privilege of protecting offenders. Every master of a family is obliged once a year to answer for the orthodoxy of all its members; but the protestant houses are winked at. If a person avoids talking on the subject of religion (which has often been attended with bad effects since the creation of the world) and with a little prudence, a person may live in Barcelona in what manner he pleases. Every Jew must give notice that he is such, to the officers of the inquisition, who appoints a person to attend him all the while he stays here, to whom the Jew is obliged to pay a pistole a day. Should he neglect giving this information, his person and goods would be liable to seizure.

The province of Catalonia bears so little resemblance to the remaining part of the kingdom, that it is very unfair to judge of the manners of the whole from this description; we must therefore proceed to give some account of other towns and places, speaking rather sparingly of those which have hitherto been described in major Dalrymple's travels, and more copiously of those places and circumstances which have escaped his notice.

The tomb of the Scipio's, near Tarragona, is small. In the front facing the sea, are two statues of warriors in a mournful posture, roughly cast, and much worn away by the sea breezes. The rock of Tarragona produces nothing but the dwarf-palm or palmeto, which grows among the stones about two feet high. The insipid pith of its root is a favourite food of the peasants; the leaves of it make good brooms and ropes, and fatten the earth exceedingly.

Tarragona is now very much contracted, and bears no proportion to its antient size. Many antiquities are to be seen in the town, and some vestiges of the palace of Augustus, of the great circus, and the amphitheatre. There is an antient aqueduct called the Puente de Ferreira, about three miles from the city. The cathedral is ugly, and is dedicated to St. Thecla; the architecture is rather heavy. The English were in possession of this part in queen Anne's war, but renounced the project of fixing a garrison here, as they had secured Minorca and Gibraltar. The plain of Tarragona is a most fruitful spot, and there is not an uncultivated part in it, which is nine miles in diameter. Agents and factors are settled at Reus, which is the principal town, and is situated in the midst of the plain. This town is increasing daily in size and population, and the number of its inhabitants have increased within these fifteen years at least two thirds.

Reus is famous for its wines and brandies, and they annually export twenty thousand pipes of the latter. This branch of trade employs a thousand stills. It is carried down to the sea in open carts; the sea lies at about six miles distance. Great quantities of nuts are likewise exported. Commerce here appears very thriving. Near the mountains which surround this plain is a convent of Bernardine monks, who, being removed from the public eye, lead a most dissolute life. A modest woman would run great risk of being insulted by these rascals, did she go near their territories without attendance. Some years ago, a set of wild young officers, who owed the holy fathers a grudge, carried thither a number of common strumpets, dressed like

modest women of fortune, and contrived matters so, that while the men of the party went up to the mountain to see prospects, the ladies were left to comfort the monks. The hot-livered Bernardines employed the time to the best advantage, but smarted so severely for the favours they received from the good-humoured nymphs, that for many months afterwards the superiors and inferiors of this order were dispersed about the neighbouring towns, under the care of the surgeons, which are not very skilful.

At Tortosa, the ecclesiastics lead a very regular life, are quite the reverse of their brethren last mentioned; we mean the higher orders of them; the inferiors, even here, are remarkably loose in their morals. The income of the bishop of Tortosa is 30,000 dollars per annum, which he expends in acts of charity and beneficence. The town is ugly, and stands on the declivity of a hill, north of the Ebro, over which there is a bridge of boats. Its commerce is at a low ebb, and consists chiefly, if not entirely, of silk and corn. The vale of Garena is very fertile.

From Bonicarlo, a society of mariners float all the casks of wine which the plain produces to the ships, and from the time of taking charge of them become answerable for all losses. In this plain they suffer much from want of water; and this frequently diminishes the vintage, as in summer the springs are in general dried up.

Cartillan de la Lana is a large and well built town; the women are very ordinary, and render themselves still more so by their uncomely manner of dressing. In the kingdom of Valencia, the climate is not near so agreeable as at Barcelona; the days are very hot, though the evenings and mornings are truly pleasant. The coasts were, till very lately, much infected with the Barbary corsairs, who frequently carry whole families from the villages.

The ruins of Murviedro are worthy observation; the present town is very considerable, and stands on the same ground as the antient Roman city. About half way up the rock, are the ruins of the theatre, which must have been very magnificent. Some mutilated statues, and other vestiges of Roman architecture, are discoverable farther up the mountain. The prospect from the summit is surprisngly fine. All the road from this place to Valencia is a perfect garden of sweets. There are villages and monasteries at every hundred yards, and the grounds are divided into small pieces by a variety of water channels: this was a work of the Moors, and contributes greatly to the convenience and health of the country. Here a disagreeable fight presented itself amidst all the fertility and beauty. The peasants appeared at their doors, men, women, and children, lousing themselves. When a young woman seeks for lice in a man's head, it is supposed that the last favours have been granted by the consenting fair one.

The city of Valencia is situated on a plain, and is very flat and woody. The climate is mild and pleasant, but there is a remarkable faintness in the air. Provisions here are very bad of all kinds, and afford very little nourishment. The men are largely made and personable, but are very inanimate. The farmers here will not allow their wives a seat at the table, but make them stand at their elbows whilst they dine. The inhabitants of this province have much of the unpolished manners of the antient inhabitants of Spain; they have very little society amongst them; they spend large incomes in a strange manner, and without much credit. They have many servants, mules, and equipages, and they are very low and obscure in their amour. The city is large and nearly circular, several large bridges cross the bed where the river should run, and there is scarce water in the Guadaviar to boil a leg of mutton. The streets of the city are crooked and narrow, and, not being paved, are very dusty in fair weather, and dirty in foul. The houses are filthy and ill built, the churches overloaded with ornaments, some of them have domes, but in general the steeples are spiral. Priests, friars, and nuns, swarm

here, but as we have hitherto sufficiently described this city, we shall at present say no more about it.

The hospitality of the British subjects in Alicant is remarkable; they shew it in the most unbounded manner to their countrymen, who are strangers in this part of the world. The town has neither buildings nor streets to render it worthy of notice, but the inhabitants make amends for all. In the hot months this place is a furnace, its form being calculated to intercept the rays of the sun, and collect them as in a focus. The port of Alicant stands in the middle of a narrow neck of land, that runs out into the sea a great way, and almost comes round in a semicircular form. Here ships ride with as much safety as in a harbour. The castle is placed on the summit of a rocky mountain, which rises directly behind the town, and is fortified after the modern method. Behind this is a plain some leagues in circumference, called Las-huertas, the gardens of Alicant lying along the sea shore; it is thickly studded with villages, farms, and plantations of fruit trees. In the hot part of the year, the air is unwholesome, and very few escape agues and fevers. The Alicant and tent wines are made here, but very few of the proprietors keep their wine to a proper age, though the high price which is paid for wines of a proper age amply repays them for being out of their money. The English factory imports all sorts of bale goods, and they export wine and barilla; the latter grows in great quantities all along the coast, and particularly at Carthagen. The merchants here are but little acquainted with the qualities of the barilla which they export, as they intrust its packing to agents. The Italian opera here is bad. From Alicant, you may see the island of S. Peto, where there is a settlement of Genoese, who are obliged to be supplied with the necessaries of life from the main land, the island yielding no productions of any kind: should they neglect laying in a sufficient stock, and should tempestuous weather arise, they would be famished.

Eleke is built on the skirts of a wood or forest of palm-trees; it is a large town belonging to the duke of Arcos. The palm-trees are old and lofty, and the forest is said to contain two hundred thousand. The country around is very cheerful, and is indebted for its fertility to the abundance of water. The bread of Oriheula, which is a neighbouring town, is most excellent, and it has the reputation of producing the best corn in Spain. It is well built, is a bishop's see, and is situated at the foot of a ridge of bare rocks, near the head of a fruitful vale. The Segura, a muddy river, divides the town of Murcia into two unequal parts, and contributes nothing to its embellishment. The town is neither large nor handsome, the walks trifling, and the streets are full of black stagnated water. The cathedral is well worth seeing; it is a large massive pile, the steeple is lofty, and intended to exhibit specimens of the five orders of architecture. From its summit there is a full view of the country. The names and banners of the Jews who have been burnt in this town by the inquisition, are stuck up in the churches as so many trophies of victory.

At Carthagen is an arsenal of a large size; its approach from the sea is defended by forty pieces of cannon, but is without defence on the land side; its government is in the hands of naval officers, but their arrangement is conducted in a most prodigal manner. The ships are heaved down in a dry dock, which would never be clear of water, owing to the springs which continually ooze through the soil, were it not for several fire engines which are always at work, and for the large pump, which is constantly plied by Spanish criminals and Barbary slaves. They have eight hundred of the former, and six hundred of the latter; they are generally employed sixteen hours out of the twenty-four. Scarce a day passes in the summer season without some of them dropping down dead, owing to the excessive heat of the weather, and noisome effluvia of the place. If these poor creatures can get hold of a weapon, despair makes them plunge it into their bosoms. Their principal food is black bread and

Engraved for Moore's New & Complete Collection of Voyages & Travels.

C. Alvarado, Madrid. The Harbor of Cadiz. Spain.

horse beans boiled in salt water, which must be owing to the fraudulence of the managers, as the king allows them each a pistreen a day. However, the only reflection which administers any relief, when considering the wretched state of these creatures, is this, that none are there who have not been guilty of the most atrocious crimes, and who have deserved death over and over.

The port of Carthageña is formed by nature in the figure of a heart, and is very compleat; its entrance is blocked up by the island of Escombera, which shelters it from the violence of winds and waves. Here are three regiments garrisoned, and several naval officers, yet the place is remarkably dull and gloomy. The play-house is wretched, and the coffee-house affords very little entertainment. The city has but five good streets or remarkable buildings, though it is large. The architecture of the hospital is good, but the stone is soft, and easily penetrated.

Not far from hence is a place called Almazaron, where is gathered the red couth, called almagra, used in the manufactures of St. Ildephonso, for polishing looking-glasses. This earth is likewise used in Seville with the tobacco, with which it is worked up, gives it a colour, and administers that softness for which Spanish snuff is peculiar.

After you leave Carthageña, you come upon a plain, the first part of which is well cultivated, but the other is a complete desert. Its desolation is prodigious, which is accounted for by the want of water, and the soil is unfit for tillage. The town of Baca stands in a bottom, and is surrounded by mountains, over which the passage is both frightful and dangerous.

Guadin is an episcopal see, and is situated like Baca. Clay hills encompass it, and are very high, they are washed into hideous shapes. Even villages are dug in them, and make a very odd appearance; neither the beauties of nature nor art can compensate for the disagreeableness of travelling this road. The plain and city of Granada is beautiful beyond expression; the kingdom consists of those parts of Spain that lie in the south-east corner of the peninsula. It is alledged that this was a colony of the Phœnicians, called by the Romans Illiberia. It is not of much consequence to discover the founder of this city, it will not repay the loss of time in writing and reading such a description. It stands on two hills, at the foot of which two small rivers join their waters. The Dauro is one of them, and sometimes washes down gold, the other is called Xenil, and sometimes washes down virgin silver. Part of the city extends along the plain in a semicircular form. The plain is eight leagues long and four broad, a beautiful and gentle slope of hillocks bound the sight on all sides; the country is alluring, the situation striking, and the air salubrious. This induced the Saracens to turn their arms this way. Some Moorish families remained in Granada after the dissolution of the monarchy, but they were continually molested by priests and bigotted princes; they were reduced to the alternative of either abandoning their country or their religion; they at last formed a conspiracy, and wreaked their vengeance on all Christians, and particularly the priests who fell in their way. This rebellion continued near two years, notwithstanding the great number of forces sent against them; they finally submitted, and were dispersed all over Spain. Whilst Granada was governed by its own kings, it flourished more than since its dependence on Spain: then it was a compact, well peopled, and opulent kingdom; agriculture was brought to its perfection, and its circulation and revenues were immense; its population was incredible, and its public works were carried on with great magnificence. A great quantity of silk was produced in the plain, and the hills behind the city afforded corn enough for its internal consumption. The mines of the mountains were then open, and yielded a vast quantity of gold and silver, inasmuch that these metals were more common in Granada than in any other country of Europe. No house was without its pipe of water; and fountains

were in every street for the public use. The inhabitants were at once easy and voluptuous; the whole now exhibits a spectacle the reverse of this. Its ancient glory is passed away with its ancient inhabitants; the streets are now choaked with filth, the aqueducts are crumbled to dust, its trade is lost, its woods destroyed, its territory depopulated, and nothing remains but the church and the law, all else is deplorable indeed.

Sugar was formerly an article of considerable trade to Madrid, but all it now produces is consumed in the neighbourhood. There are only three sugar mills at work, and they are in a declining state. It is reported that the first sugar plants were carried from hence to the West Indies. The descendants of the Moors, to this day, occupy a village in the mountains up the Dauro. They are very humble and complaisant, but do not like to part with their money, not even to pay their rent and taxes, and many remains of the Moorish manners and customs may be traced amongst them. The palace of Alhambra is an ancient fortress, and was the residence of the Mahometan monarch of Granada. Its situation is pleasant, and its air pure: these circumstances induced the emperor Charles the fifth to erect an edifice on the ruins of the old palace; but he did not finish his projected plan. The fortress stands on an eminence, between the rivers that commands the prospect of the whole city. On the platform, near the top of the hill, is a large fountain, which is a principal ornament to it. The curiosities of this place are many and various, and every thing is planned and calculated to render this place as retired and voluptuous as possible. The Moors offer up prayers to God every Friday, for the recovery of this city, which they esteem a terrestrial paradise.

On the banks of the Xenil is a pleasant walk, called the Alameda; this is one of the chief places of resort for people who either ride or walk. The environs of the town are delightful. Granada is even now a pleasant abode, refreshed by numberless streams, and perfumed by every sweet. The women here dress themselves in black silk petticoats and veils, and they appear uncommonly alluring. The city is open on all sides, and most of the streets and lanes are dirty. The common people retire to the lanes and alleys to perform certain rites and ceremonies; they do these things with decency, casting their cloak around them like a net at a proper distance from the body. There is a lofty church and some public buildings in the Rambla, which is a very broad, long street. The market-place is spacious, but its buildings are very ugly. The insides of the churches are ornamented with a profusion of marbles, and the outsides are painted in a theatrical taste. It is usual in some gentlemen's houses to frame long pieces of marble, and hang them up in the rooms by way of ornament. One whole street of artificers are employed in making little boys bracelets, necklaces, &c. which are retailed very cheap.

The cathedral is an assemblage of three churches, and, in point of architecture, stands very high in the opinion of the Granadians. The amphitheatre for bull feasts is esteemed one of the best in Spain, and is built with stone. A number of lawyers swarm to this place, where the court of chancery sits. These people absorb its riches, and are the only ones who live in any degree of affluence or splendour. Commerce is very feebly carried on, as it must be when it has neither encouragement or protection. Population decreases annually, and the crops diminish. The city, at present, contains about fifty thousand inhabitants. The number of beggars, who are fit to work, is amazing, and a disgrace to the place. In the play-house, the men occupy the ground-floor, and the women sit in the gallery.

Antiquera is situated on several hillocks, and is a large straggling town at the extremity of a plain. Escaruda is almost a perpendicular rocky mountain; the wine drank in England by the name of Mountain, is the produce of this country.

The city of Malaga is in the corner of a plain of
that

that name, the naked craggy rocks hang over the shore, and scarcely leave room for the city: from a Moorish castle, on the summit of a rock, you command the whole of it. It is hardly possible to breathe here in summer. The port, and road into it, are safe: the docks where the Moors kept their galleys are still remaining on the wharf, and serve as warehouses. In this city there are some squares of a good size, but the streets in general are narrow. Philip the second, who married Mary queen of England, began the cathedral here, which is a stupendous pile of building: it is said to be as large as that of St. Paul's in London. The outside of this edifice is crowded with columns and embellishments. The bishop enjoys a revenue of sixteen thousand pounds sterling, and his palace is a large building. There are about fourteen foreign houses settled in trade at Malaga; they export a great quantity of wine, but the demand is not so great as formerly; owing to the carelessness of the exporters, who did not examine into its quality. The Italian opera here is bad: should the host be passing by in the time of performance, all the actors, and the audience, think it their duty to drop on their knees: the time of passing is known by the sound of the facing bell: when this is gone by, the singer resumes his amorous ditty.

The Spanish lines near Gibraltar are a fortification that runs across the Isthmus, which separates Gibraltar from the Continent. Here are a regiment of infantry, and several batteries, with a fort at each end, and these defend the Spanish monarchy.

The rock of Gibraltar is a most astonishing fortress indeed, it is rendered almost impregnable, and cannot be taken but by surprise. The signal house which formerly seemed such a summit, that none but goats could climb it, is now rendered passable by carriages, through the activity of General Boyd. All religions seem welcome to this town, and meet without animosity on the same neutral ground. The Barbary beef, which is furnished here by contract, is most excellent, as is the fish taken in the bay. Nobody is allowed to shoot within the garrison, so that the partridges with which the rich abound, remain unmolested, and multiply exceedingly.

The town of Gibraltar, which has been in possession of the English since the year 1706, being in the reign of Queen Anne, is situated at the foot of the west side of a mountain of rock, called antiently Calpe. This rock is situated in 36 degrees 8 minutes north lat. and is in length two miles and three quarters from the north, and which abruptly rising out of a small isthmus, joins it to the continent. The perpendicular height of Gibraltar above the level of the sea is 1360 feet, and the eastern side is almost inaccessible. The caverns and precipices about the rock are inhabited by apes and monkeys, and it is thought that these animals are not produced in any other part of Europe. In blowing up different parts of the rock, upon various occasions as necessity required, bones, teeth, shells, &c. have been found, many of which are deposited in the British Museum, and have been described in the Philosophical Transactions. Immense are the quantities of gunpowder which have been expended in these services, and it has cost many of the miners their lives who have been employed in this dangerous business. The principal street in the town is broad and well paved, but the others are narrow, crooked, and dirty. Exclusive of the military here, the English are about two thousand in number; near three hundred Spaniards and Portuguese, seven hundred Genoese, and six hundred Jews, likewise inhabit the town, and follow various occupations. For the accommodation of these, here are an English church, a Roman catholic church, and a Jewish synagogue. The theatre is a neat little place where dramatic pieces are decently performed: many hundred Moors carry on a considerable trade in provisions and other commodities, and continually pass and repass to and from the Barbary shore. All European coins are current, but not at their full value; thus a guinea passes only for

nineteen shillings and six pence; and so of the rest. Here are shops of all kinds, taverns, coffee-houses, billiard-tables, &c. and the governor's garden is kept open for the resort of company. Gibraltar is now so strongly fortified as to be deemed impregnable; the harbour is well secured, and the breadth of the Straights is about eleven miles. A very ingenious modern traveller, who lately visited this fortress, says, "On the west side of this mountain is the cave called St. Michael's, one thousand one hundred and ten feet above the horizon. I entered it by the light of several torches about two hundred paces: there are many pillars of various sizes, from the thickness of a goose-quill to two feet in diameter, formed by the droppings of water, which have petrified in falling. One evening I ascended to the summit of the rock in an hour, by the path called the Devil's Gap, on a flight of two hundred stone steps, and then, after having walked some time, went up four hundred more, which brought me to the signal-house, built on the highest part of the mountain. The weather was very clear, so that I enjoyed the prospect of the town, the bay, the Straights, Mount Abili, or Ape's-hill on the African shore, the towns of St. Roque and Algeziras, and the snowy Alpujarra mountains. At night an infinitely greater number of stars may be discovered from hence by the naked eye, than from below; because, in this elevated situation, the atmosphere is much more pure and thin. I descended another way, passing by the remains of the Moorish castle. I was informed that there were at that time (July 1773), seven regiments in Gibraltar, and that about six hundred men were always on guard at a time; the discipline observed here is very strict, and the officers always appear in their regimentals. There are three hundred and forty guns mounted on the fortifications, and there is room for a hundred more: those of the grand battery are of bronze, the rest of iron: they are all fired in succession on the anniversary of his majesty's birth; the performance takes half an hour. At sun-rise, sun-set, and at nine in the evening, a gun is daily fired." No person is allowed to quit the English territory, either by land or sea, without a pass from the governor. Across the Isthmus, the Spaniards have drawn a fortified line, to prevent the garrison of Gibraltar from having any intercourse with the country; notwithstanding which, a clandestine trade is carried on, particularly in tobacco, of which the Spaniards are exceedingly fond. Gibraltar, which was formerly a military government, is now a body corporate, and the civil power lodged in its own magistrates.

The military establishment of Gibraltar has been very much increased of late years; and if in the year 1773 the fortress was deemed impregnable, what must it be in the year 1779. In the course of six years past many hundred thousand pounds have been laid out to great advantage in that garrison. There is no fortification so strong in the world.

Seville is the capital of Andalusia, and though we have heretofore given some account of this place in Major Dalrymple's travels, yet as it is a capital city in Spain, with whom a great deal of trade is carried on by the English, it cannot but be acceptable to our readers to have a more copious one, taken from the accounts given by other historians.

The castle of Aleazar, or the royal palace here, was built by Don Pedro, king of Castile and Leon, in the fourteenth century. Philip the fifth resided here many years, and spent his time in drawing with the smoke of a candle, on deal boards, and in angling for tench in a little reservoir. Here are some of the most beautiful hanging gardens in the world, where are several pastures surrounded by galleries and terraces, intersected by myrtle hedges, and jessamine bowers. The perfumery is as delightful as orange trees, &c. can possibly make it. By the playing of the water works, a very pretty effect is made, for nothing can be more delicious in a hot and sultry day: the flowers seemed to acquire new vigour, and the odours exhaled from the citron, orange,

orange and lemon trees were vastly poignant and balsamic.

The antient colony of Italica is entirely in ruins, and scarce any remains are to be seen, by which you can form any judgement of what it was formerly. It is imagined, that Scipio formed this colony of his veteran soldiers. Here are ruins of an amphitheatre built with pebbles, and brick arches, some of the vomitoria cells and passages are yet discernible. The people of Seville have blown up many of the stones which formed this edifice, with gunpowder, in order to embank the river Guadalquivir. Near the amphitheatre are the remains of an antient aqueduct. The orange trees here are very large, and the fruit is much more pleasing to the eye than the oranges of Portugal.

Seville was, under the Roman government, embellished with many magnificent buildings, both of utility and amusement. Here the Gothic kings resided, before they removed the court to Toledo. The city was taken by storm by Musa, the Saracen viceroy, and in the general confusion that ensued on the downfall of the kingdom of Cordova, it became an independent sovereignty, but this was annihilated in 1097. Ferdinand the Fifth obliged Seville to open its gates to him, and acknowledge his dominion. It is said, that at this time, three hundred thousand Moors left the city, and carried their arms and industry into Mahomet's territory.

The magnificence of Seville was established in a great measure by the discovery of America: the new found treasures arising from this hemisphere were deposited here, as the fleets returned into the Guadalquivir. At that time the sovereign frequently honoured this place with his presence, and merchants flocked here to traffic, the sailors wantonly lavished their treasure, which they had acquired in America. The danger and embarrassments in the navigation of the Guadalquivir were an effectual stop to its rising splendor; and what was before the highest pitch of grandeur, was reduced to solitude and poverty.

The walls of Seville appears to be of Moorish construction; the shape of the city is circular; its circumference is about five miles and a half. The streets are crooked, dirty, and narrow: in the heart of the city is a handsome, spacious walk, adorned with rows of old elm-trees: this is decorated with two statues; that of Hercules the founder, and Julius Cæsar the restorer of Seville. The churches are built and ornamented in a very barbarous stile: the cathedral is not equal to York Minster for lightness and elegance. Don Sancho the Brave began this church in the thirteenth century, and John the Second finished it about an hundred years after. The large orange-trees that shade the fountains in the middle of the cloysters, make them a most agreeable walk. In the charidad and church of the capuchins, are many very excellent pictures, such as St. Elizabeth, queen of Hungary, curing the lepers and other deceased persons: the representation of Moses striking the rock, &c.

The great aqueduct here is esteemed by the Seville historians as one of the most wonderful ornaments of antiquity now existing; but its arches are unequal, its architecture is neglected, and its direction is very crooked. The conduit is leaky, and a rivulet is formed of the waste water. It is not certain whether this is a Moorish or a Roman work: it is, however, exceedingly useful, and conveys an abundant supply of water many leagues from hence. The snuff manufactory in Seville is a lucrative branch of commerce, and is situated in a handsome, regular street: but they adulterate the snuff so much of late years, that its exportation has fallen off amazingly. It is said, that the profits of the snuff and tobacco sold out at the office amount to six millions of dollars per annum.

The exchange was formerly a place of great resort, but is now deserted by the merchants: it was erected in 1583. The building is square, and the stile plain and noble, and is a monument of the good taste of the Spaniards at that period. The hospital and the marine school are more remarkable for their size than

for any other merit. The police of this city is very severe.

The castle of Carmona is in ruins, but covers a vast extent of ground; it contains many buildings, which served as a palace and fortress for Don Pedro the Cruel. The town of Carmona is large, and stands on an eminence. It makes a figure in Roman history, and has many remains of Roman antiquities. The country about it is open and hilly, is very pleasant, and has plenty of wood and water. The road from Seville hither is very good. Ecija is prettily situated on the river Xenil, has many pleasant walks, and here are an astonishing number of steeples. The country about Cordova is bare, hilly, and arable; its approach is very agreeable, its environs are delightful, and there is a great variety of wood and water. The river Guadalquivir runs before the town: a bridge of sixteen arches leads from the south into Cordova, near the end of which is the cathedral, which was formerly the mosque. Many parts of the walls of the town are as the Romans left them: the streets are crooked and dirty. The palaces of the bishop and of the inquisition are extensive, and the hospital for the education of orphans is a noble work; the nobility here parade about in their coaches, which are very elegant. The noblesse are very sociable, much more so than in any other part of the kingdom. Thirty families, or more, meet every night at a house chosen by rotation, where the ladies do the honours: the women are in general very handsome.

Toledo is very oddly built, and is not much unlike the city of Durham, or Richmond in Yorkshire, although it is not so handsome as either for want of trees, which are a capital ornament. The city stands on a rocky peninsula, is very ill built, poor, and ugly; the streets are very steep, and nobody ventures down them in a carriage. The Tagus runs by the city; the palace is a noble and extensive building; the antient palace was burnt down by the allied army: the architecture is good, and the inner court is very grand; the cathedral is not remarkably beautiful. The wealth of the archbishop and chapter displays itself in the profusion of gold lavished on the walls. They have a group of angels fixed behind the choir, and they esteem it the glory of their church. It is a great misfortune that the people, who shew you the curiosities and antiquities in Spain, are very ignorant and uninformed; they have got their tale by rote; and if you ask them any one question out of the beaten track, they cannot answer you. This is particularly the case at Toledo: here they shew the stone on which the Virgin Mary stood, when she came to pay a visit to St. Ildephonsus.

In the convent of St. Francis, which was founded by Ferdinand and Isabella, the first novice received was Ximenes, who rose to be a cardinal, archbishop of Toledo, and prime minister of Spain, and all this promotion took place in the course of the same reign. From Toledo to Madrid, the roads are insufferably bad, and the country is very unpleasant.

Mr. Severibane and his fellow travellers, on their arrival at Madrid, found that the court was at Aranjuez; they therefore immediately set out for that place, and give the following account of it.

The beauties of Aranjuez are very great, its situation is one of the most agreeable in the world. It stands on a very large plain, surrounded by very high hills; there are many avenues of trees around it, many fountains, and shady groves, vegetables in great perfection, and plenty of milk and butter. The walks and rides along the banks, through the venerable groves, and under the majestic elms, are luxuries unexperienced by the rest of Spain. The beauties are much enhanced by the flocks of various birds that sing on the boughs, by the herds of deer which amount to several thousand head, and by great droves of cattle of all sorts. Wild boars are frequently seen at night, in the streets of Aranjuez.

In the warm weather, the company retire to a garden, in an island of the Tagus, which is an heavenly place, and is cut into a variety of walks. The

flowering shrubs, instead of being regularly cut, have been suffered to grow of their own accord, that nature as well as art might appear to have a hand in constituting the delights of this place. The west front of the palace is very handsome. The apartments are good, but do not contain a great number of pictures or statues. Where the sovereign resides, near ten thousand are supposed to live here during two or three months in the spring. The king keeps an hundred and fifteen sets of mules, which require a great number of men to take care of them. Half a million sterling has been laid out here to great advantage since the year 1763, and wonders have been performed with it. The place is truly magnificent, and is very neat and convenient. The principal pleasures of Aranjuez are walking and riding, going to court, dining with some of the great officers of state, or driving along the avenue, playing at cards, and the Italian opera. The grandees are very easy, free, and unrestrained. The king (Charles the Third) is a good looking man, at least much better than his picture represents him. His face, by being exposed to all weathers, is become a deep copper colour; he is rather short of stature, is narrow in the shoulders, and is thickly built about the legs and thighs. He generally wears a large hat, a plain grey frock, a buff waistcoat, a small dagger, black breeches, and worsted stockings. On particular days he wears a fine coat, but he is the greatest economist of his time, and therefore makes the black breeches serve for every suit. No weather can keep him from shooting, and there are but two or three days of the year in which he does not employ part in this his favourite diversion. If he hears of a wolf being seen at a distance, he will drive over half the kingdom rather than not pursue him. Many idle fellows in the country are employed to beat the hedges, and all the places of retreat, and drive the wild boars, deer, and hares into a ring, where they pass before the royal family. A large annual sum is paid to the farmers, &c. by way of indemnification for the loss of their corn damaged by hunting. The king generally sees events on the favourable side; only he is of a phlegmatic temper, and whatever he determines, is as good as done, it being absolutely out of any one's power to alter his mind by persuasion. He is a man of strict probity, and incapable of adopting any scheme which is not, in his view of things, just and honourable. He is rigid in his morals, and strictly attached to his religion, though not so much so as to render himself the tool of churchmen; these have sometimes experienced great severity at his hands. He is very strict in the education of his children, and obliges them to fish and shoot as long as he does, in order to prevent their having too much waste time upon their hands. At court, he seldom addresses himself to any young men, but generally those of his own age. He has completed many buildings since his accession, and made many roads. He has naturally no great relish for arts, but thinks himself bound, as a sovereign, to encourage them.

The prince of Asturias is severe in his appearance, his voice is harsh, and he is of an athletic make. The princess is not handsome, but is very lively and genteel; she has a most delicate hand and arm. When she walks out, all persons who have been presented to her are expected to join her, and stay with her as long as she thinks proper. She is very mild and good-natured; this has very much softened the uncouth roughness of the Prince's disposition.

Don Gabriel is timid to a great degree, but is tall, and a well-looking man: he possesses many talents, and has a turn for mathematics. Don Antonio is very much pleased with a sportsman's life. The Infanta Maria Josepha is but in a bad situation for a woman of her rank, and has reason to envy every poor girl she sees. Celibacy, etiquette, and confinement, seem likely to be her only lot during life. The king's brother, Don Lewis, after having been an archbishop and a cardinal, is on the point of marriage with a pretty Arragoneze girl, whom he took a fancy to as she was running across the fields after a butterfly. The king

has consented to this wedding with some reluctance, and it has produced a total alteration in the marriage laws of Spain. A new edict is published, preventing all matches of unequal rank and quality; whereas formerly it was not in the power of parents to hinder children from marrying whom they liked, and they were compelled to make them a suitable settlement. Don Lewis is cheerful, affable, and full of pleasantry. The king, and all the males of the family, wear the ensign of a great variety of military orders. On the left breast is a rose of stars; they also wear a blue ribband of the French order of the Holy Ghost, and the ensigns of the Golden Fleece of Burgundy; they likewise wear the Neapolitan red sash of St. Januarius, the red cross of Calatrava, and the green cross of Alcantara. The present king established another order on the birth of the last son of the prince of Asturias, called the Conception: this is a blue velvet ribband.

The breed of horses in Spain is not so much attended to as formerly. The king has some beautiful stallions, and he has likewise a race of jack asses, which are of a peculiar size and shape; they are fourteen hands high, have very large heads, thick legs, and rough coats over their whole body; they are extremely furious in the covering season. Each ass covers twenty mares, and they cost about two hundred and fifty pounds sterling each.

The method of conducting a bull feast is: one or two tarjadors, dressed in rich jackets, breeches, and boots made of very strong leather, and broad trimmed hats, and holding under their right arm a long lance, parade on horseback round the lists, and pay their respects to the governor of the place; afterwards they retire to the post fronting the door, which is opened to let out the bull. The person who opens the door, climbs up immediately into the gallery, lest the bull should make a home-thrust at him. The cavalier presents the head of his horse to the bull, and with the lance, pushes it away to the right, at the same time bearing his horse to the left. The bull is driven out of the line by the violence of the thrust, and its horns pass behind without hurting either horse or rider. Sometimes they attack with a kind of forked dagger. The houseman stands close by the door, and as the bull springs forward, he plants the weapon in the back of its neck, and kills it on the spot. If he is not skilful in this business, and should happen to miss his aim, there is scarce a possibility of his escaping from the rage of the animal; which makes this method of attack less practised than the other. In order to take off the bull's attention, several fellows run on foot and throw darts at it, which sticking in the head and shoulders, drive it almost to madness. These people are often in great danger, and are obliged to run for their lives. The bull will sometimes single out a particular man, who has nothing to trust to but his agility, as he has no weapon of any kind. When the poor creature has afforded sufficient diversion, the governor gives orders for its being killed. This is done in the following manner: a champion steps forth with a short brown cloak hung upon a stick; held out in his left hand, and a straight two-edged sword in his right. He advances up to the bull, and provokes it to action; the bull darts at him, and makes a push obliquely, with its eyes shut, he turns it off with his cloak, retiring a little on one side to be ready for the return. On the second attack, he holds the sword in a horizontal position, and with such a steady aim, that the creature rushes upon the point, and forces it up to the hilt. The bull generally drops down instantaneously, but sometimes stands a few minutes. If the bull should prove cowardly, and not run at the man, it is dispatched by stabs in various parts of the body, or worried by bull dogs. The last bull of each feast has his horns muffled, and the mob is let in with sticks in their hands, either to beat the animal, or perhaps to be bruised and tossed about themselves.

Madrid has very little to distinguish it; it never was the see of a bishop, has no cathedral, nor any church worth notice. The architecture of the churches

here is very bad; they are all small, and poor in marble as well as pictures. Their altars are piles of wooden ornaments, heaped up to the ceiling, and stuck full of wax-lights, which have often been a means of setting fire to the buildings. Henry the Fourth was the first king who made any long abode at Madrid. Before his time it was a very insignificant place, and had only a small castle for the convenience of their sovereign princes who came hunting in this neighbourhood. After the sovereign took up his residence here, the nobles of course followed. The palaces of the noblesse are but few in number; that of Medina Cœli has many precious monuments of antiquity in marble; as the duke of Alba's is a very curious painting of Corregio, called the School of Cupid, where the Deity is represented as given by Venus to Mercury's tuition. Among the portraits, the most curious are the duke of Alba, and of Anna Bullen, queen to our Henry the Eighth.

The royal palace is all of white stone. Each of the parts are four hundred and seventy feet in length, and an hundred high: the height towers above all the country, and nothing intercepts the view. No palace in Europe is more magnificent; the ceilings are masterpieces of their kind; the marbles are disposed with great taste, and they are all produced in the quarries of Spain. The great audience chamber is very rich. The walls are incrusted with beautiful marble, and large plates of looking-glass in superb frames. Here is an excellent collection of pictures done by the best masters. At the bottom of the palace-yard is the armoury, which contains a curious assortment of antient arms and weapons, which are kept exceedingly bright. Some suits of mail are embossed with great nicety, and the temper of the sword-blades is quite wonderful. The palace stands on the brow of a steep hill; they have cut a broad road with an easy ascent from the river up to it. The finishing and fitting up this palace has, in all probability, saved the city from ruin, by fixing the court to this spot. The king does not like to sojourn here, on account of the insurrection which the people once made, when slouched hats and large cloaks were prohibited, at which time the king carried his point, and the military quelled the mob. The attachment a Spaniard has to a flapped hat, is amazing, though he is obliged to wear it in a triangular form when he is within the bounds of the proclamation, yet he indulges himself with flapping it on all sides when he gets out of them.

The present king has finished the Prado, which, if they manage the trees properly, will be one of the finest walks in the world. All the coaches of Madrid drive in the ring here.

The Escorial is a very celebrated convent, and is situated in the corner of a lofty ridge of mountains. The landscape is grand, and at one view you command one of the largest edifices in the world, a boundless extent of woodland, and a good view of the whole city of Madrid; but as we have already given a minute account of it, we shall proceed to give some particulars relating to St. Ildelphonso, which palace was much embellished by Philip the Fifth. Here the court come in the hot months of summer, as it is remarkably cool and salubrious, yet its situation is exposed to sudden and frequent changes of temperature. A romantic brook runs over the rocks at a small distance from the town, and serves the king as a fishing place. The palace is patch-work, and the architecture very far from being agreeable. Here are many good pictures, but not equal to those at the Escorial. The gardens are in the formal French stile. The trees cannot take deep root, as the soil is so shallow.

The water-works of St. Ildelphonso surpass every thing of the kind; they send forth a stream as clear as crystal, whereon the sun-beams play in a most beautiful manner. The designs of the fountains are elegant, and the great cascade is admirable for its symmetry. The fountain of Diana is rich indeed, and exceeds all conception as well as description. These fountains are supplied by two reservoirs at the foot of the mountain.

Below the town is the manufactory of plate glass belonging to the crown, where near three hundred men are employed constantly.

Segovia is admirable for its aqueduct: this is a noble monument of antiquity both for its solidity and the lightness of the design. Some people say it was erected by Trajan, and others by Hercules. The Romans certainly were the builders of it, but no inscription leads to the precise period when this took place. It seems likely to remain many ages yet to come. The cathedral of Segovia is one of the handsomest in Spain; the inside is majestic, and not so much loaded with ornaments, for which the churches in this country are so justly reprobated. The castle stands in a very fine position; the royal apartments are now occupied by a college of young gentlemen, cadets, who are educated, at the king's expence, in all the sciences requisite for the forming an engineer: another part of the palace is allotted as a prison to some captains of ships, whose crews work in the Arsenal at Carthagen. These captains, who are Turks, are very handsome looking men; they are well treated, and are left to themselves; they spend their time in conversation, smoking, and playing at chess. Their lives pass on easy and tranquil, as is consistent with a state of confinement. The mint, which is below the palace, is the most ancient place of coinage in the kingdom. Most of the streets in the town are crooked and dirty, the houses are wooden, and appear very wretched: the country round about is esteemed the best for feeding the sheep which bear the fine wool.

Olmedo is a ruined town, in a fine plain, rich in brood mares, black sheep, corn, and pasture. Here are some pine woods, in one of which is a grand monastery of Bernardines. Valladolid is a large rambling city, full of buildings, which are much fallen to decay. Philip the Third made this his constant residence; it was consequently that of the great officers of state, and the nobility of various ranks. These having followed the court in its different emigrations, the buildings have fallen to decay, and exhibit a scene of desolation. The private houses are ill-built and ugly; there is something still magnificent in the palace. The Dominican convent, which is a Gothic edifice, is the most remarkable in the city. The university is in a decline, and the manufactures are at a very low ebb.

Burgos is the ancient capital of the kingdom of Castile, but has been long since abandoned by its princes. Its approach is rather pleasing. The females here are particular in their dress and demeanour, and as particular for their awkwardness and ugliness. The abbey De las Huelgas, near this town, is one of the best endowed in Spain. Its nuns are of noble extraction, and the lady abbess is almost a sovereign. The convent is not very showy, and is built in an unpleasant situation. The cathedral of Burgos is very magnificent; it rises high, and is seen at a great distance. Its form is exactly that of York Minster; the only difference perceivable between the cathedral at York and that at Burgos, is, that the one retains its internal images and ornaments, and the other does not.

The people of Biscay are very different from the rest of the Spaniards, they do not even use their language, and call the king of Spain only Lord of Biscay. The Biscayners are stout, brave, and choleric. It produces the best sailors in Spain, and the soldiers are a very valuable set of men. Their situation being mountainous, it has afforded them opportunities of withdrawing themselves from every yoke which has been offered to be put upon them. Their privileges are very extensive, and they watch over them with a jealous eye. The men are well built and active, like other mountaineers. The women are very beautiful, tall, light, and merry.

The journey from Biscay to Victoria is over one of the finest plains in the world: its fertility is wonderful, and the number of villages and buildings you pass render it very agreeable. Victoria itself is placed

on a hill, and is seen from all the environs. The streets are narrow and gloomy, the houses being built of a dark coloured stone.

In order to make our new collection of Voyages and Travels as complete as possible, and to make it serve as a Geographical Dictionary, we shall proceed to give some account of those provinces and towns in Spain which our travellers have not given a regular description of, as they did not lie in their route. This account we shall select from the most renowned geographers, and close the history of Spain with some remarks upon the character and manners of the Spaniards.

The province of Asturias is a principality, and gives title to the hereditary prince of Spain, has Galicia on the west, the Bay of Biscay on the east, the sea on the north, and old Castile and Leon on the south. It is one hundred and ten miles long, fifty-four broad, fertile, but thinly inhabited. The people, who are very poor and proud, pique themselves upon being the genuine descendants of the antient Goths. The principal places in this principality are,

Oviedo, the capital, which is situated twenty miles from the Bay of Biscay, between the little Ove and Duva, from the former of which it is supposed to take its name. It is the see of a bishop, who is immediately subject to the pope, and has an income of twelve thousand ducats. Here are also an university, founded in 1580, several convents, chapels, churches, and hospitals: and here Pelayo, and the first Christian kings, after the conquest of Spain by the Moors, resided. The neighbouring country is very mountainous, and abounds in grain, cattle, and chestnut-trees. The town has strong walls, and is the seat of the royal audience for the province.

Gyon is a small town near the sea, has a good wall, castle, and port. It was called, by the Romans, *Aræ Sextiæ*, or *Sestiniæ*, and was once the capital of the Asturias, and the residence of Pelayo, whose successors, for some time, stiled themselves kings of Gyon.

Sanmillana is a small town on the Bay of Biscay, belonging to the duke de l'Infantado, to whom it gives the title of Marquis.

St. Andero, formerly *Portus Sancti Emederi*, is a small town, with a large, secure, and well fortified harbour, which, however, has a dangerous rock at the entrance.

The earldom of Liebana, in this province, belonging to the dukes de l'Infantado, is one of the most craggy and mountainous parts of Spain, so that the Moors could never get footing in it.

Bilboa is the capital of the province of Biscay, and, though no city, is pleasantly situated on the river Ybaicabal, six miles from the sea; where it has a good port, and a great trade in iron wrought and unwrought, wool, saffron, and chestnuts. It is large and populous, standing on the place which was formerly the *Portus Amanus*, and took its name from a ford near the town, as having been at first called *Bello Vado*, which was at last corrupted into *Bilbao*, or *Bilboa*. The government suffer none to settle here, nor indeed in the rest of the province, but such as can prove that they are descended from the antient Gothic Christians, and that their blood is untainted with that of Jews or Moors.

Orduma, eighteen miles from the sea, is, though very small, the only place in the province which has the name of a city; and Duraugo, fifteen miles south east of Bilboa, has a great iron manufactory.

In Guipuscoa, the chief places are,

San Sebastian, which is a pretty large town, and noted port, on the Bay of Biscay, at the mouth of the little river Gurumea, by the antients called *Menascum*. The town is handsome, well fortified, and has a good harbour and citadel, carrying on also a considerable trade in iron, steel, and wool, and enjoying a pleasant prospect of the sea on one side, and the Pyrenean mountains on the other. Here is a company which trades to the Caraccas.

Fuentarabia is a small neat town on the utmost bor-

ders of Spain, next to France, from which it is separated only by the river Bidassoa, or Vidasso, at the mouth whereof it stands. It has a pretty good harbour, and is fortified both by nature and art. The island of Pheafants in the river Bidassoa, nine miles from Fuentarabia, was famous for the peace of the Pyrenees concluded in 1659, between Maria Theresa Infanta of Spain, and Lewis XIV.

Tolosa, twelve miles south of St. Sebastian, is a neat town; Mondragon is celebrated for its mineral springs; Solmas for its salt springs, and the *Sierre de Adriane*, in this district, is the highest mountain among the Pyrenees.

The province of Navarre in Spain is called Upper Navarre, to distinguish it from Lower Navarre in France; has Arragon on the south, the Pyrenean mountains on the north and east, and Old Castile and Biscay to the west; being eighty miles long, and seventy-five broad. It abounds with cattle, sheep, game, horses, honey, oil, wine, some grain, a few medicinal waters, and some minerals. No part of the revenues of this province, by a particular compact, is permitted to go into the royal treasury, but all is obliged to be appropriated to the public service.

The principal places of the province of Navarre are, Pampelona, the capital, situated at the foot of the Pyrenees, and walled. It is said to have been built by Pompey the Great, and from hence called *Pompeopolis*. It is the see of a bishop, who is subject to the archbishop of Burgos, and has a revenue of thirty thousand ducats. Here is an university founded in 1608, two castles, several churches, and a great many convents. Two high roads lead from this city, over the Pyrenees, to France; one to Bayonne, through the valley of Batan; and the other, which is the best, to St. Jean pie de Port, by the way of Tarassa.

Tafalla, on the river Cadaco, is a large handsome city, containing an university, and is defended by a castle; and Oléta on the same river, though now an inconsiderable place, was formerly the residence of the kings of Navarre.

The city of Tudela is pleasantly situated on the banks of the river Ebro, fifty-eight miles south of Pampelona. It is walled, and has several churches and convents, with a stately bridge over the river Ebro.

Estella is a very handsome town on the river Ega. Its name signifies a star, having been built to guide and comfort, like a star, the weary pilgrims, passing through these wild mountains, in their way to Compostella.

Cascante is a small city on the banks of the river Quelles, in the district of Tudela. Its Roman name was *Cascantum*; and some coins of Tiberius are still extant, inscribed *Municeps Cascantum*.

Viana, a town situated on the river Ebro, formerly gave title of prince to the eldest son of the king of Navarre; and Songueffa is a small town on the river Arragon.

The kingdom of Arragon has the Pyrenees on the north, Valencia on the south, Catalonia on the east, and Castile and Navarre on the west, being one hundred and seventy miles long, and one hundred and ten broad. It is barren, though well watered.

Saragoza is the capital city of Arragon, and is situated on the banks of the river Ebro, almost in the heart of the province. It was antiently a Roman colony, and called *Cæsaria* or *Cæsar Augusta*, of which its present name is a manifest corruption. It is a large, magnificent, populous city, standing in a pleasant fertile plain, watered by four rivers, and containing a great many splendid convents and churches; but the cathedral is an old irregular building. The archbishop has a revenue of fifty thousand ducats. The university here was founded in 1744. A great many persons of quality reside in this city, which has also a considerable trade, and is the seat of the court of royal audience for Arragon, of the governor and captain-general, and an office of inquisition. Of the churches, that of our Lady of the Pillar; and of the convents, that of St. Francis, are the most remarkable. Here

are two stately bridges over the Ebro, and the walls of the city, though old, are strong and lofty.

Huesca is a handsome town on the river Isuela, about thirty miles north-east from Saragoza. Here is an university, which was founded in the year 1354; and it is the see of a bishop, who has a revenue of thirteen thousand ducats per annum; here are also several monasteries. The city stands in a healthy pleasant air, and the soil is fertile.

Turriel is a city on the banks of the Turias or Guadalaviar, where it is joined by the Alhambria, about eighty miles south of Saragoza. The river is called by Ptolemy Turiolus, and much extolled by Claudian for the rich flowery verdure of its banks. Here is a citadel, and the see of a bishop, who is suffragan to the archbishop of Saragoza, and has a revenue of six thousand ducats.

Albarracin is a walled city, called antiently Lobetum and Turia, situated on the Guadalaviar, towards the borders of Castile. It had its present name from a Moorish nobleman, who was lord of it. Here is a castle, and it is the see of a bishop, who is suffragan to Saragoza, and has an income of six thousand ducats per annum.

Daroca is a considerable town on the river Xilcoa, and is forty-eight miles from Saragoza. It is walled, and situated on an eminence, amidst a fertile and delicious plain. Here are several convents, chapels, squares, and fountains; and in the neighbourhood is a large cave, of which they tell many wonders. They pretend also to have in one of their churches six linen cloths, stained with the blood that came from so many consecrated wafers, which were wrapped up in them, upon an alarm of the approach of the Moors.

Tarazona is a considerable town on the little river Queiles, thirty-six miles north-west from Saragoza, mentioned by Pliny, Ptolemy, and Strabo, under the name of Turiaffo. Near it is Mon Cayo, antiently Mons Caci, which name the Spaniards pretend it had from the tyrant Cacus, who was killed by Hercules. The town is well built and walled, carries on a good trade, and is the see of a bishop, who is suffragan to Saragoza, and has a revenue of twenty thousand ducats per annum.

The city of Borja is small but pleasant, near Mon Cayo, about thirty miles from Saragoza, towards the west-north-west, called by antient writers Belsinum, and Balsio. It is walled, and has a castle, with several convents.

Xaca is at the foot of the Pyrenees, sixty miles north-east of Saragoza; is a well built walled town, has a strong castle, and is the see of a bishop.

Loarre is a village at the foot of the Pyrenees; Xavier, on the river Callego, has its name from the famous St. Xavier. La Puebla de Alfuideu is a handsome town near the river Ebro. Montalvan is a fortified town, belonging to the order of St. Jago; and Alcanitz on the Guadalope appertains to the order of Calatrava.

Calatayud is forty-five miles south west of Saragoza, is pleasantly situated, has a fine air, strong walls, many convents, and is celebrated for its fine tempered steel.

Barbastio is situated on the Vero, over which it has a stately bridge. It stands in a fertile plain, is surrounded by a wall, contains several convents, and is the see of a bishop.

Lerida, in Catalonia, on the Segre, is an antient, handsome, and strong city, one hundred and five miles north-west of Barcelona. It contains several convents and monasteries, an university, a court of inquisition, and is a bishop's see.

Salfona is in the heart of the province of Catalonia, is strongly fortified, and the see of a bishop. Balagner, on the Segre, is nine miles north-east from Lerida; and Vique, thirty-six miles north from Barcelona, is almost encompassed by the rivers Ter and Naguerra, over which it has several bridges.

Palamos is a little town on the bay of the sea, near

Cape Palafugel, with a good harbour. It is fortified, has a citadel, and gives the title of count.

Girona, antiently called Gerunda, is a considerable town in the east part of the province of Catalonia, is about twenty-one miles from the sea, and sixty north-east of Barcelona. It stands at or near the conflux of the Ter and Onhar; has strong old walls, and other fortifications; with a great many convents, and an university; it is also the see of a bishop, who is suffragan to the archbishop of Tarragona, with a revenue of three thousand ducats per annum. The neighbouring country is reckoned the most fertile in Catalonia, and the town carries on a pretty trade, and gives the title of count.

Roses is a strong town, and has a good harbour, on a bay of the sea. It owes its name and origin to the antient town of Rhoda, which stood a little way off, near Cape Cruz.

Peucedra is a large town, and is the capital of the earldom of Cerdagne. It is fortified in the modern manner, and stands betwixt the rivers Carol and Segre, at the foot of the Pyrenees.

Urgel, formerly Orgia and Orgelium, is an antient city, earldom, and bishoprick, not far from the Pyrenees, on the banks of the Segre, about ninety miles north-east from Barcelona. It is well walled, has an antient castle, and several convents, and its territory is extremely fertile.

The inhabitants of the province of old Castile being famous for their skill in breeding sheep, we shall give some account of their method of proceeding, in the words of an eminent writer on that subject.

“From computations made with the utmost accuracy, it has appeared that there are five millions of fine woolled sheep in Spain, and that the wool and flesh of a flock of ten thousand sheep produced yearly about twenty-four reals a head, which we will suppose to be nearly the value of twelve English sixpences; of these, but one goes clear a head to the owner yearly, three sixpences a head goes yearly to the king, and the other eight go to the expences of pasture, tythes, shepherds, dogs, salt, shearing, &c. Thus the annual product of the five millions of sheep amounts to thirty-seven millions and a half of sixpences, a little more or less, of which there are about three millions and a half for the owners; above fifteen millions go to the treasury, and seven millions and a half to the benefit of the public.

Ten thousand sheep compose a flock, which is divided into ten tribes. One man has the conduct of all. He must be the owner of four or five hundred sheep, strong, active, vigilant, intelligent in pasture, in the weather, and in the diseases of sheep. He has absolute dominion over fifty shepherds and fifty dogs, five of each to a tribe. He chooses them, he chastises them, or discharges them at will: he is the prapostitus, or chief shepherd of the whole flock. One may judge of his importance by his salary; he has forty pounds a year and a horse, whereas the first shepherd of a tribe has but forty shillings a year, the second thirty-four, the third twenty-five, the fourth fifteen, and a boy ten shillings a year. All their allowance is two pounds of bread a day each. They may keep a few goats and sheep in the flock, but the wool is for the master; they have only the lambs and the flesh. The chief shepherd gives them three shillings in April, and three in October, by way of regale for the road; and these are all the sweets these miserable wretches enjoy; exposed every day in the year to all weathers, and every night to lie in a hut. Thus fare, and thus live, generally to old age, twenty-five thousand men, who cloathe kings in scarlet, and bishops in purple; for that is the number computed to keep the fine woolled sheep of Spain, with the same number of dogs of the large mastiff kind, who are allowed two pounds of bread apiece a day.

The first thing the shepherd does when the flock returns from the south to their summer downs, is to give them as much salt as they will eat; every owner allows his flock of one thousand sheep one hundred

aroves, or twenty-five quintals of salt, which the flock eats in about five months; they eat none in their journey, nor in their winter walk. This has ever been the custom, and it is the true reason why the kings of Spain cannot raise the price of salt to the height it is in France, for it would tempt the shepherds to stint the sheep, which, it is believed, would weaken their constitutions, and thereby prejudice the wool. The shepherd places fifty or sixty flat stones at about five steps distance from each other, he strews salt upon each stone, he leads the flock slowly through the stones, and every sheep eats to his liking.

The fleeces of three rams generally weigh twenty-five pounds; there must be the wool of four weathers and five ewes to weigh that quantity.

The latter end of September the sheep begin their march towards the low plains; their itinerary is marked out by immemorial custom, and by ordinances, and is as well regulated as the march of troops. They feed freely in all the wilds and commons they pass through; but as they must necessarily pass through many cultivated spots, the proprietors of them are obliged by law to leave a passage open for the sheep, through vineyards, olive-yards, corn-fields, and pasture-land common to towns; and these passages must be at least ninety yards wide, that they may not be too much crowded in a narrow lane. These passages are often so long, that the poor creatures march six or seven leagues a day to get into the open fields, where the shepherd walks slow, to let them feed at ease and rest; but they never stop; they have no day of repose, they march at least two leagues a day, ever following the shepherd, always feeding or seeking with their heads towards the ground, till they get to their journey's end.

The chief shepherd's first care is, to see that each tribe is conducted to the same district it fed in the year before, and where the sheep were yeaned, which they think prevents a variation in the wool, though indeed this requires but little care, for it is a notorious truth, that the sheep would go to that very spot of their own accord. His next care is, to fix the toils where the sheep pass the night, lest they should stray, and be devoured by the wolves.

The shepherds make up their poor huts with stakes, branches and brambles, for which end, and for firing, they are allowed by the law to cut off one branch from every tree.

In the month of May they pay the twentieth lamb; the other half tythe is paid in the winter walk. They cut off their tails five inches below the rump for cleanliness: they mark them on the nose with a hot iron: they saw off part of their horns, that the rams may neither hurt one another nor the ewes. They render impotent the lambs doomed for docile bell-wethers, to walk at the head of the tribe; they make no incision: the shepherd turns about the testicles with his fingers in the scrotum, till he twists the spermatic vessels as a rope, and they wither away without any danger.

As soon as the month of April comes about, the shepherds must exert all their vigilance, lest the sheep should escape; it has often happened, that a tribe has stolen a forced march of three or four leagues upon a sleepy shepherd; but he is sure to find them; and there are many examples of three or four strayed sheep walking an hundred leagues to the very place they fed the year before.

Some of the shearing-houses are capable of containing twenty thousand sheep: the ewes are so tender, that if they were immediately after shearing exposed to the air of a bleak night, they would all perish.

There are one hundred and twenty-five shearers employed to shear a flock of ten thousand sheep: a man shears twelve ewes a day, and but eight rams: the reason of this difference is, not only because the rams have larger bodies, stronger, and more wool, but because the shearers dare not tie their feet, as they do those of the unresisting ewes. Experience has taught, that the bold, rebellious ram would struggle

even to suffocation in captivity under the shears: they gently lay him down, then stroke his belly, and beguile him of his fleece. A certain number of sheep are led into the great shelter-house, which is a parallelogram of four or five hundred feet long, and one hundred feet wide, where they remain all day. As many as the shearers judge they can dispatch the next day, are driven from the shelter-house into a long, narrow and low place, where they remain all night, crowded together as close as possible, that they may sweat plentifully, which softens the wool for the shears, and oils the edges. They are led by degrees, in the morning, to the spacious shearing-hall, adjoining to the sweating-room. The shepherd carries them off, as fast as they are sheared, to be marked with tar; and as this operation can only be performed upon one at a time, it gives an opportunity to the shepherds to cull out for the butchery all the sheep of the flock which have out-lived their teeth. The sheared sheep go to the fields to feed a little, if it be fine weather, and they return in the evening, to pass the night in the yard before the house, within the shelter of the walls; but if it be cold and cloudy, they go into the house: they are thus brought, by degrees, to bear the open air, and their first day's journies from the shearing-house are short.

The wool is divided into three sorts: the back and belly give the superfine, the neck and sides give the fine, and the breast, shoulders, and thighs, the coarse wool. It is sold after it is washed; for, as it never loses less than half its weight in washing, and often more, when the sweating is violent, half the carriage is saved."

We shall now proceed to give an opinion of the constitution, character, and manners of the Spaniards inhabiting the different provinces.

The most active stirring set of men, and the best calculated for business, are the Catalans. The Valencians are more sullen and sedate, and better adapted to the occupations of husbandry, and are of a timid, suspicious disposition. The Andalusians appear to be great talkers, and are generally esteemed the rodomontades of Spain. The old Castilians are laborious, and retain much antient simplicity of manners. The new Castilians have a manly frankness, and little appearance of cunning or deceit; they are both determined and brave. The Arragans appear to be a mixture of Castilians and Catalans. The Gallicians are plodding, pains-taking men; and the Biscaymen are acute, diligent, warm, and very impatient of controul; indeed they rather resemble a set of republicans than the subjects of an absolute monarch.

Indolence is not discernible in any country more than in Spain. Great numbers of men are seen to pass the whole day, wrapped up in their cloaks, either dozing against a tree, or standing in rows against a wall. They seem to have no incitement to action; their faculties appear to have lost their force. They seem to have no hopes beyond the present, and have no idea of patriotism. He does not work (we mean the poorer sort) unless driven to it by irresistible want, for he perceives no advantages to accrue from industry. His food and raiment are purchased at an easy rate, and he will work no more than just to supply the scanty provision his abstemiousness requires. A peasant will even refuse to go an errand in the afternoon, if he has in the morning earned as much as will supply that day's necessity.

Though this is characteristic of a part of the nation, it is by no means so of the whole; some of them will pursue, with great avidity, a favourite scheme. They will exert great powers at a bull feast, and are very much agitated when they are gaming, to which they are remarkably addicted. They want nothing but an object to raise them, and they would undoubtedly pursue it with ardour.

The soldiery, which are in general mountaineers, are brave and hardy; they very seldom flinch, and will march with great deliberation up to the mouth of a cannon. To this they are stimulated by the example

of their commander, otherwise they will not stir an inch. It is astonishing what difficulties they will encounter, and what fatigue they will support without murmuring. The soldiery are sparing in their diet, which arises more from custom than inclination, for when they can get it, they will eat to excess. The Spaniards are fond of spices, and scarce eat any thing without garlic, saffron, or pimento; they are fond of wine that tastes strongly of the pitched skin, and of oil that has a rank smell and taste. The same oil feeds their lamps, dresses their sallad, and swims in their pottage; and it is often the case at posada's or inns, that the lighted lamp is handed down, that each guest may take what quantity he pleases: they use much tobacco both in chewing and smoking. These hot kinds of food, together with the heat of the climate, are the apparent causes of the spare make of the common people.

The Spaniards are by no means so serious or melancholy as they are generally believed to be; they have indeed a gloom upon their countenances, which is the result of misery and discontent, increased by a habit of distrust and terror, occasioned by the inquisition. Notwithstanding this, every village resounds with the music of their voices and guitars, and their fairs and Sunday wakes are very noisy and riotous; they talk loud and very vehemently. The Catalans are expert at ball, and the inhabitants of the island of Majorca are said still to wield the sling, for which their ancestors were so famous: they are in general dirty in their persons, and swarm with vermin; these are generally the effects of southern climes.

The constitution of the Spaniards are composed of the most combustible materials; they are prone to love in such a degree, that few northern nations have any idea of. The custom of embracing persons of the other sex, so much used by other nations, sets the Spaniard all on fire, and they would as soon allow you to sleep with their wives and daughters, as to kiss them; and the ladies themselves look upon that favour as a prelude to others of greater consequence. The very mention of horns is an insult, and makes the blood of a Spaniard to boil. He is equally offended if you suspect him of having an issue.

They appear to be lukewarm in their devotion, and not to be troubled with too much religion, though the country swarms with provincial protectors. Religion must not be investigated in the dominions where that dreadful tribunal, the inquisition, is established; they appear to be solicitous about the regards of their favourite saint, which being obtained, they think themselves freed from any apprehensions of damnation in the next world, and released from the observance of moral duties in this. The fiery zeal which distinguished their ancestors, is nearly at an end; they betray very little concern at the fall of the jesuits, which is one great proof of their indifference about religious matters; and it is pretty plain, that a crafty monarch might make what alteration he pleased in ecclesiastical matters. The jesuits were the most powerful body politic in the kingdom, the rulers at once of the palace and the cottage; they directed the consciences, and disposed the ranks of all men; yet these very men were seized in one night, by detachments of soldiers, were hurried like malefactors to the sea-ports, and banished for ever from the realm. One would naturally think that this business would have occasioned an insurrection among a people attached to the Romish religion; the very contrary was the case, not the least opposition was made or threatened to the royal mandate. Their memory seems to be totally obliterated with their authority.

The furious jealousy of the Spaniard has been much talked of, but is very much exaggerated; the common people are very inoffensive. The most furious instance of passion and cruelty upon record, happened a few years ago at San Lucas. A Carmelite friar fell desperately in love with a young woman, to whom he was confessor. He tried every art of seduction his passion could suggest, but, to his great vexation and disap-

pointment, she was proof against all his designs. He was mad to despair on hearing of her intended marriage to a person of her own rank and consequence. The furies of jealousy seized his mind, and he was determined to be revenged of his rival, by putting an end to her existence. Easter week was the time allotted for the perpetration of this horrid deed. The unsuspecting fair one came to confession as usual, and poured out her soul at his feet; her innocence inflamed his rage the more, and confirmed him in his bloody purpose. He gave her absolution and the sacrament with his own hands, as his regard deterred him from murdering her, before he thought she was purified from all stain of sin and corruption, and her soul was fit to take its flight to the tribunal of its creator and judge. He pursued her down to the church, and plunged a dagger in her heart as she turned round to bend to the altar. The friar was seized and condemned to die; but lest this should be too great a reflection upon a religious order, his punishment was exchanged to that of perpetual labour among the galley slaves. This was an extraordinary instance in Spain. Cannot we equal it in England? Was not the recent murder of Miss Reay to the full as bad?

The education of the Spaniards is too much neglected, and this makes their national qualities, either good or bad, the more conspicuous. Their public schools and universities are in a state of ignorance and irregularity. The improvements in literature and agriculture have gone on very slowly. The catalogue of their living authors is very confined. The common education of an English gentleman, would constitute a man of learning here; and did he understand Greek, he would be quite a phenomenon. That we may not be accused of partiality or misrepresentation, we will present the reader with the dean of Alicant's strictures upon his own countrymen in the year 1722. It must be allowed that a Spaniard is a good authority, when finding fault with a Spaniard. The following are his words, in a letter to count Scipio Maffei of Vienna.

“No country, except Italy, abounds more with ancient monuments than Spain. In every province you meet with remnants of bridges, aqueducts, temples, theatres, circuses, amphitheatres, and other public edifices; most of which have been reduced to their present deplorable condition by the violence and outrage of the inhabitants, rather than by the injuries of time. Such is the nature and spirit of the Spaniards, that to overthrow the monuments of the Pagans or the Romans, is accounted amongst them one of the most meritorious acts of piety, and most efficacious in drawing down the blessing of the Almighty. Alas! such preposterous devotion! but how can it be otherwise with a kingdom, which is ruled by a stupid, idle, monkish tribe; where it is thought a crime to deviate from the rules laid down by the hooded blockheads. Whatever they sputter out, is revered as oracles of old, issuing from the Delphic tripod. The sluggards puffed up with this nauseous adoration, thunders out the pains of hell against all such as so much as look with attention on an ancient statue. When any thing of the kind is dug up, their barbarous hands seize, break, deface it, and, lest the pure light of the sun should be defiled by the sight of such an abomination, it is burnt to lime, and buried in the ground. If the bust of an emperor, an orator, or a philosopher, should happen to be discovered, they cry out, ‘Tis an idol, away with it, destroy it,’ and instantly it shares the fate of Dagon. The vulgar demolish all inscriptions, as they believe their characters are designed to confine some unclean spirits as guardians over hidden treasure. Immense are the quantities of inscriptions that have been defaced, and thrown back into the holes where they had lain hidden for so many ages. Superstition and ignorance combine to demolish every thing of the kind. Many were sent to France, and during the late war of the succession, two English travellers freighted two ships with ancient monumental inscriptions, which they had collected near Terragona.”

Thus

Thus far the dean; and since his time, Don John Celaya, rector of the university of Valencia, directed a number of Roman inscriptions to be buried in the foundations of the bridge at Serannos; and a much later instance of the same kind of Coubanim was exhibited by the Franciscan friars at Oliva. But to return;

It is really a matter of surprise how the nobility of Spain was taught to read or write, or, once having attained so much knowledge, how they contrive not to forget it. It is difficult to say what they employ their time in, or what means they take, besides the grossest inattention to run through their large incomes. Great part of them are indeed squandered away upon servants, for when they are once admitted they are never discharged, but for some enormous offence, and both they and their families continue pensioners for life.

The grandees of Spain, very few excepted, are diminished to a race of pigmies, by a series of distempered progenitors; they dwindle away for want of heirs, and it is natural to suppose, that there will be finally an union of all the titles and estates, upon the heads of one or two families. The Conde de Attamira has no less than nineteen grandeeships centered in his person.

The women in Spain are in general small and thin, but few of them are remarkably beautiful, yet almost all of them have eyes full of expression, and are of a sparkling black. They do not paint here as in France. They have a great deal of wit and lively repartee, but this is much obscured for want of the polish of education. Their tempers are pettish and violent, having never been fashioned by polite intercourse, nor softened by necessary contradiction. The ladies about the court are very far removed from beauty, neither do they appear to have any ambition of being esteemed clever or accomplished. They neither read, work, write, or play on any musical instrument. The debauchery of the country is very indelicate, and their amours are quite barefaced. As soon as the ladies come out of the convent, and before they have fixed upon a lover, they spend their time in the following manner. They rise late, loiter away what remains of the morning, or wear it out at church in unmeaning prayers: dine sparingly, sleep, and then dress to spend two hours on the Prado. When dark, they run to the house of some old female relation, and all huddle together over a pan of coals. This having passed, they run home to their maids, and help to dress their own suppers by way of amusement.

We have been induced to give this copious account of Spain and its manners, chiefly because the generality of people are little acquainted with that country. The same reason induces us to give a further account of Portugal, in addition to what major Dalrymple has said of that country. We repeat it, that the best of authors shall be quoted.

We will begin with the capital of Portugal, which is Lisbon. This famous city is pretty nearly in the same state in which the earthquake left in 1755. There are many new buildings upon the ruins, which when completed will make a most beautiful new city. Lisbon is built on seven steep hills. The streets of it are badly paved, and they have no lamps, which renders walking in the night very unsafe as well as unpleasent. About a fifth of the inhabitants are black. The houses are from two to three stories high: no room except the kitchen has any chimney in it. They are not remarkable for their architecture, and are built with a bastard kind of marble, have iron balconies and wooden lattices to the ground floor. Here are two theatres, one for Italian operas, and another for Portuguese plays; and two public rooms where the British factory assemble twice a week to play at cards, and dance during the winter season. Any British stranger is admitted gratis to these rooms. In the course of the winter they have four fine grand balls and suppers, to which the Portuguese nobility are invited.

The chapel of the church of St. Rocco is particular for having a mosaic pavement. Its altar piece re-

presents the Baptism by St. John; the Annunciation, and the Gift of Tongues: the altar is of silver. Where the royal palace stood, which was demolished by the earthquake, there are many new streets building upon a new plan; the houses are from four to five stories high, and the foot pavement is considerably raised from that where the carriages pass. The exchange, where the merchants assemble, is near the river, and is adorned with porticoes. The arsenal is large, near which is the fish market, which is very commodious and well supplied: as also are the other markets. The country about Lisbon is pleasant, being diversified with groves of orange and lemon-trees, the roads are bordered with aloes: Most of the roads in the environs of the city, are paved with large stones. The aqueduct, in the valley of Alcantara, joins two hills, and is very admirable. The cathedral church stands on the top of one of the seven hills on which Lisbon is built: it is very well ornamented, and has a very large organ.

At Bellem is the king's palace, which is five miles from Lisbon. The theatre here is small, and has no side boxes. The palace is a mean wooden edifice, and has nothing very worthy of remark about it. There is a very large elephant in the garden, which is kept partly covered, and partly exposed to the air. This creature is no less than twenty-two feet high. The castle of St. Julian is about fifteen miles from Lisbon, and is situated at the mouth of the Tagus: it is an irregular building, and founded upon a rock, whose base is washed by the sea. It is well garrisoned, and planted with many very large brass cannon. The road from Lisbon to this castle is paved the whole way, and stands along the banks of the Tagus. It is very pleasant, for on the left you have a grand view of the ships sailing various ways, of the palace of Bellem, of the immense rock called Cape Roque, and by others the rock of Lisbon, the castle of St. Julian itself, and the ocean. On the right you have groves of orange and lemon-trees, laden with fruit and blossoms; abundance of aloes, and Indian fig hedges, and the prospect is agreeably diversified with olive yards, convents, and churches.

The road from Lisbon to Massa is likewise very agreeable. The palace of Massa is situated near the village of that name, and is built with a kind of white marble. The church is placed in the centre of the fabric, has the convent on one side, and the palace on the other. The convent is very large; the palace is not furnished, as the king does not reside here. The navy and army of Portugal are not very formidable, and cut but a poor appearance. The chief order of knighthood is called the order of Christ. It was established in the year 1283. The order is given to such common fellows, that it is almost a disgrace to accept of it, although the king himself wears the insignia of it, which are a star on the left breast, and a small enamelled red cross charged with another white one hanging by a ribbon at the button-hole. They have another order, which is that of Avis, and was instituted in the year 1147. The insignia of this order is a green cross, fleur-de-lis at the button hole.

The nobility of this kingdom is not hereditary; titles being conferred in the same manner by the king as knighthood is in England. It sometimes happens that the son has a title, and the father none. The number of the inhabitants of Lisbon cannot easily be ascertained, no calculation having yet been made. The nobility are divided into three classes. When the servant on horseback rides before a carriage, this denotes the nobleman to be of the first rank; if he rides on one side, he is of the second rank; and if behind, he belongs to the third rank of nobility. Swords are generally worn by well dressed people; lace is prohibited; topazes are in great plenty, and are very much worn.

Portugal is famous for producing oranges and lemons; it likewise produces many other fruits and garden stuff of all sorts, with various medicinal and aromatic herbs and flowers. The quadrupeds are the same as in England, as are the birds and fish.

In the kingdom of Portugal there are some iron mines, and in the last century were several copper ones. Some magnets are found near Cintra, and amber is sometimes met with on the coast near Setubal; turquoises, amethysts, hyacinths, crystals, and mercury are the produce of Portugal. The manufacture of salt is here considerable, and there are many quarries of fire-stone and marble. The Tagus is navigable a little way above Lisbon; its current is broke by many rapid cataracts, and it runs between inaccessible rocks. Tobacco is not allowed to be cultivated here under pain of death; all kinds of it, as well as muffs, are prohibited; except what comes from the Brasils. The ladies here ride on jack asses, with a pack saddle: a servant attends with a sharp stick, to make the beast go faster. The gentlemen ride on horses, and their servants on mules; the physicians do so likewise, for they have no carriages. The common dress is a large cloak and slouched hat, underneath they generally wear a dagger, although it is prohibited. The women wear no caps, but tie a kind of net work silk purse over their hair, and a ribband tied in a bow over their foreheads. The better sort of people dress entirely in the French fashion. The women are very lively, and are perpetually dancing and singing.

The king and queen go hunting every day after wolves and wild boars. Her majesty is very courageous on horseback, and rides in boots and leather breeches. She is an excellent shot.

We shall conclude our description of Lisbon with Mr. Barretti's remarks on the dreadful earthquake before alluded to. "As far as I can judge, (says he) after having walked the whole morning, and the whole afternoon, about these ruins, so much of Lisbon has been destroyed as would make a town more than twice as great as Turin. In such a space, nothing is to be seen but vast heaps of rubbish, out of which arise, in numberless places, the miserable remains of shattered walls and broken pillars.—Along a street, which is full four miles in length, scarcely a building stood the shock; and I see, by the materials in the rubbish, that many of the houses along that street must have been large and stately, and intermixed with noble churches, and other public edifices; nay, by the quantities of marble scattered on every side, it plainly appears, that one-fourth at least of that street was entirely built of marble.—The rage of the earthquake (if I may call it rage) seems to have turned chiefly against that long street, as almost every edifice on either side is, in a manner, levelled with the ground: whereas, in other parts of the town many houses, churches, and other buildings, are left standing, though all so cruelly shattered as not to be repaired without great expence; nor is there, throughout the whole town, a single building of any kind, but what wears visible marks of the horrible concussion.—As I was thus rambling over those ruins, an aged woman seized me by the hand with some eagerness, and pointing to a place just by: 'Here, stranger, (said she) do you see this cellar? It was only my cellar once, but now it is my habitation, because I have none else left! my house tumbled as I was in it; and in this cellar was I shut by the ruins for nine whole days. I had perished with hunger but for the grapes which hung to the ceiling. At the end of nine days I heard people over my head, who were searching the rubbish; I cried as loud as I could, they removed the rubbish, and took me out.'—Hear of another deliverance no less uncommon: a gentleman was going in his calash along a kind of terrace, raised on the brink of an eminence, which commands the whole town. The frightened mules leaped down that eminence at the first shock: they and the rider were killed on the spot, and the calash broken to pieces, and yet the gentleman got off unhurt."

The city of Oporto is the second in the kingdom, and contains about thirty thousand inhabitants. Several English families reside here who are concerned in the wine trade. The factory maintains an English

clergyman, who performs divine service every Sunday at their private houses alternately. The city, as well as its suburb Villanova, are each built upon a hill. The river Douro runs between them. The theatre here is very old and shabby, and serves both for Portuguese plays and Italian operas. The church of San Francisco is full of wooden ornaments, very much carved and gilded. Many letters directed to the saint hang by threads to the walls, which contain complimentary messages for the cures which had been wrought by his means. The streets of Oporto are steep and narrow, and are paved with broad stones. The inhabitants use chaises and horse litters in bad weather, which are supported between two horses or mules. The boats on the river have an awning, and sail cloth hung quite across. The principal article of commerce here is the wine: the merchants have very spacious wine vaults, which will hold six or seven thousand pipes each.

These cities, viz. Lisbon and Oporto, being the two principal in Portugal, we have given this account of them first; and shall now proceed to give a description of the various provinces, cities, and towns that remain, and make remarks at the close upon the disposition, &c. of the Portuguese.

Portugal is divided by geographers into six provinces, viz. Estremadura, Beira, Entre Douro e Minho, Traos Montes, Alentejo, and Algrave.

The province of Estremadura is bounded on the north and east by the province of Beira, on the south by that of Antejo, and on the west by the sea. It is sixty miles broad, and one hundred and twenty miles long: it is very fertile and well watered, and produces abundance of that fruit for which Portugal is so famous, viz. citrons, oranges, lemons, pomegranates, &c. The climate is pleasant and mild; the people are very industrious, and carry on a great variety of manufactures. It contains a great number of small towns, upwards of a hundred of which have nothing particular to distinguish them. The three cities are, Lisbon, Oporto, and Lieria; this latter is very populous, and is situated at the conflux of the Lana.

The province of Beira is the largest in the kingdom, has Spanish Estremadura on the east, Portuguese Estremadura on the south, the Ocean on the west, and Entre Douro e Minho, and Traos Montes on the north. It is about one hundred and forty miles each way, well watered, and naturally fertile; but the inhabitants are remarkably lazy. The most considerable places are,

Coimbra, on the Munda, over which it hath a stately bridge, about ten miles from its mouth, and ninety north from Lisbon. It was antiently a famed Roman colony. Here are now a great many convents, colleges, and churches, besides the cathedral, several courts of justice, one of the tribunals of the inquisition, an university, and the see of a bishop, who is count of Arganil, and has a revenue of forty-three thousand two hundred crusades, or six thousand pounds sterling. The number of the inhabitants is about twelve thousand. The monks of the convent of the Holy Cross here are all noblemen, and of the order of St. Augustine. The university is a very magnificent structure: the professors belonging to it are said to be about fifty, and the students about two thousand. The cathedral is admired for its architecture, its ornaments and riches. The kings of Portugal formerly resided in this city, which is noted for its excellent peaches.

Lamego is a city near the river Douro, about one hundred miles north-east from Lisbon. It is surrounded with mountains, gives the title of count, and contains about four thousand inhabitants, and several convents. Here are also several courts of justice, and the see of a bishop, who is suffragan to the patriarch of Lisbon, and has a revenue of eighteen thousand crusadoes, or two thousand five hundred pounds sterling.

Viseu, a city on a small river, which falls into the Mondego, about one hundred and twenty miles north-

east of Lisbon. Here are several convents, churches, and courts of justice; and here the ancient town of Vacca is supposed to have stood, two old Roman towers still remaining here. The bishop of this place is suffragan to the archbishop of Braga, and has a revenue of two thousand five hundred pounds sterling. The number of inhabitants is said to be about one thousand. The town was raised to a duchy by king John I.

Guarda is a strong city, one hundred and forty miles north-east of Lisbon, contains three thousand inhabitants, and is the see of a bishop.

Castello Branco is a town with a castle, containing a stately palace of the bishop of Guarda, and four thousand inhabitants; Pentrel two hundred miles north of Lisbon, is a strong town; Almeida is a fortified town, near the river Coa; Penamacor is a strong town on the Spanish frontiers; Figuera is a small port, eight miles above Lisbon; and Aviero has a good harbour, and a great salt trade.

The province of Entre Douro e Minho receives its name from its situation, which is between the rivers Douro and Minho; having Galicia on the north, Beira on the south, the Ocean on the west, and a ridge of mountains on the east. It is seventy miles long, and fifty broad; it is remarkable for its fertility, and contains the following places:

Braga, between the rivers Cavaco and Deste, is the see of an archbishop, who is primate of Portugal, and spiritual and temporal lord of the city and neighbouring country. Here is a stately ancient cathedral and archiepiscopal palace, a great many convents, several parish churches, about twelve thousand inhabitants, a noble hospital, a large college, and a house of mercy, which is a charitable foundation for the relief of persons of good families fallen to decay, and for marrying of young maidens, and putting boys to employments. The archbishop's revenue is said to be six thousand pounds sterling. There are some remains of antiquity in it, particularly of an amphitheatre and aqueduct.

Guimaranes is a small but ancient town, belonging to the crown, ten miles east of Braga, and about one hundred and fifty north of Lisbon. It is encompassed with a good wall, contains about five thousand inhabitants, several convents, hospitals, and courts of justice. It has manufactures of linen and fine thread, and is defended by an old castle.

Caminha is a fortified town at the mouth of the Minho; Valenca is a strong town on the same river, near the frontiers of Spain; Villa de Conde is a seaport at the mouth of the Ave, with a strong castle; and Barcellos, on the Cavado, is fortified with a wall and towers.

Villa Nova de Porto, opposite to Oporto, on the south-side of the river Douro, contains three thousand inhabitants; Villa Nova de Carveira, on the Minho, is well fortified; and Pont de Lima, one hundred and eighty miles north of Lisbon, is a very handsome town.

Viana de Fez de Lima, is pleasantly situated near the mouth of the Lima, thirty miles north of Lisbon. It contains about seven thousand inhabitants, several courts of justice, churches, convents, and a considerable magazine; is large, well built, strong, and has a good harbour, with a considerable trade.

The province of Traos Monte has Galicia north, Beira south, Leon east, and some mountains west. It is one hundred and twenty miles long, eighty broad, abounds in game and fruits, produces but little corn, is watered by the Douro, and contains,

Braganza, a city near the river Fervença, at the extremity of the province, and near the borders of Leon and Galicia, is about one hundred and twenty miles northward from Lisbon. It contains about three thousand inhabitants, several convents, and a good castle, has a variety of silk manufactures, and is well fortified. The ancestors of the present royal family were dukes of Braganza, before they were advanced to the throne, in the person of John the eighth duke,

but the second duke, and fourth king of that name. This town is supposed to have been the ancient *Cælia Briga*, *Brigantia*, or *Brigantium*.

Chaves, a town on the river Tamega, is about six miles from the borders of Galicia, and two hundred north-east from Lisbon. It was built by the emperor Flavius Vespasian, anno 78, and called *Aquæ Flaviæ*. There is still a Roman bridge of stone over the Tamega, with other marks of its ancient grandeur. It now contains about two thousand souls, and is well fortified.

Villa-Real, or the Royal Town, so called because founded by king Dennis, anno 1289, stands between the rivers Corgo and Ribira, about one hundred and fifty miles north of Lisbon. It is the best and largest town of the province, and belongs to the Infanta. That called the Old Town is surrounded by a wall.

Miranda de Douro, a fortified town on the frontiers of Spain, so called from its present situation on the north side of the Douro, being well fortified, and the see of a bishop, who has a revenue of fourteen hundred pounds. It stands about one hundred and twenty miles south from Braganza, and one hundred and eighty north-east from Lisbon, belongs to the king, and contains about seven hundred inhabitants.

Torrõ de Moncorvo is a walled town, and contains about seven hundred thousand inhabitants.

The province of Alentejo borders to the north on Estremadura and Beira, to the south on Algarve, to the east on Spain, and to the west on the sea. It is one hundred and twenty miles long, nearly the same broad, has a very fertile soil, and contains,

Evora, sixty-six miles south-east of Lisbon. In this city are several churches, hospitals, courts of justice, convents, a cathedral, an university, and twelve thousand inhabitants. It is the see of an archbishop, who has a revenue of about eight thousand pounds sterling. It is defended by a fort, and other works, and is famed for the institution of the order of Avis, answering to that of Calatrava, in Spain.

Portalegre, formerly *Portus-Alacer*, is a fortified city, about ninety miles east-north-east from Lisbon, and ten from the Spanish frontier. Here are betwixt five and six thousand inhabitants, several courts of justice, fountains, convents, churches, besides the cathedral, a manufacture of coarse woollen cloth, and the see of a bishop, who has about five hundred pounds sterling a year. This town gives also the title of count to the marquis of Gouvea.

Elvas, a city with a castle, and other fortifications, is one hundred and twenty miles east of Lisbon, antiently called *Helva*; and by Pliny, *Alba*. It is the see of a bishop, who has a revenue of about three thousand pounds. The neighbouring country is pleasant, and very fruitful in wine and oil, and the number of the inhabitants amounts to three thousand. Here are several convents, churches, and courts of justice, with a noble aqueduct, extending several miles, and supported in some places by a triple arch.

Beja, a city, antiently called *Pax Julia*, and *Augusta*, about seventy-eight miles south-east from Lisbon, and twelve from the river Guadiana. It is a dukedom, and contains several churches, courts of justice, and convents, with about six thousand inhabitants.

Villa-Vicosa, i. e. the Delightful Town, so called from its beauty, and that of the adjacent country. It stands about one hundred and five miles east of Lisbon, and contains near four thousand inhabitants, several convents, a stately royal palace, embellished with a fine park and a strong castle.

Ourique, Crato, and Barbo, contain nothing remarkable; Avis, sixty miles east of Lisbon, belongs to an order which takes its name from it; Campo-Mayor, one hundred and seventeen miles east of Lisbon, is well fortified, and contains near five thousand inhabitants; Olivença has a strong castle; Moura is a fortified town, near the Guadiana; and Seapa contains four thousand inhabitants.

Engraved for Moore's New & Complete Collection of Voyages & Travels.

Call. Dr. 11 p

Estremaz is one hundred and five miles east of Lisbon, contains six thousand inhabitants, several churches and convents, and is strongly fortified.

The kingdom of Algarve is bounded to the south and west by the Ocean; to the east, by the Guadiana, which parts it from Andalusia; and to the north, by the mountains called Serra de Algarve, or Caldeirao, and Serra de Monachique, which divide it from Alentejo; its greatest length being about one hundred miles, but its breadth only about twenty-eight. Its name is of Moorish extraction, but geographers are not agreed about its meaning. Under it was comprehended formerly a much larger extent of country than at present. The present Algarve was given by Alfonso X. king of Castile, to Alfonso III. king of Portugal, as a dowry or portion, when he married Beatrix, his natural daughter. Though very mountainous, it is extremely fertile in corn, wine, oil, and all sorts of fruits; and contains four cities, twelve lesser towns, sixty villages, sixty parishes, and about sixty thousand inhabitants. The principal places are,

Lagos, a town with a harbour on a large bay, about one hundred and ten miles south from Lisbon, where are several convents and courts of justice.

The city of Faro is situated on a bay, and is well fortified; it contains many churches and convents, and about four or five thousand inhabitants. The bishop's revenue is seven hundred pounds per annum.

Tavira, which is a city, is placed on the bay of the river Sequa; it has a castle, and is walled, and contains about five thousand inhabitants, besides many churches and convents.

The other towns of note are, Villa Nava de Portima, and Sylves, which have nothing very particular worthy of description.

The Portuguese are rather inferior to the Spaniards both in person and genius, but have formerly shewn themselves brave and warlike upon certain occasions: their natural characteristics are malice, haughtiness, cruelty, avarice, and a disposition totally vindictive. They have usually dark hair, black sparkling eyes, and olive complexions. The dress of the men, among the common people, is a large cloak and slouched hat. The women wear large sleeves, heavy pendants in their ears, and very large nosegays. But it is to be observed, that the nobility and gentry of both sexes are more conformable to the French fashions, than those of any other country. The ladies, even the married ones, are some of them attended by cortejos, or gallants, who are similar to the Italian cicisbeos: though this practice is not common.

The king's titles are, "King of Portugal and the Algarves, on this side and the other side the sea of Africa; lord of Guinea, and of the navigation, conquests, and commerce, in Ethiopia, Arabia, Persia, India, &c." The king's eldest son is stiled prince of Brazil. In the year 1749, pope Benedict XIV. dignified the king with the title of his Most Faithful Majesty.

There are several orders of knighthood here, viz. 1. The order of Christ; the badge of which is a red cross within a white one. 2. The order of Aviz; whose badge is a green cross, in form of a lily.

The only religion tolerated in Portugal is that of the church of Rome, yet there are many concealed Jews here.

Besides Jews and heretics, who broach or maintain any doctrines contrary to the religion of the country, the inquisition punishes all pretenders to sorcery and the black art, apostates, blasphemers, perjured persons, impostors, hypocrites, &c. The burning of those condemned by the inquisition, is called an *auto da fe*, or act of faith. There are several tribunals of the inquisition, one of which is at Goa, in the East-Indies; but there are none in Brazil. We are happy, however, to inform our readers, that the power of the Portuguese inquisitions have been of late greatly circumscribed. A gentleman, who very recently visited Portugal, says, "What a change in this country since the last reign! When the clergy governed the

realm; when a bigotted prince and superstitious people indulged their enthusiastic rage at horrid auto's da fe, in watching the torments, and listening to the dying groans of suffering martyrs! The parade of religion still remains; but the force of bigotry, from the great resort of foreigners, particularly English, is much broken, at least in the capital. Now the inquisition only prosecutes; it can neither condemn or punish without the royal sanction.

Coarse silks, woollen cloths, and linen, are the principal manufactures of Portugal; but the commerce, particularly with England, in wine, fruit, and salt, is very considerable.

As to the constitution of Portugal, it is an absolute hereditary monarchy. Both here and in Spain, there were antiently cortes, states, or parliaments; but they have long since entirely lost their share in the legislature. For the administration of the civil government, there is a council of state, and several secretaries; for military affairs, a council of war; for the finances, a treasury-court; and, for the distribution of justice, several high tribunals, with others subordinate to them, in the several districts into which the kingdom is divided. The cities have their particular magistracy. The proceedings of the courts are regulated by the Roman law, the royal edicts, the canon law, and the pope's mandates.

The revenues of the crown, since the discovery of the Brazil mines, are very considerable; but the real amount can only be guessed at. Some have said that it amounts, clear of all salaries and pensions, to upwards of three millions sterling: others make it a great deal less. Thus much is certain, that the customs and other taxes run excessively high. Besides the royal demesnes, the hereditary estates of the house of Braganza, the monopoly of Brazil snuff, the coinage, the money arising from the sale of indulgencies granted by the pope, the fifth of the gold brought from Brazil, the farm of the Brazil diamonds, the masterships of the orders of knighthood, and other sources, yield very large sums. The forces, notwithstanding, of this nation, both by sea and land, are very inconsiderable; their land forces being the worst militia in Europe, and their navy of little importance.

We cannot prevail on ourselves to withhold the following account of society and manners in France, Switzerland and Germany, written by Dr. John Moore, who accompanied the present duke of Hamilton in his travels. We have already described many towns and places in these countries; and, to make the work more complete than any hitherto published, we subjoin this general view. We acknowledge our obligations to Dr. Moore for the information he gives us on this subject, and doubt not but that which gave us so much pleasure in perusing, will give our readers equal satisfaction.

In France, there are many men distinguished at once for their learning, ease, and affability, who do not decide an argument in mixed company with imperiousness, but are in every respect as well bred as those who have no pretension to their superior talents. Throughout the country, politeness and good manners may be traced; the most distinguished nobleman, and the meanest mechanic, have each their pretensions, in different degrees, to these accomplishments; this is a more remarkable feature of their national character than the impetuosity, vivacity, and fickleness, for which both antient and modern Gaul has been remarked: politeness is so very visible in every rank, that you cannot help discerning it. The prosperous are here courteous to the unfortunate; the man in power to his dependents; and the beggar, who asks alms, if he is refused, will meet with an appearance of humanity.

Should a stranger to the country, and in a great measure to their language, be guilty of any grammatical impropriety; should his accent be very uncouth and ridiculous, he is yet heard with the most serious attention, and is never laughed at on any account.

This

This rule extends to dress, which, with the French, is a most important article indeed, yet the most daring deviation from fashion cannot make them transgress the laws of good manners. Should a person appear in the public walks in cloaths made directly out of the fashion, the French let him pass a turn or two unnoticed, before they indulge their curiosity, even by looking at his extraordinary figure.

It must be seen, with indignation, that every thing in this country is arranged for the accommodation of the powerful and the rich. Very little regard indeed is paid to citizens of an inferior station: this is visible wherever you turn your eyes in Paris. Not lighting their streets, is one instance of this; there is no accommodation for the safety and convenience of foot passengers. They must grope their way in the best manner they can; stand behind pillars, or run into shops, in order to avoid being crushed by the coaches, which are driven as near the wall as John pleases. The people on foot are dispersed at their approach, like chaff before the wind. Monarchy is raised, in this country, so very high, that it quite loses sight of the bulk of the nation, and pays attention only to a few, who, being in exalted stations, are treated as appendages of the court. Yet the common people display a remarkable attachment to the person of their prince: this will appear more conspicuous when compared with other nations. An Englishman looks even upon the virtues of his prince with a jealous eye in his life-time, but will not fail to mention them with respect after his death, and transmit his genuine character to posterity. A German is silent respecting the foibles of his prince, and admires all his talents much more than if they resided in a private man. A Persian or a Turk contemplates his emperor with fear and reverence, as a superior being, to whom he is bound by nature's indispensable laws, to pay all homage and respect. A Frenchman knows that his king is of the same nature with himself, and liable to the weaknesses of other men; though he sees and laments his follies, he laughs as he laments them, and is attached to him by respect and tenderness; is prejudiced affectionately in his behalf, notwithstanding his real character may not deserve it; in short, the king is a word which conveys to the minds of Frenchmen the idea of benevolence, love, and gratitude, as well as those of grandeur, power, and happiness.

Every Sunday the people flock to Versailles, behold him with unfated curiosity, and look at him with as much satisfaction the fiftieth time as the first. They consider him as their friend, though he does not know their persons; their benefactor, while he oppresses them with taxes; and their patron and protector, though they are in the greatest danger from a *lettre de cachet*.

The most indifferent actions of the prince are magnified into the greatest importance; his weaknesses are palliated and excused, and his errors and crimes are imputed to the ministers or evil counsellors. Every saying of his, which approaches towards evil in the least degree, or bears the smallest traces of common sagacity, is repeated with fond applause. Whether he eats much or little at dinner; the coat he wears; the horse he rides; every particular of his life, even those which ought not to be mentioned, afford matter of conversation in the various societies of Paris, and occupy the major part of the letters which pass in a friendly correspondence. All Paris, nay, all France, is really alarmed if the monarch has the slightest indisposition; and if any one should be so unpardonably indifferent to neglect this, as the chief topic of his conversation, he would be reprobated by every company.

The troops at a review perform their manœuvres unregarded by those spectators who are within sight of the king. The king, and not the priest, is the object of attention at mass: the host is elevated, but the people are lost in contemplating their beloved monarch. At the theatre, a smile from the king will make them forget the sorrows of *Andromache*.

Neither is this attachment confined to the person of

the king alone, it extends to every branch of the royal family. In this country, it is conceived they have all an hereditary right to every enjoyment which human nature is capable of. The least disappointment or chagrin is looked upon as a dreadful calamity. It may be supposed that this is affected, and an outside show, put on merely for the sake of interest; but as it extends to the bulk of the people, who are very far removed from the eye of the court, this cannot be the case. The whole of the people are so influenced by this unaccountable principle, and are so delighted and dazzled with the lustre of monarchy, that they cannot bear the thoughts of any qualifying mixture which might abate its violence, and render its ardour more benign. They consider the power of the king as their own, and they are even proud that there is no limitation to his authority. They exult in the idea that the king has an army of near two hundred thousand men in the time of profound peace, and are as vain of the king's palaces, gardens, and number of horses, as if they were in reality their own.

If they are told of the immense fortunes which individuals possess in England, the affluence, security, and ease of people of middle rank; instead of being mortified at the comparison, they comfort themselves with the reflection, that the court of Great Britain is not nearly so splendid as that of France, and that none of the English nobility have so great revenues as the duke of Orleans, or the prince of Condé. If you tell them of the freedom of debate exercised in parliament, and if the superior powers abuse this authority, they are amenable to public justice; they tell you with an air of triumph, that the minister of France would shut up such impertinent people as the members of our House of Commons in the Bastille for life. Should an Englishman decant upon the advantages of the British constitution to a circle of French bourgeois, and explain to them in what manner the people of their rank of life were protected from the violence of the courtiers and nobility, and that the poorest mechanic in England could have redress for the injury done him by the greatest nobleman in the kingdom; one would naturally imagine, considering the oppressions they labour under, that they would admire such constitution, and wish for the same in France. No, they would sympathize with the great, and feel for their want of importance. They seem to think that the king of England must be the most oppressed and injured of mankind.

This darling passion of their souls, this extreme attachment to the monarch, is carried with them to the grave. At the battle of Dettingen, a French soldier, who lay covered with his wounds, demanded of his officer, a little before he expired, how the battle was likely to terminate. The officer replied, that the British troops had obtained a great victory. All that the dying man said, was, My poor king! Notwithstanding a subject of the crown of Great Britain wishes the king all public and domestic happiness, yet if the smallest solicitude about either should disturb his dying moments, it would be a striking proof that all his own affairs, both temporal and spiritual were in a most comfortable situation.

A natural conclusion from what has been asserted, must be simply this, that is, whatever light this prejudice in favour of monarchy may appear to the eye of philosophy, and though of all passions the love of a king, merely because he is so, is the most absurd and foolish, yet it ought to be considered as very meritorious by the king himself. No people have so just a claim to the affections of their sovereign. The people rejoice when he rejoices, and weep when he weeps; they are proud of his power, and vain of his accomplishments; indulge his failings, yield their own convenience most willingly to his superfluities, and are ready at all times to sacrifice their lives, and what little fortunes they have to his honour. A monarch, who did not love his subjects, under such circumstances, must be a perfect master of insensibility and selfishness. The very reverse of this is the case, for they

they have not had a monarch worthy of this regard since the days of Henry the Fourth, and of all their kings they used him the worst.

It has been often said, that the French are insincere, and devoid of real friendship; the English in particular are led into this belief, because the manners of the French are obsequious in the extreme. An Englishman would call that flattery, which a Frenchman thinks necessary to good manners. The French language abounds in complimentary phrases, which they distribute very plentifully. They mean very little by it; and take it for granted, that those, on whom the compliments are bestowed, understand the same. They have not the smallest intention to deceive, for they imagine all the world are well informed in this particular; but if any man takes these expressions in a literal sense, he will be very much disappointed indeed, yet he has no right to accuse the French of insincerity or want of friendship; that is entirely out of the question. They never intend to convey any other meaning than this, that they are willing to put him on the footing of an acquaintance. A proper allowance must be made for the different modes and usages of nations, and it is very unfair to harbour unfavourable and harsh sentiments of another nation, because their mode of speech differs from our own. Friendship is a plant which does not grow kindly in any climate. It is a man's peculiar happiness if he can rear a few of them where his residence is fixed; but travellers have no right to expect extraordinary efforts of friendship from the people where his stay is so short that he has not time to cultivate any. It is as much as he can expect if the natives of these countries he passes through are civil and obliging. If the preachers and writers on morality could eradicate selfishness from the human breast, and make men in reality love their neighbours, it would be a change devoutly to be wished for; at least, as far as we can judge, it would be better than the present mode established; but as this is not the case, we should not find fault with those forms and attentions which create a kind of artificial friendship and benevolence, and which in many instances produce the same effects as if they were true and disinterested.

The condition of the common people of France is by no means so comfortable as one would suppose from the gentleness of French manners; though that, in some degree, qualifies the severity of the government. When it is considered what prodigious resources the kingdom has, what advantages it enjoys above other countries in point of soil, climate, and situation; the industry and ingenuity of the inhabitants, who are attached by affection to their king, and are totally submissive to his laws; it is natural to suppose that the chief part of the nation would be quite at their ease, and that poverty would scarcely be known amongst them; not only that ideal poverty which is the child of envy and covetousness, and may be felt by the richest citizens of London or Amsterdam, but that real poverty, when the laborious part of the nation acquire a competent share of the necessaries of life.

To have an adequate idea of the wealth of England, it is necessary to visit the different counties, and see how the nobility, gentry, farmers and country people subsist; the magnificence of the one, and the plenty which abounds among the other, notwithstanding all complaints, must astonish every beholder. To have a favourable idea of the wealth of France, you must confine your notice to the capital, and some of the principal trading and manufacturing towns; but must seldom enter the chateau of the seigneur, or the hut of the peasant: the one will exhibit little but tawdry furniture, and the other the most wretched want and misery. It may happen that a failure of crops, or a careless administration of government, shall at one particular time occasion distress and scarcity of bread; but when this poverty is permanent through many reigns, for a long number of years, amongst the whole peasantry of France, it is surely the proof of a careless and oppressive want.

The French, though naturally gay and volatile, are nevertheless very fond of tragedy; the most sprightly and fashionable people of both sexes flock to these entertainments, though they are in general barren of incident, full of long dialogues and declamatory speeches; yet to these the people listen with unrelaxed gravity and attention. The English are quite the reverse of this: they love shew, bustle, and parade in their tragedies, and have an utter aversion to long dialogues and speeches, however fine and beautiful the language and sentiment may be. In this particular, it should seem that the two nations had exchanged characters. Nature is not the criterion by which the French tragedians are to be tried. In comedy, they excel; in this line, their natural character and manners give them the advantage. There are play-houses established in all the large trading and manufacturing towns; also in all the frontier towns, and wherever there is a garrison consisting of two or three regiments.

We have a phrase in England, which, though a vulgar one, is true, 'Jack can never be taken for a gentleman,' or, in other words, that an Englishman who has once filled a menial capacity, whatever change may have passed in his fortune, his manners are still the same, and he retains the carriage and demeanour of a servant, though he assumes the character of a gentleman, which his fortune is equal to; but this is not the case in France. There are many valets in Paris so very polite, and so completely possessed of all the little etiquettes, fashionable phrases, &c. of the beau monde, that if they had the additional ornaments of equipage and dress, they would pass for very fashionable men in most of the European courts.

Lyons, next to Paris, is the most magnificent town in France, enriched by commerce, enlivened by industry, and is situated in the middle of a fertile country. Its inhabitants are estimated at two hundred thousand. All the luxuries of Paris are to be found at Lyons, though not in so great perfection. The theatre here is esteemed the best in all France. Here is not that difference which generally subsists between merchants, manufacturers, and the noblesse in point of conversation and manners. The people of Lyons, and those of Versailles, are much the same in these particulars; there is indeed a wonderful similitude between them.

Geneva is a most pleasant and agreeable city. The opportunities for improvement are many, and the amusements are but few, and very moderate in their kind. The hours here glide along smoothly, for though they are not always quickened by pleasure, they are unruffled by remorse, and unretarded by languor. One great source of vexation arises from our indulging too sanguine hopes of enjoyment from blessings in expectation, and too much indifference for those in possession; why should not we counteract this general temper, and be as contented at Geneva, with what it affords, as rove all over the world in pursuit of that happiness, which, if we have not here, we shall possess no-where? How foolish and absurd is it for man to permit his comfort to be disturbed, and the present time pass unenjoyed, because he has imagined some pleasure at a distance, which, perhaps, he may never obtain; and if he does obtain it, it may then change its nature, and be no longer pleasure! Dr. Young says,

The present moment, like a wife, we shun,
And ne'er enjoy, because it is our own.

Thus does the devil cheat us out of the enjoyment both of this and of another world, inducing us to prefer the pleasures of time to those of eternity, and continually prefer the future pleasures of this life to those which we might rationally enjoy at present.

The situation of this city is as happy as the heart of man could wish. The Rhone, rushing out of a most noble lake, flows through the middle of the town. Geneva is encircled with fertile fields, cultivated and adorned by the industry, riches, and taste of the inhabitants. The boundaries to this charmingly varied

gated landscape, are a long ridge of mountains, called Mount Jura, on one side, with the Glaciers of Savoy, the snowy head of Mount Blanc and the Alps on the other. The inhabitants of this delightful place enjoy security unbought by the horrors of war, and liberty untainted by licentiousness.

It is a very desirable retreat for a man of a philosophic turn, owing to the great number of men of letters who constantly reside here. If people are contented with moderate and calm enjoyments, this country is preferable to any other. The Genevans are decent in their manners, easy in their circumstances, and humane in their dispositions. The citizens are very well instructed, as learning is remarkably cheap. There is hardly any country in the world that can produce an equal number of persons, on a comparison, with minds so cultivated and improved. Mechanics here amuse themselves in their leisure hours with the works of Locke, Newton, Montesquieu, and writers of that stamp. A liberal education is cheap here, but more so for the natives than foreigners. Wherever the English resort, they either find things dear, or make them so.

The nature of the government of Geneva, which is democracy, inspires every citizen with an idea of his own importance, as no man in the republic can either neglect or insult him with impunity. Here the most powerful man in the state has something to fear from the most feeble; the meanest citizen of Geneva is possessed of certain rites, which render him an object deserving the attention of the greatest. The consciousness of this makes him respect himself, which is not an inconsiderable step towards being respected by others. In this happy republic, a spirit of independence and freedom is tempered by sentiments of decency and a love of order. The inhabitants of Geneva are represented as fanatical, gloomy-minded, and unfriendly, something like the puritans in England, and the presbyterians in Scotland during the civil wars; but this is a very erroneous opinion; there is not a country in the world where the minds of the people are less under the influence of superstition or fanatical enthusiasm. Should the Pope himself chuse to make this city his residence, his person and possessions would be as safe at Geneva as in the Vatican, at least it would be his own fault if they were not so. The clergy here are men of sense, learning, and probity, as well as moderation. They impress upon the minds of their hearers the doctrines of Christianity, with a great deal of eloquence and persuasion, and, what is much more to the purpose, they illustrate their efficacy in the conduct of their lives. People of all ranks attend the public preaching with remarkable punctuality. The Sabbath is honoured with the most respectful decorum during the hours of divine service. After that is ended, the usual amusements, such as public walks, cards, bowls, and different societies, which they call circles, succeed.

Geneva is remarkable for one custom, which does not prevail any where else; it is that of parents forming societies for their children at a very early age; they consist of ten, twelve, or more children of the same age and condition in life; they meet once a week in houses of their different parents; they are entertained with tea, biscuits, fruit, &c. and are then left to enjoy themselves in what manner they think proper. This connection is observed through life, notwithstanding any alteration in situation or circumstances; and to its latest period, they continue to pass a few evenings with the companions of their youth, and earliest acquaintance.

The country houses adjacent to the city of Geneva, which the richer class of citizens inhabit in the summer, are all of them neat, and some of them are very splendid. This situation is delightful, for they command a most beautiful prospect. The Paris de Vaux; the gardens, and vineyards, of the republic of Geneva, with its lake; besides innumerable country seats, castles, and little towns round the lake; the vallies of Savoy, and the lofty mountains of the Alps, are all

contained in one exuberant view. Those citizens, whose fortunes will not allow them to keep country-seats, make frequent excursions upon the lake in summer. They sometimes form themselves into parties of forty or fifty persons, and hire a house and garden near the town, where they assemble in summer afternoons to amuse themselves. Here they continue till the dusk of the evening, when the sound of the drum from the ramparts calls them to town. After the gates are shut, no person can enter or go out without an order from the syndics, which cannot be had but upon an emergency.

The English families live here in great cordiality and friendship with the inhabitants, and contribute their share to render this place, if possible, still more delightful. The people of Geneva seldom venture on a great festivity, without having previously performed religious duties, following the direction of the Psalmist, viz. to join trembling with their mirth. The safety of this republic is intrusted partly to six hundred mercenaries, which are kept in pay, but not to these alone, for all the citizens of Geneva are soldiers, who are exercised several hours daily, for two months, every summer, but receive no pay. As their officers are fellow-citizens, it cannot be supposed that they are under any great degree of discipline, yet they make a very respectable figure in the eyes of a disinterested spectator; they are but few in number, the major part consists of their own peasants, wives, and children; the review of the troops of Geneva meets with more approbation on this account, than any other in the world. During the time of their training, they wear their uniforms, and, at the end of that period are reviewed by the syndics. This republic has long continued in a profound peace, and it is not very likely that the peace will be disturbed, yet the citizens are fond of the parade and pomp of war: they have accordingly established military feasts, for the trial of their skill. This is their most favourite amusement, and they take every opportunity of enjoying it, though some of the citizens deride this little military establishment of the republic, and think it highly ridiculous that such a feeble state should presume to defend themselves; they consequently disclaim against the needless expence of keeping fortifications in repair, and calculate the money lost by so many manufacturers being employed in wielding useless firelocks, when their time would be much better employed in using the tools of their different businesses; but these people resemble our grumbling politicians in England, who are never so happy as when they can find fault. It is very certain, that Geneva would make a resolute defence, owing to its internal and external strength and defence.

Notwithstanding the many advantages which Geneva possesses, and that in an eminent degree, it is a lamentable truth, that suicide is very frequent here: this has been the case as long as the oldest people in the republic can remember; and, it is pretty certain, that it happens oftner here than in any other country in Europe, Great Britain not excepted. Two instances which happened lately, are very remarkable; One was occasioned by an unaccountable and sudden fit of despair, which seized the son of a very reputable citizen. The young man had, in all appearance, every reason to be satisfied with his condition; was handsome, and in the vigour of youth; he was married to a woman of fortune and character, by whom he had one fine boy; nevertheless he found life insupportable, and determined to put an end to it, which he effected just after he had passed several hours in company with his mother, wife, and child, whom he left in apparent good humour and spirits. He went into an adjacent room, applied a musket to his forehead, thrust back the trigger with his foot, and blew out his brains, in the hearing of the company he had just been with. The other instance is that of a blacksmith, who was determined to murder himself, and not having any convenient instrument at hand, he charged an old gun barrel with a brace of bullets; he put one end

into

into the fire of his forge, and tied a string to the handle of the bellows, by pulling of which he could make them play, while he was at a convenient distance; he then kneeled down, and placed his head next the barrel's mouth, moved the bellows by means of the string, blew up the fire, kept his head unmoved with astonishing deliberation, till the powder was kindled, which instantly blew out his brains. These circumstances are well attested, and are undoubtedly no less shocking than true.

It is quite unaccountable, why suicide should be more frequent in Great Britain and Geneva, than in any other country. Various are the reasons assigned by foreigners; but where they hold good, and appear probable in one place, they do not in another. It is more astonishing still, when it is considered, that in these countries, the blessings of life are so well secured to the inhabitants. Whatever is the cause of this fatal propensity, it is very evident that no reasoning can have any hand in preventing it, but what is founded upon a belief of the soul's immortality and a future state. No argument can have any effect upon a man who does not believe that important doctrine. He may be told that he did not give himself life, therefore he has no right to take it away; that he is a sentinel on his post, and ought there to remain till he is relieved, but these will be of no avail to a man who thinks he is not to be questioned for his violence or desertion: if he is told that it is a proof of greater courage to bear the ills of life, than to fly from them in so shameful and disgraceful a manner, he will answer you, by asking whether Cato, Cassius, or Marcus Brutus were cowards? For this reason, those philosophers who have endeavoured to shake this conviction from the minds of men, have opened an effectual door to suicide as well as other crimes.

Lausanne is the capital of the canton of Berne, and formerly belonged to the duke of Savoy. The inhabitants are more at their ease, and in a better situation, than any of the subjects of the king of Sardinia. The city is about thirty miles from Geneva, and is situated near the lake. Here is a greater air of care and gaiety, than in the societies of Geneva, which is owing to the residence of the nobility from the country, and some families of distinction from various parts of Switzerland. The nobles of this place consider themselves greatly superior to the citizens of Geneva, talk a great deal of the poverty, frivolosity, and ignorance of these nobility, and rank their meanest mechanics considerably above them. There is no doubt but there are errors on both sides.

The country between Lausanne and Bevaux is very mountainous; the hills are cultivated to the summit, and covered with vines. It would have been impossible to have done this, had it not been for the proprietors, who have built strong stone walls, at proper intervals, one above another; these support the soil, and form little terraces from the top to the bottom of the mountains. The people who are employed in this cultivation ascend by narrow stairs; and, in order to perform this cultivation, are often obliged to climb higher than a mason does to repair a church steeple. The nature of this country subjects it to frequent torrents; they are sometimes very violent, and sweep away both vines and soil together; nay, sometimes are so rapid as to take wall and all. The inhabitants behold this ravage with a steady concern, between the extremes of clamorous rage and gloomy despair, and behave as wisely, as any people would do in a similar situation; they only think of the best means of repairing the damage. When the storm is over, they begin with admirable patience and perseverance to rebuild the walls, and carry fresh earth to the top of the mountain.

Bevaux is a part of the Pays de Vaud, and is inhabited by the descendants of those unhappy people who were driven by a cruel and unprovoked persecution, from the valleys of Piedmont and Savoy. Whether the iniquity of the persecutors has been visited upon their children, we will not assert; we will take the more favourable side of the question, and say, that

the sufferings and steadfastness of the persecuted seems to be recompensed by the happy situation in which the children of the third and fourth generation are placed. Its situation is delightful, near the head of the lake of Geneva, just where the Rhone enters. The principal church is detached from the town, and is situated on a hill which overlooks it: from hence you have a view of the Alps, &c. In this church are deposited the remains of General Ludlow: he withdrew from Lausanne to this place, after the assassination of his friend Lisle, who was shot through the heart as he was walking to church, by a ruffian who came across the lake for that purpose. On General Ludlow's monument is a long Latin epitaph, but it does not at all allude to his having been one of King Charles the First's judges: from whence it is presumable, that those who protected him did not approve of his sentence against that ill-fated prince.

There is no country in the world more agreeable to travellers in the summer than Switzerland: the roads are commodious, and the inns are comfortable. Some of the most beautiful objects in nature present themselves as you travel, such as woods, mountains, lakes, &c. interspersed with most fertile fields and vineyards, where cultivation is in its utmost perfection, and the eye is charmed with greater variety, and a more extensive scale, than in any other country.

Musten, or Murat, is a little town, situated upon a rising ground, on the side of a lake of the same name. When Charles, duke of Burgundy, besieged it, in the year 1476, he was defeated by the Swiss with great slaughter. Within a mile of this place, near the road, is a small building filled with human bones, which are said to be those of the Burgundians slain in battle: but it is likely that some of the bones of the victors, as well as the vanquished, were thrown in to fill the place. The borders of the lake of Murat are enriched with villages in abundance, and gentlemen's houses. The manners, dress, and persons, of the inhabitants of Murat, differ materially from those of the Savoyards, Genevans, or of the Pays de Vaud.

The peasants here are all robust; their dress is very particular; they wear little round hats, like the Dutch skippers; their coats and waistcoats are of coarse black cloth, and their breeches are made of linen, like sailors' trowsers, but are drawn together in plaits below the knees, with stockings of the same stuff with the breeches. The dress of the women is as singular: they wear short jackets, with a great number of buttons. The single women value themselves on the length of their hair, which is separated into two divisions, and hangs down their backs; it is plaited with ribbands. After they are married, this practice is left off; they then twist it round the head, and fix it at the top with large silver pins: and this is all the difference which matrimony makes in point of dress. Whether married or single, they all wear straw hats, ornamented with black ribbands. They wear their petticoats so high upon their hips, that they appear to have hardly any waist; added to this, they wear a great number of them, which gives an amazing degree of size and importance to the lower and hind part of the body; this deforms the whole person, were she as elegantly made as the Venus de Medicis.

The town of Bern, from whence the Canton derives its name, is regular and well built, and has a magnificent appearance; the houses are well built with white free-stone, and are in general uniform, particularly in the principal street. The streets have piazzas on each side, and the pavement is raised, which is a great convenience in wet weather. The principal street is kept clean and wholesome, as well as pleasant, by a small branch of the river Aar being turned into it. Criminals are here employed in removing rubbish from the streets and public walks; the most atrocious of them are chained to waggons filled with rubbish, which they draw away, and those who are condemned for smaller crimes are employed in sweeping the light dust into the river, and throwing the heavy into the waggons. These criminals have iron collars round their

their necks, with a handle to them, so that they can be checked upon the least appearance of mutiny. This punishment is not confined to one sex alone, but both are subject to it, either for months, years, or life, according to the nature of their crimes.

There are advantages and disadvantages attending this mode of punishment. It deters others from crimes, by having these victims before their eyes continually; and the criminal repairs, by his labour, the injury he has done to the commonwealth. On the other hand, it habituates people to behold the misery of their fellow creatures, hardens the heart of the spectators, and they are, by this means, rendered less susceptible of the emotions of pity and compassion. Where executions and punishments are frequent, the common people are unaffected by them. At Geneva, executions are very rare, and when a person is condemned to be hanged, there is a gloom and uneasiness visible in every company for some days, both before and after the execution.

Bern has many public buildings, of which, the granary, the hospital, the guard-house, the churches, and the arsenal, are the most magnificent. Here are also accommodations for public amusements; such as theatrical exhibitions, balls, and concerts. The latter were built by the nobility, and none but their own order are admitted. Here is a theatre indeed, but nobody has yet played there, as theatrical entertainments are very seldom permitted. Here is a public walk, lately made, on the banks of the river Aar, which is very magnificent and pleasant, from which there is a most extensive prospect. An English gentleman has lately made an addition to the library, by sending two hundred pounds worth of books, written by our best authors.

The arsenal at Bern is in very good condition; there are several trophies contained in it, and the arms are well arranged. The figures of the brave Switzers who first took arms against tyranny are here exhibited, and that of William Tell, aiming at the apple on his sons head. The arms taken from the Burgundians in the various wars are here displayed.

All the different cantons of Switzerland are united together by a common bond; and though they are all of a republican government, yet they differ very much in the form of the different republics, as well as in their religion; though it seems contrary to the nature of a republic to embrace the Roman catholic religion, as that is so favourable to monarchy, yet the case here is otherwise, for those cantons, which are in the greatest degree democratical, are of the Popish persuasion, and that which approaches nearest to monarchy of them all is this canton of Bern, and they are Protestants. This canton is the most numerous and powerful, and is nearly equal to all the rest put together.

At Bern the nobility give themselves airs, and have a great degree of stateliness and pride; they will scarcely condescend to mix with the wives and daughters of merchants at balls and assemblies, where numbers are requisite to complete the entertainment. All the powers of the government, and the honourable officers of the state, are in the hands of the nobility. They are forbidden by the laws of the country to trade in any measure, consequently some of them would fall into poverty, were it not for this resource. The nobility of Bern are all judges, and the executive power of government is entirely in their hands, yet the lower ranks of the people are neither poor nor oppressed: the common trades-people seem to enjoy all the comforts and conveniences of life. The people watch the nobles with a jealous eye when they are about to tax them. They are sufficiently aware of this, and use their power with moderation, lest they should, at any time, forget this salutary caution: a good hint is given, in a German inscription, in the arsenal, viz. that the liberty of Switzerland was brought about, and established, by the insolence and rapacity of those in high power. Another corrective is this, that the Swiss have always arms in their hands.

The town of Solothurn is situated on the river Aar, it has a cleanly appearance, and the houses are well built. It is the capital of the canton of the same name, and the people seem to have a great air of content, though they are Roman catholics. The French ambassador to the cantons has his residence here. The most magnificent modern building in Switzerland is one of the churches of Solothurn. The arsenal here has arms sufficient for the number of inhabitants in the canton.

The town of Basil is larger than any other in Switzerland, but is not so populous for its size as Geneva. The windows here are guarded by iron bars and grates, like those of convents or prisons. The inhabitants seem particularly afraid of thieves: they are of a reserved disposition, and are uncommonly serious and formal in their manner. The library here is much esteemed, and is particularly writ in manuscript. At the Arsenal of Basil, is shewn the armour of Charles, duke of Burgundy. There is a famous painting in the town house, which is supposed to have been executed under the auspices of the famous council who sat so many years, and voted intrepidly against the pope. In this piece the devil is represented as driving the pope and several ecclesiastics to hell: but why they should suffer the devil to be so very active against his holiness, remains a mystery.

In the city of Basil, all the clocks are advanced an hour, so that when it is twelve o'clock at all the villages round, it is one in the city. Though this singularity is some hundred years standing, the origin of it is not known, as the inhabitants give different accounts of it. The most popular story is this, that about four hundred years ago the city was threatened with an assault by surprise; the signal for attack was, when the large clock of the tower should strike one after midnight. The clock-maker, being informed of the expected signal, caused the clock to be altered, and it struck two instead of one, on hearing which, the enemy thought they were an hour too late, and gave up the attempt. In commemoration of which signal deliverance, all the clocks in Basil have struck an hour forward.

In the town of Strasburgh is a numerous French garrison, who are much better clothed and appointed than during the last war. Besides the French, there are two German regiments in garrison here: these soldiers admit of the discipline of the cane on the most trivial occasions, which the French do not, yet the French go through their exercise as well as the Germans. The French officers speak to their soldiers with a vast deal of frankness and good-nature; this does not diminish the respect and obedience of the soldiers, but occasions a grateful attachment and affection. How much better is it to make the lives of so many men as happy as possible, than to use them like brute beasts, which is too often the case!

That which most attracts the attention of strangers in Strasburg, is the cathedral, which is a venerable Gothic pile. The religious melancholy, which usually fills the mind in large Gothic churches, is at Strasburg sufficiently counteracted, for they have exposed the vices of the monks upon every pillar and cornice of the church. They are exposed under the allegorical figures of hogs, apes, monkeys, foxes, &c. who are dressed in monkish habits, and perform the various functions of religion: that no one may be ignorant of the intention of the allegory, a monk in his sacred robes is engraved on the pulpit in a very indecent posture, with a nun lying by him. Some people consider the cathedral of Strasburg as the most impious, and others the merriest Gothic church in Christendom. The steeple is reckoned one of the highest in Europe, and its prospect is very extensive. The great clock, with its various movements, was formerly an object of admiration, but it is now beheld with indifference by modern artists.

Rastadt is the capital of the dominions of the Margrave of Baden Durlach. The town is small, but very populous. The Margrave's palace is large, and sufficient

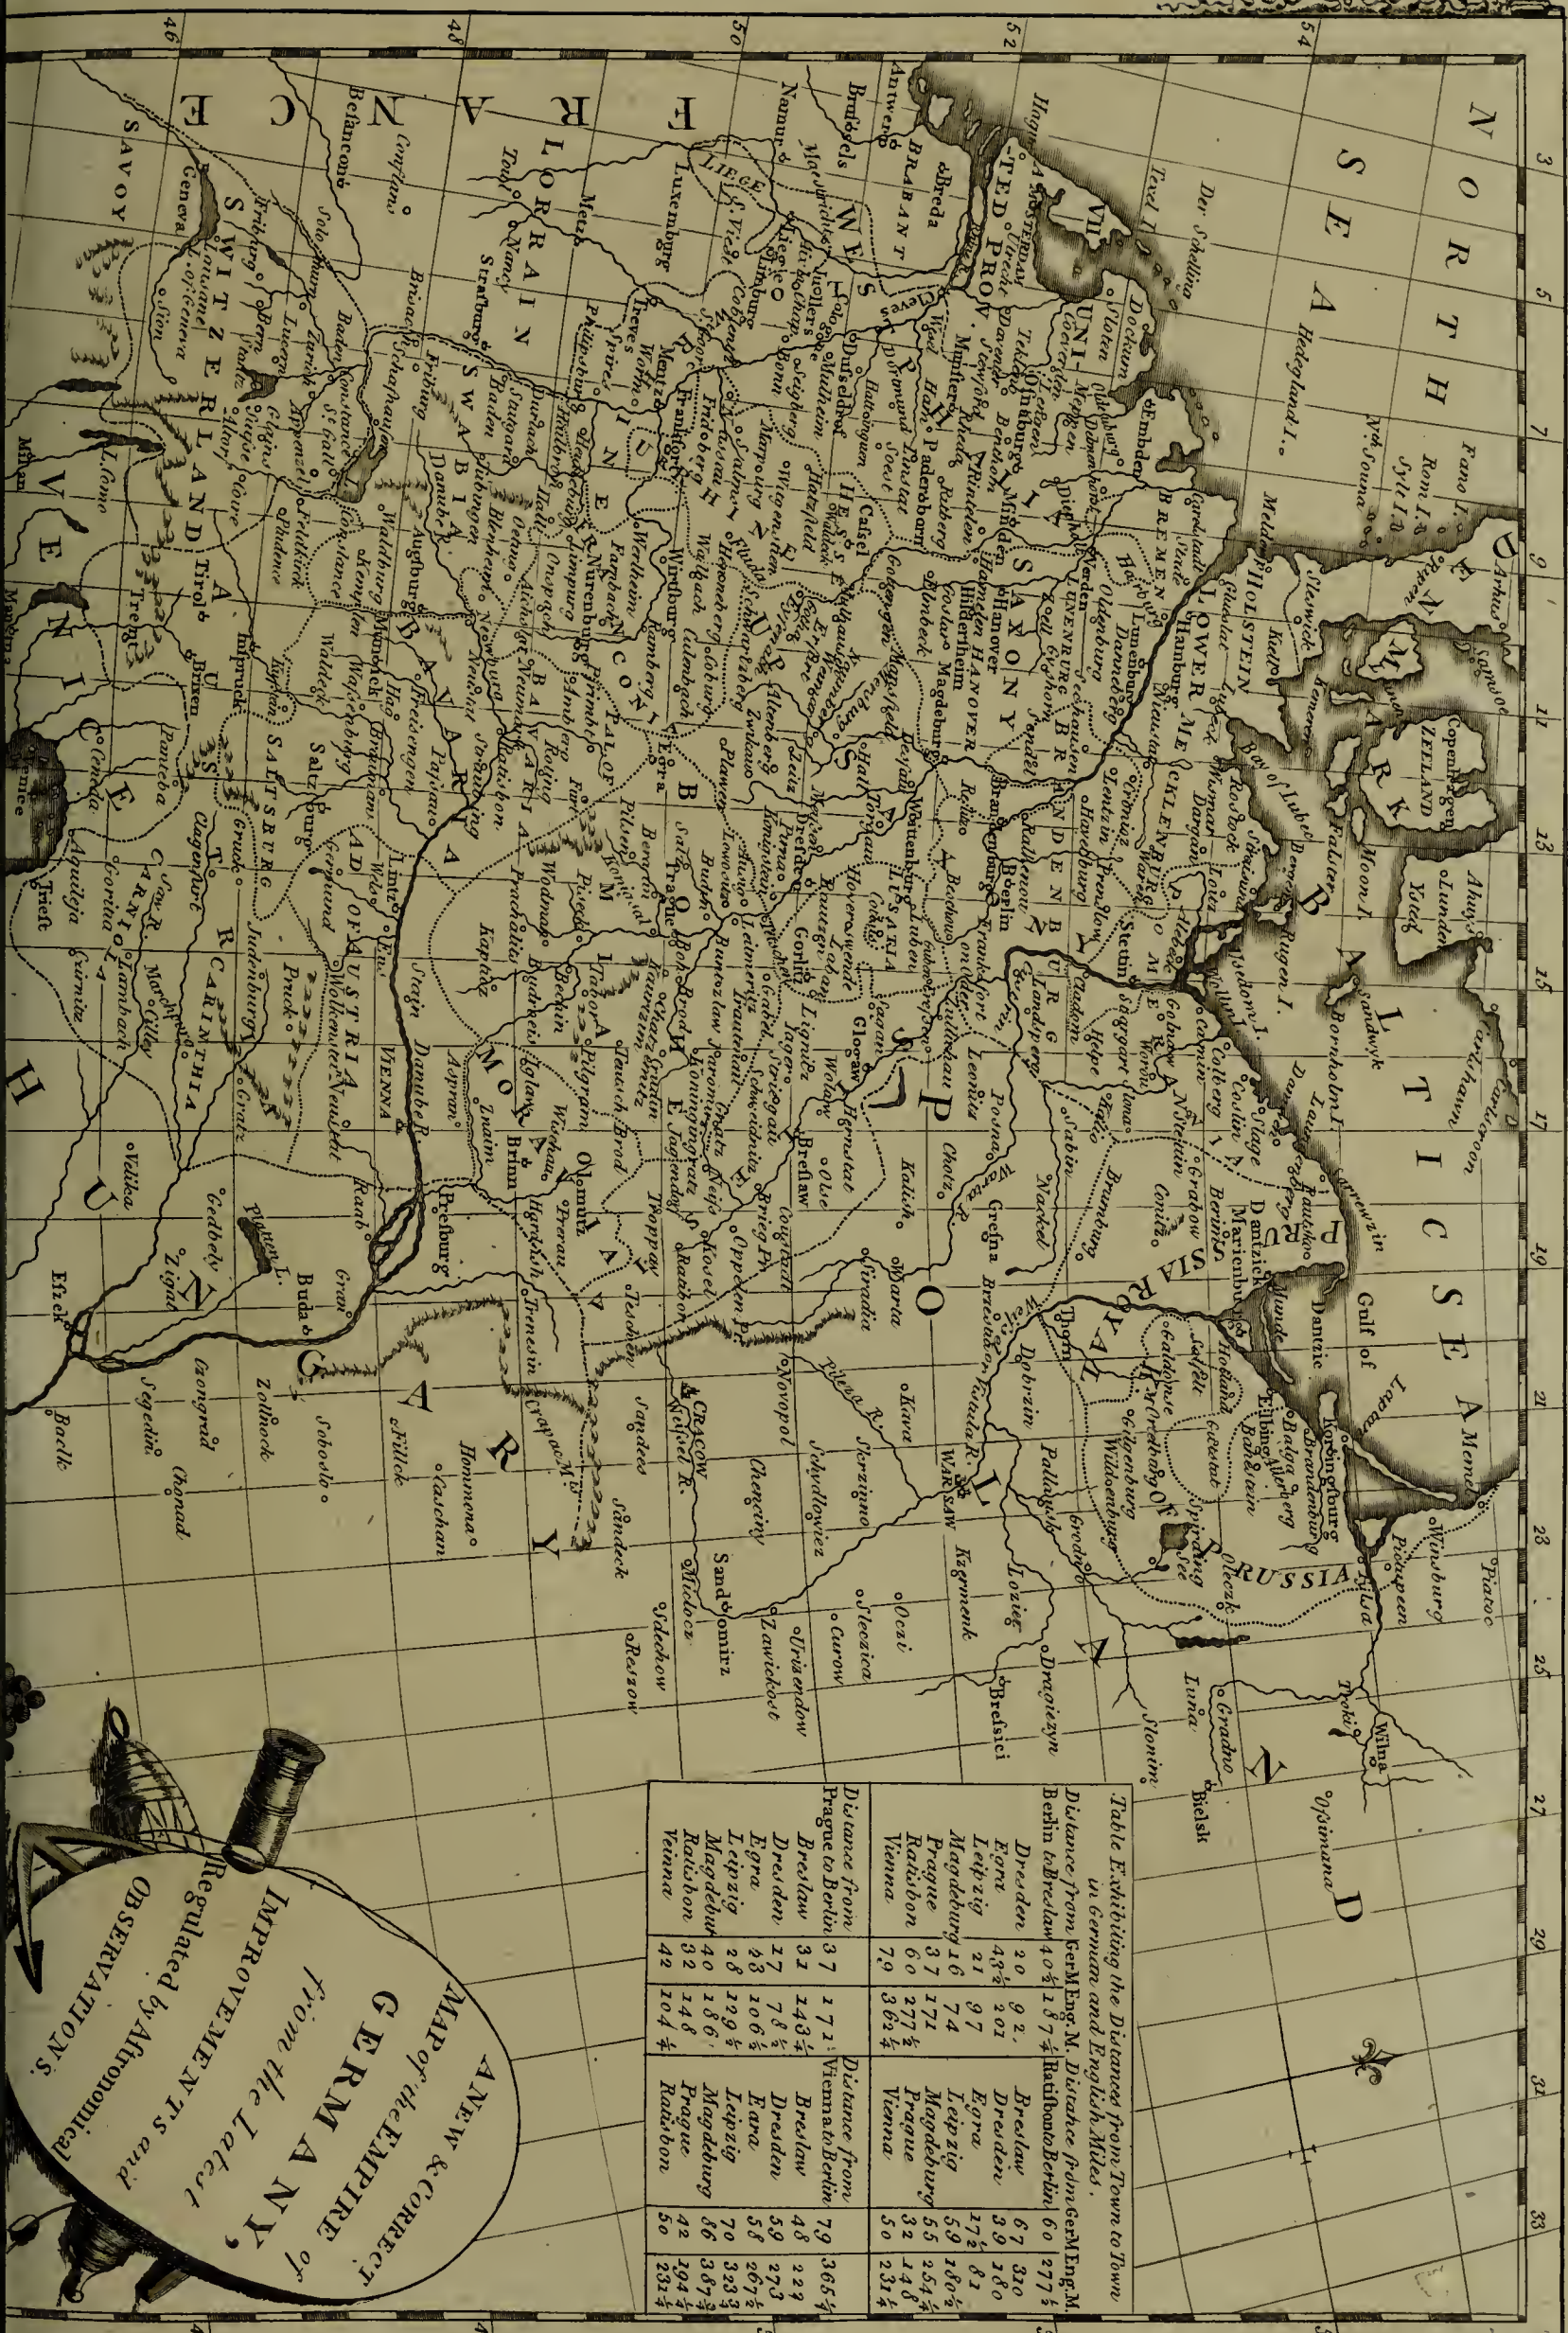

Table F. exhibiting the Distances from Town to Town in German and English Miles.

 IMPROVEMENTS and
 REGULATED by ASTRONOMICAL
 OBSERVATIONS.

to contain all his retinue. He has another palace at Karlfruch, which is built in good taste. The town is built on a regular plan: the principal street is a mile in length, and is capable of being made much larger. The houses are in general very uniform. The Margrave of Baden Durlach is about fifty years of age; he is a man of good sense, learning, and is very benevolent; speaks the English language well, and is acquainted with some of our best authors. All the German princes are minute observers of form and punctilio. The officers of the established household are much the same here as in other courts, with this difference, that their salaries are much less. The paymaster of the British forces has more emoluments than the grand chamberlain, secretaries of state, and a dozen more of these officers all put together. The Margrave has body guards, who do duty in the palace; and foot guards, who parade before it. He has likewise horse-guards and hussars, who are all well disciplined and equipped. Besides these troops which mount guard at the palace, he keeps no standing army, though their finances would better afford it than many other princes in Germany, who nevertheless have little standing armies in constant pay. In this the Margrave judges rightly, for the largest army he could maintain would not be sufficient to defend his dominions, as they are situated between the two powerful states of France and Austria.

The Margrave of Baden is adored by his subjects; he endeavours by every possible means to introduce industry and manufactures among them. Here are many Birmingham manufacturers settled, who instruct the inhabitants; also several watchmakers from Geneva, who have encouragements and privileges of every kind and degree. How happy are the people under the benign government of such a prince! but how much more happy are those, at least if they think themselves so, who are born under a government perfectly free, and who are in no danger from the arbitrary disposition of any sovereign!

Manheim is esteemed one of the most beautiful towns in Germany. The streets intersect each other at right angles, and are quite straight. The number of inhabitants is calculated at twenty-four thousand, including the garrison, which is five thousand strong. There are three entrances to this town, under gates most beautifully executed: the ramparts are about three miles round: the fortifications are nearly surrounded by the Rhine and the Neckar, are well contrived, and in good order. The palace of the elector is a magnificent structure, and is situated at the junction of the Neckar and the Rhine. They boast much of the cabinet of curiosities, and the collection of paintings. The elector is a man of taste and magnificence, appears to be about fifty, and has a sensible, manly countenance. He is much esteemed by his officers, with whom he is very affable and free. A table is provided daily for his officers, of thirty covers, to which those strangers are invited who happen to be at court. At the court of Manheim is an established jester or buffoon; formerly they were in every court, but that practice has subsided.

The town of Heidelberg is about four leagues from Manheim; it is situated in a hollow way, on the banks of the Neckar, and is surrounded by well cultivated hills. These hills exhibit charming scenes of exuberant fertility. Their summits are crowned with trees and their sides clothed with vines. The elector's castle is placed on an eminence, and commands the town and valley below. The inhabitants of the Palatinate are partly Protestant and partly Roman catholics, yet they live in perfect harmony with each other; insomuch that the great church here is divided into two apartments, in one of which the Protestants assemble, and in the other the Roman catholics.

At Manheim, the lives and manners of the inhabitants are as uniform as their buildings. The calmness of the streets of London at mid-night is a picture of these streets at mid-day. The inhabitants seem to be under the same restraint and discipline as the troops.

It is worthy of remark, that not only the soldiers musquets, and the movements of their bodies, during exercise, but also their devotions, are under the direction of the major's cane. Part of the military manoeuvres is performed in the following manner: when the major flourishes his cane, the drum beats single, and every man raises his hand to his hat; when the drum beats a second stroke, the soldiers take off their hats, and are supposed to pray; at a third stroke, they put on their hats again, having finished their petitions. So that if any man has the audacity to continue his prayer longer than the major chuses, he is punished on the spot, and taught to be less devout in future. Whoever invented drums, certainly never dreamed of their becoming the regulators of people's piety.

Through this part of Germany it is very easy travelling; the roads are very good, and the country is a continued plain; there is hardly an ascent all the way from Basil to Mentz. Near the city of Mentz are a great number of friars, of all colours and conditions; their plump persons, and easy complexions sufficiently prove that they do not live in the fertile country near the Rhine for nothing. They appear to pay occasional homage to Bacchus, without being restrained in their worship like the Manheim soldiers. On both sides of the Rhine the ground here becomes hilly and irregular, and forms banks finely exposed to the sun. The best Rhenish wine is here produced.

The town of Mentz is well situated, and plentifully supplied with churches. The cathedral is gloomy and Gothic; it contains a number of jewels, a rich wardrobe for the priests, and some relics. Here are some troops, but the officers seem conscious that the clergy are their masters; they do not appear to have that air of consequence with others of their profession.

The streets of Mentz are built in an irregular manner; they swarm with ecclesiastics, many of them ride in superb coaches, attended by a train of servants. The clergy here seem to take very good care of themselves; yet the rest of the inhabitants appear likewise to be in easy circumstances. This extends to the peasantry themselves.

Frankfort on the Maine is a spacious well-built town, the houses are stately, clean, and convenient; and the shops are well furnished; the air and manners of the inhabitants sufficiently prove that they are not under a tyrant's sway. Though the houses are of brick, they are covered with red stucco, which they think will make the building more durable. Frankfort is a free imperial city, has a small territory belonging to it, and is governed by its own magistracy. Lutheranism is here the established faith, and the magistrates are of that communion. All religions are tolerated here: the Roman catholics possess the principal church of Frankfort, but no public processions of the host are permitted in the streets. They are obliged to confine their ceremonies to the houses of individuals, or within the walls of their church. The Jews have a synagogue here, where they perform their religious ceremonies. The Calvinists have never been allowed any place of public worship within this territory; but are obliged to perform service at a place called Bockenheim, in the county of Hanau. This is very extraordinary, that Martin Luther should shew more indulgence to his old enemy Lord Peter, nay even to Judas Iscariot himself, than to his fellow reformer John Calvin.

There are no public buildings in Frankfort worthy of attention. Here is a custom observed which is very singular, though its origin is very uncertain. Two women appear every day at noon on the battlement of the principal steeple, and play some solemn airs with trumpets; it is accompanied by vocal psalmody, performed by four or five men, who constantly attend the female trumpeters for that purpose. The people of Frankfort have a great taste for psalm singing; many people, both men and boys, have this for their only profession; some families engage them two or three evenings in the week, before the master and mistress get up. When any person in tolerable circum-

cumstances dies, a band of these singers assemble in the streets, before the house, and chant an hour every day, till the corpse is interred; when they bury the corpse, the same band accompanies it to the grave, singing psalms all the way. They conduct their funerals here in a very solemn and singular manner. A person clothed in black heads the procession, carrying a crucifix at the end of a long pole. Many hired mourners, in the same dress, each with a lemon in his hand, follow him. The singers walk next after them, the corpse in a hearse, and the rear is brought up by the relations of the deceased, in mourning coaches. This is the method pursued at all funerals, whether the deceased is a Roman Catholic, a Lutheran, or a Calvinist. It is rather wonderful that the two latter should follow this practice, and particularly the Calvinists; for whatever they did with the lemons, one would think they could never digest the crucifix.

The number of Calvinists at Frankfort is very considerable, and it is believed they are the most industrious people in the place; they certainly are the richest. They are excluded a share in the government, which many of them consider as a hardship: they are chiefly the descendants of French Protestants. Some villages near Frankfort entirely consist of French refugees. Here are one or two families of English extraction.

Frankfort abounds with the children of Israel, but they are subject to a great inconvenience, being obliged to live altogether in a single street, which is built up at one end; at the other end is a large gate, which is regularly shut at ten o'clock at night, after which no Jews dare appear in the streets; the whole herd are cooped up in this place, like so many black cattle, till the morning. The street is narrow and very much crowded with inhabitants, and as the Jews were never remarkable for cleanliness, and are very prolific, it is easy to suppose that this is not the sweetest part of the town; they could scarcely have worse accommodations in the land of Egypt. The principal people among them have frequently offered considerable sums of money to the magistrates to permit them to build or purchase another street, but all to no purpose. The Jews here are obliged to fetch water when a fire happens in Frankfort. They are permitted to chuse judges, out of their own body, to determine disputes amongst themselves; an appeal lies to the magistrates. They have many privileges, to compensate for their inconveniences.

Frankfort is divided into the Noblesse and Burgeois. The Noblesse consists of some good families, from various parts of Germany, who chuse Frankfort for their residence; and some original citizens who have obtained the rank of nobility. The nobility have a public assembly once a week, where they converse, drink tea, or play at cards, from six till ten. On the other evenings they meet at each others houses, and employ the time in the same manner. No families of the other class are admitted to these assemblies, but establish some of the same kind amongst themselves. The Burgeois often entertain their friends and strangers in the most hospitable manner. To some of those entertainments the noblemen are invited, who frequently accept of it, but their ladies never condescend to meet.

Throughout Germany, the difference of ranks is observed with a scrupulous distinction. At the concert, which is supported by subscription here, the wives and daughters of the nobility have the front seats, let them come in at what hour they please, and those of the citizens must be contented to sit behind. Most of the plays represented on the German stage, are translations from the English or French. The French language is cultivated here as only fit for people of fashion to converse in; the native language of the country is treated like a vulgar and provincial dialect. Children in the first families are taught French before they can speak the vulgar tongue; indeed pains are taken to prevent this, that it may not hurt the pronun-

ciation of the other. The German language is nervous and expressive, and capable of all the graces of poetry.

One of the winter amusements of Frankfort is that of the traineau parties, but this cannot be used except there is a great deal of snow upon the ground. A traineau is a machine formed like a horse, lion, swan, or griffin, indeed, in any fanciful form; it is made below like a sledge, that it may slide over the snow. A pole stands upon one side to which a flag is fastened, which waves over the head of those placed in the machine. A lady wrapped in fur, sits before, and a gentleman stands behind on a board made for the purpose. The machine is drawn by two horses, which are either conducted by the postilion, or driven by a gentleman. The horses are gaudily ornamented, and have bells hanging from the trappings which cover them. These parties consist of about thirty traineaux, each attended with two or three servants on horseback with flambeaux, for this amusement is taken when it begins to grow dark. One traineau takes the lead, the rest follow at a convenient distance in a line, and drive for two or three hours through the principal streets and squares, the horses trot briskly, and the motion of the machine is easy and agreeable. What with the torches, bells and flags, it makes a very gay appearance, and is much relished by the parties concerned as well as the numerous spectators.

The residence of the hereditary prince of Hesse Cassel is at Hanau. The prince is not on the best terms with his father, but he lives independently on the revenue of this country, which are guaranteed to him by the kings of Britain, Prussia, and Denmark, but there is no intercourse between the courts of Hanau and Hesse Cassel.

Near Frankfort on the banks of the Maine, but in the territory of the elector of Mentz, is a very magnificent building, which appears to be the residence of a prince or bishop, but is no other than the country seat of a Frankfort tobacconist, who carries on a considerable manufactory here. The building is immense, and the apartments very numerous indeed. The history of this building is as follows: the tobacconist is not a native of Frankfort, though he has for many years been established there. He applied to the magistrate for liberty to purchase a spot of ground to build a dwelling-house, &c. upon, which cannot be done without their consent. This request was refused, he therefore immediately purchased a piece of land in the territory of Mentz, next to that of Frankfort on the banks of the Maine; and, as he was highly piqued with the magistrates, he raised a building much larger than he intended, and much more extensive than necessary, being fully persuaded that the remorse of the magistrates would be in proportion to the size of the building. He has already expended fifty thousand pounds on the temple of Vengeance; but his wrath is still unappeased, he yet lavishes his money with a rancour against these infatuated men, which is very unbecoming a Christian. The wisdom of the tobacconist is not applauded by the inhabitants of Frankfort, though they acknowledge the imprudence of the magistrates; they even assert, that there must be some apartments in the tobacconist's brain, to the full as empty as any in the vast structure he is building.

As Darmstadt is the palace of the reigning prince, this prince has a most enthusiastic passion for military manœuvres and revolutions. His chief amusement is duelling and exercising his soldiers; indeed it is almost his sole employment. In order that no inclemency of the weather may prevent the gratification of this passion, he has built a room which will admit fifteen hundred soldiers to do their exercise. These soldiers here are tall and well clothed, and go through their manœuvres with great dexterity. There is no regular fortification round the town, but a very high stone wall, which is merely intended to prevent the desertion of the soldiers, to which they are very much inclined. The Darmstadt soldiers take no delight in their

their warlike amusements, which constitute the supreme pleasure of the prince.

The horse-guards of the prince are dressed in buff coats, and are magnificently accoutred: there are but few of them; some of these are under six feet three inches high, and several of them are much above that enormous stature. The whole army of the prince of Hesse Darmstadt does not consist of more than five thousand men. He is much blamed for keeping even that number; his subjects say that his revenue will not admit of it, besides they say that manufactures and agriculture suffer considerably by it.

The inns of Frankfort are remarkably good and clean, they have all of them ordinaries both for dinner and supper, as have all the inns in Germany and Switzerland. Here are no private lodgings to be had, as in London or Paris. Apartments are therefore retained at the inns, for strangers, during their residence in the city. It is customary throughout Germany, for ladies who are travelling, to dine at the ordinaries. Though there is much expression in the countenance of a French woman, the German ladies have the advantage of a fairer skin, and a more blooming complexion. They more resemble English women than French, though they differ greatly from them both. A French woman is easy in her manners, and has in general an appearance of great cheerfulness and vivacity. She is willing to be acquainted with you, and expects you will address her. An English woman has more restraint, and a stranger may discover a look which borders upon disdain. Among the most handsome English women, a sulky air often appears. While you are allured with her beauty, your freedom receives a considerable check. A German beauty, though she has not the smart air of the one, nor the reserve of the other, appears much more pleased than either.

The difference of travelling in Germany and France is very visible, and particularly with respect to the postillions. A French postillion is generally either fretting, singing, swearing, or laughing, all the while he is on the road; and though a hill or bad road oblige him to go slow, he is nevertheless cracking his whip without any reason, for he knows that his horses cannot go faster, nor does he mean that they should. Every Frenchman has an utter aversion to quiet, which he sucks in with his mother's milk. The very reverse of this is the case with the German postillion: he drives four horses with all imaginable tranquility: he neither sings, frets, or laughs, he only smokes; and if he comes to a narrow pass-way, he sounds his trumpet, to prevent any carriage from entering at the other end till he has got through. If you bid him go faster, it is of no avail. He is not at all affected, whether the road is good or bad; and it is all the same to him, whether the weather is fair or foul. He is quite regardless of the people he drives, and does not care a farthing, whether they reproach or applaud him. He never loses sight of this one object, which is to conduct the carriage and its contents from one stage to another, with as much ease and safety to his horses and himself as is possible.

The manner in which the genteel people, who are strangers at Hesse Cassel, employ themselves, is this: they generally denote the forenoon to reading; they then go to the palace, about half an hour before dinner, where all the officers who have been invited assemble in a large room. The landgrave soon appears, and converses with the company till the princess Charlotte, his consort, arrives, with such ladies whom he thinks proper to invite. The company then walk into the dining-parlour, where the table is spread with thirty covers, and another table is laid in an adjacent room, where there are as many more. The folding doors are left open, so that it appears but one company. All officers who are not under the rank of colonel, and the strangers, dine at the landgrave's table. Some little time after dinner, the company retire into the room where they first assembled; the landgrave and landgravine leave the assembly, and they all meet again at seven in the evening to cards.

The landgrave plays at a game something like that we call the lottery act, they call it *cavaniolle*, where neither attention nor address is requisite: the landgravine plays at quadrille, and chooses her own party each night. There are other card-tables in the same room for those who choose to play. Gaming continues for two hours: the landgrave then salutes the landgravine on both cheeks, and then retires to his own apartments, and she presides at supper, where there is less formality, and consequently greater pleasure than at dinner. Sometimes there is a concert in the landgrave's apartment, and during the carnival there are masquerades; the men are dressed in dominos, and the ladies in their usual attire; they play at cards, and converse till supper time. Whilst this is about, a gentleman of the court carries a parcel of tickets in his hat, equal to the number of the men in company; which are presented to the ladies, each of whom draws one; the same kind of tickets are presented to the men, who take one a piece. When the card-playing is over, the officer calls number one, upon which the couple who are possessed of that number immediately come forward, and the gentleman leads the lady into the supper-room, sits by her, and is her partner for the evening. The company put on their masks after supper. The landgravine is led into the masquerade-room: all the rest follow, each lady being handed by her partner. Her highness and her partner walk to the upper end of the room, the next couple stop at some distance, and so on, which appears as if they were going to dance country dances, but they only walk a minuet and sit down, except the landgravine, who dances minuets with several gentlemen, afterwards cotillions and country dances, and these continue till five in the morning.

The landgrave of Hesse Cassel is one of the greatest princes of Germany, next to the electors of the empire; and only some of these, such as the electors of Hanover, Bohemia, Bavaria, and Saxony, are more rich and powerful than he. The present flourishing state of its finances is, in a great measure, owing to the large subsidies received from Great Britain during the last two wars, and what it now receives for the hire of their troops. The peace establishment is sixteen thousand men, who are disciplined in the Prussian manner. Here is a company of French comedians, but they are paid by the landgrave for performing twice a week. The inhabitants are chiefly Calvinists, and they shew no great inclination for dramatic entertainments. The theatre is small and neat: the court occupy the front gallery; and when the sovereign rises all the audience do so too, and continue standing till the court sit down.

The country about Cassel is hilly, and abounds with wood. The city is situated on the river Fulda, and consists of the old and new town. The old town is large and irregular, but the new town is regular and well built, where the nobility and officers of the court live: the whole city does not appear to be crowded with inhabitants. The landgrave's chateau is in the town, where he resides in winter, but he has several villas and castles in different parts of the country. One of them is very beautifully situated, near the town, where he resides a great part of the summer: around this palace are some noble parks, gardens, and a very complete orangery. In the menagerie is a considerable number of animals. The academy of arts is situated near the town, and contains many valuable curiosities.

The Gothic temple and cascade at Warenstein is worthy the admiration of strangers: it is situated at the bottom of a high mountain; the principal cascades are in the middle, and on each side there are stairs of large black stones, of a flinty texture, which were formerly brought from a rock at a considerable distance. Each flight of stairs consists of eight hundred steps, which reach from the bottom to the summit of the mountain. When the works play, the water flows over these stairs, and forms two small cascades. There are platforms at convenient distances,
and

and a spacious basin in each. Many statues and sea-deities, with grottoes and caves, adorn the whole. The water rushes from the summit in a great and pleasing variety of channels, in detached cascades, and in large sheets; in one part, the current is broken by a rock, consisting of large stones, artificially placed there: the whole has a most brilliant effect, when viewed from the bottom. On the top of the mountain a Gothic temple is built, and on the top of that is an obelisk, crowned by a colossal statue of Hercules leaning on his club: the figure is made of copper, and is thirty feet high. Within the club is a stair-case, large enough for a man to ascend, and view the country from the top, where there is a window. This noble work at Warenstein is said to be superior to every thing of the kind in Europe, and appears to be one of the displays of Roman magnificence.

The town of Minden is situated in a vale, where the river Fulda is joined by another river, and takes the name of the Wefer. The town of Minden seems to be in danger from frequent inundations.

Gottingen is a neat well built town, situated in a beautiful country. King George the Second established a university here of great reputation.

Brunswick is situated in a plain, on the banks of the river Ocher. The city acquires fresh beauty every day, as new buildings are taking place of the old. The family of Brunswick Wolfenbüttele does not derive greater lustre from antiquity, from having given empresses to Germany, nor from having a branch of the family on the throne of England, than it does from the persons who now compose it. The manners and disposition of the reigning duke make him a conspicuous character, as a sensible, wealthy, benevolent man. His duchess is the king of Prussia's favourite sister: she is addicted to mathematical inquiries, and is fond of study. The duke's military fame is well established: he is splendid in his manner of living, and is fond of magnificent dress. The hereditary prince of Brunswick is well known in England for his many excellent qualities, both as a soldier and a citizen. The princess is likewise too well known to need any description: she has not lost any affection for her native country since she has left it. The prince Leopold, and his sister the princess Augusta, are both beloved for their amiable dispositions. They dine and sup together always, except a day or two in the week. The officers of the court, and the strangers who are invited together, make a company of about thirty at table: in the evening the company is more numerous. Vingtun, is a game that the duke and prince Ferdinand always join in. The hereditary princess always plays at quadrille. Gaming for large sums is very wisely prohibited at this court: the duchess in particular puts a very small stake upon her cards.

Part of the palace is occupied by the family of the hereditary prince, who has seven children: they are very fair and handsome. The duke passes a good deal of time at his country seat, which is about six miles from the town, where he has made considerable improvements. The house is surrounded with a fosse, and contains a great number of apartments. Here are a great number of paintings, which entirely cover the walls.

Fortifications have been the cause of much calamity to many German towns: these not being sufficient to defend them, has attracted the attention of their enemies: for this reason many of them have been dismantled; but the fortifications of Brunswick were of great utility last war, and are now in a good state of defence. The academy here has lately been new modelled, and the plan of education is much improved. This is owing to the attention of the hereditary prince, who has taken much pains to accomplish it. Every advantage will be found here, for those students who intend pursuing a military life. Here are but few temptations to expence, and no examples of extravagance.

The public library at Wolfenbüttele is reckoned one

of the most complete in Germany. Here are many original manuscripts, and, amongst others, some letters of Luther, that eminent reformer.

At Saltzdahlen is a palace entirely built with wood, yet it contains many handsome apartments. Here are a good collection of pictures, placed in a long gallery; and a cabinet of China porcelain, containing several thousand pieces. There are many gentlemen's seats near the town of Brunswick, which, in Germany, is very rare, as you may travel over a vast extent of ground without perceiving any habitations but those of the prince and the peasants; there being very little appearance of mediocrity.

At Brunswick they have some masquerade balls, but the company do not go to them in procession, as at Cassel, but drop in promiscuously. In the masquerade room there is a gallery for the reigning family, who go either with or without masks. The Germans are in general very fond of masquerades; for they are in common so habituated to form and ceremony, that they are glad of an opportunity of throwing them off; as then they partake of the pleasures of social mirth and familiar conversation. So remarkably tenacious are the Germans of form and punctilio, that the lady of a certain general officer, in particular, cannot appear at court because she is not noble. She is, however, visited at home by the sovereign, and all the families of distinction, who universally regret that the custom of the country should deprive the court of so considerable an addition to its beauty and reputation.

The town of Zell is small. This place is noted for being the place of confinement for the late unfortunate queen of Denmark. The houses of Zell are old, and have a mean appearance. The high courts of appeal are held here for all the territories of the electoral house of Brunswick Lunenburgh: from this circumstance, the inhabitants chiefly derive their support. The castle of Zell is a stately building, it is surrounded by a moat, and is strongly fortified.

Hanover is a neat, thriving, and agreeable city, and appears more like an English than a German town. The customs and manners of the English gain ground very fast: the influence of freedom has likewise extended itself to this place; as a necessary consequence of this, ease and satisfaction are very discoverable in the countenances of the citizens. The fortifications of the town are in very good order, and the troops are well disciplined. The infantry are not so tall as some of the German troops. The soldiers here are all volunteers, and not forced into the service, as they are in other parts of Germany. Desertion is not frequent among them.

The palace of Hernhausen is situated at the end of a magnificent avenue, about the width and length of the Mall at St. James's. The palace is not very extraordinary, and the gardens are planted in the Dutch taste. The orangery is very fine. Here is a spacious amphitheatre cut out in green seats for the spectators. Plays are sometimes acted in a kind of rural theatre during the fine weather, which, when illuminated, has a pleasing effect. The arbours, groves, and labyrinths, are well calculated for this pleasant amusement. Here are also several reservoirs and fountains, and a canal about a quarter of a mile long.

At the palace of Hanover, a regular household is established, and the soldiers constantly mount guard, as if the elector resided there. The servants are dressed in the same liveries as those at St. James's. Strangers are entertained at the palace in a magnificent manner. The sovereign of Great Britain is here spoken of with all possible respect and affection, and the same sentiments prevail all over the electorate. He has established his reputation by governing his Hanoverian subjects with justice and moderation, though he has an unlimited power over them. Let those factious spirits at home, who represent him as inclined to tyranny, take this along with them, that where he might be a tyrant, there he is not; an incontestable proof that his disposition is moderate, mild, and just.

Magdeburg

Magdeburg is the capital of the duchy of that name. The king of Prussia has a seat in the diet of the empire as duke of Magdeburg. It is a very considerable town, strongly fortified and well built. Here are many manufactories, but the principal ones are woollen and silk. The German woollen cloths are much inferior both to the English and French, though the Prussian officers assert, that the dark blue cloth made here wears better than any other, and looks much better when it has been worn, than those cloths made in England or France. The town has an easy communication with Hamburg by the Elbe, and lies on the road between Upper and Lower Germany, which is very convenient for the trading part of the town. The principal magazines and founderies of the king of Prussia are established here; and, in time of war, it is convenient to place any thing out of the reach of sudden insult. The country about Magdeburg is well cultivated and fertile; but it is very barren about Brandenburg. The deserts of Arabia cannot well be more sandy and naked.

The town of Brandenburg is but small, though the electorate takes its name from thence; a river divides the old town from the new, and separates the castle from both. The king of Prussia has encouraged some French manufacturers of woollen cloth to reside here. There are not, in the whole town, more than fifteen hundred inhabitants. At every garrison town in the Prussian dominions, strangers are examined very particularly, and with more form and accuracy than is done in the towns of France. The title of duke here, and in all the German towns, is much respected; it implies a sovereign, and is more respectable than that of prince; whilst that of lord is so common to be given to every Englishman of decent appearance.

The prince and princess of Prussia reside almost constantly at Potsdam. The prince is a tall, handsome man. The princess is of the family of Hesse Darmstadt. The reviews at Potsdam are well worth seeing. The troops are drawn up in one line along the summit of some hills, from whence they descend over rough and unequal ground, firing in grand divisions all the way, till they come to the place where they go through various parts of their exercise; but the most capital reviews are at Berlin, we shall therefore postpone giving a more particular account, till we treat of that place.

The houses at Potsdam are built with a white free stone; they are almost all of them new, and are nearly of the same height. The streets are well paved and regular, and there are several magnificent buildings. With respect to the external appearance of Potsdam, it is a well built agreeable town, but the furniture and conveniences within the houses do not at all correspond therewith. His majesty has frequently expressed an inclination to see the town of Potsdam increase; and in order to ingratiate themselves in his favour, many of the principal inhabitants have built houses. The houses are let to merchants and trades-people at very small rents; but few towns are worse inhabited, as almost at every house you will see buff-belts, breeches, and waistcoats hanging to dry, for every housekeeper has two or more soldiers quartered upon him. The king prefers this method to their being quartered in barracks.

The castle or palace of Potsdam is a magnificent building, and the gardens adjoining are very pleasant. The study is by much the finest apartment in the palace: its ornaments are of massive silver; the writing-desk, &c. are all made with exquisite taste. The king's wardrobe consists of two blue coats faced with red, two yellow waistcoats soiled with Spanish snuff, three pair of yellow breeches, and a suit of blue embroidered velvet for particular occasions; these, with two suits of uniform which are at Sans Souci, form the entire wardrobe of the king of Prussia. The late king was so attached to reviewing his troops, that when he was on his death-bed, it operated as a cordial, to have the bed moved to the window, and his head raised, that he might see the men under arms; but by frequent repetitions this cordial failed. At

No. 85. VOL. II.

length his eyes became dim; when his head was raised he could no longer see them, and he expired. Surely the ruling passion was then felt as strong in death, as any man ever felt it before this renowned monarch.

The palace of Sans Souci is at a small distance from Potsdam. Here the king resides very much. The gallery contains a great number of paintings. The new palace of Sans Souci, which the present king began and finished, is a most splendid work. The offices are at a great distance from the body of the building, and are joined to it by a double colonade. The front seems rather too much crowded with statues. The building has a cupola, terminated by a large crown, supported by the three Graces, though three Prussian grenadiers might have been more suitable. The floor, sides, and the roof of the large hall on the ground-floor, are all marble, which is very agreeable when the weather is excessively hot. The roof is low and vaulted, and supports another room of the same dimensions, which is also lined with beautiful marble. All the apartments are adorned with rich furniture and paintings. Lord Marechal has built a house opposite the old palace, where he constantly resides. He is a nobleman of a most amiable character; in his garden, there is a door which communicates with the king's garden. The king has also a key to his lordship's garden, so that they are common between them.

The town of Berlin, at the time of the reviews, looks more like the cantonment of a great army, than the capital of Prussia. The court resembles the levee of a general in the field. All but the foreign ministers and a few strangers are dressed in uniform. The king converses with his courtiers in an easy, affable manner, and they themselves appear with a manly military boldness, devoid of that cringing so usual in court. The number of men reviewed at one time here, is about forty thousand. At break of day, about eight thousand men march out of Berlin, under command of a general officer, and take possession of a village on a rising ground, at about three miles distance. Some time after the king himself joins the army, which are assembled at the gates of the city. These he divides into three columns. One he commands himself, and commits the others to the care of two general officers: they all march by different routes to the village occupied by the other soldiers, which village is attacked and defended. The advancing army are cannonaded from the village, the leader of each column advances with circumspection, and makes such circuits, which will expose the men very little to the fire. After this, the three columns meet on a large plain near the village, but are protected from the batteries by a rising ground. Here the king divides the army, and forms them into two lines. The right wing of the army makes the attack, and as soon as the signal is given, all the drums and fifes strike up. The soldiers then advance with a rapid pace, accompanied with a numerous train of artillery, which are discharged and recharged with great rapidity. When the soldiers come within a proper distance of the village, they use their firelocks with great dexterity. The men in the village cannonade, and fire their small arms furiously upon the advancing army. The king stands between the advancing men and the village during the attack. When they get near the hedges, a new battery opens from the village, which throws the men into confusion, and the front line gives way; the second then advances as the former, which is also broke, a retreat is founded, and the wing retires. The cavalry from the village advances to charge the retreating army, but they are driven back by the cavalry of the right wing. The retreating army is also harrassed by a body of hussars from the village. These are sometimes repulsed, and are fired on by detached parties which drive them away.

The whole of the review generally lasts from five in the morning till noon, when the troops return to Berlin. All their evolutions are executed in a most surprising manner. A very large body of men indeed

charge at full gallop, and keep their ranks and distances exactly. On the evening of the review is a ball and concert at prince Henry's palace. The king seldom appears at it; all his vacant hours from business, he passes in reading, or in conversation with persons whom he esteems. The hereditary prince of Brunswick is his most constant companion. The palace of prince Henry is one of the most magnificent buildings in Berlin. He lives in a very sumptuous manner, and has a number of established servants. No king in Europe has a more perfect knowledge of his dominions and subjects than the king of Prussia. He makes the circuit of his dominions twice a year. He never relaxes the rigour of his discipline, and his army is the best disciplined of any in the world; they are always ready at a minute's warning. The Prussian officers are always employed either in training recruits, or in examining their dress. Their lives are very active, but with very little variety; they have the same occupation, and are employed always in the same place. The regiments do not change as in England. Desertion is very rare among the Prussian soldiers; they have so many difficulties to encounter, that they seldom attempt it. The moment a man is missing, a certain number of cannon are fired, which announce the desertion to the whole country. The peasants have a considerable reward for apprehending a deserter, and are liable to very severe penalties if they harbour him. Parties are also sent from the garrison to apprehend him in different directions. The soldiers are never allowed to go without the walls of the town, and if this difficulty were got over, the chance is very much against their escaping through the Prussian dominions. Should they arrive safely at any of the neighbouring states, it is most likely they would be obliged to enlist in their service. On account of the officers stay in one place, and being confined closely to one employment, they acquire a grave, serious appearance, and are quite unlike British or French officers. Few of them have very extensive ideas. Their knowledge is principally confined to the warlike sciences, and many of them think, that the chief end of their creation is the knowledge of wheeling to the right and left, and charging or discharging a firelock. His majesty of Prussia does not seem inclined to give them opportunities of extending their knowledge, that they may not be led to despise their daily employment of drilling soldiers, examining the state of their spatterdashs and breeches, and counting the buttons of their coats. If the king discovers any superior abilities among his officers or soldiers, that person is sure to be advanced, and put in such a situation where his abilities will have their full power and exertion.

The city of Berlin is, perhaps, one of the most beautiful in the known world. The streets are regular and commodious. The city covers nearly as much ground as Paris, but its number of inhabitants is considerably smaller. The principal edifices are the king's palace and prince Henry's. The arsenal is a noble structure, is built in the form of a square, and contains arms for about two hundred thousand men. The king tolerates every kind of religion in all parts of his dominions, and thinks any controul on the consciences of men quite unjust. He even has the extreme delicacy not to influence them by his example, for he professes no kind of religion whatever.

The opera-house is a beautiful structure. The many inscriptions and ornaments of the palaces, the method of decorating the churches, with the Mercuries, Minervas, &c. that are met with in this country, would lead a stranger to judge, that the Christian religion was banished from Prussia, and that old Jupiter and his family had regained their long lost places and honours. On the new bridge over the river Spree, is an equestrian statue of William, the great elector, which is esteemed a very fine piece of workmanship. In the corner of one of the squares is a statue of marshal Schwerin, who is represented as holding the ensign in his hand, with which he advanced at the battle

of Prague. When he perceived his troops on the point of giving way, he seized the ensign from the officer's hands, whose duty it was to carry it, and marched towards the enemy, saying, as he advanced, "Let all but cowards follow me." This gave the troops fresh spirits; they would not abandon their general, and charged with such vigour, that the fortune of the day was turned. It cost the old marshal his life. He was eighty-four years of age.

The king of Prussia intends placing the portraits of his greatest heroes in the churches of Berlin, instead of saints and crucifixes. The queen of Prussia keeps her court at Shoenhausen, situated about six miles from Berlin, where she passes the summer. She has a public day once a week, where the prince, nobility, foreign ministers, and strangers attend. After the queen has walked round the circle, and spoke to every one, she sits down to cards; sometimes she invites a particular number of the company to supper. This court resembles the other courts of Europe, and these assemblies are the only established amusements for the ladies of quality at Berlin. The king very seldom appears at the queen's court, nor indeed at any place where women form any part of the assembly. Notwithstanding this particular humour of the king's, the Prussian ladies are by no means neglected. Many married ladies have avowed admirers who attend them on all occasions, and are invited to all entertainments; they sit next them at table, and are in the same party with them at cards. This is almost necessary to the happiness of a Prussian lady, for if she is not provided with an attendant of this sort, she is generally out of countenance, and both she and her husband are in an awkward situation. At Berlin it is very common for man and wife to be divorced by mutual consent, where there are no children; and you frequently meet with parties where a lady, her present and former husband are in company, and are all in the most perfect harmony imaginable. Jealousy is here held in utter contempt, and abhorrence and scandal is very little known. The most fashionable walk here is one of the principal streets. Before the houses, on each side of the way, is a causeway, and between these two causeways are fine gravel walks, planted with lime-trees. Under these trees tents are pitched, where ice, lemonade, and other refreshments are sold. Here the bands of music which belong to the different regiments practise during the summer.

One would suppose, that under the arbitrary government of Prussia the people were under great restraint, but they converse here as freely upon public affairs as they would at a London coffee-house: the government is supported by a standing army of one hundred and eighty thousand men: speculative politicians may discuss what subject they please. While the king retains the power of disposing of their lives and fortunes as he pleases, he suffers the people to amuse themselves in their own way. The king is very much superior to a gossiping disposition, and does not encourage it in the least degree. He listens to no little malicious tales, formed in private parties: should any body attempt repeating them in his presence, he would meet with deserved disgrace. He takes no notice of anonymous letters, and will not hear any injurious information, unless the informer will appear openly and support his assertions. The king is so totally devoid of personal fear, that he resides at Sans Souci without any guard whatsoever. In the house where he sleeps, there are not above ten or a dozen persons, servants included. All circumstances considered, this argues great magnanimity.

Public courtezans are more numerous in Berlin than in any town in Europe, in proportion to the number of its inhabitants: they beckon to passengers from their windows as they pass in the day-time, and are not disturbed by the magistrate. It is a received opinion, that this uninterrupted licentiousness does not break in upon the peace and happiness of the community; and they think, that an attempt to restrain it would be attended with worse consequences than the

the thing itself. The better kind of citizens and manufacturers here live among themselves; neither ape the courtiers, or condescend to the vulgar; they are decent, plain, honest people. The king has endeavoured, but without much success, to establish commerce in his dominions. His various efforts have been rendered ineffectual by injudicious taxes, monopolies, and other restrictions.

The revenues of the king of Prussia, though very considerable, must be very much hurt by the amazing standing army he keeps, the sumptuous palace he has built at Sans Souci, and many other expensive undertakings he has completed; at least, if we judge by the conduct of other monarchs, this must be the case. But when we consider with what prudence the king has managed these matters, and what a rigid economy he maintains in every department of state, they may not be much infringed upon. In his dominions, there are no appointments to enrich individuals at the public expence: the highest office a man can fill will only enable him to lay up a decent provision for his family. Every article is highly taxed in Prussia: there are no means by which the king's revenue can be augmented, which have not been tried by this sagacious monarch. He has drawn considerable supplies from the vanity of his subjects, since the beginning of his reign. The Germans have a great rage for titles; and many wealthy citizens have been induced to purchase them at court. The king encourages this kind of traffic: he very rarely consults any body, but he has many nominal privy counsellors.

The Prussian army was originally raised, and is still recruited, out of the different cantons into which the kingdom is divided. Each regiment is quartered, in time of peace, near the canton out of which it was raised. Let a peasant have ever so many sons, they are all liable to be taken except one, who is left to take care of the farm. All the rest wear badges from their childhood, to denote that they are training up for the service when the state requires it. If a countryman has only one son, he is not obliged to go unless he is, unfortunately, remarkably stout and well made. In order to qualify this apparent hardship, and render it as little burdensome as possible, the king draws as many recruits as he can from the neighbouring German states. The recruits who are procured in this manner remain constantly with their different regiments; but the Prussian soldiers have, in time of peace, eight or nine months furlough allowed them every year, in which they are permitted to go home, till the ground, or get their livelihood in any other way. By this means a great saving to the state is made, and the labour of so many men is of much service, both to themselves and others. In one sense the Prussian army is only a militia, embodied for three months in the year, and then dispersed all over the country. A very good argument this, for the utility of our militia laws. Some people say the militia are not to be depended on, should they be called to actual service: here is a proof to the contrary.

The mode of conducting the entertainments at Sans Souci is as follows: the princess Amelia is mistress of the ceremonies, and waits at the palace to receive the king. Theatrical entertainments are daily exhibited. The company assemble in one of the apartments of the palace, and go to the playhouse about six. The theatre has neither boxes nor pit, the benches are semicircular, and rise one above another. A short time after the royal family arrive, the princess Amelia is led into the playhouse by prince Frederick of Brunswick, and the princess of Hesse is led in by the king; the duchess of Wirtemberg, and the other princesses, are led in afterwards. The royal family, with their attendants, occupy the first row, though the king generally sits in the third or fourth. The piece then begins, and is usually finished about nine; after which, the whole company return to the large apartment, where the king remains conversing till supper is ready: he retires before supper, and goes to bed at ten. The princess Amelia presides at supper, and

those she invites are pretty numerous. Comedies are very seldom acted, for the principal performers never act in them, and the king loves tragedy better; this latter is a better reason than a thousand others. The tragedy of Oedipus is the king's favourite piece: he enjoys the representation very much, especially when that remarkable speech against the priests is pronounced.

The king of Prussia is a very extraordinary man: few objects are too great for his genius, and none seem too small for his attention. He is a man of infinite wit, and yet continues doing his business methodically, like any drudge. Other princes acquire importance from their stations; he gives importance to his. Whilst the traveller desires to see the king, because he admires the kingdom, his curiosity is here reversed: let Prussia and its palaces be ever so well worthy of attention, they are much more so when it is considered that they belong to Frederic the Second, who, without any ally but Britain, repelled the united force of Sweden, France, and Russia; who, at this time of life, is now capable of, and has undergone lately, all the fatigues of a vigorous campaign. He is below the middle size, well made, and remarkably active: he is very hardy and laborious, which is not the effect of his constitution, but of the manner in which he has lived. He has great spirit and penetration, has fine blue eyes, and his countenance upon the whole is rather agreeable. His features acquire a great degree of animation when he converses. He stoops very much, and generally leans his head to one side. His voice is clear, and his conversation agreeable. He talks a great deal, but those who hear him wish him to say much more. He seldom varies his dress, as his wardrobe sufficiently proves. A blue coat, lined and faced with red, a yellow waistcoat, and breeches, boots with turn-up tops, which fall in wrinkles about his ankles: this is the general garb of this astonishing monarch. He generally wears a large Prussian hat, with one of the corners over his forehead and eyes, and the front cock on one side. His hair is curled behind, and has one curl on each side: it is pretty evident that his hair-dresser has been much hurried in the execution of his office. He takes a great deal of Spanish snuff out of a large gold box, the lid of which is ornamented with diamonds. The dress he puts on in a morning serves him the whole day, and his time of dressing occupies a very few minutes. All his hours, from five in the morning till ten at night, are arranged methodically, and dedicated to particular purposes: the arrangement has not been broken in upon for many years. Business of every kind is transacted with him by letter; no proposal must be made to him any other way: this method is open to the meanest of his subjects, who are sure of having an answer written by the king's secretary, and signed by himself. He dines precisely at noon, generally invites eight or nine of his officers, whom he always leaves at three. At table the king appears on an equal footing with his company, and wishes them to be so with him. The king is always active and assiduous, and he takes care that all his ministers and servants shall be so too. His orders are always equitable, and are never given out of caprice; which makes his service very agreeable: no favourites of any kind have any influence over him. He distinguishes well between those who serve him in the departments of state, and those who contribute only to his amusement. No person in office, who punctually fulfills the duty of it, has any reason to fear, because the king caresses his enemy. Should his enemy be invited often to the king's table, and should he never have that honour, the one is no proof of particular attachment, nor the other of a disregard: the true intrinsic merit of both is well known, and will be proportionably rewarded.

The city of Dresden is one of the most agreeable in Germany, both in part of situation, the beauty and convenience of the houses and streets, and the magnificence of its palaces. It is built on both sides of the Elbe, which is very broad here. The elector of Saxony

is very magnificently lodged; in his palace are many natural and artificial curiosities, besides a great number of very good paintings. Though a fortified town should have no palaces within, nor suburbs without, yet Dresden has both. The bad effects of this were severely felt last war, when the city was besieged. Many of the houses still lie in rubbish, but the inhabitants are re-building them as fast as possible. These may perhaps be destroyed next war, and it would undoubtedly be for the advantage of Dresden, that the fortifications were removed to the frontier towns. The Prussian bombardment considerably hurt the Porcelain manufactory here. The Saxon troops are in general handsome and well made. The uniform of the guards is red and yellow, that of the marching regiments white. During the summer, the soldiers only wear waistcoats, even when they mount guard, but they are always neat and clean. Their band of music is very compleat. The whole country of Saxony is remarkably fine and fertile.

There are many places in Bohemia very beautiful: the capital town is Prague, which stands in a hollow, and is surrounded with hills. The town is large, and retains many vestiges of foreign splendor, as well as evident symptoms of internal decay: it was once the royal residence, but is so no more. All the Bohemian nobility who can afford it, live at Vienna. Notwithstanding the evident marks of decay which are to be seen in Prague, in many particulars, the piety of the inhabitants appears to be in a very flourishing state. Such a redundance of crucifixes, saints, &c. are affixed to all the buildings, and so many people are to be seen on their knees before them in every part of the city, that a stranger would think he was walking between files of musqueteers. Their devotion is likewise very rapturous; they are not barely contented with kneeling, but some fall prostrate in the street and address their saints with such fervor, that one would think their hearts were made of stone indeed, not to pay more attention to their petitioner than they appear to do.

Vienna is not of great extent, but it is very strongly fortified. The town is populous, and is said to contain about twenty thousand inhabitants. The streets are narrow, and the houses are built very high. Many of the public buildings are magnificent. The principal ones are the imperial palaces, the library and museum, the palaces of the princes Lichtenstein, Eugene and others. No houses without the walls of Vienna, are permitted to be built within six hundred yards of the Glacis, which in case of a siege prevents the necessity of destroying the suburbs. At the boundaries of this plain the suburbs are built, which form a magnificent and extensive town. The suburbs, &c. are said to contain three thousand inhabitants.

The emperor of Germany is easy and affable, but very plain in his dress, though very graceful; the empress resides in a palace about three miles from Vienna. The fortunes of this celebrated princess have interested Europe for many years. Her magnanimity in supporting the calamities to which, in early life, she was exposed, and the great moderation with which she has demeaned herself in prosperous circumstances, have secured to her universal approbation. She possesses but small remains of that beauty, for which she was so much admired in her youth.

The etiquette of the imperial court is not so great as represented, all the family behave with a vast deal of ease and good humour. They have also a striking resemblance of each other, are of a fair complexion, and have blue eyes. The queen of France is the handsomest of this family, only because she is the youngest. There are few places in Europe where a young gentleman can pass a year more agreeably than at Vienna, after his education is finished. Here are few examples of extravagance, and no opportunities of deep gaming, gross debauchery, or open profligacy.

At Luxenberg, the prince of Kainitz has lately built a house, where he lives in a hospitable, magnificent stile. He devotes the morning to business, and

has generally a large party to dine with him. Still greater numbers pass their evenings at his palace, sometimes the emperor himself makes one of the party. The emperor lives with his subjects in a very easy, unceremonious manner, he converses with all the ease and affability of a private gentleman, and seduces others to talk with the same ease to him. By this means he acquires a great knowledge of mankind, and contributes very much to his own happiness. He is the least punctilious person in his dominions.

Dr. More informs us, that he made a short tour with the viscount de Caval into Hungary; and gives the following account of it:

The capital of Lower Hungary is Presberg; this city, like Vienna, has suburbs more magnificent than itself. Here the states of Hungary hold their assemblies, and in the cathedral church the sovereign is crowned. The castle is a noble Gothic building of a square form, and has a town at each corner. The regalia of Hungary is deposited here. This is the usual residence of prince Albert of Saxony: all the princes of the Austrian family are distinguished by their politeness and affability. The view from the citadel is very extensive. The palace of Esterhaise is the residence of the prince of that name, who is the first Hungarian nobleman, and lives in great splendor. The palace is a fine building, and is situated near a fine lake. The apartments are grand and commodious, and the furniture excessively handsome. Near the palace is a theatre for operas, and other dramatic entertainments, and in the garden a large room for masquerades and balls. Here is another theatre for puppet shews, which is perhaps the very best ever reared for that amusement. In the garden there is a wooden house, built upon wheels, which contains every accommodation. The prince sometimes entertains a dozen people in this vehicle, who can all take an airing together round the park and gardens. The machine, when loaded, is easily drawn by six horses. Hungary is a cheap country, the land is very fertile, and produces very fine grapes. It is beautified with lakes, the windings of the Danube, and many streams which flow into that beautiful river. The race of horses here are active, hardy, and spirited, are very useful in war. The Hungarians are remarkably handsome and well made; their women are likewise very beautiful; the Hungarians enjoy many privileges. None of the emperor's subjects are taxed so gently as they. This may perhaps be owing to the grateful remonstrance she has of their loyalty and attachment to her during her troubles.

The emperor of Germany is of a middle size, fair complexion, is well made, and is very much like the queen of France his sister. He is regular in his way of life, moderate in his pleasures, steady in his pursuits, and diligent in business. He is very fond of his soldiers, and sees that they have every comfort which their situation requires. He is an œconomist, and lavishes but little money on favourites, useless pomp, or mistresses. His usual dress is a plain uniform of white, faced with red, and when he goes to any of the neighbouring palaces, he drives a pair of horses in an open chaise, with only one servant behind, and no other attendant whatsoever. He dislikes the guard turning out when he passes. He is very fond of conversing with ingenious people.

The Austrian army make a fine appearance, and are very well clothed; the uniform is a short jacket of white cloth, with waistcoat and breeches of the same. Every private man has a furtout coat, which he wears in cold or wet weather. This is rolled up in a small compass when the weather is good, and is of very little inconvenience on a march. Instead of shoes, they wear short boots; and instead of hats, they wear caps of stout leather, with a brass front. The number of men in the Austrian army is estimated at above two hundred thousand, and they have a great number of excellent officers.

There is much more attachment to religion in Vienna, than in any other part of Germany, perhaps this is out of compliment to the empress.

Engraved for Messrs. Longman & Co.

We shall next present our readers with the celebrated travels of Mr. Keyfler, through Germany, Bohemia, Hungary, Switzerland, Italy, and Lorrain. This work was originally printed in Germany, and was very much approved of there by men of letters; it has some time since been translated into English, and has met with much approbation in this country. On both these accounts, we think we cannot do better than to give our numerous readers an account of all the important occurrences, observations, and remarks which happened during the course of his travels through these countries.

Mr. Keyfler says, "I begin with the city of Schaffhausen in Switzerland, which is pleasantly situated, in a plain; is of itself very handsome, with broad streets and good houses. The Rhine, washing the south part of it, divides it from the canton of Zurich, and is of great advantage to its commerce. At my first entrance into Switzerland, I must not omit to observe that a great many are very much deceived in their notions of these people, and of their trade. They suppose Switzerland to be little else than a confused chaos of barren rocks, craggy mountains, perpetual snows, and gloomy valleys, scarcely affording subsistence to the wretched inhabitants; but this is far from the truth, for the country yields every necessary of each sort for the inhabitants, and they have a great deal to spare, which they export among their neighbours. Flax, linen, &c. are sources of considerable wealth to the Swiss, besides many other very great sources of commerce.

Sensuality, luxury, pomp, and an infatuation for every thing foreign, prevails in Switzerland to a great degree. To check this growing evil, proper endeavours have been employed to restrain the indiscriminate use of foreign commodities; but it is here as in other countries, what is prohibited is most desired by the inhabitants, and they are happy in every opportunity of evading the law. At Geneva, the richest inhabitants are not allowed a service of plate; and on this very account it is more frequent and costly in their adjacent country houses, where the law does not operate.

In some parts of Switzerland the ladies are under sumptuary laws, and are prohibited the use of fine cloaths, &c. The consequence of this is, that in the summer season they will go to the German spas, and other places, where they can give full scope to their vanity. Zurich excels in good cloth, and the silk manufactures in the Pais de Vaud answers very well. The humane reception of the French refugees at Geneva has furnished it with a great number of useful artificers in various branches. Zurich has long been remarkable for its traffic, and next to it are Basil, Geneva, and Schaffhausen; these four are accounted towns of the greatest commerce in the whole country. The Rhone and the Rhine are convenient for their foreign trade: the former conveys the goods from thence into France and the Mediterranean; and the latter distributes them in Germany, the Netherlands, and the Northern Sea.

The burghers at Schaffhausen are estimated at two thousand; the arsenal is sufficient, on an emergency, to arm the townsmen. Every common inhabitant and peasant goes to church with his sword by his side; whoever appears before the magistracy without that weapon, incurs a penalty. Over all the district of Mount Jura, the men not only go to church with their swords, but with a bayonet and firelock cocked, which, during the service, they keep by them, or hang up in a corner of the church; which usage was probably derived from the various commotions in their country, which distinguished former times.

The church of St. John, at Schaffhausen, is said to be the largest in all Switzerland; it is well built, and much ornamented. The commerce between Schaffhausen and Basil is interrupted by two falls of the Rhine, which happen between these towns: this occasions a necessity to unload their goods, and put

them on board other vessels. On the rocks, which divide the Rhine into three streams, grow pines and other trees, and near to one of them is an iron manufacture, which turns to very good account:

The castle of Hohentveil is situated about four leagues from Schaffhausen: on any dangerous emergency, this is a place of security for records and other valuable effects. The Lutherans at present make it a place of worship. It belongs to the duke of Wirtemberg. This fortress has a garrison, under a lieutenant, major, &c: where long services are rewarded by an honourable repose at this place. The officer is suffered to lie a night from his duty. The castle stands in a very fruitful country, amidst pleasant villages, and old castles upon high mountains, which form an agreeable contrast. The lake of Beden is only two miles distance. The mountain on which the castle stands, produces excellent wine. Here is a custom, that every person of rank who comes to view the castle, shall carry a stone of ten pounds weight from the lower to the upper castle; and many of them have inscriptions, with the names of the persons who brought them up. This castle was purchased by the duke of Ulrich, in the year 1520, of a widow of the town of Klingenburg; since that time it has continued in the hands of the dukes of Wirtemberg.

I have made an excursion into the neighbouring parts of Swabia, where the Danube takes its rise. The Danube does not flow less than four hundred German miles: it runs by fifty cities, and takes in twelve rivers, besides a great number of less streams. This celebrated river rises near Don Eschingen, in the territories of Furstemberg, and, by the conflux of several rivulets, soon becomes considerable. The territories of Swabia are very different in point of fertility. In Swabia there is much good sense and German frankness.

From Schaffhausen, I went through Singer and Zell, where we and our carriage embarked in a vessel for Constance, and went through Lindau, arrived at length at Bodensu, where the famous lake is situated. The Bodensu divides itself towards Germany into two parts. In this lake are a variety of fish, particularly salmon trouts of a very great length. The inhabitants near the lake pickle and export them. The abbey of Richeneau is situated in an island of that name in the middle of the lower lake. The abbot was formerly possessed of great revenues, but they are now considerably diminished. It is a handsome building, and remarkable for a large emerald, presented to it by Charles the Great, which they are very careful of since the attempt to rob the abbey. The prior, for the greater security of this gem, lets but few, even of his brethren, know where it is deposited, and it was with great difficulty we could get a sight of it.

Charles the Great was so called, on account of his extraordinary size; by some he was called Charles the Fat. He lies buried in this abbey. In the cloysters of the abbey is the picture of a nobleman, who died in 1675, in the seventieth year of his age, with a beard reaching to his knees; but I could not discover his name, as the weather has obliterated the inscription.

Constance is a middling city, which makes a good appearance towards Lindau: it contains about six hundred burghers, and Lindau contains seven hundred. The pulpit of the cathedral is supported by a statue of John Huss, who was sentenced to be burnt. The placing him in this position was designed as a mark of further disgrace, though it naturally admits of a more honourable construction. Of a piece with this is the superstition of the vulgar at Constance, who declare, that the ground on which John Huss was burnt, is accursed, so that no grass will grow upon it.

In the Dominican convent lies the famous Emanuel Chrysolaras, who, in the year 1319, was driven out of Greece by the Turks, and was deputed to several courts to obtain assistance against those inveterate enemies of the Christian name; but his commission proved abortive. Constance was formerly an imperial

imperial city, but the religious commotions in the year 1577 brought it under the power of the house of Austria.

The county of Lindau, on the continent, is very fine; the town itself stands on the lake of Boden. In this neighbourhood is the forest of Bregentz, where a very odd custom prevails among the sons of peasants who are unmarried. They are allowed to have carnal conversation with a girl till she proves with child, and then, and not till then, are obliged to marry her under severe penalties: they look upon this practice as very innocent; and are so strongly attached to it, that when the government wanted to put an end to it, they were ready for an insurrection. They call the practice *Fuegen*; and in a meeting of the peasants on this affair, an old grey-headed man rose up, and backed the prosecution of the suit in this laconic speech: "My grandfather fueged, my father fueged, I fueged, so shall my son, and all his generation."

From Lindau to Tifd, the country is in general very indifferent, and a great part of it is hilly. The roads are still made worse by travellers using their own carriages, which makes the ruts too narrow and inconvenient for any other.

Fussen lies on the frontiers towards Tifd; it is well built, and the streets are uniform and broad, and belongs to the bishop of Augsburg; in approaching it, you go a considerable way along the river Leek, which forms several very agreeable cascades.

The governor of Inspruck daily knows, within twenty-four hours, what persons come into his province, by means of the passports, which are strictly examined into. Tyrol is a very considerable and profitable country. Exclusive of its silver mines, which are now greatly exhausted, the mountains of Tyrol produce amethysts, jasper, onyxes, granates, hyacinths, malachites, and a species of crystal, so hard as to be used instead of a diamond for cutting glass. Coming into this province from Germany, the lofty mountains appear very amazing, which, from Ulminster, are seen covered with snow even in July. In several parts, especially before noon, heavy clouds are seen resting on the middle of a mountain, and higher up it is quite clear, when at the top again, it is enveloped with clouds. Those mountains produce dwarf pines and shrubs. The Shamoy is an inhabitant of these mountains: their flesh is not in season in the summer, they are consequently then spared. The huntsmen have sharp crooked bits of iron on their shoes, and sometimes fastened to their hands, that they may with greater facility pursue this swift-footed creature among the precipices. The ball found in their bodies has the qualities of the bezoar.

The peasants in Tyrol make a most wretched appearance, very much like gypsies; they are, however, zealous in their religion, and are warmly attached to their sovereign, of which they have given many singular proofs, during his contest with the elector of Bavaria. Their farm-houses, barns, &c. have a very mean appearance; boards are laid to cover them, and they are secured from the wind by heavy stones.

The roads are good from Fussen to Inspruck; all the stones are thrown on one side, and in many parts wide passages are made at a great expence through the rocks. In the last stage between Fussen and Inspruck, you pass through Zurl, a small town, and come to the rock on which Maximilian the First had nearly been killed when pursuing a Shamoy, which circumstance has given rise to many fabulous stories. The sum of the whole is this, that the emperor, at a Shamoy-hunting near Inspruck, was in great danger, when at a vast height, the shank, and all his foot irons used in hunting these creatures, had given way, one only excepted, which still held him, though very much bent, and the peasants let him down safely by ropes.

Inspruck is a fine city; and well paved. The jesuits colleges, and Franciscan monasteries, occupy whole streets. The town-house and governor's palace are very fine buildings. In the knights hall, in the palace,

the exploits of Hercules are finely painted in fresco. In the garden are some handsome saloons where the assemblies are held. Here is a fine brass equestrian statue of Duke Ferdinand, which, though of very great weight, rests entirely on the hind feet of the horse. The famous golden roof is over a balcony in the chancery, the pieces of copper of which it consists are overlaid with gold. Some people imagine the copper, by length of time, is assimilated into the same nature with the gold. The parish church is remarkable for the beauty of its stucco work, its lofty roof, and marble pillars. The jesuits erected an exquisite monument to the memory of Maximilian the First, whose body lies without any epitaph in the cathedral of Vienna. Over the monument is a brass statue of the emperor kneeling, between four other smaller statues, all of brass, representing four Virtues. Round the tomb, which is of white marble, are his most remarkable actions recorded. In the church of the Franciscans, are twenty-eight statues of brass ten feet high; some of them are with, and others without inscriptions.

About a league from Inspruck is the castle of Ambros. It is a seat of the archduke, which was built on this spot on account of its beauty and convenience. Here are many curiosities collected at a great expence by former sovereigns of this country. Here is also a large quantity of armour, and amongst them many old Roman shields and helmets.

Against the wall stands a wooden image of one Aymon, who belonged to duke Ferdinand's guards; he was eleven feet high, but did not live more than fifty years. The famous baron Benterorieder, the imperial minister, who did not live to a great age, was eight feet eight inches high; when he travelled this way, he measured himself by Aymon's wooden image, but he did not reach higher than his arm-pits. Near to this wooden giant stands the image of a dwarf, who lived at the same time, and in the same house with Aymon, and is but three spans high. As Aymon frequently bantered the dwarf on his diminutive figure, the dwarf, in order to be revenged, desired the duke to drop his glove, and order Aymon to take it up, he, in the mean time, walked under the duke's chair, and as Aymon was stooping for the glove, gave him a slap in the face, to the great diversion of the spectators. Among other curiosities, here is a bit of the rope with which Judas hanged himself, and the certificate of a nobleman, declaring he found it at the sacking of Rome. The number of the universities and antiquities in the castle of Ambros, are too tedious to relate.

Halle is a pretty town near Inspruck. Here is a mint or coinage worked by water, and is said to stamp one hundred and fifty dollars a minute. At this place the Tyrolese killed the Bavarian general Berita, by beating him with hammers.

Near Schwatz is the imperial silver mine, where two thousand persons are constantly employed. Some miles from this place are several copper mines; and the copper they produce is naturally soft; they are the property of the lords of Slembach. Near the town of Schwatz is a good glass-house. The people of Tyrol are remarkably prolific, and cannot find sufficient employment for their children; they are therefore sent into other countries. The parents mark them before they go, with a needle, or the point of a knife, which being rubbed over with a particular kind of black ink, never wears out. This has been often a means of proving their consanguinity many years after.

The fort of Ratenberg stands between Schwatz and Gundal. In the Heritenstenian lake, is a particular kind of fish; they have nine small eyes, are about two fingers long, and about the thickness of a quill.

The deserts in the Tyrolese mountains, being a secure retreat, the persecuted Waldenses fled thither, and dispersed themselves in the adjacent valleys, where they propagated many doctrines, which are much the same with those believed by the Protestants. Luther's faith was embraced openly by the Waldenses,

ses, but the bishop of Brixon, in whose diocese one of these Tyrolese mountains lay, caused twenty thousand of the inhabitants to quit the country, and disperse themselves among the Protestant states of Germany: this happened in the year 1681.

The Bavarian salt-works at Reichenhall, are between Uncher and Salzburg. The springs are raised by a wheel of a very large size, and one of a smaller, to which are fixed leather buckets, which throw out the water that is raised: this is conveyed through leaden pipes to a great distance. Notwithstanding the constant working of this spring, it is so redundant, that a great deal of water always remains in it. A subterraneous aqueduct was begun and completed some centuries ago, which astonishes every beholder; its channel runs under the town of Reichenhall, and several gardens and fields, at the depth of twelve fathoms from the surface, and is a mile and a half long. At the end of it, the water breaks out with great impetuosity. The passage through this aqueduct is performed in boats by candle-light; the current is so rapid, that you go through it in a quarter of an hour. This canal is five feet broad, and the bottom is cleared of stones and rubbish every ten years. The roof appears to be everlasting; it is made of free-stone, and overlaid with a hard kind of rosin. The descent to this subterraneous aqueduct is by stone steps.

Salzburg is a very beautiful city, the houses are high, but the streets are narrow. One part of the city stands on a steep rock, and the small houses by the side of the river Salza appear to be stuck on it like swallows nests. Here is a fountain before the palace, which is said to be the finest in Germany; the figures are made of white marble, but are made in a grotesque stile. The reservoir is one hundred and seven feet in circumference, exclusive of the steps; four large horses spout the water out of their mouths and nostrils, but not with so much rapidity as the figures above them. The height of the whole exceeds fifty feet.

The palace of Salzburg is very magnificent, and abounds with many excellent paintings, statues, and pieces of marble. From the summit is a most delightful prospect. The citadel stands near it on a high mountain. The new apartment adds much to the beauty of the palace, and contains all the offices of the archbishop. The mews is a good building, and contains a hundred and fifty houses. They eat out of white marble mangers, and running water is turned in twice a week through both sides of the stalls to carry away the filth. Over the stable is a fencing school. The horse-pond is very large, and in its centre is placed a large marble horse, spouting water out of his mouth.

The winter riding-school is very lofty, and has galleries for the accommodation of spectators. The summer riding-school is a kind of amphitheatre, open at top. This latter serves for baiting wild beasts, which the people in this country are very fond of.

In the cathedral, the altars are of beautiful marble of different kinds. Under the cupola are four altars, with an organ over each; the finest organ is over the chief entrance, and consists of three thousand two hundred and sixty pipes. The roof of the cathedral is covered with copper. The gallery between the church and the palace is of white marble. The chimes of this cathedral are very harmonious.

The new university church of the Immaculate Conception of the blessed Virgin Mary, is a noble building, and the inside is ornamented with a very fine stucco work. Before the Theatin convent is a marble pillar in one piece, which is twenty-four feet high. In St. Sebastian's church lies the famous Paracelsus, who was remarkably self-enamoured, and the vainest man in the world, not excepting any.

The palace of Mirabella is a good building, the chapel takes up the principal side. Fronting it is a mount Parnassus, with a brass Pegasus at top. The water falls from it by cascades. In the palace is a grand marble stair-case, finely painted, the floors are

inlaid with white marble, the furniture is crimson embroidered with gold. The garden is very beautiful, the river Salza runs by it. There is a large aviary in the garden. The theatre is decorated with green turf, and deserves attention. The orangery is a good one, and produces plenty of fruit.

The city of Salzburg is fortified by seven bastions, and the archbishop's troops consist of a thousand men. They wear an uniform, which is white faced with red, and sometimes plain brown. The carabineers, who are the life guards, and the other officers, wear black with red facings, laced with gold.

The archbishop has another palace at Klepheim, about two miles from the city. Four princes, with their retinues, have lodged in this palace, which was very large and commodious; but the size is now much diminished, and scarcely affords room for the archbishop, and his household. The garden belonging to the palace lies entirely waste. The great hall is the finest part of the whole building. The archbishop is so fond of hunting, that he prefers this palace to the others, being more convenient for that diversion. Near this palace is a beautiful pheasant nursery. The archbishop has several lords of the bedchamber, and many other great officers of state. There are eight suffragans to the archbishop of Salzburg. His income is computed at near a million of dollars.

Hellbrun is another of the archbishop's seats, and is situated about a league from Salzburg. The building is not remarkable, but the garden is very pleasant. It is laid out in the manner of a wilderness, and abounds with very fine pieces of water, of various shapes and dimensions. The water is quite transparent, and you can see all the fish they contain playing about. In the garden is likewise a beautiful decayed grotto; also the statue of a monster, which might be taken for a savage, were it not for its cock's comb and eagles feet. Under it is this inscription:

"The original of this monstrous figure, called a forest devil, was caught in hunting near Haversberg, Matthew Long being the cardinal and archbishop: his skin was yellowish; he had all the marks of savageness, and never looked at any one, but hiding himself in corners; he had the face of a man with a beard, eagles feet with lions claws, the tail of a dog, and on his head grew a large cock's comb: he soon died with hunger, as neither allurements nor violence could bring him to eat or drink."

In the menagery are several curious beasts and birds. Near it is a warren, which is surrounded by a deep moat, which keeps the rabbits from wandering beyond this effectual boundary. The salt-works of Halle are about a German mile from the city of Salzburg: the salt stone has a fine lustre, and exhibits a great variety of colours. This makes an agreeable appearance by moon-light. The rock salt is managed here in the same manner as at Halle in Tyrol.

I arrived at Munich just in time to see the festival of Corpus Christi: the procession consisted of several thousand persons, and it was a full hour and half before the whole procession passed by. All kinds of tradesmen, with every religious order, joined in the procession; religious histories were exhibited on a great number of triumphal cars, by children superbly dressed. At the head of their respective fraternities, among whom were several people of the first distinction, rode St. George and St. Maurice, in Roman habits. St. Margaret was represented by a young lady, in the attire of a Roman vestal, leading after her a large dragon, in which two men were inclosed, who set it in motion. The four mendicant orders proceeded the next, which was carried under a splendid canopy. Immediately after came the elector of Bavaria in person, and his consort, both holding a lighted taper. Next to the electress came her master of the household, who was followed by some ladies of distinction, and after these the whole court. The garrison, burghers, and peasants, closed the procession; and when the clergy

clergy stopped at four several places, to give the benediction, they were saluted each time by eight guns from the ramparts.

Where the procession passed, the streets were boarded and strewed with flowers; but the length of ground they walked must have been very disagreeable, as the weather was remarkably hot. The ladies were dressed in the Spanish fashion.

The electoral court at Munich has no marshal's table; the elector and his consort generally dine alone. State affairs are under the direction of four privy counsellors, with whom the elector daily confers. The lords of the bedchamber are very numerous, and are allowed but a slender salary. Here are one hundred and thirty knights of the order of St. George; likewise here is a new order, called The Immaculate Conception of the Virgin Mary. The knights of this order solemnly engage to support and maintain her immaculate conception; though the council of Trent leaves every man to think as he pleases on this doctrinal head. The sentiments of the monks, and many late revelations of the Roman church, differ very much in this article. Catherine of Sienna had a divine inspiration against the immaculate conception; whereas St. Bridget had a divine revelation in favour of it: these opposite visions are pleaded and discussed with great warmth by the sticklers on each side of the question. Pope Sixtus the Fourth enjoined silence to both parties; nevertheless, Launoï paid no regard to the papal mandate, and attacked not only the virgin's immaculate conception, but also her corporeal ascension into heaven.

There are between thirty and forty state festivals in a year, at the Bavarian court, which the courtiers do not much relish, as it costs them a great deal of money in changes of dress, and some of them cannot very well afford it. The troops of the electorate are not many in number, but are increasing. The corn trade, beech mast, white beer and salt, bring in large sums to the treasury; and here is a kind of beer brewed, much like English fine ale, which brings in an immense sum.

The palace consists of four courts. The ascent to the emperor's hall is by a flight of most beautiful marble steps; the hall itself is one hundred and eighteen feet long, and forty-two wide. Here is a statue of Virtue, composed of one single piece of porphyry. In the museum are many Roman statues and busts, and most of them were brought from Italy. Among other curiosities is a brass statue of only seventy pounds weight, and yet it is very difficult for a strong man to lift it, unless he places himself so as to give it a certain equilibrium; but by advancing the left foot before the statue, it is so constructed as to be lifted up by a single finger, put in a hole made for that purpose.

The treasury of the elector has very few equals, but was much richer before the unfortunate disturbances at the beginning of the present century. It at present contains, among many other, the following valuable articles. A hill, with a castle on it, composed entirely of oriental pearls. Several vessels of green jasper; a cabinet of many large pieces of crystal work; among the rest, a ship, several spans long, the pilot and the tackling are made of very fine gold: a large lazule bowl; patterns of a gold service, of the finest gold, for three large tables; a ruby as large as a walnut; St. George on horseback, cut from a piece of fine red agate, his armour is composed of diamonds, set in gold; a double brilliant diamond, of the size of a nutmeg; a larger one, which cost one hundred thousand guilders; a set of buttons and loops of diamonds, with rubies between them; another set, only of diamonds, and much superior to those worn by Lewis the Fourteenth, when he gave audience to the Persian ambassador; the images of the Bavarian family, of blue chalcedony; an ivory closet, with figures in relieve, of curious workmanship, in which are preserved near twelve hundred gold Roman medals; and several large china vases.

This treasury was conveyed away with such secrecy by some gentlemen of the court, after the battle of Höchstet, that the Imperialists could not lay hands on it. It was concealed from the elector himself, and was not delivered to him till his restoration and return to his dominions.

Munich is a most beautiful city; has many stately buildings in good condition; the streets are wide and spacious. The palace of the master of the horse is a great ornament to the city; it is built on so extensive a plan, that the four sides of it form four streets. The pillars of his stable are of red marble.

The churches of St. Anne and the Theatines are remarkable on account of the beauty of the stucco work with which they are ornamented. In the latter, on the left-hand, is a holy sepulchre, and on the right a scala santa, on twenty-eight steps, as at Rome. No person is permitted to walk up, but must ascend kneeling, saying on each a number of ave-maria's and pater-noster's. This must be very painful to some, who ascend with extended arms, and the most intense devotion. In the church of our lady is a large black marble monument of the emperor Lewis, of Bavaria, with six large and several small statues of brass. Here is also a large organ, made of box wood. The roof of the jesuits church is remarkably high and broad. The college is large, and the library is well filled with books, both ancient and modern. They shew you in the college a part of St. Christopher's back bone, but it rather resembles that of an elephant or whale.

The palace and other electoral buildings, together with the public workhouse, sixteen monasteries, churches, and other religious structures, take up near half the city of Munich: the precinct of the Augustines alone consists of several streets. The arsenal is a good one, and contains a great number of arms. The inhabitants of this city are computed at forty thousand.

Between Munich and Slesheim the road is very good, they are about nine miles asunder. The entrance of the palace of Slesheim is very magnificent, for the pavement and rows of pillars on each side are of red and white marble. Here are many valuable paintings, and the furniture of all the apartments is very good and elegant. The garden adjacent to the palace is very beautiful; in it are several canals, with fountains playing; in this garden is one walk nine hundred paces in length, and the whole of the garden is surrounded with moats, and walks of trees. At the termination of the long walk is a very elegant building, called Lustium, where are many capital paintings. From the top of this building is a most beautiful prospect.

The palace of Nymphenburg is about two miles from Munich, but is not so magnificent as Slesheim, though the gardens and water-works are superior, and afford a pleasing summer retreat. In the garden is a grand cascade and basin, with several brass figures, also a delightful structure, called Rademburg; this consists of some elegant grottoes and a large bath; the floor is overlaid with copper, and the walls are decorated with porcelain. Opposite this building is the mall and the bowling-green; and on one side of it is a beautiful hermitage, in imitation of a ruinous building. This structure stands in a kind of desert, and within it is a large grotto with a consecrated altar, and on it a crucifix and two candlesticks, which are said to be made out of the horn of a unicorn. Underneath it is a kitchen and cellar, where the utensils are made of a neat set of earthen ware.

Starenburgh is another electoral seat, about nine miles from Munich. Here the court sometimes takes the diversion of water-hunting. A stag is forced into a lake in the neighbourhood, the hounds pursue him, and then the huntsmen follow in boats; there is a splendid barge for the elector, &c. which carries twenty-four brass guns. The court sometimes amuse themselves with heron-hunting; and at the conclusion of every year, a heron, which has been taken alive, is set at liberty, and they put a silver ring on

one leg, with the name of the reigning elector engraven upon it. These birds are very long lived, for one of them was taken a second time, with the name of Duke Ferdinand on its ring; this happened near seventy years after the duke's death.

When I was in Tyrol, I was surpris'd that so fine a country should be without vineyards, and concluded that, when I had pass'd the mountains, I should meet with some, but I have hitherto been disappointed; for though there is a great deal of level ground between Saltzburg and Augsburg, I have seen none yet.

The city of Augsburg is not so magnificent as it was formerly: it was the most considerable town in Germany for commerce. The burghers are computed at six thousand; the council is compos'd both of protestants and papists. The Town-House is esteem'd a very capital building; the entrance is of red marble, polished, and supported by two pillars of white marble. In the great hall, adjoining to the street, are eight large pillars of red marble. Here the city main-guard is kept, who are provided with six field-pieces; round the hall are twelve brass busts of the Cæsars. There are many historical paintings about the chambers of justice, and many well chosen exhortations written on the walls, which are design'd to admonish the judges to act with prudence and impartiality. The floor of this chamber is paved with red and white marble.

The Pulach-Tower stands near the Town-House, and in an area adjoining to it is a beautiful fountain, with a representation of the four seasons, in brass figures; in the centre is the emperor Augustus, with apposite inscriptions; in the wine-market also is a pretty fountain, with the figure of Hercules in brass. The bishop's palace is but an ordinary building, but the hall is rendered remarkable by the confession of Augsberg having been presented in it to the emperor Charles the Fifth.

This see is generally fill'd by the younger princes of the electoral houses of Bavaria and Palatine, and the revenue is very considerable. The monks of St. Ulrich dispose of a powder call'd St. Ulrich's earth, recommending it by the name of that saint, who is said to have banish'd all the rats out of the city and neighbourhood into a hole, which is shewn to this day in the church of St. Ulrich. If it be true that no rats are to be found in Augsburg, it is a matter of wonder that no physical cause is assign'd for it. Certain it is, that in some places venomous serpents are not to be found, and if they are brought there, they immediately die. This is undoubtedly the case with the islands of Malta and Candia; and, in Macedonia, the islands of Gozo and Ivica, are fatal to all poisonous creatures.

The church of the bare-footed friars belongs to the Lutherans, and is very splendid, both within and without; it has a great number of silver utensils, and particularly twelve large flaggons, which were us'd formerly, when the sacrament was administer'd only once in six weeks, and the communicants were very numerous. The library belonging to the evangelical college is worth observing. The arsenal is in a good condition, and well fill'd with arms of all sorts. In the museum are a number of curiosities.

The Einlafs, or the Admittance, as it is call'd, is among the public buildings of note: it was invent'd by a Tirolse peasant, and is work'd by two men: it saves the trouble and danger they were expos'd to formerly, when they open'd the gates at night, for travellers or carriers. This is an admirable contrivance for security and convenience: it is construct'd in the manner of a draw-bridge, with gates at each end; and when one gate shuts, the other opens immediately.

By the water-engine, the water is rais'd to the summit of three towers: the spring water is brought to the city from a considerable distance, but the engine is work'd by the river Lecke. From these towers, the water is convey'd to every burgher's house in Augsburg.

The houses of the citizens are render'd beautiful and convenient, by the many fine and extensive gardens contiguous to them: in some of them are water-works, and many shady walks, which form a delightful summer retreat.

The road from Augsburg to Ulm is very sandy and full of sloughs, which renders travelling disagreeable. The city of Ulm is well fortified, but no person is suffer'd to go upon the ramparts without paying a guilder, which is about two shillings and sixpence sterling. This practice has been establish'd by order of the principal people of the city, that the hay and fruits which grow on the ramparts may not be trampled on and spoil'd.

The steeple of the cathedral is very high, and from its summit there is a delightful prospect; the whole country round the city is perfectly level. It appears, by an inscription on the wall, that the emperor Maximilian the First, in the year 1492, climb'd to one of the upper galleries, and, it is said, that standing with one foot on the edge of the wall, with the other he made a cross in the air. What strange methods great men have taken, in the different ages, to perpetuate their memories!

In the beginning of this century, the city of Ulm met with a severe misfortune. The Bavarian forces, by stratagem, got possession of the Goose Town, as it is call'd, and as soon as their rear-guard appear'd, from behind an eminence cover'd with trees, they made themselves masters of the city. The castles of Schellenburg and Hockstadt gave a surpris'ing turn to affairs, and after a short siege Ulm recover'd its ancient freedom.

The city of Ulm is far from retaining its former wealth or splendor, but this declension is not peculiar to this city alone; many other imperial towns join in the same complaint. In my former excursions through this country, I have observ'd, that the smaller and poorer the imperial towns are, the more they give themselves up to feasting, and a variety of riotous and expensive diversions. Experience shews, that the imperial towns have hitherto enjoy'd their privileges with less oppression, and fewer restrictions, than the Franconian and Swabian imperial knights, who have lately been treated with great severity. The hatred which some princes bear to them is such, that a court preacher having once given out the hymn,

“ O holy Spirit, come in unto us, &c.”

he found it necessary to omit the whole verse in future, because it rather convey'd an idea of respect to these knights; the sense of the remaining part of the verse is this;

“ May we feel the elevating virtue of thy unction, and be thereby strengthened to behave as valorous knights.”

This conduct is similar to that of some zealous republicans in Cromwell's time, who had such an abhorrence of monarchy, that they alter'd the words in the Lord's prayer from ‘ thy kingdom come ’ to ‘ thy commonwealth come.’

There was a league form'd against these knights, in the year 1713, by some powerful princes of Germany; but George the First, king of Great Britain, declar'd to the Imperial court, that he would afford the oppress'd most powerful assistance, and the league was in consequence thereof broken.

The duchy of Wurtemberg must be reckon'd among the best and most fruitful parts of Germany, if a few mountainous tracts in the Black Forests, and on the Alb, or the Wurtemberg Alps are excepted; it has been justly compar'd to Transylvania, on account of the pleasant termination of the hills and valleys. According to the nicest calculation, the duchy of Wurtemberg contains fourteen prelates and abbots, four of which are general superintendants, thirty-six particular superintendants, about five hundred and seventy ministers of the gospel in the towns and villages, and about four hundred and fifty thousand inhabitants.

After the repeal of the edict of Nantz, the duke of Wurtemberg might have reaped very considerable advantage by granting encouragement to the French refugees, there being among them many rich people; and those profitable manufactures had been introduced into his duchy, which enriched Brandenburg and other countries; but a blind zeal for orthodoxy, and the clamours of many of the clergy, who were for setting up altar against altar, and asserted that Mahometanism was preferable to Calvinism; filled the assembly of the states with such jealousies and apprehensions, that the court was disappointed in its good intentions. The peoples eyes were opened when it was too late, and they had reason to curse the bigotry of the priests, when they saw what an opportunity they had let slip.

The mode of application to the duke of Wurtemberg upon business, is this: a memorial is first delivered in to the privy council, from whence it is sent to the chief minister, and by him it is given to the privy secretary; when the matter is laid before the cabinet council, who usually first ask the opinion of the privy council. When this is reported to the cabinet council, and is there approved, then, and not before, the duke's order concerning the answer is issued to the privy council. By this procrastinating method, they have ample opportunity to delay the decision of any matter which may be disagreeable; and, at the same time, must impede that business which requires dispatch.

The accountant, and comptrollers of account, are here called chamber counsellors: the affairs of this chamber are properly the province of the council of commissions. At the reformation, seventeen opulent monasteries were secularized. The monasteries, and other church lands, are managed by an ecclesiastical chamber, which, by the laws of the land, are to see that the revenues are employed to no other use than the support of churches, schools, and the clergy, the general care of the country, the redemption of mortgages, the discharge of debts, and to the disburdening the lands of the people; but this chamber has gradually been encumbered with other expences. The mines are under the direction of a particular office.

The duke's troops amount to four thousand men; the country is divided into high and low lands; the high lands include Tubinger, and the adjacent country, but are neither so fertile and warm as the low lands, some of these lands produce tolerable good wine, and on the hills is excellent pasture for sheep. The low lands are very fruitful, and the wine they produce is most excellent, particularly about Brackenheim, Uhlback, Hailbrun, Unterteskheim and Stettin; besides the plowed lands and vineyards, this country also produces very fine mineral water.

The police of this country is under the direction of certain officers, who are stationed in all the cities, towns, and villages, who inspect into the offences, clandestine meetings, and other misdemeanors of their fellow citizens, and make a report of the same to the magistracy of the place, who enquire further into the matter. These inquisitors act privately, and swear to the faithful execution of their office; they have no stated salary, but are generally rewarded with a counsellor's place, or some other office in the government. As no accused person knows his accuser, he is liable to be wrongfully dealt with, and this practice must be an inlet to many abuses.

Stuttgart is situated in a delightful country, which abounds with gardens and vineyards, and would have been a better situation for a palace than Ludwigsburg. The old palace here is falling to decay, and is never inhabited. In this palace is a noble hall, and near it is a beautiful orangery. In the museum are many natural and artificial curiosities, and amongst others is a picture of a woman, with a large beard; this seems rather an error of nature, but there are some cases in which bearded women have been found to enjoy a good state of health. In the year 1726, the people were very much diverted at the carnival at Venice, by

a bearded female rope-dancer. The history of the bearded amazon is well known, who served as a grenadier in all the campaigns of Charles the Twelfth, and gave astonishing proofs of her courage, till she was taken prisoner at the battle of Pultowa. In the year 1724, she was brought from Siberia to Peterfburg, and introduced to the Czarina with a beard above a yard long.

Ludwigsberg is about six miles from Stuttgart, and was formerly only a place for breeding cattle, but is now a considerable palace, which has but few equals in Germany. This palace is completely furnished, and the looking-glass and lackered closet are worth observation, as is the picture gallery, and the audience-room for ambassadors. The chapel belonging to the palace is very elegant, though too small for the purpose. In the menagery is a curious collection of birds and beasts. The green-house is remarkably fine, and contains several hundred straight trees, some of which are of the thickness of a man's body. The stables at Ludwigsberg are well built, and the houses are well chosen. Drinking is not so much in fashion at this court as it was formerly, though there are some old boozers still living in the palace, who are very famous for drinking large quantities of Burgundy.

The castle of Hohentubigen is now only used as a hunting seat. The city of Tubingen, which lies near it on the mountain, contains about five thousand inhabitants, and is famous for its university. The valleys of Ammos, Nicker, and Zerfstenauer, render the situation of this city very delightful. The castle has good apartments, and it must formerly have been a good fortification; it is vaulted underneath, and one cellar in particular is three hundred and twenty feet high; the undulating sound, caused by dropping a stone, or firing a pistol down the mouth, is very awful.

Learning is in a very good state in the duchy of Wurtemberg; and I will venture to affirm, that in all Germany, there is not a Protestant province, in proportion to its extent, that contains so many learned and eminent divines as this does. The inclination and capacity of the young students is strictly examined, and a watchful eye is kept over their application and acquirements, besides the examinations in the town schools, which frequently take place; two visitors are appointed by the duke to go a circuit, and examine the state of the public schools. Those young men who have stood the test of these examinations repeatedly, are for two or three years successively examined before the consistorial council; and if they are capable of taking upon them the pastoral function, they are sent to one of the two monasteries of Blaubern and Derckendorf; here they bind themselves by oath, constantly to serve the house of Wurtemberg; and if they render themselves unworthy of the sacred function, by any misbehaviour, they engage to repay the state the expences of their maintenance at the public schools. The students remain in the above mentioned cloysters for two or three years, and are afterwards removed to higher seminaries. The cloister teachers are men of great erudition; in these cloysters the youth are furnished gratis with board, washing, lodging, physic, and cloathing.

From Stuttgart I came to Durlach, which has experienced the effects both of good and bad fortune. The first object of attention here, and for which no expence has been thought too great, is the turret on the body of the palace, from whence there is a pleasing prospect of the whole town; the palace itself is built with timber and bricks; the garden, though small, is very elegant, and contains a beautiful collection of orange, lemon, and bay trees: here is also an aviary for three hundred Canary birds, which by day, in summer time, fly about the gardens, and at night repair to their habitations. Unfortunately a few winters ago, by overheating the house, the fire caught a billet of wood, which happened to lay there, and the poor birds were all suffocated with the smoke.

Behind the palace is a decoy for wild ducks, where above two thousand are daily fed. The chief defect in Karlfruch (which is half a league nearer the Rhine), is want of water. The neighbouring country is a sandy level, which in summer time makes travelling disagreeable.

There are two stages and a quarter between Karlfruch and Raftadt, but it is worth a traveller's while to turn off a little on the left hand to the Favorita, built by the widow of a late margrave, in the newest taste. Here is a chamber of a very beautiful porcelain, and a cabinet lined with looking-glass, and many curiosities both of art and nature. Some of the other rooms are hung with a Chinese manufacture of paper and silk. In all the apartments, gardens, &c. of this delightful Favorita, are discoverable the minutest regularity, decency, and œconomy, that were ever visible in a place of such dimensions.

Raftadt is regularly built, has a stately palace, which is the centre of the town. Few people are seen in the streets, and the town has, upon the whole, a gloomy appearance. The founder of Raftadt was the late margrave, concerning whom prince Eugene said, "that if he had the margrave of Baden's experience, or the margrave, his good fortune, one of the two must be the best general in Europe." This margrave fought many battles in the allied army, under the command of the great duke of Marlborough and prince Eugene.

The country from Raftadt to Strasburg, is very fertile and pleasant. Strasburg is a large old city, with very few fine houses. The ramparts are very pleasant, being planted round with rows of trees. Some new works are carrying on towards fort Kehl, that the city and citadel may be effectually joined together; this subjects the inhabitants to a great inconvenience, for they are obliged to part with the intermediate fields and meadows, and have only promises of payment for the damage they sustain. When this city was taken in the year 1681, the burghers were deprived of part of their fine ground for the new fortifications, but they have never received any indemnity. An engineer lately made a large model of this city, by very great application, and the labour of several years, which filled a large hall; it is now removed to Paris. The new citadel towards the Rhine, like the city itself, stands on lower ground, and the fortifications of both make no very formidable appearance. In the neighbourhood are some marshy grounds, which render the city very unhealthy. Here is an academy for cadets, who are instructed in all the military sciences.

The garrison of Strasburg consists generally of about ten thousand men; a monthly deduction is made from the officers pay towards the support of the theatre, by which means they have free admittance into the pit, and it is prudential to provide this amusement for them, as it prevents many disorders, and more prejudicial meetings, which might otherwise happen among such a number of military men. A company of officers sometimes agree to act themselves in any favourite piece, in which they succeed very well. They have also established a new order of knighthood amongst themselves, by the laws of which all things are to be in common; any one having more than is necessary, is to bestow the overplus on an indigent brother, and all superfluities are to be burnt or destroyed, as the inventions of luxury, and fomenting an unbecoming softness in men of a martial disposition. It may easily be conceived, that this order cannot boast of many rich members; and however philosophical the establisher may be, it will very soon terminate.

Within the walls of the city, they have water from the Preusche, and those without from the river Ill. As in all other places, the customs and manners of the inhabitants here vary with the times. The French mode of dress is the prevailing one at present.

The cathedral of Strasburg is very fine. When this city surrendered, it was immediately taken from the Lutherans, and given to the Roman catholics, on which account, the bishop of Furstenberg, being then

at Paris, said before the king, 'Lord, now lettest thou thy servant depart in peace, for mine eyes have seen thy salvation;' which is of a piece with the same kind of compliment of M. Daucourt, concerning the surrender of this same city in the year 1683. Lewis said, 'Let Strasburg submit; and Strasburg submitted: a power more than human, and to be compared to that alone, which, at the creation of the world, said, 'Let there be light, and there was light.'

This cathedral was finished in the year 1449, and it is matter of astonishment how these devices came upon its walls, such as monkies, hogs, &c. in monkish habits; the Protestants have been charged with it, but as the building was finished long before the reformation, I cannot see with what propriety. The furniture and ornaments which the French king, Lewis the Fourteenth presented to this church, are extremely rich and magnificent; fifty persons are said to have been employed on them during eleven years, and they cost that monarch six hundred thousand dollars. Opposite to the chancel is a draw well, where it is supposed, in the times of heathenism, the victims were washed; the washing of victims was by the antient Germans, and northern people, looked upon as an essential part of religion, so that the altars had always a spring near them. In the time of Clovis, St. Remigius consecrated this water for the purpose of baptism, which till the Reformation continued to be the sole use of it, and was carried for this purpose to the neighbouring villages. Its water is sweet and clear, and may be drunk at present either in the church, or carried home to the people's houses.

To this cathedral church belongs a large clock, which exhibits the several motions of the planets, &c. and is deservedly placed among the ingenious works of antiquity.

The city of Strasburg has many other curiosities, for the particulars of which, we refer the reader to a famous account, given by Dr. Moor, in his View of Society, and Manners of Germany, &c.

I come now to give you an account of the royal palaces belonging to the king of Sardinia, both in the city of Turin, and those that are near it. The palace in the city consists of two principal wings, which communicate one with the other by a gallery. The king's apartment is very well furnished, and in his bed-chamber is an exquisite piece of tapestry, representing a battle, in which the Lorrainers were entirely defeated. The queen's apartment projects into the palace-yard; in it are some good pictures of the royal family, with several large pieces of Porcelain, presented by king Augustus. Here is a gallery of statues which are very numerous, and on this floor his majesty resides. The closet where he confers with his ministers is near the audience chamber, and opens into a fine gallery of paintings. The fresco on the wall and ceiling is very admirable.

The king descends by a pair of stairs from his apartment to the library and archives; the number of books in the library is considerably diminished, seven thousand volumes having been presented to the university: it still contains many valuable pieces, and to have a sight of it, a written order from the king to the librarian is necessary. The royal records are in very good order, great care being taken of them. Every closet has a particular catalogue of all the papers in it, that the keeper of the records may immediately find what is wanted. The king had formerly a very valuable collection of medals, but they have gradually diminished.

In the left wing of the palace is the chapel of the holy Sudary, which is built entirely of dark grey marble, that it may be adapted to the tragical relief preserved there. The model was drawn by father Guarini, and cost a great deal of money. The sheet, as the clergy here pretend, wherein Christ was wrapped after his crucifixion, has on both sides the figure of a man imprinted in blood; it is kept in the middle of the chapel, in a tabernacle, and is only shewn on very particular occasions, as on the marriage of the hereditary

hereditary prince, &c. The supposed sudary of Christ is also shewn at Mentz, Lisbon, and in about twelve Romish churches besides. It is most likely that neither of them have the real one, but that the confusion the disciples of the Saviour were in during those troublesome times rendered the preservation of the linen which bound his sacred body altogether impossible.

In the chapel of the palace the king says mass every day. Under the chapel is a passage to the cathedral of St. John, where, at the windows, hang the standards and colours taken from the French at the relief of Turin. The gallery for the music, and the organ loft, are richly adorned with sculpture and gilding. A particular place is appointed for the king's band of music, in the galleries of the chapel royal. The king has made some very pleasant gardens behind the palace, among the fortifications of the city. The whole spot lying within the fortifications, has a communication with the outworks through a broad vaulted passage.

The country palace which the court mostly frequent is La Venerie, where the king generally stays from spring to December; it is about three English miles from Turin. The road to it is well paved, and the greatest part of it is planted with trees on each side, which renders it very shady in summer time. It is a great pity that this method is not more generally adopted, as travelling would be much more pleasant than it is now. About a quarter of a mile from Turin you enter upon the Campagne de notre Dame, where in 1706 the French trenches were forced. Before the king's palace is a street well built with freestone, two stories high. In two chambers, adjoining to the king's apartments, are the pictures of thirty of his majesty's ancestors, with Latin inscriptions, signifying their most famous achievements. Beyond these is a chamber of pictures of the emperors of Germany, another of the kings of England, and another of the kings of France, which are all drawn as big as life.

The King's Mews is a good building, and contains upwards of two hundred horses. At the entrance of the stables, a stranger is required to give up one of his gloves, which is redeemed when he comes out with a piece of money. The royal chapel at La Venerie is a beautiful building. The cupola is of a graceful height, and within it are the statues of St. Ambrose, St. Chrysostom, St. Augustin, and St. Jerom, standing on red, green, and yellow marble pedestals; the statues are of white marble, and were brought hither from Rome. The high altar is a glorious sight, and there is scarce any kind of marble which is not to be seen in this chapel.

The palace garden is not taken much care of; the water-works and grottoes, the fountain of Hercules, and the temple of Diana, are all destroyed.

Rivoli is another royal palace, about three leagues from Turin towards Sura. The road runs in a direct line, through fields, meadows, and vineyards, it has been planted since the siege of Turin in 1712; the French, among other devastations, having rooted up every tree throughout the country. This road affords a beautiful prospect, and at one of the vistas stands the palace of Rivoli upon an eminence, and at the other end is the city of Turin.

At Rivoli are very good apartments, and some excellent paintings; the royal family are much better lodged here than at La Venerie or Turin; the air is very clear and healthy, and remarkable for giving a good appetite, but is so keen as to render it disagreeable to sleep in. The church of Superga stands upon the highest eminence in the territory of Turin; at each end of the church are two elegant towers, and the cupola is supported by eight large Corinthian pillars of dark grey marble; their base is between five and six feet high, and of the same marble streaked with white. The front of these bases are inlaid with large pieces of white and red marble so curiously, that they resemble agate. Besides the upper lofty pillars, within the cupola is a gallery with eight windows in the circumference. In the centre of the roof, within a circle,

are the following words: "Victorius Amadeus Rex Anno Salutis MDCCXXVI." Without the dome are three galleries, one above another, the two lowest have stone balustrades, those of the upper are of iron work. The prospect from the upper gallery exceeds description; and comprehends, among a variety of other objects, the Capuchin monastery, or the mountain Le Valentin; Rivoli with the long terrace, planted with trees; the valley towards Sura, its mountains covered with snow, the meanders of the Po; the Doria and Stura, and the fine plains along these ruins which extend as far as the eye can reach; the vallies and levels beyond Malcallin, also the delightful eminences in the neighbourhood, covered with vineyards, gardens, and country seats, and finally Turin itself in a spacious plain.

Contiguous to the church is a large square building, for the occasional devout retirement of the royal family: the apartments are plain and unornamented, and the court-yard is surrounded with a cloister, as it is in monasteries.

The palace of Valentin is so called from the title given to those gentlemen who, on St. Valentine's-day, wait upon the ladies. It is a general custom all over Italy on that day for single women to chuse one among their male friends, who is to gallant them the ensuing year wherever they go, and is expected to present them nosegays and other trifles; the attendance expires at the year's end, and often terminates in marriage. But as these valentine gallantries are left off at court, the palace of Valentin is also neglected.

The king of Sardinia's revenues are very considerable; in his territories on the continent, are sixteen bishopricks, including the two archbishopricks of Turin and Tarantaise. Besides the city of Turin, three hundred and forty towns and villages are subject to the former; and, as among the Roman catholics, every one is obliged to communicate at Easter; and to deliver to the priest an account of the number of his family, the number of the inhabitants can pretty easily be ascertained; I have been assured, that from such computations, the number of the king's subjects in Piedmont and Savoy, and other parts on the continent, amount to two millions and some thousands.

The prerogative of the king of Sardinia, in civil affairs, is equal to that of any monarch in Europe; and in ecclesiastical matters, few sovereigns carry matters with so high a hand. The situation of the king's dominions on the continent, oblige him to be on his guard in case of any broils between the houses of Austria and Bourbon. A war in Italy being very expensive both to the French and Germans, the house of Savoy has always shewn that it knows how to rate its friendship and assistance. The duchy of Savoy is quite exposed to the French, and has been often taken possession of without any resistance; neither its frontier nor inland towns are in the least fortified. The king of Sardinia cannot think of being a gainer, by declaring against France; the great power of that monarchy, and the mountainous nature of the country, are an effectual bar to the extending his dominions on that side; and it would be very impolitic in him to break with the French monarch; for, with the assistance of the French forces, the king of Sardinia may face all his enemies. On the other hand, it is not easy to dislodge the house of Austria from any of its possessions, therefore the king has always judged it most adviseable to procure some little advantages by leagues and stipulations. This method has answered so well, as by degrees to transfer almost the whole country of Montserrat, and some other neighbouring territories, into the hands of the house of Savoy.

The king's regular forces consist of about twenty-two thousand infantry, besides the horse-guards and artillery; he has likewise fifteen well disciplined regiments of militia, which are embodied for about two months every year. The king formerly had a regiment, the officers of which were all knights of Malta, from whence it was called the regiment of the white cross; but the king soon found that another regiment

was of more service; for, on a summons from the grand master, this regiment was for some time without officers; besides, as they were all persons of rank, they could not bear the severity of strict discipline. On these accounts, the king thought it best to let the regiment dwindle away by degrees. The king of Sardinia has four regiments of foreigners, mostly Germans, which make a body of five thousand men; these not only serve to give a weight to his authority in his own country, but also are as a pattern to the Piedmontese and Savoyard soldiers; for their discipline is very complete.

Another advantage accrues from this method, because more hands are spared from tillage. The late king renewed a law which the regent duchess, Christina, made in the year 1648, and calculated for the increase of the human species. By this law it was enacted, that all parents having twelve children, lawfully begotten, should be exempted, during life, from all taxes and imposts upon such goods as they were possessed of before the birth of the tenth child: they were likewise free from all tolls or duties chargeable on home goods, being subject only to contribute towards repairing roads, bridges, and harbours. In the number of the twelve children are included not only those of the first generation, but likewise the grand-children, whose father happens to die before their grandfather, as also those who are killed in the king's service.

In the year 1710, a great number of Protestant recruits enlisted in a Piedmontese regiment, and many of them turned Roman catholics. The motives of their conversion to the Roman catholic faith were not from conscience or devotion, but on account of five livres which was paid to every one who came to the Romish church, besides what they got from monasteries or people of substance, who were fond of seeing the members of their church increase. Among these recruits was an honest Swabian, who went about Turin, asking, in his own country dialect, where the monastery was which gave five livres to any man turning Roman catholic.

It contributes not a little to the maintenance of military discipline and order, that the regiments continually do duty at Turin, as the king's foot-guards. The king's presence occasions great care and punctuality among the troops: the guard is daily relieved by an hundred and eighty-four men, and consists of twenty-four grenadiers, thirty troopers, and about an hundred and thirty musketeers.

The pay of the troop of horseguards is about twenty-six thousand livres a year. The private men are mostly gentlemen, and have each twenty-five livres a month; four of them join in keeping a servant. As the king travels very expeditiously, they are often very hard put to it. The king is always preceded by a marshal de logis, with five life-guards, and is followed by eleven of the gentlemen in waiting. The king keeps an exact account of all his officers, observes every one's good and bad qualities, and frequently makes inquiries concerning their behaviour. From these informations, he prefers them, without any regard to rank or seniority. It is the king's pleasure, that all offices in his disposal be accounted equally honourable. A minister of the state petitioned the late king to make his son a lieutenant or an ensign, as it was but an inconsiderable post. The king answered, 'I have no inconsiderable posts to give away.' It is owing to this that the sons of many noble and wealthy families are ensigns and lieutenants; and no person can obtain a genteel post at court, who has not first served in the army.

The life-guard consists of three troops, the Savoyards, the Piedmontese, and the Sicilians. The fortified places on the continent are not numerous, many of them having been blown up by the French: however, except on the Milanese side, the king's dominions are still pretty well secured.

The citadel of Turin, as to its situation and esplanade, very much resembles that of Tournay, and still more that of Lisle, which, however, has more

houses in it, and likewise water in the ditches. If the subterraneous works of Tournay are admired by connoisseurs, those of Turin are not in the least inferior; if they do not rather surpass them. A permission from the governor is necessary, to obtain a particular view of Turin and its citadel. The fortification is a regular pentagon, or a fort with five royal bastions, and has a vaulted deep well in every bastion, so that they cannot be deprived of water: considering the number and spaciousness of the subterraneous works, the whole citadel may be said to stand as it were in the air. The ground on which it stands is raised a little above the adjacent country, so that no water can be conveyed into the ditches and lower works. In this its chief strength consists; as the mines, &c. would be rendered unserviceable, could they be overflowed. It is also well fortified and undermined towards the city, to which it is nearer than the citadel is to Milan. The proximity of Milan to Turin is a great disadvantage, as Milan is not fortified: the city and citadel of Turin mutually add to each other's strength.

The city of Turin is surrounded by walls and bastions lined with free-stone. The fortifications may be walked round in an hour and a half, but this is not permitted to any one without an order from the commandant: there is a beautiful prospect from the ramparts. The city is not large, but is very populous: the inhabitants are said to be between fifty and sixty thousand. The plague, which made such dreadful havock at Marseilles, drove to Turin a great number of useful manufacturers. Within the walls are forty-eight churches and monasteries, and seventeen more in the neighbourhood. If Turin continues to increase in size and magnificence as it has done hitherto, it will certainly have the noblest streets of any city in Europe. The houses are built on piazzas, which afford shelter in the wettest season.

The ecclesiastical buildings in this city are much inferior to any other, for they are remarkably antient, whereas the other buildings were begun and finished in the two last reigns. The chapel of St. Laurence, close by the palace, is the finest in Turin; the tabernacle, or the great altar, consists of beautiful small pillars of oriental marble; and the pyx, in which the host is kept, is made of lapis lazuli. The chapel of the holy Trinity is somewhat smaller, but is full of magnificent decorations; it has a lofty cupola, superb altars, and curious works in marble of various colours; here is also a rich foundation for pilgrims. The Corpus Christi chapel is in the Green Market, and remarkable for the miracle said to have been wrought there. In the year 1743, the Savoyards having pillaged Exiles, it happened that a consecrated host was brought to Turin along with the booty: it was packed up, together with some other things, upon an ass; and when the beast came to this spot, he kneeled down, and could not be made to stir a step further. In the mean time, the box in which it was deposited flew open, and the wafer shot up into the air, where it continued hovering in the sight of the people till the bishop arrived, into whose sacred hand it gently descended, and was by him carried into this church. Improbable as this story is, it is generally believed in Turin. The Jesuits church, and that of La Consola, are the finest in Turin. The church of St. Philip, and that of St. Thomas, are also very magnificent. The Franciscan church is ornamented on the outside with fine statues and pyramids.

Many of the convents in this city have dispensaries belonging to them, well furnished with medicines. Among the many laudable foundations at Turin, the five hospitals for sick and lame of all sorts are some of the most useful. The largest and best hospital in Turin is that of St. John. It was often found that several single women, whose pregnancy was the fruit of criminal conversation, cruelly made away with their children; such distressed women are admitted here. There were lately, in this hospital, about twenty such patients, besides four hundred foundlings

and orphans, a hundred incurable, and two hundred other patients who were judged curable: the children are employed in spinning silk, till they are fit to be taught some trade. The ground floor is for the male patients, and the upper floor for the females. The beds are placed at a convenient distance from each other, and there is an altar in the centre; so that all the patients have a sight of it, and can hear mass without getting out of bed. It has three doors in front, and over the grand entrance are these words, 'Saluti pauperum temporali; divitum æternæ apertum', which is, in English, 'This edifice is open for the temporary relief of the poor, and for the eternal salvation of the rich.' The management of this excellent foundation is lodged in two deputies of the chapel of St. John, and two of the seventy counsellors of the city. These deputies manage the revenues and expences of the city, whilst the senate takes cognizance of civil and criminal processes: they are chosen annually, but are often continued longer in office. Besides physicians, nurses, matrons, &c. here are four confessors belonging to the hospital.

To prevent the exaction of the peasants in raising the price of wood in winter, there are four large store-houses of wood and coals belonging to the city; and when the peasants take advantage of the cold weather, fuel is sold at this magazine at a reasonable rate.

The king takes care to be exactly informed about the execution of the laws, and he has been known formerly to go by himself, muffled up in a cloak, that he might look into the state and management of the city. The king once took from a baker a loaf which looked coarse and short of weight, and carried it to the senate, that it might be weighed and examined. The baker complained of the heavy duty, and, as his complaint was not entirely groundless, the king ordered an alteration to be made, and the excise on bread was lowered.

I shall now proceed to mention some of the inconveniences of Turin; among their number are the thick fogs, which, in autumn and winter, are continually rising from the Po, and other waters, by which the air is rendered very unhealthy. These exhalations very much incommode the city, whilst Aivoli enjoys the serene sky and brightest sunshine. The inns also want much regulation; for though the country affords very fine wine, yet you cannot get it under an exorbitant price.

The manner of burying the dead at Turin is very disagreeable: the corpse is carried in procession to the grave, where it is put into the ground without any coffin. In some contagious distempers, such as the small pox, &c. this custom is attended with bad consequences. Persons of rank have family vaults in the churches and chapels, but the commonalty are thrust into a vault belonging to the parish church, fifty or a hundred together, without any coffins. These receptacles are very deep, and have large doors; notwithstanding this, there are noxious effluvia which penetrate into the churches. This impropriety, I am sensible, is not peculiar to Turin, but is common to most large cities, especially in popish countries. Dr. Verheyen, professor of physic and anatomy at Lorrain, composed the following epitaph for himself, by which it appears that the doctor was an enemy to the burying the dead in churches: I shall give it the readers in English; 'Philip Verheyen, doctor and professor of physic, ordered his mortal part to be buried here in the church-yard, that he might not pollute the church, and infect it with noxious effluvia. May he rest in peace!'

Another disagreeable thing at Turin is the unrestrained permission of mountebanks, and other quack doctors, who defraud the common people of their money and health at the same time. Notwithstanding there is an order from the university, that these itinerants shall not presume to vend their medicines without a licence from a professor of physic, yet they exhibit publicly on all occasions. The Place du Chateau is never without a stage or two erected for

these quacks, where they emulate each other with music and drolleries, in order to increase the number of their hearers. Their manner of recommending their medicines is somewhat extraordinary. I happened to hear one, who began his harangue in this solemn manner, 'Blessed be the Lord Jesus Christ, of whom I desire no more, than that, according to his righteousness, he will deal with me at the last judgment, as I shall deal with you this day. I venture my whole substance out of a tender concern for your health; but the devil, that eternal enemy to all good, so blinds your eyes, that you look upon a few sols as if they were an hundred scudis, and thus neglect your own welfare, and that of your relations, which you might recover for a trifle. If I take but a doit from you against my conscience, I wish I may be swallowing your melted money in hell, without end, amen, &c.' This impostor's medicine consisted of two powders, which were infallible remedies against the bloody flux, the falling sickness, the cholic, consumption, and dropsy, and were both sold for the value of an English penny.

The king of Sardinia has enacted many wholesome laws and regulations for the governance and convenience of the inhabitants of his dominions. He has nearly extirpated the banditti out of his kingdom, so that travelling is much more safe than formerly: very severe laws are enacted against those reptiles, who formerly over-ran the whole kingdom. Here is another commendable regulation, that from the inferior judges lies an appeal to the president of the province; and from him, within ten days notice after the sentence, to the senate of Turin; no judges or magistrates are to take any presents except provisions, and of them only a sufficient quantity for three days. Every malefactor who is taken up, is to be examined within twenty-four hours after he is in custody, under a heavy penalty payable by the judge. The accusation, and the answer, after being audibly read in the prisoner's hearing, must be signed by him, and, if he cannot write, he must make his mark before witnesses. Abortions procured by art, are made capital offences, without regard to the nice distinction, whether the foetus has had life or not. If any person knowingly utters bad money, although he is not at all concerned with the coiners of it, he is condemned for ten years to the galleys. A person guilty of theft, for the first offence, is sentenced to draw in a cart like a horse, or be publicly whipt; for the second offence, he is branded on the arm, and condemned for five years to the galleys; a third fault sentences him to the galleys for life, and a fourth is generally punished with death. A house-breaker is condemned to the galleys during life, and should he have it in his power by any means to repeat the fact, he is sentenced to die.

A notary making a false instrument, or forging a title to an estate, forfeits his life. None are to carry any fuzees, musquets, or pistols, or any set of firearms, not even on a journey, under a heavy penalty; but this prohibition does not extend to the king's immediate vassals, their brothers, or children, or any of the officers of state who are permitted to travel with them. Foreigners travelling through the king of Sardinia's dominions are likewise permitted to wear firearms, but must deliver them up during their stay in any town.

The postmasters at Turin are not to furnish travellers with horses without a licence from the secretary of state for foreign affairs; and those in the provinces, from the governors or chief magistrates of the place. No person, without a particular order, is permitted to ride post without a postillion; there are likewise many other regulations for travelling. The roads are very good, and kept in constant repair.

The people of Turin are in general very sagacious. Quickness of parts, and penetration, are not confined to the great or learned, but are conspicuous in people of the lowest class; to which, besides the warmth and serenity of the climate, their frequent intercourse with the French has, in a great measure, contributed. In

the mountains of Avorta, the people are an exception to these remarks: they seldom travel beyond their hills and vallies, and scarce think there is any part of the world inhabited but their own. The greater part of them have large wens upon their necks, and, as their horses, fowls, &c. have the same kind of excrescence, it is probably owing to the snow-water which they generally drink. But such is the power of custom, that a wen is reckoned no deformity; and a story goes about, that a foreign woman, who had no wen, coming into a church in this country, in the middle of sermon time, a general laughter ensued on so uncommon an appearance. It is added, that even the preacher, after looking about for the cause of such a disturbance, could not contain himself; but soon recovering his sacerdotal gravity, represented to his auditory, that, in what they had done, they might not mean any harm, but that the natural defects of our neighbours were not a subject for laughter and mockery: that a Christian, upon seeing such spectacles, should rather take occasion to be thankful to his Maker for his bounty to him, than insult his fellow creature, from whom God has with-held his gifts.

The ladies at Turin are very easy in their conversation; their tongues are perpetually going, and they laugh to excess. Every one has her gallant, and a confidant for carrying on intrigues; and with them they chiefly converse in assemblies. Vanity, and an extreme fondness for praise, makes them put on a shew of politeness to strangers, but this wears off the longer they stay at court or in the city.

Turin is famous for the manufacture of silk stuff, but the brocades and tissues are not so good as those made in France. No great number of silk-worms are permitted to be kept in Turin, because they imagine that they may be pernicious to the health of the inhabitants: their many changes, fermentations, and putrefactions, filling the air with noxious effluvia, which, in a populous city, are not so easily dissipated as in the open country.

From the number of white mulberry-trees in any person's plantation, it is easily computed how many worms the owner may breed: they eat less in a warm than in a cold season. The butterflies are no sooner out of the cocoon but they copulate, and within eight or ten days after having laid their number of eggs they expire. The eggs are carefully preserved in the winter, till the mulberry-trees begin to bud; then these eggs being laid between mattresses, and in a continual warmth, are hatched in forty days. Some women have a method of accelerating the production, by carrying the eggs, in paper bags, in their bosoms. The nobility have large stocks of silk-worms, which, under certain conditions, they commit to the care of their tenants: the punctual attendance they require, the care in feeding them, and letting in fresh air into the rooms, occasion a great deal of trouble. The proprietor furnishes the eggs, together with a proper proportion of mulberry-leaves, and in return has half the silk.

This country produces truffles in great abundance, and it is a profitable employment for the peasants to dry up this admired vegetable. They are likewise found in all parts of Germany, but for the plenty found in Piedmont, it may be termed their native soil.

The great plenty of wine in all parts of Piedmont is another considerable advantage to the country. Like other Italian wines, it has a luscious sweetness when new, but when kept to a proper age, is exceeding good, and very well pays the interest of money for keeping. The mountains of Montserrat produce the best.

Piedmont is a fertile country, and in every part of it produces abundance of chestnuts, filberds, and mulberries. The large chestnuts are much admired by the common people; they put them into an oven, and when they are thoroughly heated, they steep them in red wine, and put them into an oven again.

The finest part of all the king's dominions, and

indeed few spots can come in competition with it, is the country betwixt Turin and Corri. Savoy affords such plenty of box, that instead of birch, as in Germany, the common sweeping brooms are made of it.

Grazing turns to very good account here, and the profits of it are considerable. Though mules are bred in Savoy, they are nevertheless brought here from Naples, Sicily, and Auvergne, and fetch a very good price.

The Sardinian nobility are very much oppressed, many of their privileges are considerably abridged, and they cannot live with that splendor which their exalted station require.

A foreigner who intends to settle here, must be naturalized, and take the oath of allegiance; and if afterwards he happens to be three years absent, he loses all his former rights and privileges. All foreigners of every rank, are incapable of possessing any acquisition in land or money, by will or inheritance, and all legacies left them are null and void. This law is particularly severe, for no state in the world forbids legacies to Savoyards or Piedmontese, nor even to make them their sole heirs. There are many other hardships to which foreigners are subject in the king of Sardinia's dominions.

Mr. Keyser thus proceeds: soon after my arrival at Turin, being very desirous to see the famous Borromean islands, in the Lago Maggiore, while the fair weather lasted, I made a little excursion into the Milanese, in which I found that the best way of performing it is with the Veturini.

Chivasso is the first place of note I came to, after crossing the Doria and Stura: as it stands upon a morass, it is not to be approached by mines. It is four leagues from Turin, situated in a large plain, a good part of which is converted into tillage, and produces Turkey corn; but towards Zigliano, it is a barren waste in many places, covered with a kind of reddish heath. The fortress of Verva, formerly so celebrated, lies still in the ruinous condition to which it was reduced by the long siege it sustained against the French in 1705.

In these parts, the clocks are set after the Italian method; an hour after sun-set, they strike one, and so progressively to twenty-four. In some places, the clocks strike no more than twelve, in others six, beginning again at one, so that at first it is a little puzzling to reconcile the Italian clocks with the French and German method of computing time; but in those places where they strike but twelve progressively, the equinoxes remove all difficulty.

Verulli lies seventeen Italian miles from Zigliano, (which is pronounced Ciano) and twenty-five miles from Chivasso. It is a pretty large and flourishing city, but the citadel and fortifications were totally demolished by the French in 1704, and still lie in ruins. Over the door of a church (which, perhaps, is some particular asylum) I observed this inscription:

Quod justitia punit, pietas protegit.

What justices punishes, piety protects.

As if justice and piety were so opposite as not to be reconciled to each other: daily experience indeed sufficiently shews the asylums and immunities granted to churches and monasteries to be inconsistent both with justice and true piety.

In all the Piedmontese territories on this side, there is a great plenty of Turkey wheat. The common people make bread of it, and when it is mixed with rye, it is used by people of good circumstances; the husks of it serve for fuel, and the large stems for mending the roads. It is thought of such a quality, as to be prejudicial to the health of those who sow and reap it, especially those who eat it, and also to impoverish the land on which it grows. If this is the case, it is a great pity that its growth is so much encouraged, and more so that it ever was introduced into this country.

The inhabitants of Piedmont think rice so prejudicial to the soil and themselves, that its growth is absolutely prohibited. The whole world scarce affords a tract of land so well watered as the Milanese, and as the ditches and canals every where divide the fields and meadows, no place can be better adapted for rice. Upon entering the Milanese, I saw it in great quantities, where it is allowed with this restriction, that it is not to be sown near any town; and boundaries are fixed, within which it must not grow on any account. The pernicious effects of such a marshy soil are but too evident; after sowing the rice, the ground is laid under water, and so continues till the rice is ripe. Most of the inhabitants of these countries, where it grows in abundance, are troubled with violent head-achs, vertigo's, and fluxes.

The fertility of the soil is so great in most parts of the Milanese, as to yield two crops a year; the corn sowed in the autumn of the preceding year ripening in June; and this is no sooner carried in, but the ground is a second time sown with barley, Turkey wheat, &c. which is reaped in November.

Novora, the first city on this side the Milanese, is well built and fortified. The great number of marble pillars and statues, the curious bronzes, together with the silver chapel in the cathedral, are well worth seeing. The bishop of Novora has a temporal jurisdiction over a large tract of land, as far as the Lago Maggiore, on which account, when he rides a horseback, he wears a sword.

The country, as far as Cesti, is extremely pleasant and delightful, and most of the roads are planted on each side with rows of chestnut trees, which form a delightful avenue. This country is subject to very violent rains, and the inhabitants use very odd habits to defend themselves from the showers. Those who ride on horseback are covered with oil skin; indeed this practice obtains in other countries, especially in England. The meaner sort, who travel on foot, wear long cloaks made of straw or rushes, fastened round the neck, and reaching down to the middle of their legs. This is not much unlike the dress of some of the American savages.

The Lago Maggiore is sixty-five Italian miles in length, and six in breadth, and in the middle is almost eight fathom deep. Towards Switzerland it terminates in a canal, which is of great convenience for commerce. Near Cesti, the lake discharges itself into the river Teuse, which is properly the efflux of the Lago Maggiore; and at the beginning of it, the current is so rapid, as only with the help of a single oar to carry a boat thirty Italian miles in three hours; but on the other hand, this rapidity makes the passage very dangerous at low water. The quickness of the passage on the lake is balanced by the want of dispatch on the canal, called Ticinello; the boat is drawn by horses so slowly, that a whole day is spent in getting up to Milan. This canal is of very great advantage to Milan; for by means of this, and the Lago Maggiore, it carries on a trade with several provinces of Germany, Switzerland, and France.

The bottom of the Lago Maggiore is stony, its water is clear, but of a greenish colour, like that of other deep lakes. It affords trout, perch, tench, and other kind of fish; great quantities of which are pickled for exportation. The frequent eating of fish makes fast-days very disagreeable here, and the innkeepers always take care to buy the cheapest sort.

On the right hand, in the passage from Cesti to the Borromean islands, stands Lizzana, an old castle situated on a mountain, which is divided into ten or twelve terraces, one above another, and make a pretty prospect. About a league from Cesti, on the left hand, stands Arona, which belongs to count Barromeo. Opposite Arona, on the right hand, close by the lake, lies the little town of Anghiera with its castle.

The Lago Maggiore is every way environed with hills, covered with vineyards and summer-houses. Above the vineyards are plantations of chestnut trees,

the fruit of which, in the northern parts of Italy, are consumed in such quantities, that when chestnuts are in great plenty, the price of corn falls, especially at Genoa: they continue fresh and green till Christmas, but the country people eat them till Easter, and they are esteemed dainties when roasted, and steeped in red wine.

Along the banks of the lake are fine rows of trees, and walks arched with vine-branches; and on the left hand of the lake, are many natural curiosities, and amongst them several natural cascades falling down the mountains.

Two leagues from Cesti, the lake begins to widen, and as you enter the bay, two celebrated islands appear on the right hand. It will be proper first to give an account of Isola Madre, as we are naturally apt to undervalue any object, whilst the idea of another of superior beauty and excellence is fresh upon the mind; but the wind obliging our steersman to stand further off to the left, it was our fortune to be landed first on the Isola Bella. These two islands can be compared to nothing more properly than two pyramids of sweet-meats, ornamented with green festoons and flowers. In the garden of the Isola Bella are ten terraces, and the perpendicular height of these taken together is sixty ells above the surface of the water, each ell consisting of three spans. These terraces proportionably decrease in their circumference towards the top of the hill. The oblong æra on the summit affords a most charming prospect, is paved with fine stone, and is surrounded with a balustrade. It is from forty to fifty paces long, and on every side is a range of marble statues, in the gigantic taste. The rain water runs into cisterns underneath, to which also other water is conveyed, in order to supply the water-works. Round every terrace there is a pleasant walk, and at the four angles are large statues and pyramids, placed alternately. The walls from the bottom to the top are covered with laurel hedges and espaliers of orange, lemon, peach-trees, &c. The laurels stand in the open air, during the whole winter; but the lemons and oranges are sheltered with boards, and in very cold weather are cherished with heat from fires, provided for that purpose at a very great expence. The annual charges of these Borromean paradises are very considerable.

The Isola Bella was originally, and no longer since than the middle of the last century, only a barren rock, to which every basket of earth, and every thing that is found there must have been brought by water at a prodigious expence. The Isola Bella has a south aspect, and at the two angles of its façade are two round towers, in which are very lofty apartments, adorned with red and black marble. On the left hand of the garden as you come from Cesti, is a covered gallery, supported by stone pillars, and shaded with lemon-trees. On the other side is a delightful walk of large orange-trees, consisting of four or five rows. Near this is a delightful grove of laurels, with narrow walks, and a cascade which falls down above twenty steps; here is also a plantation of large pomegranate-trees. The lake comes so close up both to the palace and gardens, as scarcely to leave as much dry ground as is sufficient for a man to stand upon. There is nothing to be seen but the lake from the island, and walls or perpendicular rocks impending over the water. On the east and west side are large vaults, on which the earth has been raised to the height abovementioned. These vaults are not only a foundation for the soil, but likewise an ornament to the garden, being so many grottoes. Near the palace are kept in a shed, built for the purpose, three fine gondolas for parties of pleasure on the water.

In the palace are great numbers of fine pictures, vases, busts, and other curiosities; among the paintings are many beautiful flower-pieces. Several of the chambers are hung with portraits of the Borromean family. The vaults on which the palace stands are contiguous to the lake, and are decorated with marble and shell work. The floor is a kind of mosaic work, consisting

consisting of small stones, and represent various figures. Besides this assemblage of the beauties of art and nature, the lake, with its undulating waves, continually washes the entrance of these grottoes, so that a more delightful summer retreat cannot well be imagined, much less described. Towards the south, and close behind the house, are five lofty cyprus trees of an extraordinary size. In going from the house to the garden, the air is quite perfumed with the odors of fruits and flowers.

The first *Castra-Espalies*, after ascending a few steps, consists of bergamot, lemon, or citron-trees; next to this appears a high range of orange-trees; beyond this is a lofty grotto, adorned with water-works and statues; over its centre is a unicorn of an amazing size, in a springing attitude, with a Cupid on his back. On both sides there is an ascent by steps to the oblong *æra*, which terminates the ten terraces. I believe I may safely say there is not such another island in the world. On two pedestals are the following inscriptions, which I shall give the reader in English; they serve to give an account of this amazing and beautiful *Ifola*, and of the founders of its buildings and gardens.

“ Vitalliano Count Borromeo, privy counsellor to his Catholic majesty, master of the ordnance, and his imperial majesty’s vicar general in Italy; by the foundation underneath, and the edifices erected by him on these rugged, mishapen rocks, imparted a dignity to his leisure, and grandeur to his amusements, 1671.” The other inscription is,

“ Rennatus Borromeo, count and lord of Arona and its castle, of the conquered countries of Novora, &c. 1671.”

From *Ifola Bella* to *Ifola Madre*, is half an hour’s sailing, though their great height makes them appear much nearer. *Ifola Madre* has seven terraces, which are high and sloping, and at a considerable distance from each other. The greatest part of the external foundation of *Ifola Madre* is a high perpendicular rock, projecting considerably over the water. The house is not near so remarkable as that of *Ifola Bella*, yet contains many valuable paintings. The garden abounds with beauties, with groves of citron, orange, cedar and jessamin trees. Many pheasants are kept on this island, which is a place of security for them, as they cannot fly over the lake: here is a little house built for the young pheasants, and near it is a beautiful grove of lofty cypress trees; this appears to me the pleasantest part of the island, and recalls to my mind the fabulous descriptions of the enchanted places of antiquity. The emperor Charles the Sixth, and the empress, passed several days on *Ifola Madre*. Among the other curiosities of this island is a large ebony tree, which much resembles the fir-tree, and produces large red berries. The walls round both islands are set with painted flower pots, and when any prince visits them, they are illuminated by night, which exhibits a glorious spectacle.

Mr. Keyfler proceeds next to give a long description of Milan; but as we have already given Dr. Burnet and Mr. Addison’s accounts of that famous city, we will pass over what Mr. Keyfler says about Milan, and accompany him in his travels from thence through many places not yet mentioned, or but slightly touched upon.

The country between Milan and Pavia is extremely pleasant; the meadows on each side the road are very fertile, and are watered with small canals; here is also a large plantation of trees, and many luxuriant vineyards.

Five Italian miles on this side Pavia, is a celebrated Carthusian monastery; the church of this monastery is remarkably superb, the front is entirely of white marble, ornamented with sculptures, the whole building is covered with wire, to secure it from being sullied or damaged. Within the church is some curious iron work, which is gilded over, and is said to have cost an immense sum of money. Here are also twelve incomparable statues of Carrara marble, four

of which on the outside represent the four cardinal virtues, four more represent the four Evangelists, and the others are statues of St. Jerom, St. Ambrose, St. Augustine, and St. Gregory. Two very curious basins for holy water are shewn here; and besides the high altar are here sixteen others placed in different chapels which front each other, most of the altars are differently adorned. The great altar-piece, with the two tables on each side of it, are of Florentine work, and glitters with a profusion of gems; the tabernacle of this altar is so curiously inlaid with onyx, agate, &c. that it is valued at eighty thousand dollars. The roof of the church is painted of an azure colour, and is inlaid with stars of gold in humble representation of the starry heavens. Here is also a good deal of mosaic work; and in the vestry, the historical part of the Old Testament is most ingeniously carved on sea-horses teeth.

The founder of this convent was John Galeazzo Visconti, who died in 1494, and lies buried in the church, where a magnificent white marble monument is erected to his memory.

The library is not equal to the outward magnificence of the building, but it is not often that a Carthusian monk makes any figure in the republic of letters. The building on the right hand of the entrance into the great court has very fine apartments, where the late empress was sumptuously entertained. In a little square garden adjoining to the convent are some beautiful box hedges, and some very fine water works, with which the holy fathers take much delight in playing tricks upon the monks of the other orders, and they cannot well escape a severe soaking.

In the area of the building is a large garden of a quadrangular form, with a beautiful walk covered over with vines, and adorned with marble statues on each side. Opposite the wall of this spacious square are the monks cells, built separately, with a little private garden behind every cell; they are about sixty in number. Formerly all strangers were entertained here gratis, but the intrusions and excesses of German officers and others have occasioned this laudable custom to be laid aside, yet the Carthusians are still more hospitable than other orders. They are slow in singing their offices, which are the same with other orders, and fourteen hours out of the twenty-four are spent in the choir. The same rules are observed at the Grenoble Chartreuse, where a remarkable custom is observed. The German monks, by reason of the distance and situation of the place, generally come thither on horseback; and are allowed, before they alight, to discharge their pistols in the inner court, and also at their departure. This privilege, not altogether so consistent with the monkish reclus state, is said to be a return for the liberalities of the German nation towards founding the convent.

Pavia is a large old city, and is but thinly inhabited; it is situated on the Ticino, over which there is a good stone bridge of seven arches. Its fortifications are very inconsiderable, and there are no traces remaining of its having antiently been the capital of the powerful kingdom of Lombardy. The cathedral is old, and built only of brick, like most of the other public edifices here. In the cathedral is kept a ship’s mast, which, amongst the vulgar, passes for Rolando’s lance.

In the Augustine convent is the fine monument, designed for St. Augustine, which has been in hand ever since the year 1364, but is not yet finished; it is to be removed into the church of St. Peter and St. Augustine, contiguous to the convent, when all the preparations and disquisitions requisite to the translation of these sacred bones shall be completed. Hitherto it has been obstructed by the regular canons, who are proprietors of half the church, for they deny that the relic is genuine. The body of this saint is supposed to have been brought from Hippo to Sardinia in 506, and, at the beginning of the eighth century, to have had a second translation to Pavia. The care of this treasure was committed to the monks of St. Peter’s convent; but in the twelfth century these monks

monks were succeeded by canons regular, and in the fourteenth century the Augustine monks were added to this trust, whose convent lay near this church, one side of which, by a papal decree, was assigned to the canons, and the other to the monks. The choir was left in common, both possessing it alternately every month; however, the monks have provided themselves with a small, though well built church, in their own convent, and live in continual hopes that St. Augustine's bones will again come to light; they continually work at this superb mausoleum in order to keep themselves in countenance.

They have a singular way of asking alms at Pavia, the better to excite charity; the beggars hold out a plate with a human skull in it.

The university of Pavia was founded by Charles the Great, and repaired by Charles the Fourth; here are seven colleges, but that of St. Borromeo is the finest building. Pius the Fifth was the founder of the Collegium Papale; there is a large statue of that pope before its front, but there is one much superior to it of white marble within the cloister.

In the area before the citadel, is a grand equestrian statue of brass; some say it was designed for Antoninus Pius, and others for Constantine the Great.

Voghera lies about five leagues from Pavia, it is but an indifferent town, and belongs to a marquis, who takes his title from its name: here is nothing worthy of remark at this place. The country from Voghera to Tortona is very pleasant: the castle of Tortona, which lies to the left on a hill, is a fine fortification.

From Tortona to Alessandria is twelve Italian miles. The fortifications of Alessandria are but indifferent. Here are operas performed in April and October, and the fairs are kept in those months. In the cathedral are some good marble sculptures and paintings, in fresco, and on the pavement of the chapel is the following humble epitaph:

“ Philip Maria Resta, the least of bishops, and the greatest of sinners, recommends himself to the prayers of the reader, March 31, 1706.”

From Alessandria to Felizane is six Italian miles, and eight more from thence to Asti. Within a mile and a half of Felizane, lies Solerio, on an eminence which commands on all sides an extent of country of near seventy miles, interspersed with towns and villages; amongst those which make the least appearance, are Castellata and St. Salvatore; the last of these is extensive, and contains a great number of polite inhabitants. It is also celebrated for its salubrious air, which draws thither a great number of valetudinarians.

Asti is a large city, which stands in a delightful and fertile valley. By the extent of the walls which inclose the very suburbs, it must have been well fortified formerly, but at present these works are going to ruin, and no care is taken to repair the citadel.

The cathedral is an elegant structure, with a lofty roof, a fine cupola, and some good paintings, in fresco. According to an inscription lately put up, it was anciently a temple of Juno; but by St. Surus, one of Christ's seventy disciples, it was converted into a Christian church.

The distance from Turin to Genoa through Alessandria is about sixty Italian miles. Between Alessandria and Novi is the Abbey del Bosco, which is always inhabited by fifty or sixty monks of the Dominican order. The offices of the church take up six hours of every day, and there are only two hours employed in the school. The library is not remarkably good, but the building upon the whole is spacious and convenient. In the prior's chamber is an historical picture of the whole life of Christ, but the figures are so small that they cannot be distinguished without a magnifying glass. In the church of the convent are many capital marble sculptures of an uncommon size, and near the high altar is the much admired tomb of Pius V. founder of the convent. The Sarcophagus is of red Ethiopian marble, resembling agate, and rests upon a base of black touch stone,

on which is a long inscription in golden letters. In one of the side chapels is the adoration of the eastern Magi painted on wood, by Raphael, but the colour begins to decay. In the vestry is the last judgement, on a copper-plate, by Michael Angelo, who has filled heaven with popes, bishops, and monks, and sent the laity of all ranks and degrees to hell. As this could not but be highly acceptable to the clergy, it may be supposed that this compliment, if it was not bargained for beforehand, did not go without its reward; in the opinion of many, the case ought to be reversed, for however bad the moral character of the laity may be, I think they are equalled at least, if not exceeded by the above named orders. In the same vestry is also a curious porphyry table, and near the altar on the right hand is an excellent picture of Pius V. and within the altar is kept a slipper of his red velvet, with a very low heel, and embroidered with a cross of gold. We were at a good deal of trouble to get a sight of this slipper, it being at first insisted on that we should kiss it, but a young student of Silesia helped us over this obstacle, and procured us without any stipulation a full permission of seeing every thing; however, by their many ceremonies in bringing out the slipper, the monks thought, or would have us think, that they shewed us an extraordinary indulgence.

The most remarkable thing in the church, at least in the opinion of the monks, is a wooden crucifix, which they say in the year 1647 turned to the right towards a chapel, in which are kept a piece of the cross of Christ, a thorn of his crown, and some other relics, at the instant that a thief was about carrying off the riches in it; but the noise made by the image in turning itself, frightened him away. The crucifix, to this day, remains in the same posture; yet it is not the body of the cross which can be properly said to have turned, but only the lowest part of it, and this may be no more than the natural warping of dry wood.

Novi is the first Genoese town, which is not very remarkable; the country from Alessandria hither is perfectly level. The road from Novi is good, and is paved in many parts, but there are several eminences which are a kind of prelude to the neighbouring Apennine mountains. Beyond the river Lemo, on the left hand near the road, is the fine fortress of Gavi, which is built on a steep rock, and belongs to the Genoese. The acclivity of the mountain begins at Voltaggio, which is two stages from Novi.

The Apennine mountains derive their name from Alpen, an old word among the Gauls, and is still used among the Germans, to express a mountain in general. In Virgil's *Æneid* is a passage to this purpose. “ Though all high mountains are by the Gauls called Alps, yet the name belongs properly only to the mountains of Gaul.”

The situation of Genoa is one of the most inconvenient, yet one of the most beautiful, of any city in Italy, and is seen to the greatest advantage a little way out at sea; its stately buildings, which have gained it the name of Superba, forming a glorious amphitheatre, gradually rising along the hill. This declivity, and the narrowness of the streets, exclude the use of coaches in Genoa; all but the principal ladies walk on foot, and they are carried in chairs. To this narrowness of the streets it is owing that Genoa takes up so little of the plain beneath it; another reason assigned for it is, that the loftiness of the houses, and the narrowness of the streets, abate the excessive heat of the summer by intercepting the sun-beams, which tends to preserve the healthiness of the city. The streets are very well paved, and are kept very clean, to which the want of coaches, or other carriages, contributes not a little.

Most of the houses are flat roofed, and have a gallery on the top. The roofs are chiefly covered with tavagna, a stone very much resembling slate; and on account of the shelving situation of the city, these areas, on which are many orange trees planted in tubs of earth, have a very pleasing effect.

The number of cannon placed on the fortifications of Genoa, is about five hundred. The city is surrounded towards the land with a double wall; it is ten Italian miles in circumference; and such is the inequality of the country, that it takes up three hours to ride round it. This wall is of too great an extent to be of much service, it serves very well indeed to keep out the banditti.

On entering the city, travellers are required to deliver up their fire-arms, but they may have them again by paying a small piece of money. Travellers may walk about every-where, and see all things with greater freedom than could be expected in a republic, which, from its neighbourhood to the French and Piedmontese, cannot be without some diffidence and jealousy. The west side of the city is watered by the river Bonzevera, and on the opposite side runs the Bisagno, with a stone bridge over each of these rivers.

The harbour of Genoa is large, but not very safe; amazing sums have been expended in mending it, and the mole has lately been lengthened very considerably. In the middle of the harbour, on a place called the Royal Bridge, is a commodious watering place for ships, the water being conveyed by pipes from the mountains. Within this harbour is the Darsena, or wet dock for the galleys of the republic. From the formidable figure which the Genoese fleet formerly made, it is now reduced to six galleys, and all the use of these is to fetch corn from Naples and Sicily, and to give the ladies an airing. The complement of the largest galleys is from sixty to a hundred soldiers, and three hundred and twenty rowers, five or six on a bench, which serves them for a bed. The wet dock abounds with Turkish slaves, who are generally of a surly, fierce aspect, to which their long whiskers do not a little contribute; their garb is a coarse cloak with a cowl not unlike that of the capuchins. In the wet dock they are at liberty, but in the city are chained in couples; they are allowed to keep tippling houses in the Darsena, or wet dock: the officers give them all possible encouragement, and advance them a small sum of money, with which in their trips to Marseilles, Corsica, and other places, they buy all kind of nick-knacks at a very cheap rate, and make a good market of them at Genoa, where every thing sells remarkably dear; but the officers come in for a share of the profits. Some of these slaves are supplied with goods to trade with, out of the republic's warehouses, part for ready money, and part for credit at a stated price. At night, none of them are to be absent from the Darsena, where they are mustered and locked up every evening. Private persons who have been successful in fitting out the Barbary corsairs, may keep such slaves; but they are generally sold to the state which puts them to the best use, and can best secure them. Their common employment is knitting woollen stockings and caps. The lenity and indulgence of Christians to Mahometans, is here very discernible; I wish their prophet taught them to exercise the rule of gratitude in this respect; then their conduct towards Christian captives would be much more lenient than it is at present.

The rowers on board the galleys generally consist of three classes; the first class is of indigent people, who sell themselves for a certain term of years; the second class are criminals, who have been sentenced to tug at the oar for a limited time, or during life; the third sort is Turkish or Barbary prisoners, who, though they should become converts to Christianity, do not recover their freedom; but it is not uncommon for them, by means of their godfathers, to be put into a better way of living, and, upon their good behaviour, to obtain their liberty.

The light-house is ascended by a hundred and sixty steps, and stands on the west-side of the harbour; it is situated on a high rock, which is fortified. Every night, except about the summer solstice, a lantern with thirty-six lamps is hung out at the top of it towards the sea; and when a number of ships is known

to be in those seas, an addition is made to the number of lamps. At coming into the harbour or at sea, when a merchant-man salutes a ship of war, the return is two guns less; and by the report, it may be known whether the ships are English or French, the former firing much slower than the latter.

The commerce of Genoa falls very short of that prosperity and importance to which it might be brought, and this is owing to the incommodious harbour, and the high price of all sorts of commodities. The chief manufactures here are velvets and damasks, besides the lesser articles of silk, stuffs, brocades, lace, gloves, sweetmeats, fruits, oil, parmesan cheese, anchovies, and drugs from the Levant.

The English have a consul at Genoa, but no English merchants are settled here. Many French protestants have chosen Genoa for their retreat; and notwithstanding the difference in their religion, they are well received. The number of the Roman catholic inhabitants is computed at a hundred and fifty thousand. Some of the antients give the Siguerians or Genoese but a very indifferent character for fidelity and honesty.

The police is on a much better footing than many cities in Italy; and the streets are so safe at night, that there are scarce any instances of violence being committed. The love of gain seems to be the predominant passion of the Genoese; all ranks and degrees of men here are engaged in trade. The laws have provided against excessive splendor or luxury. Foreigners, and the eight counsellors of state excepted, no person is to be attended by above one footman.

It does not seem to agree with the modesty of the sex, that most of the married ladies of distinction are every where attended by a gentleman, who, in the streets, walks before their chair, and, at coming into the church, holds the holy water to them, and performs all the other little acts of complaisance, in a particularly attentive manner. Some ladies are not satisfied with one such obsequious dangler, but admit several for distinct offices; one attends his lady when she goes abroad, another provides for the table; another has the management of parties of pleasure and diversions; a fourth regulates the gaming table; a fifth is consulted about receipts and disbursements of money; and both the beauty and wit of the lady are commonly rated according to the number of these votaries. They all pass under the denomination of Platonic lovers, and one would almost imagine that the husbands had nothing to fear from all these familiarities; for the Genoese being true Italians in point of jealousy, cannot be ignorant how far these familiarities may be carried, as they themselves are, in their turn, *cizibei* (for so their attendants are called) to other married ladies.

This piece of gallantry is not confined to the young women only, but ladies advanced in years pique themselves much upon having these attendants. However, this custom is merely arbitrary, there being no indispensable obligation at all to observe it, and it now seems in some measure to be upon the decline.

Very few beauties are seen at Genoa, their blooming years being mostly spent in the seclusion of a nunnery. The dress of married ladies is generally black silk or velvet, the liberty of chusing what colour they please expiring with the first year of their marriage. One would imagine that this custom did not very well compact with the general vanity of the sex, which, to the cost of many husbands, does not terminate with the first year of their marriage; but custom has established this law in Genoa, it is the fashion, and must be complied with.

The nobility are divided into old and new; with regard to public employments, no manner of difference is made between the two classes; but in other respects, the old nobility value themselves infinitely above the new. The state of Genoa is very poor, though many individuals are immensely rich. Most of the nobility are merchants, and there are particular walks assigned for the old and new classes of mercantile noblesse on the public exchange.

The government of Genoa is an aristocracy, and no affairs of moment can be transacted without an assembly of the nobles. As for the doge, he has no more than the shadow of sovereignty, and the blaze of his outward splendor is extinguished at the end of two years; that office being of no longer continuance. He is not capable of being chosen again till he has been five years out of office. Upon any irreconcilable disputes in the biennial election, it is adjourned from week to week, and the government is lodged, in the mean time, in the oldest senator. Though to be elected doge, it is not requisite to have a feat in the senate, yet a candidate for that dignity must exceed fifty years of age, this being an indispensable qualification. The vote of a poor nobleman is often secured by fifty or sixty louis-d'ors; and they tell a story of a necessitous nobleman, who was going a journey, and wanted to borrow a cloak of a wealthy member of the same order, but met with an unkind repulse; some time after coming into the senate, when his ill-natured rich neighbour wanted but one vote to make him doge, the candidate solicited his vote, and made him very large promises, but all to no purpose, for the poor senator openly declared, 'that his neighbour suffered him to go a journey without a cloak, and, in return, he might go without a cap for his part.' The doge of Genoa always wears a cap, as one of the insignia of his office.

The doge resides in a palace belonging to the republic, with his wife and family, and eight senators appointed for his council. He has a guard of two hundred men allowed him, who are all Germans; their uniform is red, faced with blue; and that of the Corsican corps is blue, faced with red: the bombardiers wear red coats and leathern waistcoats, and are armed with bayonets; but the rest of the soldiery, which is composed of all nations, are clothed in white, with blue facings. The number of the republic's forces is five thousand men, who are cantoned in Savona, Sarzana, Novi, Gavi, Spozza, Ventimiglia, and in the fortified places of the islands of Corsica.

The processions at which the doge assists on certain days having been described by others, I shall only mention that he is then dressed in crimson velvet or silk; but the senate, which follows him, are dressed in black. The doge, during his administration, is stiled 'his serenity'; but after the expiration of that office, he has no other title but 'his excellency', which is common to all senators; and it is said that, at the expiration of his government, the secretary of state pays him this compliment; 'Your serenity having fulfilled the time of your dogeship, your excellency is at liberty to quit the republic's palace, and retire to your own dwelling.' The Genoese nobility are all stiled 'illustrious'.

The state palace is an old mean building; the left side of it is appointed to the doge, whose table is defrayed at the public expence. The palace stands in the centre of the city, and has a guard at the entrance.

The arsenal contains about twenty-five thousand muskets, and among other curiosities is a shield with a hundred and twenty pistol-barrels fixed in it, which may be fired in three equal discharges of forty at a time; likewise the cuirasses of several Genoese ladies, who, in the year 1301, under pope Boniface the Eighth, performed a crusade to the Holy Land. Through the arsenal is a passage, over a draw-bridge, for the doge to go into church; but every evening, by a strict order, the bridge is drawn up.

In the new square, before the doge's palace, is a daily market, Sundays not excepted, for vegetables and other provisions; and, in the middle of January, here are exposed to sale green peas, artichokes, melons, and most kinds of flowers in great plenty.

The new street is the finest in the city, which is twelve common paces in breadth, and was planned by Alexio Galeazzi, an architect of Perugia, who also built most of the fine palaces in it. Among these, are ten or twelve of most remarkable beauty and mag-

nificence, as those of Doria, Pallavicini, Lercari, &c. The first floor of these palaces opens into beautiful gardens and orangeries, strongly supported with stonework, like the Horti Pensiles of the ancients. Over the entrance of the palace of Doria is written this motto, 'Here we have no settled dwelling:' and the same words are placed over the door of the republic's palace, which are very well adapted to the doge's short continuance in it.

The suburbs, on the light-house side, are very delightful, and are full of gardens and summer houses. What particularly deserves a traveller's notice, is the Villa Imperiale, where the eye is charmed with a successive variety of the most elegant decorations, such as beautiful hedges, espaliers, walks, and covered alleys of cypresses, box, rosemary, vines, lemon, orange, and citron-trees; as also statues, canals, fountains, grottoes, &c.

Micconi's celebrated cabinet of coins is still to be seen at Genoa, but Mr. Keyser says, 'the owner being about removing his goods, I could not see it.'

The religious buildings in this city are thirty-seven parish and twenty collegiate churches, seventeen convents, and two large hospitals. The church of the Annonciada is one of the most beautiful and magnificent in the whole city: it abounds with fine sculptures in marble. Here is an admirable communion-piece. St. Ambrose's church is a good structure: over the altar is an excellent piece of Rubens, representing the circumcision of Christ, where the emotions of tenderness in the woman standing by are admirably expressed. The altar is adorned with four large pillars of black, and the statues of St. Peter and Paul of white marble; a St. Ignatius performing a miracle, by Rubens, on another altar, and the ascension of the virgin Mary into heaven, must give great pleasure to all connoisseurs in the art of painting.

The Jesuits college is a very fine building. The court is surrounded with two lofty galleries, both supported by pillars of Carrara marble. The greatest curiosity in the library, which is none of the best, is a manuscript French translation of Quintus Curtius, by a Portuguese nobleman. It is dedicated to Charles the Bold, duke of Burgundy, and the frontispiece represents the translator delivering the book to the duke; the most remarkable exploits of Alexander are also represented in it, in many elegant paintings on vellum.

The cathedral is dedicated to St. Lawrence; and in a chapel, on the left hand of the entrance, where thirty lamps are continually burning, are kept, with great veneration, the bones of John the Baptist. The altar is supported by four porphyry pillars, and over it is a picture by Vandyke.

The principal curiosity in this church, which cannot be seen without the archbishop's leave, is an emerald dish, said to be a present from the queen of Sheba to king Solomon. It is pretended, that it was afterwards used for the paschal lamb, and after that by our Saviour at the last supper; and lastly came to the republic of Genoa, either by the generosity of Baldwin, king of Jerusalem, or as its share of the plunder of the city of Caesarea, in the year 1101. This dish is of a round figure, with an hexagonal rim, and is eight inches and a half in diameter: it is quite plain, without any engraving, and is made of one single emerald. As for this dish being used by Jesus Christ at the last supper, several Romish writers themselves have treated it as an absurdity, though a Genoese has taken a great deal of pains to prove the reality of that tradition.

In coming from the Piazza Sarfano to St. Mary's church, which stands on an eminence, you go through a broad street; and at the end of it is a stone bridge, which joins together two eminences in the city, formerly separated by a deep valley. This bridge cannot be seen without astonishment, for it consists of one small, and three large arches, of such a height as to be elevated ten or twelve feet above several houses of five or six stories; the whole height of the bridge is
near

near ninety feet. The breadth of this extraordinary bridge is forty-five feet, and its length about a hundred and seventy paces.

In the churches of St. Mary, St. Martha, and St. Matthew, are many elegant marble pillars and statues, which it would be endless to notice particularly.

In the church of St. Filippo Neri, belonging to the fathers of the oratory, are some fine paintings in fresco, besides some admirable marble sculptures. Every Sunday evening during the winter an oratorio or religious opera is performed in this church, which is founded on some scripture history, and is succeeded by a sermon of near an hour and a half long; then the service concludes with a piece of church music. As the design of this is to keep people from ill company, and at the same time to incite them, by the most animated exhortations, to sanctity of life, no great objection, I think, can lie against it; but the diversions in summer, though instituted with the like view, cannot be looked upon in so favourable a manner. Near prince Doria's palace, without St. Thomas's Gate, these fathers have a garden, with a beautiful edifice in it, where, every Sunday in the afternoon, they permit several kind of games, such as draughts, chess, and billiards; dice and cards indeed are excepted. It is true, they do not play here for money, but for *ave-mary's*, *pater-nosters*, and other prayers; and at the breaking up of a party that loses, kneel before an image of the Virgin Mary, and there, according to their losses, discharge them to her as to God, by *pater-nosters*, &c. In the evening they leave off playing, and an oratorio is performed; next comes a spiritual exhortation, and, at length, this medley of levity and religion closes with a solemn piece of music. The intent indeed is far from culpable, being to divert the commonalty from riotous meetings; and an excessive fondness for gaming is gratified without prejudice to their substance or families; but how this abuse of God's name in these last prayers can be justified, or such babbling can be deemed lawful or edifying, is a mystery to me. I asked our guide what course was taken when they played so deep, or the loss was so great that the conquered party could not go through the multitude of prayers he had lost? He answered, that this could not happen, the fathers not allowing of any great ventures; so that most of them play only for trifles, such as repeating a few rosaries, prayers, &c.

The chief hospital for the poor of the city of Genoa stands upon an eminence, and is an excellent institution. Each patient has a bed to himself, and on this foundation are several poor boys brought up to handicraft trades.

At the funeral of single persons, a sort of garland, decked with all kinds of white artificial flowers, is placed upon the coffin. When persons of distinction are buried, the religious fraternities walk in the procession; with their white hoods drawn over their faces, carrying a wax flambeaux in their hands.

I must not omit to observe, that the inns at Genoa afford but indifferent entertainment, though they are rather better than at Turin, but care must be taken always to make an agreement for every thing beforehand. The inns are all furnished with wine from the vaults of the republic, and in sealed bottles; yet that does not much mend the matter, the wine being none of the best, though it is not adulterated by the landlords. His whole profit arises from the empty bottles, but he takes care to make it up in other articles.

Besides this monopoly of wine, which all who have none of their own growth must buy from the republic; it is the state only which deals in corn, none being sold in any market, but all bakers must apply for it at the public granaries.

Mr. Keyser says, The journey from Genoa to Lucca is very troublesome and dangerous, the roads being bad, and are often infested with robbers; the inns afford but few conveniences, so that for those who have already seen Milan, it is most adviseable to take a felucca for Leghorn, especially in autumn or

winter. During these months, the corsairs keep at some distance from the coast of Italy, and the wind being generally in the northern quarter, the passage is easily performed in two days. A pass from the consul of any nation that is at peace with the regencies of Barbary, may indeed prove of service in this voyage; but a certificate of health is absolutely necessary.

The distance between Genoa and Leghorn is computed at about a hundred and twenty Italian miles. The coast is very pleasant, with several villages and single houses, situated by the sea-side.

Leghorn, anciently called *Liburnus Portus*, was formerly a mean, unhealthy place, belonging to the Genoese; but was ceded to Camo, the first duke of Tuscany, in exchange for Sarzana, an episcopal city near Loric, on the Genoese frontiers. The advantage of this exchange seemed to be wholly on the Genoese side; but the great duke had already conceived his plan of making Leghorn turn to a much better account than it had hitherto done. The many ditches and canals, with proper cultivation, have amended the soil extremely, and, in some measure, put an end to the noxious exhalations, so that the air is become much healthier. However, the city labours under a great want of good water, which the inhabitants are obliged to fetch from Pisa.

The port is free for commerce to all nations, and all religious sects are here tolerated: though the public exercise of religion is only allowed to the Roman catholics, yet in some measure it is to the Greeks, Mahometans, and Jews. As the harbour is never without English, Dutch, or Danish vessels, the Protestants have, at all times, an opportunity of baptizing their children, receiving the sacrament, and performing other parts of their worship; for the English factors constantly maintain a chaplain at Leghorn.

The duties on imported goods are so easy as not to cause the least obstruction to commerce: every bale pays about nine shillings sterling, let the size be what it will, and the contents are never examined. The baggage of travellers is never searched, and they are put to no inconvenience. Of all foreigners, the English are the greatest traders here.

The number of Jews at Leghorn is said to amount to eighteen thousand, and this city is called their paradise; for, except living by themselves in a particular part of the city is reckoned a hardship, they enjoy all manner of freedom without one ignominious mark of distinction: their trade is upon the increase, which very considerably affects the Christian merchants. Here is an inquisition, but it does not exercise any power over the Jews, and is limited to the spiritual concerns of those of the Romish communion.

Leghorn is said to contain forty thousand inhabitants, including the Jews; but this calculation seems much exaggerated for so small a city. Most of the streets are broad, and regularly built. One quarter of the city is called *New Venice*, on account of the many canals which keep it clean, and its convenience for trade.

From the ramparts is an agreeable sea prospect; the city is well fortified, having two forts towards the sea, besides the citadel; there are about three hundred brass guns mounted on different parts of the fortifications, and the garrison consists of about six hundred men.

At the entrance of the harbour, on the left hand, are two towers, which are said to be the remains of an harbour belonging to the Pisans. The harbour of Leghorn is divided into the outward and inward; the inward is called the *Darsena*, and is appropriated only to the duke's galleys; they are six in number, and are sometimes sent on a cruize against the corsairs. The outward mole has a strong barrier of stones of a great size, to which more are continually added; it has a strong pavement, with a parapet running along the middle of it, where, on one side or the other, a person may always be sheltered from the wind. The length of the mole is six hundred common paces, but the breadth of the harbour is said to be fifteen hundred:

dred: on this mole the wealthy inhabitants take the air in their coaches. One great defect of this harbour is its shallowness in the middle, so that ships of burden are safer when fastened to the side of the mole, than in the harbour itself.

The road for a mile or two affords safe anchorage, but is exposed to some danger from the corsairs and the weather. On a building near the harbour, where the great duke formerly resided, is this inscription:

“Fly hither, ye merchants, with alacrity; this sacred place, by its beauty, commodiousness, freedom, and plenty of all the necessaries of life, allures you; Cosmo III. being the sixth great duke of Tuscany, who resides in this house, courteously invites you; having enlarged and fortified the city, he rebuilt this edifice, first raised by his great grandfather, Frederic I. and made it more superb and magnificent, in the year 1695.”

The light-house stands in the open sea, upon a detached rock, from whence, in clear weather, is a good view not only of Corsica, but even of Sardinia; the former may be discerned from the mole. Not far from the light-house, but upon the main land, is the lazaretto, where persons and goods coming from places suspected of infection perform quarantine.

The Turkish slaves, and other galley rowers, are every night secured in a large place, surrounded with a high wall. In the day time they are set at liberty, and may exercise their industry, either in labour or traffic; but must be careful to return at night to their place of confinement. They lay singly in long barracks; the beds are in five or six rows, over one another, with rope ladders to ascend to them; and nothing is punished with greater severity than when two are found in one bed.

In the square before the dauena is a statue of duke Ferdinand, with four Turkish slaves, in bronze, chained to his pedestal; representing a father with his three sons, having got possession of a galley, endeavoured to make their escape, but were overtaken. Besides the rashness of such an attempt, by four persons only, it is a subject too mean for the triumph of so illustrious a prince; another account is much more probable, which is, that these Turks were four desperate pirates, of a very uncommon stature, who, after infinite damage done to the coast of Florence, were taken by the said duke, and put to death. The want of an inscription leaves the matter doubtful; but we must determine on the most probable side.

None of the churches in Leghorn contain any thing remarkably curious. The Greeks, who are here permitted the open exercise of their religion, are either Latin Greeks, or Eastern Greeks. The former acknowledge the pope's supremacy, and, with very few exceptions, conform to the church of Rome; so that the Roman catholics make no scruple of going to their church, and joining in their worship: the chief difference between them consists in kneeling, or genuflexion, which the Greeks do not observe.

The Armenians have a church here, but their religion has such an affinity to the Romish, that their priest could not so much as inform me of the difference; except that the Armenians, in their own country, have no images in their houses, in order to avoid offending the Turks.

The public prostitutes have a particular part of the city of Leghorn assigned them, out of which they are not permitted to pass without leave, and paying a few sols.

Leghorn is far from being a cheap place to live at, provisions and other necessaries brought thither by land being subject to very high duties, and the duke reserves to himself the monopoly of several commodities, particularly brandy, tobacco, and salt. It seems rather strange that high duties should be imposed on provisions, when such trifling ones are exacted on every article of commerce; but it is unfortunately the case with Leghorn, as with many other places, that where there is one convenience, there is another inconvenience to balance it; which is a strong proof, that no

government, or any state, has yet arrived at perfection.

The barks go daily from Leghorn to Pisa, by a canal, which is sixteen miles in length. This canal, besides the great convenience it is of to trade, serves as a drain to several morasses; in winter indeed it is sometimes frozen. The passage is trifling, but the company in general is very disagreeable. The vessel is drawn by men, and takes up six hours in the passage. The way by land is over a continued plain, and you cross several stone bridges over the canal. Leghorn is by no means to be ranked amongst the most healthy cities. The country is, for the most part, sandy, and is well planted with trees of different sorts, such as oaks, elms, &c. and thickets of various trees, among which the black buffaloes both feed and shelter.

Pisa was formerly a celebrated republic, where formidable fleets have often signalized themselves on many occasions; but falling under the power of the Florentines, after the declension of their commerce, by opening the harbour of Leghorn in their neighbourhood, scarce the shadow of such grandeur is now remaining. The city is indeed spacious, the streets broad and well paved; but such are the bad effects of decayed commerce, that the inhabitants seem enervated, and the grass grows in the streets.

Pisa enjoys a healthful air, good water, and the soil is fertile around it; it is a convenient and delightful situation, being washed by the river Arno. The inhabitants are said not to exceed seventeen thousand, whereas the size, and other circumstances of the place considered, it might very well contain eighty thousand.

The university was founded in 1339, has several good colleges and endowments, and also some able professors, who are of the great duke's nomination. The exchange is a superb edifice built in the year 1605, but is now almost desolate.

One advantage the artificers of this city partake of, is the building of the galleys, which the great duke removed to Pisa, on account of the conveniency of the Arno for that purpose. This city is likewise the chief seat of the order of St. Stephen. The knights of this order swear allegiance to the grand duke, and likewise to serve against the infidels.

Not far from the college stands the ducal palace, which has nothing either magnificent or suitable to that title about it. The market-town is very properly ornamented with a white marble statue of the goddess of Plenty. It stands upon a pillar, which serves both for a whipping-post and a pillory. The archbishop's palace is a mean old building, and has nothing remarkable but a white marble statue of Moses in a fountain in the inner court.

In the cathedral towards the leaning tower, is a pair of large folding gates of brass, on which is represented the life of Christ, but very badly executed, though they are said to have been brought from Jerusalem by the Pisans, in one of their crusades, and, probably, in time, they may pass for the gates of Solomon's temple. On the side of the church are three entrances with brass doors, on which are several historical pieces of the Old and New Testament in basso-relievo; but quite of another sort of workmanship, and much superior to that mentioned above. Here are many fine pieces of painting, and many sculptures very well executed in this cathedral. In the baptistry is a remarkable echo and whispering gallery. Near the cathedral is a famous leaning tower, which ignorant persons take for great skill in the architects; but it leans from no other cause than the badness of its foundation.

The Church della Spina is but a mean one, though it is said to contain many valuable reliques. In the other churches are many excellent paintings.

Here are no less than three bridges built across the Arno; the middle one is entirely of marble. The physic-garden is situated near St. Stephen's church, is very large, and well stocked with plants.

The

The distance from Pisa to Succa, is twelve Italian miles, and the road is most delightful, especially in dry weather. The country is inclosed and well planted. In summer and autumn nothing can exceed this tract of land; the mountain, which runs all the way on the right, being covered with olives and cypress trees of an extraordinary height.

The whole republic of Succa is not above thirty Italian miles in circumference, but the fertility of the soil, and the mildness of its government, have been such inducements for settling here, that the inhabitants of the city, and the great number of villages contiguous to it, are computed at a hundred and twenty thousand, thirty thousand of whom are able to carry arms.

The council of state is composed of a doge and nine senators, who are all members of the great council, and are changed every two months. These counsellors, whilst in office, live in the republic's palace, and their expences are defrayed by the public. A doge is not capable of being re-elected till the expiration of seven years. The great council above-mentioned consists of a hundred and thirty of the nobility and a hundred and ten commoners, who are changed every two years. The palace guard consists of seventy Switzers, and the rest of the republic's forces are about five hundred men. Its ordinary revenue is about eighty thousand pounds sterling.

The city is fortified with eleven bastions, and there are about two hundred and fifty pieces of cannon mounted thereon. The ramparts are very pleasant, and planted with trees. The country in which the city stands is a delightful plain, terminated on all sides by a chain of mountains. The inhabitants have attained the name of Industrious, from their particular industry in their silk and other manufactures. A considerable profit accrues to the republic of Succa from the growth of their olives; the oil which they produce being remarkably good. The city contains near forty thousand inhabitants, whom I must commend for candour and politeness, as well as their easy and decent behaviour. Here are seen more young women in the streets, shops, churches, and schools, than in any other town in Italy, where they are in general shut up in nunneries. Their police is very commendable; and great care is taken to suppress luxury, superfluous magnificence, and such dissipations which often prove destructive.

Strangers never fail to be welcomed here with an evening serenade, which is accompanied with an humble intimation, that they would be pleased to make some return for such an honour. The houses here are in general well built, and the streets well paved and broad, but most of them are irregular. The palace is large and spacious, without any thing curious, unless it is the arsenal, which makes a part of it, and contains arms for twenty thousand men.

The cathedral is a spacious building of the Gothic kind; the patron of it is St. Martin, and it contains many valuable curiosities. In the centre of one of the squares or piazzas of this city, is a white marble statue of the Virgin Mary, upon a high pillar.

The distance from Lucca to Pistoria, is twenty Italian miles. A finer scene cannot be imagined than the country hereabouts exhibits: even the Milanese must yield to it in a variety of pleasing objects.

“Here all the seasons lavish all their pride;
“ Blossoms and flowers, and fruits, together rise,
“ And the whole year in gay confusion lies.”

Pistoria was antiently famous for the defeat of Cati-line; and, in latter days, for the tumults of the Gwelfs and Gibellines: but at present it is in such a low condition, that though the town is large, it does not contain above two thousand inhabitants.

The cathedral is a Gothic structure, in which are several good monuments of its bishops. The churches of St. Francisco de Sala, and St. Prospero, are well worth seeing. The library, exclusive of the manuscripts, consists of fourteen thousand volumes, and is

open every day. This magnificent donation was made in the year 1726, by cardinal Fabroni; and, in the Pope's ratification of it, a permission is granted to the fathers of having prohibited books of every kind in this library, provided they keep them carefully locked up, and allow only those to look into them who can produce a licence for that purpose from the see of Rome. The episcopal palace, which joins to the cathedral, is a mean building.

From Pistoria to Florence, is twenty Italian miles. Within seven miles of Florence, is Poggio a Cajano, where Pope Leo X. of the house of Medicis, laid the foundation of a palace, on account of the pleasant views of the neighbouring mountains; which was finished by the great duke Francis. Its outward appearance has neither splendor nor magnificence, but it contains a most valuable collection of paintings by the most celebrated masters.

The country hereabouts produces a kind of large thick reeds or canes, which are used in the vineyards instead of poles; and it is very remarkable, that the horned cattle here are universally white.

Rome only excepted, Florence contains more curiosities than any city in Italy; it was stiled by Octavius Ferrarientis, “the Italy of Italy itself.”

The great dukes formerly resided at Il Palazzo Vecchio. The first object which strikes the eye in the palace, is a tower projecting out of the building, which in one part is broader than the basis, but soon returns to a proper symmetry. At the entrance of the palace is a marble statue of Hercules killing Cauri, both bigger than the life. Opposite to this group, and not at all inferior to it, by way of contrast, is David triumphing over Goliah, by Michael Angelo. Here are also to be seen two of the antient Dii Termini. In this palace are also several excellent paintings and marble statues. Here the duke's wardrobe is kept, in which are twelve large closets full of plate, a great part of which is finely chased, and set with jewels, and among the rest are four side or bed-posts which belonged to the state-bed of Cosmo III. The most valuable thing in the wardrobe is the altar-cloth, covered with pearls, rubies, and other stones, among the rest two gems, called Aqua Marina, in size equal to a large walnut, and are said to be of an inestimable value.

In a square before the old palace, is a very grand fountain, adorned with shells, cornucopia's, and four other sea gods of brass. In the centre is Neptune drawn in a large shell by four horses, two of which are of brass, and the other two of white marble. Near this fountain is a brass equestrian statue of Cosmo the First.

On this square is likewise the Fabrica degli Uffici, built by Cosmo the First, on the ground-floor of which the principal magistrates of the city live together for the maintenance of the public tranquillity, and the more speedy dispatch of business. The other story is filled with artisans employed for the duke's wardrobe and gallery, and particularly in Florentine works, where nature and painting are surprisngly imitated by proper arrangements of sparks of gems, and bits of the finest marble inlaid. The uppermost is laid out in several apartments of curiosities, which would be too tedious to enumerate.

On entering the Tribuna, the eye is immediately struck with six marble statues, standing in the centre, among which is that famous one called the Venus de Medicis. This has hitherto, in the opinion of all judges, been esteemed to surpass all the statues in the world. It formerly stood in the Medici's palace, on Mount Pirioco at Rome, from whence it was brought to Florence, by order of duke Cosmo III. The mismanagement in the packing up and carriage was such, that the hips, legs, and arms of the Venus were broken off by the way; however, they have been replaced and joined with so much art, that it must be a very nice eye that can discover the least trace of that misfortune. The inscription on the base shews it to be the work of Cleomenes an Athenian, the son of Apollodorus,

Iodorus; yet among all the remains of antiquity, this is the only place where we meet with the name of this great master. The pedestal is modern, and between two and three feet high; and as the statue seems to lean a little forward, some connoisseurs think it was originally designed for an elevated situation; but this inference is of no great certainty. Possibly this attitude is owing to the modesty with which Venus endeavours to hide her charms, and, as it were, withdraw herself from the beholder's eye. The right knee advances a little forward, the left hand is placed a little before the pudenda, and the right across her breasts; yet without touching the body. This statue seems rather less than the life, which is owing to its being naked, and in company with others of a larger size. The head inclines a little to the left shoulder; the bloom of youth, the pleasing softness of her look, and her beauty and modesty, seem to rival each other in the charms of her countenance. Her person is rather plump; and the flesh is so admirably executed, that one imagines it so soft that it must yield to the touch. Here indeed, the statuary's skill is not a little assisted by the polish of the marble, which at first was of a pure white, but time has given it a yellowness; however, it does not yet look amiss, and in the sun-shine is almost transparent. Her hair at present is brown, and this possibly may be no more than the faded gilding, which was not unusual among the ancients.

Amidst the admiration of all ages, and the resort of curious persons to see it, the Venus of Medicis has not escaped censure. Most connoisseurs agree that the head is rather too small in proportion to the parts of the body, and particularly the hips; some find fault with the largeness of the nose; possibly the partition along the vertebræ of the back is a little too deep, considering the object is a soft, plump female; at least the bend of the arms, and the inclination of the upper part of the body seem to lessen, if not totally to prevent so deep a position. The fingers are of an extraordinary length, and all excepting the little finger on the right hand, without joints; but it is manifest that the hands have not undergone the artist's last touches, and consequently this should not affect his reputation.

In the Tribuna are such a redundance of curiosities, that it would be endless to describe them. The private armoury will afford a person of a martial disposition a great deal of pleasure. The expence of seeing the gallery, and the several cabinets of curiosities, is about a guinea.

Near this building is the Fonderia, or the duke's laboratory for chymical preparations, in which are made those balsams and essences which the duke sends to foreign princes.

The great duke's usual place of residence is the Palazzo de Pitti, so called from the family to which it first belonged; the front is of rustic work and unhewn stones, and makes no very beautiful appearance; but towards the garden, the architecture is tolerably elegant. On the right hand of the entrance of this place lies a large magnet, which is said formerly to have weighed five thousand pounds, but it has since been damaged by fire. The Swiss guards here, upon seeing any foreigners approach, immediately run to rub their halberds on this load-stone, and afterwards hold them up with a range of keys hanging to them by magnetism. This artifice is very mean; but that the guards should, in plain terms, bilk those, and at the old palace tease strangers for a few pence, seems very little to comport with the dignity and magnificence of their master.

The duke's library is in bad condition; the late keeper of it, Magliabuchi, was well known in the republic of letters: he died on the 4th of July, 1714, to whom only by substituting the word 'memory' instead of 'genius,' Owen's epigram on the University of Oxford is very applicable:

No other library can equal thine,
Nor this thy boundless genius can confine,

Whose views extends in learning's spacious plain,
And far surpasses all that books contain.

The jesuits and he equally hated each other; and he was particularly nettled at this character which they gave him:

"He appears learned among librarians, but a library keeper among the learned."

His own library made a very indifferent appearance, the books lying on the ground in heaps; but by the assistance of his great memory, Magliabuchi could immediately find the books on any given subject. The books which he frequently consulted bore the marks of snuff, which he took to excess; and others which had served him for plates were daubed with yolks of eggs, which were his principal food. By the length of nails he resembled a harpy. He very seldom changed his linen; so that when a shirt was once put on, there it remained as long as it would hang on his back. As he lived in this sordid manner, and hardly ever washed himself, it is no wonder that the offensive effluvia he emitted could scarcely be borne with, but for the pleasure of his conversation. If a list was ever to be published of learned and ingenious slovens, Magliabuchi would undoubtedly be entitled to the first place amongst them; but with many illustrious names in his retinue. The nymphs of Parnassus cannot have been very delicate to associate with such disgusting mortals.

The palace gardens are very large, and the parapet is very extensive; they are ornamented with fountains and statues. On one side of the garden is the ducal menagerie, where are kept almost every kind of wild beasts and birds.

Contiguous to the physic garden, which is well planted, is the riding-school, for the duke's family. Riding with the lance is practised here against a moveable wooden image, which stands still, if the lance hits the shield in the centre; but if the push is wrong, the machine whirls about, and punishes the rider with a severe blow.

Without the city are two very fine palaces, called Poggio, or Villa Imperiale, and Pratolino; the former is but an Italian mile from the city. They are both remarkable for fine statues, fountains, gardens, and paintings.

Mr. Keyser then proceeds to give a long account of the churches, and other religious buildings, at Florence; but we fear we shall tire our readers with such descriptions, and shall therefore pass them over, and give some additional account of the other parts of the city.

The appearance of the city of Florence suffers considerably from the great number of paper windows to be seen here. The Mercato Nuovo is properly the exchange of Florence, where, about noon, the principal merchants meet to do business, many of whom are of great families; for here, as in Genoa, commerce is not held to be in the least derogating to nobility: they deal in the retale as well as in the wholesale way, and a nobleman often condescends to measure out a yard, or half a yard of silk, without any regret. It is by commerce that even the ducal family has risen to that greatness in which they have maintained themselves for near two hundred years.

The city of Florence contains seventeen squares, or markets, and is adorned with seven fountains, six columns, two pyramids, and a hundred and sixty public statues. A particular part of the city is assigned to the Jews, and they are treated with great lenity.

The river Arno divides the city of Florence into two unequal parts, between which there is a communication by four stone bridges. The citadel, which consists of five bastions, was built on an eminence, by Alexander, the first duke, for the better keeping the city in awe. In Florence are about nine thousand houses, and seventy thousand inhabitants; its chief trade consists of woollen and silk manufactures. It is said that few persons in this city can see perfectly clear, which some naturalists impute to the foggy, moist

moist air; but at this rate most of the inhabitants of Mantua, Venice, Leyden, Amsterdam, &c. would have but little use of their eyes. The Florentines are allowed to be inimitable in making repartees, and telling stories with a good grace: they are very vain of these frivolous endowments, and the government of the tongue is little known among them. It were well if this vanity was all that could be laid to their charge; but they are, to a proverb, addicted to the unnatural vice. Thus it is not strange, that with such lascivious inclinations, the Florentines should not have the best eyes; immodest and frequent acts of venery being very prejudicial to the sight.

In the time of the ancient Romans, there was from Florence to Sienna, and from thence to Rome, a paved road, called *Via Capia*, of which there are still many remains; though it is not kept in such good repair as the road which reached from Rome to Naples, and was called *Via Appia*.

Sienna is thirty-two Italian miles from Florence. The road is every-where paved, and runs along a great chain of hills: the country yields some pleasant prospects of vineyards and olive plantations.

Sienna lies upon three hills, which render the streets very uneven; but this is compensated by the agreeableness of the prospect, and the exceeding healthfulness of the air. The inhabitants are very civil, and of a cheerful disposition; the women have their share of beauty, and have more freedom than in other parts of Italy. It is thought, that at Sienna the Italian language is spoken with more propriety than any where else. Charles V. instituted an academy here, and granted several privileges to the German students. The university is now very much on the decline.

Sienna is but thinly inhabited, and contains scarcely seventeen thousand people. Though the many towers built on private houses give the town a grand appearance at a distance, the buildings, in general, are very mean.

The senate consists of nine persons, but they are under the direction of the great duke of Florence; no measure of any consequence can be taken without his consent. The senate house is but a mean building.

The cathedral is the principal building appropriated to religious uses, and is both within and without incrusted with black and white marble, alternately disposed in rows.

Opposite to the cathedral is a spacious hospital, founded by a shoemaker, who has a statue erected to his memory, with this opposite inscription, "A cobbler may go beyond his last." He lies buried in the church belonging to the hospital.

Mr. Keyser then travelled to Rome, Naples, and Loretto; but as those places have been amply described by the writers whose works we have given the public, we shall proceed to Mr. Keyser's description of Ancona, &c. omitting those places where other travellers have been.

Ancona is built on an uneven situation. Over one of the gates is this inscription, "Fair Probité, which built this city, delights to associate with Peace on this happy spot."

The cathedral stands on an eminence, and affords a delightful prospect of the town, and along the sea coast. The city, besides its outworks, is also fortified with a citadel; but neither of them is sufficient to hold out against an enemy. The harbour is very commodious, but the trade is inconsiderable, which is generally the case in every part of the papal dominions. The Jews are very numerous in Ancona; they live in a particular quarter, and are obliged, by way of distinction, to wear a bit of red cloth in their hats: when their remarkable visage is considered, and that it is very different from that of all other nations under heaven, this custom appears to be unnecessary.

The harbour is secured by a strong mole, and near it is erected a triumphal arch, to the emperor Trajan, his consort, and his sister, in gratitude for the great

improvement made in this harbour by that emperor, at his own expence. The exchange is a regular building, and has a beautiful front. The head of the mole is fortified, and eight or ten guns are generally mounted on it.

The inhabitants of Ancona, especially the female sex, so far excel those of the other parts of Italy in shape and complexion, that they seem to be quite a different race of creatures.

The sea near Ancona is observed to ebb and flow about a foot, or a foot and a half; which phenomenon gradually abates, as the Adriatic approaches to its junction with the Mediterranean, and increases in its northern part towards the city of Venice.

The town of Senegaglia lies on the sea coast, about sixteen miles from Ancona, but has nothing worth the description of a traveller of taste.

The distance from Senegaglia to Fano is two posts, or sixteen Italian miles. They who would persuade the world, that the country about Fano is the finest spot in Italy, certainly do a great injury to many other parts of it. The greatest curiosity here is a triumphal arch, built of marble, which, after having withstood the injuries of time, &c. till the year 1458, was then very much damaged by the cannon, during the siege of the town.

In the cathedral and other churches are to be seen some admirable paintings, &c. Here is an elegant theatre for comedies and operas, which is made use of in carnival time.

Pesaro lies about eight Italian miles from Fano. Here is a fountain of mineral waters, which is very convenient for the inhabitants, and is ornamented in a good taste. On the great market place is a statue of pope Urban VIII. in a fitting posture.

Pesaro is a large well built city, though its fortifications are but inconsiderable. The figs here are the best that Italy produces, and are even preferable to those of Slavonia.

The country about Placentia is delightfully pleasant and fruitful; and so well cultivated, that it has the appearance of a large garden or orchard. In such a charming fertile country it may be supposed that the clergy have not neglected to procure fat benefices, and large endowments. Accordingly I have been assured, that of the twenty-eight thousand inhabitants of the territories of Placentia, two thousand are ecclesiastics of the different orders.

On the fifth of April the yearly fair commences, and lasts a fortnight. The fair of Placentia is esteemed the largest in Italy, but it is not to be compared with the fair held in Germany.

From Placentia to Cremona is eighteen Italian miles, along a fruitful well cultivated country. In the way to Cremona, the Po is ferried over; there being no bridge on this river below Turin.

Cremona is an university, which was founded by the emperor Sigismund, but is now in a very declining condition. The fortifications of this city are of no importance; and it owes a great part of its reputation to the attempt made on this place by prince Eugene, in the year 1702. By means of a correspondence carried on between the Imperialists and some of the townsmen, he got possession of the *Porta Santa*, and the town-house, where marshal Villeroy resided; and on the first of February entered the city by a canal, or aqueduct, through which formerly the French also surprised this place. But unfortunately, the troops, which were to support this bold enterprise, lost their way by the darkness and fog of the night, came up too late, and gave the French time to recover their panic, and put themselves in a posture of defence, so that the Imperialists were forced to retreat, contenting themselves with the honour of carrying off Villeroy prisoner from a garrison of six thousand men.

In the cathedral and other churches of Cremona, are handsome monuments, and marble sculptures, as well as some good paintings.

The distance from Cremona to Mantua is forty Italian

Italian miles. Mantua lies in a morass, caused by the overflowing of the river Mincio; which runs through Mantua.

Mantua is fortified with a good citadel, but otherwise is more indebted to nature than art for its strength. The vapours which arise in the summer from the stagnant putrid water about this city, render the air so unhealthful, that nobody would stay here during that season, who could go any where else.

This city contains eighteen parish churches, and fourteen convents, which are, undoubtedly, too many for a place that, exclusive of the Imperial garrison, has not above ten thousand inhabitants. The Jews in Mantua are supposed to be four thousand in number; a particular quarter of the city is assigned them, where they are shut up every evening. They have four or five synagogues here.

Since the last war, Mantua has very much fallen to decay; a considerable trade was formerly carried on here, and the silk manufacture particularly brought large sums into the country. Of its flourishing condition, and the origin of Mantua, in ancient times, Virgil speaks thus in his tenth *Æneid*:

“ Ocnus was next, who led his native train
 “ Of hardy warriors thro’ the wat’ry plain,
 “ The sea of Manto, by the Tuscan stream,
 “ From whence the Mantuan town derives its name;
 “ An ancient city, but of mixt descent,
 “ Three sev’ral tribes compose the government;
 “ Four towns are under each, but all obey
 “ The Mantuan laws, but own the Tuscan sway.
 DRYDEN.”

Here is a famous museum and excellent academy. The palace church contains a rich treasury of relics, &c. and many good paintings. Mantua is an episcopal see, immediately dependent on the pope. The city has three suburbs on the other side of the lake, viz. Porta Fortezza towards the north, Il Borgo di S. Giorgio towards the east, and Il Thé towards the south.

Trieste is pleasantly situated on a hill, and forms a semicircle, which is encompassed with vineyards. The town is but small, the castle which stands on an eminence is surrounded with ditches, or moats, but is otherwise in a poor condition; the garrison consists only of forty-five men. The inhabitants of Trieste affirm, that their harbour is much safer than that of Fiume, as the latter is surrounded with high hills, which makes the wind recoil back towards the harbour. Trieste is conveniently situated for carrying on a trade between Germany and Italy.

The natives of Trieste are accused of being lazy and proud, of never applying themselves to any useful employment, and of being of such a malicious temper, that they molest and injure strangers to the utmost of their power.

The sea about Trieste and Fiume affords excellent fish; but the fishermen are so lazy and indolent, that they never go out to fish till want compels them; and even then they reserve the best fish for themselves to feed upon.

Besides the annual fair lately instituted, the staple commodities of Trieste are salt, oil, almonds, iron and minerals, which are brought thither by the way of Laubach. Some salt works are established here.

But these advantages are attended with several inconveniences, for the stagnated and putrid water, by its exhalations, communicates an unhealthy quality to the air, which is very sensibly felt at Trieste, where the soil is marshy, and, after the tide is out, emits a very nauseous smell.

The Jesuits church is a handsome building, but contains nothing worthy observation. About two or three Italian miles from Trieste, lies a fine tract of land, famous for producing two sorts of wine; one of which is called *Vino de Re*, the other *Vino di Santi Martiri*, but the latter grows four in six months, whereas the former will keep five or six years.

Fiume lies by the sea side, on a small plain in the

middle of a valley, that produces good wine, figs, and other fruit. The fruit here is excellent, by reason of the frequent vicissitudes of rain and sunshine, in this climate. The city is very populous, and the inhabitants in general are more wealthy than those of Trieste.

The cathedral is worth seeing, being adorned with several beautiful marble pillars and statues. To this church belong seven canons, who have the extraordinary privilege of filling up the vacancy when any of the number dies. Fiume is subject to the Venetian bishop of Pola in matters of religion; who is not, however, invested with the power of immediate visitation, but performs it by the *Archi-presbyter* of Fiume, and even for this a license from the emperor must be privately obtained.

The Jesuits church is not yet finished, and possibly never will, as the college enjoys large endowments, and has considerable legacies left it, in order to complete the building. Behind a moveable picture, over the high altar, is kept a pretended miraculous crucifix, which being once struck by a profane wretch with a stone, as the story goes, bled most profusely. The stone said to be that which was thrown against the crucifix, and some drops of the blood that issued from it, are kept in a glass and shewed to strangers.

The town of Buccari stands on a rocky hill, and is a place of very considerable trade; the harbour is commodious and safe, but is a little exposed to the south east wind, which sometimes makes it dangerous.

Having completely gone through all the places worth notice in Italy, &c. we shall give the reader a complete geographical account of Hungary and its provinces, and Bohemia, compiled from the best travellers and historians.

Hungary is divided into Upper and Lower. The former contains Zemplin, on the Bodrogh, which gives name to a country that contains several inconsiderable towns, and many vineyards that yield excellent wine, particularly that which takes its name from Tokay, a considerable town, pleasantly situated near the conflux of the Theis and Bodrogh. Though the wine properly called Tokay grows only on one mountain, yet that of the neighbourhood is but little inferior, and usually passes under the same name.

The castle of Skepus gives name to a county of great extent, abounding in some parts with fruitful corn-fields, rich pastures, pulse, and flax, and in others with woods and mountains, some of which are among the loftiest of the Carpathian chain. No wine is made in any part of it, but it has some iron and copper mines. Near the castle of Skepus is a cavern, in which all the winter the water is fluid, but in summer large quantities of ice is brought from it for cooling their liquors. The principal towns in the county, besides the mine-towns, are Leutschau, Kasmark, and Lublyo. The two first are walled. Vitriol, or copperas, not only gushes out from the mines of this county, but breaks forth also from the surface of the ground. The village of Vockotz is famous for its medicinal springs.

The city of Erlau, a considerable bishop’s see, forty-five miles north-east of Buda, has a castle and warm bath, and in the neighbourhood are vineyards. The town is surrounded with old walls and bulwarks, and is the capital of the county of Heves, in which are several other towns. To this county is united that of Jasi, or Philisti, with Great Cumania. The principal town of the former is Jasz-Bereny, which is large and well built, and stands in a fertile country.

Great-Varadin, or Waradin, is a well fortified city in the county of Bihar, being the see of a bishop, situate on the river Koros, one hundred and ten miles east of Buda. It has a strong castle on the east side, and the epithet of Great, to distinguish it from Little Waradin in the county of Chege. In that of Bihar is also Debretzen, a royal free town, which is large and populous.

The town of Temes-Var, on the river Beg, is the capital

capital of the Bancat, or territory to which it gives name, and which (one small district excepted, that was ceded to the Turks, at the treaty of Belgrade, in 1739) belongs entirely to the empress-queen. There is another strong town in the Bancat, called Lugos, situated among mountains, besides others of less note.

In Lower Hungary, the principal places are, Nitra, on a river of the same name, a well peopled, but mean built town, with a bishop, whose palace and cathedral are in the castle. Leopoldstadt, a strongly fortified place on the Wag, and the only place in these parts which could make head against an enemy.

Presburg is the capital of the kingdom, called by the inhabitants Pofony and Presporen, situated on the Danube, about forty-six miles east from Vienna. The castle, in which the regalia are kept, stands on a hill above the town. Here the states assemble; and in the cathedral, dedicated to St. Martin, the sovereign is crowned. The town is not very large, nor well built, but is very ancient, pleasantly situated, and enjoys a good air. Its fortifications are only a double wall and ditch. In the lower suburbs is a hill, where the sovereign, after coronation, goes on horseback, and brandishes St. Stephen's sword towards the four cardinal points, intimating, that he or she will defend their country against all its enemies. Besides the cathedral, there are several other popish and one Lutheran church, with a Jesuits college, three convents, and two hospitals. It gives name to a county, and is the residence of the archbishop of Gran, who is primate, chief secretary and chancellor of the kingdom, legatus natus of the papal see, and prince of the Holy Roman empire.

The castle of Lepto-Ujvar-Hradek, gives name to a county every where full of mountains and rocks, higher than those of the Alps; one in particular, called Benikova, is three thousand paces perpendicular in height. They abound in metals, minerals, and medicinal springs, with caverns, in which are many curious figures in drop-stone: The exhalations from some of the mineral springs suffocate birds in their flight over them.

Gran is a royal free town on the Danube, where it is joined by the river Gran, thirty-five miles from Presburg, and ninety-two from Vienna. Here are some natural warm baths. When this city was besieged by the Imperialists, in 1596, Sir Thomas Arundel, of Wardour castle, distinguished himself in such a manner, that the emperor Rodolph created him a count of the empire, and king James I. made him a baron of England, which honours are still enjoyed by his posterity. The neighbouring country is very pleasant and fruitful, and yields excellent wine. The town is well fortified, gives name to a county, and has a castle on a high rock, in which is the cathedral; but the archbishop, who is primate of Hungary, resides at Presburg, and the chapter at Tirnau.

There are two towns of the name of Buda, the old and the new. Old Buda is but a poor mean place, but the new is a royal free town, standing on the Danube, seventy-five miles from Presburg, and one hundred and six from Vienna. It is well fortified, and was the capital of the kingdom and residence of the king, until it was seized by the Turks in 1529, in whose hands it continued till 1689. Here is a castle situated at the extremity of the town, on the east side, commanding the greatest part of it. Here also are several warm baths, of which some are so moderate, that they are immediately fit either for bathing or drinking; but others are so hot, that they cannot be used until mixed with cold water, or conveyed to cool in other baths. The town has considerable suburbs. The neighbouring country yields a good red wine, and excellent melons. Very near the town is the island of St. Andrew, in the Danube, eight miles long, and eight broad: and near it, on the banks of the river, is the town of St. Andrew, which makes a better figure than Buda itself. A few miles also below Buda is another island, called Especl, which formerly belonged to prince Eugene, who had a feat in

the neighbourhood, where he often resided. From the same place a pleasant mountain, that runs into the Danube and is covered with woods and vineyards, is called Eugene's Promontory. The Danube here is about a quarter of a league in breadth.

Schemnitz, the principal mine town in Hungary, is chiefly inhabited by Protestants. The gold and silver mines still produce a considerable quantity of ore (though short of what they did formerly) and about a thousand workmen are employed in the mines.

Cremnitz, the capital of the county of Beps, contains a mint, but the mines are so exhausted as scarce to deserve working.

The Hungarians are generally fierce, cruel, proud, revengeful; better soldiers than mechanics, and huntmen than scholars. The nobility affect pomp, gluttony, and drunkenness. The men are strong and well made; they shave their beards, leave whiskers on the upper lip, wear furs on the head, a close bodied coat girt with a sash, and a short cloak buckled under the arm, in order to leave the right hand at liberty. The horse, who carry a broad sword and battle ax, are called Hussars, and the foot are named Heydukes. Here are five languages spoken, viz. the Hungarian, Sclavonian, Wallachian, German and Latin. Though not above a fourth part of the people are Roman Catholics, yet that religion is the established one. But Protestants, and particularly those of the Greek church, are tolerated; and Jews are doubly taxed. The trade of the country is in the hand of the Jews and Greeks.

Ever since 1527, the Austrians have had the crown of Hungary in their possession, and it was finally settled on the heirs male of the house of Austria in 1687; and in 1723, in case of their failure, upon the heirs female. The states consist of the prelates, barons, gentry, and royal towns.

The revenue of this kingdom exceeds a million sterling, arising from the mines, duties on cattle, royal demesnes, salt-works, contributions, customs, &c. The fortifications and garrisons constantly maintained on the frontiers against the Turks, are a great expence to the government. Hungary can easily bring into the field a hundred thousand men, regulars and militia; for there are fifty thousand in actual pay, and the provinces furnish the other fifty thousand, when they are wanted.

Transylvania, formerly Dacia, had its modern name from its situation, Trans-Sylvas, that is, beyond the woods or forests. It is situated to the south of Hungary, being about one hundred and sixty miles long, and one hundred and fifty broad. Its mountains yield silver, iron, lead, copper, quicksilver, rock salt, cinnabar, sulphur, vitriol, salt-petre, antimony, red ochre, isinglass, and other minerals, and several of them are cloathed with vines. Many petrifying, salt, and medicinal springs, cold and hot, with a great variety of plants, are also found among them. The fields and vallies are rich and fertile, yielding corn, pulse, and fruits, and the forests abound with buffaloes, elks, stags, wild-goats, bears, foxes, martins, lynxes, ermines, beavers, wild-asses, wolves, bees, &c. Vast numbers also of black cattle and horses are bred here: of the latter there is a wild sort, with manes hanging down to the ground. The principal rivers are the Szamos, the Maros, and the Aluta. As to the inhabitants, they are of several sorts, as Hungarians, Saxons, Walachians, Armenians, Bulgarians, Greeks, Rascians or Servians, and a people of Tartar origin, called Sekli. Here are also Jews and Zigduns, or gypsies, as in Hungary: In regard to religion, Roman Catholics, Protestants, Greeks, and Armenians, are all tolerated here. The Protestants are much more numerous than the Roman Catholics. For a long time this country was chiefly governed by waywodes, set up and supported sometimes by the Turks, and sometimes by the emperors of Germany. In 1713, Michael Apaffi, the last of these waywodes, dying without issue, Transylvania was annexed to Hungary, without regard to the claims of the Rakotzi family;

family; and, since 1722, hath been made hereditary to the princes and princesses of the house of Austria, whereas before the prince succeeded by free election. The states, like those of Hungary, consist of the prelates or clergy, nobility, gentry, and royal towns. But none of the royal, or any other towns here, contain the least circumstance to render them worthy of a description.

Sclavonia extends from the Adriatic to the Black Sea. Modern Sclavonia has the Drave on the north, and the Save on the south, terminating eastward on the Danube, and westward on Carniola, and extending about three hundred miles from east to west, and seventy from north to south, where broadest. It takes its name from the Sclavi, a Scythian nation, who, about the time of the emperor Justinian, possessed themselves of this and the neighbouring countries. The inhabitants are a mixture of Sclavonians, Croats, Walachians, Germans, Venetians, Turks, Servians or Rascians, and Hungarians. Sclavonia was long subject to the Venetians, afterwards to the Turks, by whom the greatest part of it was ceded to the house of Austria, at the treaty of Carlowitz. In 1746 it was united to Hungary by the empress queen. The states send representatives to the diets of Hungary, and have also diets of their own. A viceroy, or ban, presides over Sclavonia, jointly with Croatia and part of Dalmatia. Some say that the word slave took its rise from the tyranny exercised by the Venetians towards the people of this country, when under their dominion. The air is pleasant and temperate, the face of the country level, and the soil fruitful in corn, wine, and pasture. The only religion publickly tolerated, is the Roman catholic; yet there are many of the Greek church. The principal place is

Essek, a large town on the Drave, eighty-seven miles north-west from Belgrade. It was particularly remarkable once for a wooden bridge, erected by the Turks over the Danube and some morasses, which was near eight miles in length, and thirty yards in breadth, with rails on each side, watch-towers at every quarter of a mile's distance, and stairs leading down to the marshes; but this bridge was destroyed by the Imperialists in their late wars with the Turks, who used to invade Hungary by it.

Croatia, on the west of Sclavonia, is eighty miles long and seventy broad. The Croats, or inhabitants of this country, derive their origin from the Sclavi, and speak the Sclavonian language. In the late war, fifty thousand men were raised in this country, and twenty thousand in Sclavonia, for the service of the empress queen. Both horse and foot are good soldiers, especially the former, serving for much the same purposes as the hussars, pandours, and other irregulars. The soil, where cultivated, is fruitful in wine and oil, and many other products; but being a frontier country, it is usually very much ravaged in war. Here is one bishoprick, but not any university, seminary, or town worth mentioning.

Dalmatia is subject to the Venetians, Austrians, Turks, and Ragusans; that is, the former have the maritime places, and the three other powers the rest. The language is Sclavonian, the religion Romish; the mountains are covered with olives, vines, myrtles, and sheep, and lined with gold, silver, and other ores, and the plains are fertile. The inhabitants are of Walachian extraction, for the name of the country is a contraction of Mauro-Walachia, that is, Black Walachia; and the Walachians, it is said, are the descendants of the Roman colonies that were antiently planted in these countries. There is a people in this country and Carniola, called Uscocks, a rough savage race, much addicted to rapine, and noted for their agility, skipping like goats among the mountains, from rock to rock. Their language is Walachian, and their religion the Greek, or something like it.

Lara, an archbishop's see, is the capital of Venetian Dalmatia. It stands a hundred and fifty miles from Venice, on a small peninsula or island; for it is separated from the land only by a deep ditch, into

which the sea flows at high water, under a draw-bridge. Here is a capacious harbour, and a citadel, in which the proveditor, or governor of Dalmatia resides; and the town is otherwise so well fortified, that it is deemed impregnable. To supply the want of fresh water, the rain is carefully preserved in cisterns. The cathedral is dedicated to old Simeon, who took the child Jesus in his arms, and whose body, they pretend, is still preserved in it. The city is very antient, and contains many magnificent structures, particularly the archbishop's palace, the arsenal, the magazines, convents, hospitals, barracks, &c.

Calissa, is a strong town on an eminence. In the neighbourhood are a great many vine and olive-yards, with a very important pass, leading from Turkey into Dalmatia.

Salona, at present a small place on the gulph, but antiently the capital of Illyricum, and a Roman colony, noted for its purple dye, its helmets, coats of mail, &c. it was also the station of the Roman fleet for the Adriatic, and the place to which Dioclesian frequently retired.

Ragusa, a small republic; in its constitution it much resembles Venice, the government being almost entirely in the hands of the nobles. The chief magistrate is styled rector, answering to the Venetian doge, except that he is changed every month. Here also are several councils, of which, that of the Pregadi has the chief direction of affairs. To guard the city against contagious distempers, here is a board of health, consisting of five nobles. It is said of the Ragusans, that they pay tribute to the Turks out of fear, to the Venetians out of hatred, and to the emperor, Spain, the pope, and Naples, out of respect, and from political views. They are so jealous of their neighbours, that the gates of the city are allowed to be open only a few hours in the day. Their chief protector is the grand seignor, to whom they pay an annual tribute of twenty thousand zequins. The languages spoken here are the Italian and Sclavonian. The established religion is the Roman catholic; but those of the Turks, Greeks, and Armenians, are tolerated. The only place of any note in their territory is that from which the republic takes its name, which was antiently called Epidaurus. At present it is a small, but well built town, standing on the sea-coast, in a wholesome air, but barren soil, and having a good harbour, is also the see of an archbishop, and some small fertile islands in the Adriatic belong to it.

Bohemia received its name from the Bemi, or Bojemi, its antient inhabitants, who were the descendants of the Boii, or Gallic nation, that retired into the Hercynian forest (which runs through this country), in order to avoid the persecutions of the Romans. It is bounded on the east by Poland; on the west by the palatinate of Bavaria, with part of Saxony; on the north by Lusatia; and on the south by Austria. It is about three hundred miles in length, from north to south, and two hundred and fifty from east to west. It is necessary to observe, that this kingdom once comprehended Lusatia, till the house of Austria granted it to the electorate house of Saxony.

The country of Bohemia, in the general acceptation of the word, is divided into two parts, viz. Bohemia Proper, and the marquisate of Moravia.

As each of these divisions, though comprised under the name of one kingdom, has something peculiar to itself, either in the produce of the country, or the nature of the inhabitants, we shall describe each separately, beginning with Bohemia Proper.

The kingdom of Bohemia, properly so called, is one of the best countries in the Austrian dominions. It is bounded on the east by Moravia and Silesia; on the west by Bavaria; on the north by Lusatia; and on the south by Austria. It is about one hundred and seventy miles in length from east to west, and one hundred and forty in breadth from north to south. It is almost surrounded with mountains and woods; in the former of which are mines of gold, silver, copper, tin, iron, lead, sulphur, and nitre. Here are likewise abundance

abundance of carbuncles, emeralds, amethysts, jasper, sapphire, crystals, and other precious stones, most of which are purchased by the Jews, and exported into foreign parts.

The climate of Bohemia is rather unwholesome, owing, as is supposed, chiefly to the large thick woods with which it abounds. The soil is, in general, tolerably fertile, being well watered with rivers, particularly the Elbe, the Moldaw or Muldaw, the Egra, Oder, Vistula, Teyn, and Iglá. It produces great plenty of corn and millet; as also abundance of hops, saffron, ginger, red wines, flax, wool, and timber. They have excellent pasturage, and, besides cattle and sheep, breed great numbers of fine horses, which are chiefly purchased for the use of the French. The woods abound with various kind of game, as also several sorts of wild beasts, the most remarkable of which are bears, lynxes, wolves, foxes, martens, badgers, beavers, and otters:

This country also produces terra sigillata, or sealed earth, Muscovy glass, stone, or pit-coal, alum, vitriolic water, marble, mineral waters, and hot baths. The river produces various kinds of excellent fish, and in some of them are found gold-dust. Here were formerly great numbers of salt-pits; but the working of them not answering the expence, they have been some time laid aside, and the country is supplied with that article from Misnia, and other places:

This kingdom is divided into twelve circles, or provinces, exclusive of Prague, and the territory of Egra; or Eger. Before, however, we take notice of the towns in the other circles, it will be necessary to describe the city of Prague, which is not only the principal place in this division, but also the capital of the whole kingdom of Bohemia:

Prague is situated in 14 deg. 40 min. east longitude, and 50 deg. 5 min. north latitude. When the Bohemians first settled here, they called it Boihoheim, as being the capital of the kingdom; it was afterwards called, by the Slavonians, Prague, which name it hath ever since preserved. It is situated in a pleasant and fruitful country, in the midst of gardens and fine fields, and is surrounded with magnificent palaces, belonging to the nobility and gentry. It is about twelve miles in circumference, and is watered by the river Moldaw, which runs through the principal part of the city. The houses are chiefly built of stone, and consist, for the most part, of three stories. Here are near an hundred churches and chapels, and about forty cloisters, besides nine synagogues for the Jews. The Christian inhabitants are computed to be seventy thousand, and the Jews about twelve thousand.

This city is divided into three parts, by the names of the Old Town, the New Town, and the Lesser Town. The Old Town, which is as large as the other two, is very populous, and the houses are uniformly built, and well inhabited. Here is a university (the only one in Bohemia), which was founded by the emperor Charles IV. in the year 1358. It has still a great number of students, though very inferior to what it contained when John Hufs was rector of the university in 1409, there being, as it is said, at that time, not less than forty-four thousand. And when the emperor Charles V. would have retrenched their privileges, twenty-four thousand are said to have left it in one week, and sixteen thousand more soon after. Here are also several monasteries and colleges, of the latter of which there is a very magnificent one near the bridge, that formerly belonged to the jesuits, and was founded by the emperor Ferdinand for an hundred of that order. Great numbers of Jews live in this quarter, from whence it is called by some Judenstant, or Jews Town. These people have almost the whole trade of the city in their own hands. They deal in every kind of commodity, especially the precious stones found in the Bohemian mines; and as they receive all old-fashioned things in payment for the goods sold, they greatly prejudice the Christian handicrafts.

The New Town is by far the best built of the
No. 88. VOL. II.

three, and the streets longer and much more spacious. It was formerly separated from the Old Town by a wall, but now only by a ditch, into which they can admit the water from the river Moldaw. Here are the ruins of the palace of their antient kings, the walls of which are so strongly cemented, as to be almost impenetrable. Here is likewise a very handsome college that formerly belonged to the jesuits, over the entrance of which are thirteen statues of men, as large as life: they are made of stone, whose quality is such as to resemble brass. A small fortress was some years ago built for the security of this part of the city; it is a very neat building, and has ramparts well provided with cannon.

The Lesser Town, pleasantly situated on the western side of the Moldaw, communicates with the Old Town by means of a bridge, which is exceeding elegant, and one of the largest and most substantial in Europe. It consists of twenty-four arches, is seventeen hundred feet in length, and thirty-five in breadth. It hath a magnificent gate at each end, and the sides of it are decorated with several statues of saints. Part of this town lies on a rising ground, the summit of which is called Ratschin-Hill, and the streets and buildings that surround it form another part, which is distinguished by the name of Upper Prague. On this spot are many elegant buildings belonging to the nobility; and here the emperor has a magnificent palace, with a summer-house, which affords one of the most beautiful prospects in the universe. The halls, galleries, and other apartments, are adorned with a prodigious number of paintings, executed by the best masters. The great hall, where the coronation feast is kept, is said, exclusive of that at Westminster, to be the largest in Europe. In this part of the city is a very handsome and spacious cathedral, called St. Vest, which contains many antient monuments and magnificent tombs, erected to the memories of some of the most distinguished personages of this kingdom. The original edifice was destroyed by the Swedes in 1648. The magnificence and beauty of the present structure consist in the thickness of its walls and arches, the building itself being very plain, and without any kind of ornaments. Among the distinguished personages interred in this cathedral are two saints, namely, St. Wencenslaus (the founder of the cathedral, who was king of Bohemia), and his wife's confessor, St. John of Nepomuck, who, because he would not discover her confessions to her jealous husband, was, by his order, thrown from the bridge into the Moldaw. He was afterwards canonized at Rome by pope Benedict XIII. in the year 1721, at the request and expence of the empress, and of the states of the kingdom. Great numbers of people, from all parts, resort to the shrine of this saint; and his tomb, which is adorned with a rich canopy, is loaded with the most valuable presents. This saint is at present held in such veneration in Bohemia, that there is no church where he has not a chapel, no public building without his effigy, and scarce any person to be seen who has not his picture hanging before them, like the badge of an order, to a straw-coloured ribbon. The statue of him in brass, as large as the life, is erected on the bridge, near the spot from whence he was thrown into the river.

At some distance from the cathedral are two sumptuous palaces, both of which have elegant and extensive gardens. One of them belongs to the family of count Colorado, and the other to that of count Wallenstein. The latter is the largest and most magnificent, above an hundred houses having been pulled down to make way for it. The hall is lofty and spacious, and the gardens large and beautiful. On one side of them is an aviary inclosed with trees; and on the other are large stables of curious architecture, for thirty-six horses. The racks are made of steel, and the mangers of marble, with a marble pillar between each stall; and over every manger is the picture of the horse it belongs to, as large as the life.

The town-house, a very beautiful structure, is situated in a spacious square, and has a noble clock, with a great variety of motions. It is a uniform building; and the principal room, which is elegantly finished, is ornamented with the pictures of the emperors of Germany, and the kings of Bohemia.

The market-place consists of one large and spacious street, where a market, or rather fair, is kept every day in the week. In one part of it is a large stone column, on the top of which is the statue of the Virgin Mary in gilt brass, and at the corners are four angels, each of which holds the figure of a devil in chains. Near this column is an antique fountain of curious workmanship, having twelve fronts: the basin is of red marble, and in the centre is a figure on a pedestal, round which are engraven the twelve signs of the zodiac.

The castle stands on Ratschin-hill, sometimes called the White Mountain. It is a regular fortress, and is always provided with a strong garrison. On the same mountain stands also the archiepiscopal palace. Near the castle is a pyramid, on which is a long inscription, intimating, that it was erected in remembrance of a particular circumstance that happened in the year 1618, when the states of the kingdom being assembled at the castle, the emperor's deputies were, by order of him and his council, thrown from the uppermost windows, for having taken measures to deprive them of their liberties; and that though they fell from so great a height, yet neither of them were killed, or even received any material hurt.

The inhabitants of Prague are, in general, exceeding poor, and their shops very meanly furnished; notwithstanding which, it is said, there are few cities where the nobility and gentry are more wealthy, and live in greater state. Here is much gaming, masquerading, feasting, and very splendid balls, with an Italian opera; and assemblies are held every night in the houses of persons of quality.

The principal traffic consists chiefly in lustres and drinking-glasses, which are made of Bohemian crystal, and so generally esteemed, that they are exported to most parts of Europe. These crystals are also polished by the Jews, who turn them to good account, by setting them in rings, ear-pendants, and shirt-buttons.

The tribunals meet at the emperor's palace, to execute all public business relative to the kingdom. The chief of these tribunals consists of twelve stadtholders, at the head of whom is the great burgrave, governor of the kingdom and cities (who is immediately under the emperor), and the chancery of Bohemia.

The inhabitants of Prague enjoy many ancient privileges granted them by their ancestors. Among the charters by which they are held, there is a remarkable one preserved in one of the churches: it was granted by Alexander the Great, and as it is one of the oldest records in Europe, and consequently a great curiosity, we shall, for the entertainment of our readers, preserve a translation of it. It is as follows: "We, Alexander the Great, son of king Philip, founder of the Grecian empire, governor of the Persians, Medes, &c. and of the whole world from east to west, and from north to south, son of great Jupiter, by, &c. so called; to you the noble stock of Scavonians, and to your lineage, because you have been unto us a help, true in faith, valiant in war, we confirm all that tract of earth from the north to the south of Italy, from us, and our successors, to you and your posterity for ever: and if any nation be found there, let them be your slaves. Dated at Alexandria, the 12th of the goddess Minerva. Witness Ethra and the eleven princes, whom we appoint our successors."

This city has sustained great injuries, at different periods, since the commencement of the last century, having been several times besieged, taken, and plundered. It was first attacked by the archduke Leopold, bishop of Pessau, who plundered the Lesser Town, as he would have done the whole, had it not been timely relieved by the emperor Matthias, king of Hungary.

Nine years after this, it was again plundered by the Imperialists, who entered this city, and carried off an inestimable booty. The depredation was made soon after the famous battle of Weffenberg, or the White Hill, on the 8th of November, 1620, when Frederick the Fifth, elector palatine, was totally defeated by the forces of the emperor Ferdinand, under Maximilian, duke of Bavaria, and thereby lost the Bohemian crown and his German electorate. It shared the like fate in 1631, when it was taken by the elector of Saxony, after he had made himself master of Bohemia; but the following year the great Wolfstein, who recovered the country from the Saxons, took this city by storm. In 1641, the Swedish general, Koningtmark, surprised and plundered that part of it called the Lesser Town, with only three thousand soldiers; but the inhabitants of the Old Town, assisted by the scholars of the university, repulsed him, and that part of the city escaped being plundered. On the 26th of November, 1741, the French and Saxons, after a very short siege, stormed and took it, with two thousand seven hundred and eighty men in garrison, and one hundred and twelve pieces of cannon, besides a great quantity of ammunition and provisions; and the next month the elector of Bavaria was there proclaimed and crowned king of Bohemia. But in 1742, the Austrians having for some months blockaded and besieged it, the marshal Belleisle collected all the provisions, &c. that he could carry with him, marched out of the city in the beginning of December, with several thousand foot and horse, to Egra; and the same month the rest of the garrison capitulated to the Austrian general, prince Lobkowitz, and marched out to the number of four thousand men, leaving two thousand sick behind them; not long after which, the queen of Hungary was crowned queen of Bohemia. In 1744, the king of Prussia invested it with a considerable army, which having with its bombs, &c. destroyed a great part of the Old and New Towns, the Austrian garrison, after the trenches had been open six days, surrendered themselves prisoners of war. But the city was soon again in the hands of its sovereign; for, in November the same year, on the approach of prince Charles, with the Austrian army, the Prussian garrison evacuated the town, after nailing up the cannon, breaking twenty thousand pieces of various kinds of arms, and throwing the powder, and other warlike stores, into the river Moldaw. His Prussian majesty made another attempt on this city in 1757, but was repulsed, and all his efforts rendered totally abortive.

The territory of Egra or Eger receives its name from its capital, which is situated ninety miles west of Prague, and is the only place of any note throughout the whole district. It is tolerably large, and built on the declivity of a rock at the foot of the mountains which inclose Bohemia on the west, and near the river Eger, from whence both it and the territory have their names. The city is well fortified with a double wall next the river, and in other parts with a triple one, besides which, it hath a very strong castle. Frederick the First, made it an imperial city in 1179, for its fidelity to him against the duke of Bavaria. In consequence of this, it has the privilege of coining money; and from the judicial sentences of its council, there lies no appeal but to the sovereign.

In this city are several ancient and elegant buildings, among which are three cloisters, and a handsome college that formerly belonged to the jesuits. Here are likewise several churches, with courts of judicature, hospitals, baths, and store-houses for corn. At a small distance from the city is an acid spring, whose waters are purgative, and remarkable for removing disorders in the eyes, ears, and other parts of the head. In its neighbourhood are also mines of silver and gold; but they have not been wrought at for several years past.

The Eger is very broad, and so deep as to admit vessels of very considerable burthen, which is of the utmost

utmost utility to the inhabitants of the city, who are also plentifully supplied from it with a great variety of excellent fish.

The circle of Beraun-Podbrad comprehends Moldaw, which was united to it in 1714, and contains one hundred and fifty feignories. The principal places and buildings in it are,

Beraun, a royal borough on the river Meis, near which, in 1744, the Prussians were defeated by the Austrians.

Pezebram, a royal mine-town.

Old-Knen, a small town belonging to the order of the cross with the red star.

The Holy Berg, a very handsome college, which formerly belonged to the jesuits.

St. John-under-the-rock, a cloister of Benedictines, whither the inhabitants of Prague make pilgrimages, and the abbot of which belongs to the states of the country.

Konigsaal or Zrabassaw, a royal foundation, and cloister of Cistercians, the abbot of which is also a member of the states.

Ostrow, a Benedictine cloister, in an island on the river Moldaw.

The circle of Rakowitz comprehends that of Slan, or Slansko, which was united to it in 1714. It is in some parts mountainous and woody, and in others very fruitful, producing a great plenty of corn, and other necessary articles. It contains a hundred and six feignories, estates, and seats. The most remarkable places in it are the following :

Rakonitz, or Rakowitz, which gives name to the circle, but is otherwise very inconsiderable.

Krziwoklad, a small town, where formerly were kept state prisoners, as also the royal treasure.

Raudnice, another small town, where there is a cloister of regular canons of the order of St. Augustine.

Doxan, a cloister of nuns of the order of Præmonstratenses, the provost of which is a member of the Bohemian states.

Plas, a cloister of Cistercians, whose abbot is also of the like dignity.

In the circle of Leutmeriz, the most distinguished place is Leutmeritz, which gives name to it, and is the capital of the province. It is situated on the Elbe, thirty-five miles north-west of Prague. It is a rich, well built, populous town, a royal borough, and bishop's see, the prelate of which is a suffragan to the archbishop of Prague. Here is a handsome college, which formerly belonged to the jesuits, and consisted of eleven priests, four masters, and seven coadjutors.

The other remarkable places in this circle are, Austi or Aussyg, a royal borough on the Elbe. In the territory of this town is made a strong sweet red wine, called Podikalcky ; it generally looks thick and inuddy, and seldom keeps good longer than twelve months.

Dieczin, Tetzen, or Titchen, is a neat town, situated on the Elbe, and in it is a fine citadel built on a rock.

Bæneflow, Bensfen, or Pensfen, is remarkable for the best paper being made in it of any other place throughout the Bohemian dominions.

Lippey, a small town, is remarkable for producing fine potters earth, cloth, and polished glass.

Krupka, or Krauppen. In this town is an image of the Virgin Mary, to which pilgrimages are made from various parts of the kingdom. In the neighbourhood of this town are tin-works, and a college that formerly belonged to the jesuits.

Belin is a small town, in which is a fine citadel, and a spring of excellent water.

Lowrice is another small town, near which, in 1756, was fought a warm battle between the Prussians and Austrians.

Toplvi is a small but pleasant town, and remarkable for containing several warm baths, the springs of which were discovered so early as the year 762.

The circle of Saaz is very fertile, being watered by

the river Moldaw, which runs almost through the centre of it. It is remarkable for producing great quantities of hops, and several sorts of excellent grain. The principal places in it are the following :

Zotee, or Saaz, a royal borough, and the capital of the circle.

Pons, or Brux, a royal borough on the little river Bila. It is a well built town, and contains three cloisters, with a commandery of the knights of the order of the cross, with the red star.

Launy, a royal borough on the river Eger.

Kadan, situated also on the same river, and noted for producing excellent beer.

Chomutow, a royal borough, in which is a handsome college that formerly belonged to the jesuits. The neighbourhood of this town is remarkable for producing great quantities of alum.

Folkerow stands on the river Eger, and produces alum, sulphur, and vitriol.

Elbogen, or Loket, the capital of a territory which was annexed to this circle in the year 1714, and a royal borough. It is seated on a high steep rock, near the river Eger, within seventy-two miles of Prague, and, being a frontier town strongly fortified, it is called the Bohemian key to the German dominions. The inhabitants of it speak the German language.

Wary, or Carlsbad, that is, Charles's Bath, a royal borough, is celebrated for its baths and medicinal waters, which baths are of two sorts, differing both in heat and strength ; the one being boiling hot, and the other little more than lukewarm. The source of them is in the middle of a river, formed by torrents from the neighbouring mountains, whose waters are exceeding cold ; notwithstanding which, those of the mineral springs, especially of the hottest, are seen to smoke in the river. These waters are beneficial in the cure of various disorders, particularly the gravel ; and their virtues have been particularly described by Hoffman, and other physicians. The town itself is but a dirty place, inhabited chiefly by armourers, and other artificers in iron.

Joachimthal, a small town, famous for having several silver mines in its neighbourhood, which were first discovered in the beginning of the sixteenth century.

Chlum, or Culm, a small place belonging to the order of the Holy Cross, is remarkable for a celebrated image of the Virgin Mary, to which pilgrimages are frequently made from all parts of this circle.

Dreyhaokin is a small but neat town, and in its neighbourhood is a mine that produces excellent copper.

The circle of Pilsen is remarkable for abounding in excellent pasturage, on which account are bred in it great numbers of fine sheep, and it produces the best cheese in the whole kingdom. The chief places of note here are the following :

Pilsen gives name to the circle, and is a large well-built town, situated between the rivers Miza and Radbuza, about forty-four miles south-west of Prague. It has two large churches, and near the centre of it is a spacious market-place, well supplied with most kinds of provisions. The west and south sides of it are defended by a bulwark and a large ditch, within which are strong walls, with towers and bastions. This city hath suffered greatly in the respective wars of Bohemia, it having been taken, retaken, and burnt several times.

Klattau is a royal borough, well fortified with walls and ramparts. The only remarkable building here is a handsome college, which formerly belonged to the jesuits.

Domazlicé and Kokyczany, both royal boroughs, in the latter of which is a cloister of regular canons of the order of St. Augustine.

Nepomuck is a small town, and noted only for giving birth to the saint of that name, who is so much venerated by the Bohemians. The principal buildings are, a small castle, with a cloister of Cistercians.

The chief produce of the circle of Prachin, consists

in precious stones, with some silver and gold. The principal towns in it are,

Wadnary, a royal borough, situated on the river Blanice.

Berg-Ruickenstein, a royal mine-town, in the neighbourhood of which is found silver.

Pisek, and Schuttenhofen, two royal borough towns, both of them situated on the river Watawa.

Wolin, a small town on the river Wolnika, belonging to the prebost of the collegiate church at Prague.

Strahorrice, another small town, situated on the same river, and belonging to the grand prior of the order of Malta, in Bohemia.

Hufynee, a town situated on the river Blanice, and remarkable only for giving birth to the famous John Hufs, the celebrated reformer.

The principal places in the circle of Bechin are, Budweis, a royal borough, situated on the river Moldaw. It is a small, but neat town, well built, and strongly fortified. The chief building in it is a cloister belonging to the order of Dominicans. All salt brought out of the Austrian dominions must be first exposed to sale here, and pay toll.

Tabor, a royal borough, pleasantly situated on a mountain, forty-five miles south east of Prague.

Neuhaus is a neat town, and has a beautiful citadel, with a large manufacture for cloth.

Krumlow, or Crumau, has also a fine citadel, and a handsome college that formerly belonged to the jesuits.

Wittingen is a good town, and has a large fortress, with a cloister of regular canons of St. Augustine.

The chief produce of the circle of Kaurzim is timber, which is conveyed to Prague by the river Moldaw. It hath four royal boroughs, namely, Kaurzim, Kolin, Bohemian-Brod, and Gelowey; but neither of them contains any thing remarkable, except Kolin, which has several palaces and churches. The only building, exclusive of those, in this whole circle, is the Benedictine cloister of St. Procopius, situated on the river Sasawa, the abbot of which has a seat in the diet.

Among the towns in the circle of Tschaslau, the most remarkable are the following:

Kuttenberg, a royal borough, about thirty miles south-east of Prague, is noted for its silver mines, which yield also copper, and were formerly very profitable. Though this town is small, yet it is well built, and contains many handsome edifices, among which is a large college that formerly belonged to the jesuits.

Czalaw is also a royal borough, in the principal church of which lie the remains of John Ziska, the famous leader of the Hussites, who died in 1424.

Lodecz, a small town and seigniory, which the empress queen purchased in 1753, of baron Koch, for two hundred and forty thousand florins.

Chotofuce, a small town, where the Prussians obtained a compleat victory over the Austrians in 1742.

Golez-Genikow, a handsome market town, and remarkable for having in it an image of the virgin of Loretto. The principal places in the circle of Chrudim, are,

Chrudim, Alla-Meyta, Poliefka, Choltice, Hrochuw, Teynecz, Koffenberg, and Pardubice. The three first of these are royal-jointure towns. Choltice has a handsome citadel, as has also Pardubice, the latter of which is remarkable for the manufacture of sword-blades and knives. Koffenburg was formerly the property of the jesuits, but since their extirpation it hath been joined with Hrochuw and Teynecz, and all those now belong to the order of Præmonstratenses. The most considerable place in the circle of Konigin-gratz.

The most remarkable place in this province is Konigin-gratz, which gives name to it. It is a royal-jointure town and bishop's see, situated forty-five miles north-east of Prague, at the conflux of the rivers Elbe and Erlitz. Here is a commandery of the

Teutonic order, and a fine college that formerly belonged to the jesuits.

Trautenau is another royal jointure-town, situated on the river Uppau.

At Kukus on the Elbe, in this circle, is a celebrated medicinal spring and bath; and at Chluemec, near Braunau, the emperor Lotharius was defeated, and taken prisoner by the Bohemians:

In the circle of Benslaw, the most remarkable place is Inng-Bunslaw, which gives name to it, and is its capital. The town was a barren borough till 1595, when the inhabitants purchased its freedom; and in 1609 it was ranked among the royal boroughs by the emperor Rodolph.

Mielnick is a small royal jointure-town, situated near the conflux of the Elbe and Moldaw, and contains a castle and collegiate church. It is remarkable for producing red wine of a most excellent quality.

Nymburg is another small town, situated on a plain at the conflux of the Elbe and Marlin. It was enlarged by king Wenzel II. who made it a royal borough.

Benatky is a small town on the river Iser, and contains a citadel. It is remarkable for having been the residence of Tycho Brahe, the celebrated astronomer.

The Bohemians are a mixture of Slavonians and Germans; the former of whom live in villages, and are slaves. The inhabitants of the towns are neither fond of arms, arts, or trade, but prefer an idle, indolent life. They are in general well made, strong, and subject to few diseases. In their dispositions they are subtle but courageous, and always make a point of fulfilling their engagements. The gentry, and middling sort of people, are open and agreeable in their conversation; but the boors, or peasants, are sly and morose, and such arrant thieves, that there is no trusting them. The people in general are exceeding illiterate, notwithstanding there are many seminaries of learning in different parts of the country; which is owing to the negligence of the parents, whose natural indolence renders them strangers to the spirit of literary emulation.

The language is a dialect of the Slavonic, but somewhat harsher than that of their neighbours, who speak the same language, as the latter change the consonants more into vowels. Most people of fashion, however, through their intercourse with the court of Vienna, speak High Dutch, or German, with which the language of the common people is also intermixed.

The Bohemians are supposed to have received the Christian faith so early as the sixth century; but if not then, it is certain they did in the ninth, and their religion was that of the Greek church, till Boleslaus, surnamed the Good, introduced popery among them. John Hufs, and Jerom of Prague, were burnt by order of the council of Constance, in the fifteenth century, for endeavouring to bring about a reformation in religion. This occasioned a bloody war, which continued for many years; but the Hussites were worsted, and in 1347, the greater part of them were obliged to quit their country; upon which they withdrew to the neighbouring dominions, especially Poland and Prussia. However, when Luther appeared, great numbers of the Bohemians embraced his doctrine, and these at first had a toleration; but afterwards, being persecuted, they took up arms, and in 1618 chose Frederic V. elector palatine, for their king; but the war ended unfortunately both for the king and the Protestant Bohemians, the former being taken prisoner, and the latter being persecuted with the most unremitting severity. In 1627 the remaining Protestants were deprived of all their rights and privileges, and such as would not submit to the Roman catholic church were compelled to quit the country.

Since the above period, popery has been the established religion in this country. There are, however, a few Lutherans in some parts of it; but they are obliged to be on their guard, and to conceal themselves

felves as much as possible. The Jews are more indulged, having an extensive toleration for the exercise of their religion.

The archbishop of Prague is born legate of the holy apostolic see of Rome, and it hath always been his office to crown the kings of Bohemia. He is also a prince of the holy Roman empire, though he has no seat in the diets, primate of the kingdom, and perpetual chancellor of the university of Prague. His suffragans are the bishops of Leutmeritz and Koningrotz. The government of the church and clergy is vested in the archiepiscopal consistory, from which an appeal lies hither to the sovereign or pope.

For a considerable time, Bohemia was governed by dukes, and afterwards by kings, who were limited in their power, and elected by the states; though they usually kept to the family of the deceased monarch. After the battle of the White Mountain in 1620, the crown was made hereditary in the Austrian family; so that, from that time, the states have had nothing more to do with respect to the right of succession. The states, indeed, are summoned every year, by command of the empress queen, and meet at Prague; but it is only for form sake. They consist of the clergy, nobility, gentry, and representatives of the towns. Here a commissioner from the sovereign lays before them the necessity of granting such supplies as the court demands, which usually amount to a very great sum; and these are granted without hesitation, or examination. The peasants here are bondmen to their lords, and to the hard yoke which galls them is doubtless owing, in a great measure, both their perverse obstinate disposition, and their indolence; the latter of which, among other things, is evident from the wretched condition of the villages, which, though wood is to be found here in great plenty, and building is far from being expensive, are very mean and despicable. The clergy are composed of the archbishop of Prague, several bishops, provosts, and abbots, besides the inferior clergy. The nobility are divided into princes, counts, and barons; and the next degrees to these are knights, burghers, husbandmen, and peasants. Each circle has two headmen, or captains, one out of the state of lords, and one out of the state of knights. Bohemia is generally considered as a part of Germany, but with very little reason, for it is not in any of the nine circles, neither doth it contribute any thing towards the forces or revenues of the empire, or is subject to any of its laws.

The staple manufacture of Bohemia is linen, of which they export great quantities, together with corn, malt, hops, and mineral waters. They have also considerable manufactures of copper, iron, glass, earthenware, and paper, of which also a part is exported.

The revenues are raised by the states of the kingdom, who are assembled annually at Prague, to provide such sums as the empress demands of them, over and above the customs and duties to which she is intitled by her prerogative. The revenue is said to amount to near one million sterling a year. The standing militia of the Austrian hereditary countries is twenty-four thousand men, towards which Bohemia furnishes nine thousand. In times of war, these serve to fill up the marching regiments.

The marquisate of Moravia is about one hundred and twenty miles in length, and one hundred in breadth. It is bounded on the east by Silesia and Hungary; on the west by Bohemia Proper; and on the south by Austria. A great part of it is over-run with woods and mountains, where the air is very cold, but much wholesomer than in the low grounds, which are full of bogs and lakes. The mountains in general are barren; but the more champaign parts tolerably fertile, yielding corn, hemp, flax, saffron, pasturage, wine, fruits, and garden-stuff.

Moravia also abounds in horses, black cattle, sheep, and goats.

In the woods, and about the lakes, are plenty of wild fowl, game, venison, bees, hares, foxes, wolves, beavers, and a beast of prey called Rysowe, about the

size of a dog, having its belly and feet spotted, and leaping suddenly on its prey, from rocks or trees.

This country likewise produces marble, bastard diamonds, amethysts, alum, iron, sulphur, salt-petre and vitriol, with wholesome mineral waters and warm springs; but salt is imported.

Its rivers, of which the March, Morawa, or Morau, are the chief, abound with a great variety of fish; particularly trout, crayfish, barbel, eels, jack, and perch.

The Moravians are, in general, open hearted, not easy to be provoked or pacified, obedient to their masters, and true to their promises; but credulous of old prophecies, and much addicted to drinking. Their language is a dialect of the Slavonic, differing little from that of Bohemia; but the nobility and citizens speak German and French.

The states of this country consist of the clergy, lords, knights, and burghesses; and the diets, when summoned by the regency, are held at Brun. The marquisate is divided into six circles, each of which has its captain, and contributes to its sovereign about one third of what is exacted from Bohemia. Seven regiments of foot, one of cuirassiers, and one of dragoons, are usually quartered in it.

Christianity was promulgated in this country in the ninth century, and the inhabitants continued attached to the church of Rome till the fifteenth, when they espoused the doctrine of John Huss, and threw off popery; but after the defeat of the elector Palatine, whom they had chosen king, as well as the Bohemians, the emperor Ferdinand II. re-established popery. However, there are still some Protestants in Moravia; and some few years since, a set of enthusiasts, called Hernhutters, or Moravian brethren, headed by one of the counts of Zinzendorff, appeared among them, who, at first, met with great encouragement in England, but afterwards, when their tenets and practices came to be better known, fell into contempt; though they have still some followers among the lower sort. The bishop of Olmutz, who stands immediately under the pope, is at the head of the ecclesiastics; and the supreme ecclesiastical jurisdiction, under the bishop, is vested in a consistory.

The commerce of Moravia is considerable. Of what they have, Brun enjoys the principal part. At Iglau and Trebitz, are manufactures of cloth, paper, gunpowder, &c. In some parts of the country are also iron-works and glass-houses.

The chief-places in the marquisate of Moravia, are the following:

Holomau, or Olmutz, the metropolis, is a small, but neat, well built, and populous city, situated on the river Morawa, eighty miles north of Vienna. It is divided into the Old and New Town, in which are some spacious, regular streets, with fine houses, all painted on the outside, two great squares, a cathedral dedicated to St. Wenzel (where it is said, St. Cyril is interred), several hospitals and cloisters of monks and nuns, an university, riding academy, learned society, and twenty-six churches. It is a royal borough, and the see of a bishop; and, by means of its river, carries on a considerable trade with Bohemia, Hungary, Poland, Silesia, and Austria. In the neighbourhood is a cloister of canons regular of the order of Præmonstratenses, whose abbot is mitred.

Brunn, or Brinn, is well built, fortified, and inhabited; and a place of the greatest trade in Moravia. Here are held the courts of judicature and the diets. There are six cloisters, a collegiate church, the bishop's palace, and a large college, with an hospital of the knights of Malta in the suburbs. The cloister of Augustine hermits is famous for an image of the Virgin Mary, made, as they pretend, by St. Luke, and a foundation for young ladies. The citadel is called Spielberg, or Spilmberg, and stands on a mountain close to the town.

Gihlawa, or Iglau, a strong, well-built, populous town, and royal borough, is on the river Ighlawa, and was the first town of Moravia that received the

Augsbuurg confession. The principal buildings in it are a large college and gymnasium, with two monasteries, one of Dominicans, and another of Franciscans. The trade of the town is chiefly in beer, and a coarse woollen cloth. It is much frequented by travellers, being situated on the borders of Bohemia, and in the high road to Hungary.

Znoym, or Znogms, a royal borough on the river Teya, is the road from Prague to Vienna, which makes it a considerable thoroughfare. Here is a strong castle; but the town, being overlooked by a mountain within cannon shot, is capable of holding out long. Here are four cloisters and a large college; and in its neighbourhood are two cloisters, and many vineyards. It was here that the emperor Sigismund died, in the year 1145.

Hradisch, a strong royal town on the March, contains a large college, and a cloister of Franciscans. About a mile from the town stands the Cistercian cloister of Welhrad, whose abbot is the first of the regular prelates at the diet.

Kromerziz, or Kremser, a well-built walled town on the river March, or Morave, belonging to the bishop of Olmutz, whose large and beautiful palace here was destroyed by fire in 1752, together with the archives, the suburbs, and fifty-five burghers houses. Here is also a collegiate church, several cloisters, and a mint.

Uniczow, Littau, Zwittaway, Muglitz, and Profnitz, are all walled towns. The first is a royal town, and has a manufacture of salt-petre, glass, and gunpowder.

The other towns in this marquisate are very trifling, nor does either of them contain any thing that merits the least attention.

The marquisates of Lusatia has Silesia on the east, Misnia on the west, Bohemia on the south, and Brandenburg on the north. It is divided into the Upper and Lower marquisates; the air of the former, which is a hilly country, is more salubrious than that of the latter, the situation of which is low and fenny. The mountainous tracks are barren, the vallies are fertile, and both the marquisates produce wood, turf, wheat, rye, oats, millet, beans, peas, buck-wheat, lentils, flax, hops, tobacco, manna, wine, &c. Here are likewise medicinal springs, quarries of stone, earths, and clays for tobacco-pipes and earthen wares, bastard diamonds, agates and jaspers, allum, vitriol, &c. Cattle, venison, and fish are plenty; the country is well watered; the language of the people is very inarticulate, guttural, and barbarous; and their dress, at once, singular and mean. Both marquisates were anciently subject to the king of Bohemia, the archdukes of Austria, or the electors of Brandenburg; but in the year 1636 they were ceded to the elector of Saxony. Christianity was established here in the seventh century, and at present the reformed is the established religion. The manufactures are woollen and linen stuffs, caps, gloves, stockings, spatterdashies, hats, leather, paper, iron, glass, gunpowder, bleached wax, &c. many of which the inhabitants export. The imports are silk, yarn, wool, spices, wine, corn, hops, garden-stuff, fruit, &c.

The states of Upper Lusatia consist of state lords, prelates, gentry and commonality; and without the concurrence of these, nothing of importance can be transacted. The diets are either ordinary or extraordinary; the former meet once in three years, the latter upon particular emergences.

Upper Lusatia is divided into two great circles, called Budissen and Gorlitz.

The circle of Budissen receives its name from the capital of the marquisate. The town of Budissen is the seat of the same diets, and of the chief officers and tribunals. It is situated on the Spree, twenty miles north-west from Gorlitz. It is pretty large, handsomely built, strongly fortified, and well inhabited: its castle is situated on a high rock within the town walls. The Lutherans and Roman Catholics perform divine service in different parts of

the cathedral. Here are several other churches, a council-house, library, orphan-house, spinning-house, house of correction, two diet-houses, three hospitals, a gymnasium, &c. The trade of this place is in hats, stockings, gloves, linen, glazed leather, cloth, fustian, Turkey manufactures, &c. to a very large amount.

Camenz on the Elster contains eight churches, three hospitals, a manufactory of linen, and another of woollen cloths, and a Latin school.

Lobau has a mineral spring, Markliffa a Latin school, Uhyft a castle; and Baruth, a small town, with a citadel, is situated so pleasantly, that the meadow in which it is erected is called the Golden Au.

Gorlitz, the capital of the circle of the same name, is twenty miles to the east of Budissen. It was erected in 1139, by Boleslaus king of Poland, but soon after burnt, from whence arises its name, for Gorlitz, in the Slavonic tongue, implies burnt town. It is the seat of justice for this part, and the residence of the governor; has several neat churches, and many stately houses, built of stone. The chief trade is in beer, and in dressing and dying woollen and linen cloth. It is well fortified with walls, towers, and ditches; and the approach to it difficult, because it stands in a morass, on the west side of the Neisse, which rises on the borders of this country, and runs through it into the Oder; its great church, formerly called St. Peter and Paul, has hardly its equal in Europe; near a small church, on a mount without the city, there is a model of the holy sepulchre at Jerusalem, built two hundred years ago by the direction of a citizen who had been there several times. Zeyler, who says there is a fine college in this town, mentions several fires that have happened here, which the reader may observe, from his history, have been more frequent in this, than any part of Germany, or, indeed, of Europe.

Muska has a great alum work; Great Radmeritz contains a noble temporal foundation for twelve ladies, and Herrenhuth is a small place belonging to the count Zinzendorff. It was founded in 1722 by some Moravian brethren, and is now the chief nursery and seat of that sect called Hershutters.

Lauban, upon the river Queiss, and the confines of Silesia, four leagues east of Gorlitz, which, though but little, is well fortified, and has a great linen manufactory.

Zittow, on the river Neisse, a fine city near the borders of Bohemia, eight miles south of Liebau, and twenty-eight east of Dresden. Wenceslaus, king of Bohemia, encompassed it with walls in 1255. It is well fortified, and the houses are built in the newest style. It has a good trade in beer, a great manufactory of cloth, an hospital, which was once a Franciscan monastery, and large populous suburbs.

The land estates of Lower Lusatia are similar to those of the Upper. Spiritual matters belong to a consistory erected in 1668; the chief officers are the president of the upper office, the land captain, and the land judge. The tribunals are the Upper Office and the Land Court, and the whole is divided into five little circles, viz.

Luckau, containing no place worth notice but the town of the same name, which is walled, has a Latin school, a poor house, a house of correction, two hospitals, and several churches. Spremerbergh contains a town of the same name, and thirty-two little villages. Kalau contains a town of the same name, Lubbenau, Dobrilugh, and twenty villages. Luben contains a town of the same name, the town of Friedland, and a few small villages. Guben contains a town of the same name, to which belong six villages. Neuzell with the appendage of thirty-six villages. Schiedlo, Schenkendorf, and Tersta, to which belong thirty-five villages; Pforten having the jurisdiction of twenty villages, and the town of Sorau, which has a castle, school, hospital, and manufactories of yarn, linen, and woollen.

Having

Having now gone through a full description of every thing worthy of notice in Hungary and Bohemia, we shall proceed with this useful and entertaining work, in giving the public a most complete and accurate account of the kingdom of Poland, which we have extracted from most esteemed travellers through that country.

Poland derives its name from the flatness of the country, and is bounded by the Baltic, Livonia, and Russia towards the North; by Russia, and the Lesser Tartary, towards the east; by Beparabria, Moldavia, Transylvania, and Hungary, towards the south; and by Pomerania, Brandenburg, Silesia, and Moravia, towards the west. It extends from 46 deg. 30 min. to 56 deg. 30 min. north latitude.

The air of Poland is temperate and healthful in general, but is exceedingly cold in the northern parts; and as it lies almost in the centre of a large continent, at a distance from the sea in most parts, the weather is more serene and settled, both in winter and summer, than in those countries which border upon the ocean. The lakes lie chiefly in the Greater Poland; Cujavia, and the territory of Lublin, and both lakes and rivers abound with fish. Its principal rivers are the Weisfel, or Vistula, the Wasta, or Vasta, the Nieper, or Beristhenes, the Neistor, or Tyra, the Devina, the Bog, or Bohurst, the Bug, and the Nicmen, or Ruffe.

The mountains in this country are very inconsiderable, except those which divide it from Hungary, being a ridge of craggy hills, about three hundred miles in length, called the Carpathian mountains, from whence several considerable rivers arise, which fall into the Euxine and Baltic seas.

The Greater Poland, in which is comprehended Cujavia, contains seven palatinates, or governments. The chief town of Pofnania, which is the most western part of Poland, is Pornan, which is a bishop's see, situated on the river Vasta. It stands in a plain, surrounded by little hills, and is defended by a double wall and ditch: the town is small, but beautiful, being built, for the most part, of free-stone. The principal public buildings are the castle, the cathedral church, and the bishop's palace, which stand in the suburbs; and two colleges, one of which belongs to the jesuits. The city is governed by a starosta, chosen annually out of the Schipins, or Aldenna, who, during the time of the enjoyment of this office, has the title of general of Great Poland.

The city of Gruma is situated on the marshes, between twenty and thirty miles to the eastward of Pornan; it is an archbishop's see, and gives a title to the primate of Poland. It was founded by Leckus, their first monarch, and was antiently the metropolis of the whole kingdom. It is now the residence of the archbishop and primate of Poland, and enjoys very large privileges. In the cathedral is said to be laid up an immense treasure, offered by the votaries of St. Adelbert, whose tomb stands in the middle of the church. It was plated over with silver by king Sigismund the Third. The gates of this church are all of Corinthian brass, finely wrought.

The principal towns of the palatinate of Kalish, are Kalish, the same name as the palatinate itself, situated on the river Profna, about forty miles to the southward of Pornan. It is defended only with a single brick wall, and some low towers. Here are some religious houses, a magnificent jesuits college, and some ruins of an old castle.

The other chief city of Kalish is Kolo, situated near the Wasta, about thirty miles to the eastward of Pornan; the town is built with timber, &c. surrounded with a mud wall.

The chief town of the palatinate of Sciadia bears the same name, and is situated on the Vasta, about fourteen miles to the southward of Pornan: it is defended by a strong castle and wall.

Rava, the principal town of the palatinate of that name, is situated in a plain on the river Rava, about fifty miles south-west of Warsaw. It is mostly built

of wood, and is defended by a castle, where state prisoners are usually kept.

Lavitzin, in the palatinate of Rava, is situated about twenty miles from Rava, where the primate of Poland has a noble palace. The church is a beautiful structure; besides which here are several considerable abbeys and monasteries.

Lancinia, the palatinate and city of the same name, is situated on the river Bfura, about fifty miles north-west of Rava. It stands on a plain, and is defended by a castle built upon a rock.

Uladislaw is the chief town of the palatinate of Bresty, and is situated about sixty miles to the eastward of Guesna. It is the residence of the archbishop of Cujavia, and hath a cathedral, built after the Gothic manner.

Cruswick is the principal town in the palatinate of Inavlooz, in the territory of Cujavia. It is situated near the lake of Goplo, and is accounted the most antient city in Poland, next to Grusna.

There are three palatinates in the province of Lesser Poland. In the palatinate of Cracow, the chief towns are Cracow, the metropolis of the kingdom, situated in a spacious plain, near the Vistula. It is the largest and best built town in Poland; the houses are of free-stone, the streets broad, and the public buildings magnificent. It is divided into four quarters, viz. Cracow, properly so called, which is surrounded by a high wall, and defended by a noble castle, founded on a rock, on the banks of the Vistula. Here stands the king's palace on a hill, affording a most delightful prospect over the neighbouring country: and here is the famous cathedral of Stanislaus, whose tomb brought immense riches to that church. Here the kings of Poland are usually crowned and buried. The quarter of Casimir lies on the further side of the river, and is joined to the rest of the town by a wooden bridge. The other two quarters of Shadomia and Cleparia lie on the banks of the Vistula, between Cracow and the abovesaid bridge. Besides the cathedral, there are fifty parish churches in the town and castle; the most celebrated is that dedicated to the Virgin Mary. In this city also is an university, begun by Casimir the Great, and finished about the year 1401, and contains eleven colleges. Here are also fourteen grammar-schools; all which colleges and schools are under the government of a rector: and very few persons are advanced, either in church or state, who have not received their education here.

This city is supposed to have taken its name from Cracus, or Gracchus, one of the first dukes of Poland, descended from the family of the Gracchi in Rome, at least, if we can give any credit to Polish historians. It was made an archbishop's see at the first planting of Christianity here; but upon some difference with the pope, it was removed to Grusna: however, this city is still the see of a bishop, suffragan to the archbishop of Grusna; here the supreme court of judicature is held, and in the castle the crown and regalia are kept.

The city of Ofwieczin is the capital of a duchy of the same name, and is seven Polish miles from Cracow. This city is built of timber, as most of the rest are, and hath a wooden castle.

Zator is also the capital of a duchy of that name; is built of wood, and stands in a plain near the river Vistula, about five Polish miles from Cracow.

The city of Severia is the capital of a large duchy, to which it communicates its name, and is defended by a strong castle, situated in the middle of a lake.

Czentochova, near which is a monastery, is famous for having a picture of the blessed virgin, said to be drawn by St. Luke, which occasions the resort of a multitude of pilgrims, with the richest offerings. Here the traveller is shewn large quantities of gold and silver plate ornaments for the altars, and habits enriched with pearls and precious stones, the gifts of the Polish nobility. The monks pretend that many miracles have been wrought here; they are possessed

possessed of a large territory about their monastery, and have a garrison of three hundred soldiers in it. This may be compared to Loretto, both for its wealth, and the superstition of its votaries. In this palatinate are also several cities, towns, palaces, and religious houses, besides those already mentioned.

Sindomir is the second palatinate in the Lesser Poland; the chief city is called Sendomir, which is pleasantly situated on the side of a little hill, on the banks of the Vistula, and is much frequented on account of the courts of judicature being held here. It lies thirty-two Polish miles south of Warsaw, and twenty-eight east of Cracow. It is defended by a strong wall and castle, besides other regular fortifications.

The city of Zawichost is built with wood on the river Vistula. It is defended by a castle with a double wall.

Lublin is the third palatinate of Lesser Poland; the chief city bears the same name, and is situated on a river, about fifty-eight miles to the northward of Sendomir. It is a small well-built town, and is defended by a castle, and is much frequented by Turkish, German, Muscovite and Armenian merchants. The Jews inhabit the suburbs, where they have a synagogue. Here are two courts of justice annually held, which occasions a large number of the gentry to assemble at this place. The other towns of this palatinate are not worthy notice.

The duchy of Lithuania is another province of Poland, though it may rather be called an independent state, in alliance with Poland, than a province belonging to it. It is governed by its own laws and officers, though united under one sovereign, or head, of the two nations, and having one representative body of the whole.

Wilna is a palatinate of this duchy, which joins to Samogitia: the chief towns are Wilna, or Valenski, situated on the confluence of the rivers Wilia and Wilna. It is a large, populous, and trading city, the capital of all Lithuania, and a bishop's see. The public buildings are magnificent; amongst them are the palace of the ancient duke, and the castle: The cathedral, and many of the churches and monasteries, as well as the colleges belonging to the universities, are built of stone; but the private houses are of wood, and make but a mean appearance. The university was founded in 1579. The cathedral stands within the castle, wherein is interred the body of St. Casimir, having a large silver tomb, of great value, built over it.

In this city is held the grand tribunal for Lithuania. The Muscovites made themselves masters of Wilna in the year 1655, but were immediately obliged to restore it to the Poles, who have remained masters of it ever since.

The city of Wilkomirz is situated on the river Seviara, and is about thirty-five miles north-west of Wilna, to which belongs a very large district, wherein are several considerable towns belonging to the crown, the bishops and nobility.

Braclaw is the second palatinate in the duchy of Lithuania; it lies north-east of Wilna, on the confines of Courland. Braclaw is the principal town, which is built of wood, and is situated on the sides of a large lake, being defended by a castle built upon a rock.

To the eastward of Braclaw lies the palatinate of Polorsko, which joins to Muscovy. The chief town is Polooz, situated on the river Dwina, and is about a hundred miles east of Braclaw. This place was in the possession of the Muscovites in the year 1579, when it was recovered from them by Stephen Botori, king of Poland. It has frequently been taken and retaken since that time, but it is now in possession of the Poles.

Witepsk is another palatinate of Lithuania, and lies to the eastward of Wilna. The chief towns are Witepsko, situated on the Dwina, about fifty miles east of Polorsko. This is a frontier town towards

Russia, and has usually a good garrison of soldiers in it. Mofrilow is another large town of this palatinate, where the Muscovites bring fur and other merchandize to trade with the Poles.

The principal town of the palatinate of Troki bears the same name, and is situated on a point of land that shoots out into a lake, and is surrounded by inaccessible marshes, about twenty miles west of the city of Wilna.

Grodno is situated to the southward of Troki, on the river Niemer, over which there is a fine bridge, esteemed the best in Poland. Here is a college belonging to the jesuits. The town is meanly built, but the inhabitants carry on a considerable trade.

Minski is another palatinate of this duchy; the chief town, of the same name, is situated in a marsh, about fourscore miles from Wilna, and is defended by a double wall and two castles.

The palatinate of Muilaw lies to the eastward of Minski, and is bounded by the Nieper, which separates it from Muscovy towards the east. The chief town is Muilaw, which is built with timber, and is situated on the river Sofa, about a hundred and fifty miles east of Minski. The town is a frontier against Russia, and has usually a pretty good garrison of soldiers.

The palatinate of Novogrodeck lies to the south-west of Lithuania, having Troki on the north, and Trienski to the east. The chief town is Novogrodeck, a large city built with timber, it is situated on the river Niemer, and is sixty miles south of Wilna. In this city and Trienski, the diet of Lithuania is alternately held.

The province of Prussia is bounded by the Baltic-sea on the north, by Lithuania, and Lomogitia on the east; by proper Poland and Warsovia towards the south, and by Pomerania towards the west. It is divided into Regal and Ducal Prussia; Regal Prussia takes up the western part, and is subject to Poland, and Ducal Prussia the eastern part, and is subject to the elector of Brandenburg, whose father some years since assumed the title of king of Prussia, from the eastern part of this country under his dominion, and was recognized as king by the rest of the European powers.

Regal Prussia is divided into three palatinates, viz. Pomerania, Culm, and Marienburgh.

Pomerania is situated on the left side of the river Wesel or Vistula; Dantzick is the principal town, which was but a village in the year 1295, when king Primislaus made great additions to it, and cast it into the form of a city, and in 1343 it was walked round by the knights of the Teutonic order. Two rivulets pass through the town, supplying it with water, and turning abundance of mills. The houses are well built of stone, or brick, six or seven stories high; and the granaries, wherein vast quantities of corn are deposited, are still higher, to which the shipping may lie close and take in their loading. The public buildings, which are very magnificent, are the great church of St. Mary's, the town-house, the arsenal, the place of St. Dominick, the exchange, and jesuits college.

This city hath undergone many revolutions. The Danes, the Poles, and the knights of the Teutonic order, were successively masters of it. In 1454, John Casimir, king of Poland, gained the possession of it, and granted many privileges to the citizens, who, notwithstanding, in defence of the Augsburg confession, took the part of Maximilian, of Austria, against the Poles; whereupon they were besieged by Stephen, king of Poland, but, by the mediation of neutral princes, were restored to their religion and liberties. This city is under the protection of Poland at this day, but governed by their own magistrates, who determine all criminal causes finally, and all civil causes, not exceeding a thousand livres, and levy taxes on the inhabitants; one half of the customs only, and the profits of some mills belonging to the crown.

The inhabitants are computed at two hundred thou-

thousand, most part of them are Germans, and their jurisdiction extends forty miles round the city. They send two representatives to the diet of Poland, and are permitted to coin their own money, with the effigies of the king on one side, and the arms of the city on the reverse. They maintain a garrison at their own expence, but have no fleet; though here are abundance of merchant ships of considerable burthen. They trade to all the countries in Europe, except the East and West Indies. The established religion is Lutheran; but papists, anabaptists, and calvinists, are tolerated among them.

The magistracy of Dantzick consists of thirty senators, among whom are several merchants and gentlemen of the long robe: none of the clergy but Lutherans are admitted into this body, except four Calvinists. The senators continue for life; the first four of them are styled burgo-masters, out of whom a president is annually chosen: next to these are thirteen consuls, who choose the said burgo-masters out of their body as often as there is a vacancy, and elect all other officers of the city.

Though this city is under the protection of Poland, it has been frequently necessitated to apply to other powers to defend it against the insults of potent neighbours; and particularly against the Swedes, who knowing it to be a wealthy city, either fined, or made some pretence to extort sums of money from them, particularly in the year 1706; the English, the Dutch, and the king of Prussia, entered into an alliance for their protection.

The abbey of Oliva stands to the north-east of Dantzick, which is famous for the peace concluded there, in the year 1660, between the king of Sweden, on the one part; and the emperor, the king of Poland, and the elector of Brandenburg on the other.

The palatinate of Culm lies on the eastern side of the Vistula, between that river and the province of Great Poland. The chief town is Culm, which is situated on a hill near the banks of the Vistula, about fifty miles south of Dantzick. It was once a famous city, and a bishop's see; but having suffered much by the ravages of war, the bishoprick was removed to Culingue, a small town, about twelve miles to the south-east of it.

The city of Thorn is situated on the Vistula, twenty miles south of Culm. This city is said to be the best built of any in Royal Prussia, the houses being more magnificent, and the streets broader than at Dantzick, and the town-house only to be exceeded by that of Amsterdam; here is also a small university: but nothing has rendered this town more famous than the late contests between the papists and the protestants, in which most of the protestants interposed in favour of their brethren, but at last left them unaccountably to the mercy of their enemies. It has been frequently taken and retaken by the Poles and Swedes. The last time the Swedes made themselves masters of it was in 1703; but the Poles took possession of it again on the king of Sweden's misfortune at Pultowa, the fortifications having been first demolished by that prince.

The third palatinate of Regal Prussia is Marienburgh; the chief town is of the same name, and is situated on the Nogat, which is a branch of the Vistula, twenty-five miles south-east of Dantzick, and about twenty south-west of Elbing. It was antiently the chief city of the Teutonic knights, founded by the cross-bearer of that order, and is said to have taken its name from a miraculous image of the Virgin Mary. It is now but meanly built with wood, and does not abound in wealth.

The situation of Elbing is very pleasant; it is populous, and is divided into the old and new town: a considerable trade is carried on here. It was antiently a free Imperial city, after which, the knights of the Teutonic order gained the dominion of it. When Dantzick and Thorn submitted to Poland, it followed their example. It hath been more than once taken by the Swedes, and retaken by the Poles.

The territory of Warmia is in this part of Polish Prussia; some geographers call it the fourth palatinate. The gentry here are exempt from the regal jurisdiction, and are governed by their bishop, who is a prince of the empire.

Ducal or Brandenburg Prussia, is that from whence the present king of Prussia takes his title as duke of Brandenburg. Its chief towns are Koningberg, situated at the mouth of the river Pregel, and is the capital of the province: it is a large well built populous city, and is a place of good trade. Here is a cathedral, and an university founded by duke Albert. Memel, another town in Ducal Prussia, is situated on a fresh water bay, and has a convenient harbour; the said bay having communication with the Baltic, near the city. It is defended by a castle, and the situation is naturally strong, being surrounded by lakes and marshes. The other towns in Ducal Prussia are Pillaw and Heligfreil.

The provinces of Samogitia and Courland come next to be described. Samogitia contains two towns, viz. Roscine, which is a small one, and situated on the river Dubissa, about four score miles north-east of Koningberg and Midnith, or Vormatia, which is the seat of the bishop of Samogitia.

The territory of Courland is bounded by the river Dwina: it is in length about a hundred and fifty miles, but in breadth no more than thirty. This country is at present under the dominion of its own duke, who pays homage to the king of Poland. Goldingen is situated on the river Wetaw, about thirty miles from the Baltic. Windaw is situated at the mouth of the river Wetan, near the Baltic. Mittaw is the capital of the whole duchy, and the residence of the duke of Courland. It is defended by a magnificent castle, but the town is meanly built.

Warsaw is the chief city of the province of Mazovia. It is esteemed by some to be the metropolis of the kingdom, because it is the residence of the court, and the place where the grand diet assembles; but Cracow also claims the honour of being the capital of Poland, as hath been already observed. Warsaw is situated on the Vistula. The public buildings are a square palace, in which the king resides. Opposite to it, on the other side the river, is another palace, where the diet of Poland used to sit: there is a third palace, built by king Casimir; and about a league from this city is a fourth, built by king John Sobieski. The other public buildings are the church of St. John the Baptist, the arsenal, and the castle.

The city of Warsaw was almost consumed by a fire, which happened in the year 1708, and lasted nine days. In the neighbouring plains, the nobility meet, and reside in tents, at the election of a new king.

Czenko is situated on the Vistula, thirty miles south of Warsaw, and is remarkable only for being the residence of the palatine.

Polachia is a small territory, situated between Mazovia and Lithuania. The chief town is Bielk, which is defended by a strong castle.

Polisca is bounded by Lithuania and Polachia on the north, by Volhinia on the east, by Red Russia towards the south, and by the Lesser Poland on the west; is about two hundred miles in length, and sixty in breadth. The chief town is Breste, which is situated on the river Bug, an hundred miles to the eastward of Warsaw, and is defended by a castle built on a rock.

Red Russia, or Little Russia as it is sometimes called, to distinguish it from Muscovy, or Great Russia, is about two hundred miles long, and one hundred broad; it was antiently much larger, and comprehended all Volhinia and Podolia. This province is divided into three palatinates, viz. Chelm, Belez, and Limberg.

In the northern part of this province is the palatinate of Chelm; its chief town bears the same name. It was formerly a bishop's see, but having been nearly destroyed by the Tartars, the bishop's seat was removed

moved to Kranistow, about twenty miles to the southward of it.

The palatinate of Belz lies to the southward of Chelm. The chief town is Belz, situated in a morass, about fifty miles to the southward of Chelm.

Of the three provinces, Limberg is the most southern, the chief city bears the same name; it is the capital of all Red Russia, and the see of an archbishop. It is situated on the river Poltow, which falls into the Berg, and is about a hundred and fifty miles distance from Cracow to the eastward.

The chief town in the upper part of the province of Podolia is Caminieck, which is a bishop's see, the capital of Podolia, and a palatinate. It is a well built populous city, surrounded by rocks, and fortified by art, and is defended by a castle. The Turks made themselves masters of it in the year 1762, and held it till the peace of Charlovitz, in the year 1699, when it was restored to the Poles.

Braclaw is the chief town of the Lower Podolia, and is the capital of a palatinate. This town has been very much plundered by the Tartars, and is not in a flourishing condition, though few places would be more fruitful if the lands were cultivated.

The Higher Volhinia has Lucko for its principal town, which, indeed, is the capital of all Volhinia: the city is large, and an episcopal see, subject to the archbishop of Goruna. Lower Volhinia is divided into two parts by the river Nieper: its principal city is Kiow.

The Polish nation is very remarkable for vivacity of spirit, long life, and strength of body: they are generally open hearted and honest, more apt to be deceived than to deceive, and are not so easily provoked as appeared: they are courteous and hospitable to strangers, and will frequently invite them to reside at their houses. They apply themselves early to letters, but having acquired a perfect knowledge of their own and the Latin tongue, they think this sufficient. It is said that there is no place in the world where they speak Latin so well, even the women, as they do in Poland. The nobility and gentry are fond of warlike employments, and are great travellers. They endeavour also to qualify themselves for employments in church and state, leaving trade and husbandry entirely to the common people. They are so enured to hardships, that they look even upon the Germans as an effeminate people, and their armies have been known to lie abroad in the snow. The soldiers want discipline, otherwise they would be invincible.

The inhabitants of Poland are very fond of making a great figure, and entertaining a number of servants, horses, and arms, for that purpose. Their persons are rather tall and bulky, their complexions fair, and their hair usually a pale yellow: their constitutions are good, and their looks healthful. They cut the hair of their heads short, and shave their beards, leaving only a large whisker on each lip; their mien is stately, and their countenances grave. They carry a pole-ax, a sabre, and a cutlass, by their sides, which they never put off but when they go to bed. They wear a vest which reaches down to the middle of the leg, and a kind of gown over it, lined with furs, and girded with a sash: the sleeves of it are close, like those of a waistcoat. They wear a fur cap on their heads, but no neckcloth. Under their vests they wear a shirt, made almost like a woman's shift, without collar or ribbands. Their breeches are wide, and made but of one piece with their stockings. Instead of shoes, they always wear Turkey leather boots, both abroad and at home, with thin soles, and deep iron heels like a half moon. When they appear on horseback, they wear over all a short cloak, which is generally covered with furs both within and without. The people of quality wear fables, and others the skins of tygers, leopards, &c. The peasants usually wear a sheep-skin with the wool on in winter; and in summer, a thick coarse cloth; and their shoes and buskins are made with the bark of trees: they wear no linen at all.

The habits of the Polish women resembled the men in a great measure formerly, but now those of quality copy the French and Germans in their dress. Both men and women are very extravagant; they have very large wardrobes, and will have their servants dressed nearly as well as themselves; on which account they sometimes spend their estates, and are reduced to great wants. This prodigality is not confined to their habits, their buildings, furniture, &c. partake of the same profusion.

The Polish houses consist chiefly of ground floors, and they seldom live above stairs; neither are their buildings united, but the dwelling-house is over-against the gate, the kitchen and offices on one side, and a round or square court, and the stables, on the other. It has been the fashion, of late years, to build with brick or stone; but formerly all the private, and some of the public buildings, were of timber.

The rooms are usually hung with tapestry, and the rest of the furniture is proportionably rich, except where they are liable to the incursions of the Tartars, and there they have as little furniture as possible.

The Polish gentry have seldom any gardens or orchards to their houses, though the soil is extremely fit for them; but there are bagnios in every house, and stoves, the women having theirs separate from those of the men. There are also public baths in every Polish town for the use of the common people, to the use of which, their constant health is very much imputed: they bathe every day. The huts of the peasants are built with poles, in a circular form, and are open on the top to let out the smoke; they are covered with boards or thatch, and, as they generally consist of only one apartment, the people and their cattle sleep together.

The principal nobility and gentry of Poland have their horse and foot-guards, whom they keep, night and day, at the gates of their houses: these generally go before their coaches in the streets. But the most considerable figure they make is at the general diet, or assembly of the states; where some of them have from five hundred to a thousand guards to attend them. They esteem themselves not only equal, but superior to German princes, especially such of them as are senators; and indeed they want little to distinguish them from sovereigns in their respective districts, except the privilege of coining money.

When they sit down to dinner or supper, they have their trumpets and music playing, and a great number of gentlemen to wait on them at table, who all serve in their different offices with the most profound respect; for though all the gentlemen of Poland are said to be on a footing, as having votes in the diet, yet wealth will even create a distinction; and the inferior gentry here often find themselves under a necessity of serving the rich who can maintain them. Indeed, the patron they serve is usually very civil to them, and permits the eldest to eat with him at table with his hat off, and every one of them hath his servant to wait on him.

Venison, wild fowl, and river fish (for they have no sea fish), they have in plenty; but the Poland beef, veal, or mutton, is not in any esteem. They eat but little bread, though there is plenty of corn, as they prefer roots to it, which they dress in different ways: soup and broth are not much admired. They are immoderately fond of pork, bacon, and peas.

They have very large quantities of plate in their houses, which they exhibit at feasts. Those who are invited bring their servants with them, and it is no uncommon thing to see a gentleman give his servant part of his meat, which he eats as he stands behind him, and to let him drink out of the same cup with him. Though there is usually great plenty of provision served up, there is very little returned to the family, but the gentlemen's servants seize what is left: they generally have a napkin, on purpose to carry off the sweet-meats for their ladies.

After the cloth is taken away, and the ladies are retired,

tired, the gentlemen usually sit and drink, and smoke a great while. Bumpers are pretty much in fashion, nor will they easily excuse any person from pledging them.

In Poland, they make their beer of ground wheat, which is their common drink. They import great quantities of wines from other countries.

The inhabitants of this country never eat any salted meat; it is generally roasted, and is very fresh. Their drink is spirituous and strong, and they use themselves and their children very hardily. They will sleep upon the ground without a bed, in frost and snow; and carry about their young infants naked, in their arms, in the severest weather: they take a great deal of exercise. The confirmed health of these people is astonishing, their vigour equally so, which may possibly be augmented from these circumstances, added to their great freedom and privileges. Musick and conversation, which they are very fond of, may likewise have a good effect upon them. Morose, and melancholy tempers generally prey upon their unhappy possessors, and are often conducive to their want of health and strength.

The Polish gentlemen generally ride on horseback, but as it is an open country, they frequently drive a pair of horses in a calash, especially on journies. There are very few inns upon the road, but boarded booths are built at proper distances, without furniture, where the traveller is at liberty to lodge. The keeper of the booth is obliged to find straw for his guests. Travellers usually carry their provisions with them. Travelling is rather dangerous, on account of the many waters which it is necessary to pass. The cold, in winter, is very intense, especially in the northern parts, on which account travellers are usually provided with cases, lined with fur, to put their feet in; and the horsemen line their boots, and seldom travel without a cordial. Their noses are also said to be in some danger of being frozen; the remedy they use is to rub them with snow.

A very great quantity of corn grows in Poland, more than in any other kingdom in Europe, particularly of rye and wheat, which the Hollanders import in large quantities. The river Weisel or Vistula runs quite across the kingdom, from south to north, and makes the shipping the corn very convenient: it is carried down that stream in barges to Dantzick, where they keep large granaries by the water-side.

The most common way of manuring their ground is by burning it. When the heart of a fine piece of land is worn out, they take the same method with another, being under no necessity of ploughing the same continually, very large plains lying uncultivated. Their ploughs are very much like ours, but in some provinces are made entirely of wood, without any iron work about them; and when one of their governors obliged them to fortify their ploughs with iron as other people do, there happening to be an unseasonable time, and a bad crop after it, they could never be persuaded to strengthen them with iron again, but chose to let their land lie fallow, than be put out of their old way.

They fatten a great number of black cattle in Poland, and send them into Germany. They have also a good breed of horses.

The exports of Poland consist of wheat, rye, barley, oats, pulse, and generally of all kinds of grain. Oxen, sheep, horses, hogs, hemp, flax, linen, hops, hides, tallow, leather, furs brought out of Muscovy and dressed here, Polish furs, honey, wax, timber, pot ashes, pitch, masts, planks, salt, beer, vitriol, nitre, lead, iron, copper, glass, pit-coal, earthen ware, and wool, the last of which there is great plenty of, and tolerably good.

The Poles import cloth, silk tapestries, rich furs, jewels, gold, and silver, wines, spices, salt fish, fruit, and tin; and notwithstanding their exports are large and valuable, their imports far exceed them, and the balance of trade is vastly against them, for which several reasons are assigned. The following are not in-

considerable, viz. Their gentry, or men of fortunes never interfere in trade or merchandize, except it is in Prussia; on the contrary, they spend their whole revenues in rich habits, furniture, splendid equipages, and a profuse way of living. They want the advantage of the sea for foreign traffick, and have only Dantzick, and another port or two, in all this large country. The Tartars lying between them and Turkey, renders all traffick on that side very hazardous, and precarious. They have very few manufactures, and those they have are not much improved. Linen, leather, hard-ware and earthen-ware, compose the whole list of their manufactures.

In Poland, there is no distinction between nobility and gentry, nor are there any degrees of nobility as in other countries: neither the king, nor republic confer any titles of honour; nor is there any difference made between them, but what their officers, employments, or greatness of their estates create. A noble Pole despises the highest title that can be conferred by foreign princes. Every Polish gentleman is a petty sovereign in his own lands. His tenants, or subjects, as he calls them, are under the jurisdiction of such officers as he shall appoint. It is but in some few cases that the superior courts take cognizance of any offences committed within their districts. If the gentleman kills one of his tenants, he is liable to a fine; or if he ravishes a tenant's wife, or daughter, the family are enfranchised by that means, and he loses their service.

Notwithstanding the common people of Poland are subject to many oppressions, and are looked upon as in a miserable condition, they live in great plenty. Their landlords leave them enough to maintain their families, and the peasants are not reduced to that distress which some of our cottagers are.

The forces of Poland, though formerly very considerable, are now much reduced, and seldom exceed forty thousand men. The army consist chiefly of horse. That body called the hussars, amount to about fifteen hundred, who are inclosed in armour from head to foot; their weapons are pistols, lances, and sabres. Another body, called *Tovanyz*, have no other armour but a breast-plate, helmet, and gorget; their weapons are carbines, bows, arrows, and sabres; both these bodies are picked men, and adorn their heads with the feathers of ostriches, cranes, turkies, &c. covering their armour with the skins of tygers, bears, or leopards, and look very terrible in the field. The Polish foot are very contemptible, and serve rather for pioneers, and other drudgeries in the army, than to encounter the enemy.

The fortified towns in Poland are very few, so that they do not much trouble themselves about a train of artillery, and have scarce an engineer in the country. When they have occasion for cannon, they are brought from some neighbouring city, and they are obliged to German engineers to manage them. The only fortification they have on the side of Turkey is *Caninieck*, and this does not seem capable of any long siege. The other fortified towns are not worth naming. The Poles are so far from looking upon it as a disadvantage to be thus destitute of fortified towns, that they impute the preservation of their country and liberties chiefly to the want of them. It is true, they have been subject to the incursions of their enemies, and one part or other of the kingdom has been overrun by them, but they have been forced to retire as suddenly as they advanced, meeting with no fortresses where they might fix themselves, and have never been able to maintain their ground in this country for many hundreds of years past, but the Poles yet remain an unconquered people.

In Poland, the established religion is the Roman catholic, and they are very zealous and bigotted. Neither the regular nor secular clergy are admirable for their morals. The laity are in general devout, and generous in their benefactions to the churches and altars of the saints; but they are not very compassionate towards the distressed and poor, suffering frequently

quently their own slaves and menial servants to perish for want of necessaries; and they behave towards their unhappy wretches as if they were of another species.

Having given this compleat history of Poland, we shall proceed to give the reader as complete a one of the Netherlands, including the United Provinces, and conclude our description of Europe by a particular history of Great Britain and Ireland, with their adjacent islands.

The Low countries, or Netherlands, were so denominated from their low situation at the mouths of several great rivers, viz. the Maese, the Rhine, the Scheld, &c. lying between 2 and 7 degrees of east longitude, and 49 and 54 degrees of north latitude. They are about three hundred miles in length, and two hundred in breadth.

The Netherlands were antiently part of Gallia, Belgica, and afterwards constituted part of the circle of Burgundy, and consist at present of seventeen provinces. The seven northern provinces revolted from the Spaniards, and entered into a treaty of union for their mutual defence in the year 1579, at Utrecht, and obtained the name of the seven United Provinces; the greatest part of the other ten, being subject to the house of Austria, are called the Austrian Netherlands.

The Austrian or French Netherlands consist of ten provinces, viz. Brabant, Antwerp, Mechlin or Malines, Limburg, Luxemburg, Namur, Hainault, the Cambresis, Astori, and Flanders.

These provinces are very fruitful, and produce good corn and pasture, and their gravelly light lands are now as valuable as the rich heavy ground, by the improvements they have made, with sown grafs, turnips, &c. but chiefly by the implantation of flax and hemp; their manufactures of linen and lace are brought to great perfection, viz. their lawns, cambrick, Mechlin and Brussels lace; their tapestry is very rich, and they have still a good woollen manufacture, particularly light stuffs and camblets.

The face of the country is generally flat, especially Flanders, where there is scarce a hill, or stone to be met with. The richest land lies between Dunkirk and Bruges, extending forty miles in length, abounding in wheat, barley, and good meadow and pasture land; but between Bruges and Ghent, and Ghent and Antwerp, is a gravelly or sandy soil; and that part of Brabant which lies between Antwerp and Holland, is equally unfit for corn, but enriched with plantations of flax, hemp, and hops. The rest of the Austrian Netherlands consist of little hills and villages, woods, inclosed grounds and open fields, not unlike England.

Their numerous rivers and navigable canals are very advantageous to them, and make the carriage of goods from one part of the country to the other very reasonable.

The woollen manufacture was very considerable in this part of the world, while Bruges was the market for English wool; and the foreign trade of Antwerp exceeded that of any part of Europe, until the Dutch built forts at the mouth of the Scheld, and turned the current trade to Holland. No country has more considerable towns, or better fortifications. It was the seat of war for near two hundred years past; the French, Spaniards, and their allies, perpetually contending for this rich country.

The government of the respective provinces is vested in the sovereign, and the states of each province, which consist of the bishop, abbots, and dignified clergy; of the nobility and gentry, and the burgeses of their great towns who meet at Brussels, but assemble in separate houses, and make laws for their respective provinces. The civil and canon laws are in force here, where they do not interfere with the municipal laws of the country.

No foreign forces ought to be introduced into this country, by the antient laws of it; but this is now disregarded both by the Austrians and French, as well as some of the rest of their privileges. By the treaty

of Utrecht, their barrier towns were to be garrisoned by twenty-five thousand Dutch. Popery is the established religion, but it is professed rather moderately; and the inquisition has lost its baneful influence.

The United Netherlands are situated between 3 and 7 deg. of east longitude, and between 51 and 54 deg. of north latitude, bounded by the German or British seas on the west and north, by Westphalia on the east, and by the Austrian Netherlands on the south, and contains seven provinces, viz. Holland Proper, Zeland, Friesland, Groningen, Overysfel, Guilderland, and Utrecht.

The Zeuder sea, which is a large shallow bay, divides this country almost into two parts, and the Dollart bay divides Groningen from East Friesland. This country is a perfect level, and has not a hill on it, but abounds with bogs and marshes. There are several lakes in Holland and West Friesland; indeed one half of the country may be called a lake in the winter, as it lies under water; though in the summer season it affords rich pastures.

Some people imagine, that the United Provinces have, in a great measure, been gained out of the sea, by casting up banks, and draining them. Others are of opinion, that there has been a great deal of them lost by inundations of the sea, and tempestuous seasons; and both these conjectures may be right, for their seas and rivers appear, in many places, to be above the land at the time of high water, and are only kept out by prodigious banks of earth, called dykes. The inundations have been frequent and alarming.

There is scarce a good harbour on this coast, notwithstanding the country is so famous for its trade and shipping: the best are Flushing, Rotterdam, and Helvoetsluys. The harbour of Amsterdam is very incommodious, and is situated in such shallow water, that ships of any burthen cannot come near it unless at high water, and even then they are obliged to unload great part of their cargoes before they can enter. This is particularly inconvenient for a city which has, in a manner, engaged the trade of the whole world.

Holland appears to be entirely cut through with canals, which lead to every town and village, and almost to every farm house. The sight of such a number of sails steering every-where through the land, has an odd effect, and seems to indicate, that there are as many people living upon the water as on the land.

Sir William Temple says, that the air of this country would be a perpetual fog and mist, were it not for the severe frosts which purify it, and never fail to visit them with every east wind, for almost four months in the year. Though this is necessary for their health, it is a disadvantage to their trade and commerce, for their harbours are frequently shut up in winter for two or three months together.

The spring is much shorter, and less agreeable, in the United Provinces, than in England, the winter colder, and some part of the summer much hotter; nor is it uncommon for the violence of the one to give way to that of the other, without any intermediate temperate season.

Were it not for the neatness and cleanliness of their houses and streets, their country would scarce be habitable; the air would corrupt every hot season, and expose the natives to infectious distempers, which indeed they seldom escape three summers together, especially at Leyden, where the waters stagnate more than they do in any other part of the country.

The gout and scurvy are the chief disorders of this country; but they are often visited with malignant fevers at Amsterdam and Leyden, which lie mostly in the head, and frequently occasion sudden death. If the patient recovers, he continues a long while in a languishing condition. The plague is seldom known here, at least all conversation about it is suppressed; and no distinction is made, as with us, what distemper any person dies of. Long life is a blessing seldom known in this country; both men and women begin

to decay very early. Sir William Temple remarks, as an uncommon thing, that he had seen at the Hague, which is the most healthy part of Holland, two men above seventy. This shortness of life may possibly proceed from their diet, and want of exercise, as well as the badness of the air; for dried and salted flesh and fish are their usual food, and strong liquors are commonly drank. They scarce know what the usual sports mean, neither do they ride on horseback, or walk from one town to the other about business, but are drawn along in a boat by a horse on a smooth canal, which scarcely affords any motion. They are, in general, corpulent, and full of gross humours, which may be attributed to these causes.

The city of Amsterdam is the capital of Holland, and the metropolis of the seven United Provinces. The foundation of this city is laid upon several thousand piles of vast timbers, driven in with infinite labour and expence; the ground on which it is built was formerly a bog. It is secured by the Wye towards the sea, and by bastions and outworks towards the land. The principal streets are wide, and the canals, planted on each side with trees, run through them. The other streets are very narrow. They are so careful of their pavement, that all goods and merchandize are drawn upon sledges, and no wheel carriages are suffered but gentlemens coaches, for which privilege they pay a large tax. The hired coaches are set on sledges, and drawn by one horse. The harbour is spacious, containing great numbers of ships, but, as we said before, is very inconvenient.

Amsterdam is supposed to be about one-third as large as London, and contains between three and four hundred thousand inhabitants. The private houses are well built with brick; their churches are handsome, but not comparable with those in Roman catholic countries.

Eleven Calvinistic churches are built at Amsterdam, which is the established religion here. Here are likewise one English, two German, and two French churches. The Roman catholics have about thirty places where they worship; some of them are chapels, and the rest of them are apartments in private houses. The Lutherans, Anabaptists, and Jews, have also their meeting-houses; and indeed all sects are tolerated, but no churches have bells, except the Calvinistic.

The exchange at Amsterdam is a magnificent building, but not equal to that of London, either in its architecture or ornaments. The stadthouse is still more magnificent, and is said to have cost near three hundred thousand pounds in building; but this expence was considerably augmented by the driving upwards of twelve thousand large piles, or rather trees, into the bog, to lay the foundation on. Here they hold their courts of justice, and the officers and ministers of state have apartments. Here the vast treasure of the state is lodged, which is supposed to be the richest in the world, and is guarded every night by a body of the burghers, whom they chuse to intrust with the care of it, rather than to mercenary soldiers: this treasure is computed to contain three hundred tons of gold, or thirty-two millions sterling.

This bank pays no interest, though it receives interest for the sums lent to the East and West India companies; these companies trading, in some measure, for account of the state. The bank lends money, at a low interest, on all kinds of merchandize.

The East-India house is another magnificent structure, and is divided into a great number of apartments and warehouses, where the fine spices lie in heaps, and almost stifle you with their fragrance. The East-India company seems to be an independent state, or rather, the United Provinces are, in a manner, dependent on this company. Their greatest men are members of it; and as the city of Amsterdam is said to influence the province of Holland, so this company influences the government of Amsterdam.

The bridge over the river Amstel is another curi-

osity; it is six hundred and sixty feet long, and seventy broad, and from it there is an admirable prospect. This is esteemed the pleasantest walk about the city, which affords very little pleasure to any but men of business, who continue heaping up wealth to the end of their lives, without any other view than to have it said they died immensely rich. The admiralty and arsenal are good buildings, and justly admired.

There are no soldiers in Amsterdam, the citizens taking the defence upon themselves.

Haerlem is situated about ten miles west of Amsterdam; there is a communication between them by a canal. The principal building is the great church, formerly a cathedral, the largest and most elegant church in Holland. The linen manufacture established here is very considerable; it is known to us by the name of holland. Here are also several manufactures of silk and velvet.

The city of Leyden is about eighteen miles south of Amsterdam, and four miles east of the sea; it has also a communication with that city by a navigable canal. It is one of the neatest and pleasantest towns in Holland, but is very unhealthy, owing, as before observed, to the great quantities of stagnant water. This town is well fortified; but what renders it most secure, is the opportunity they have of overflowing the country, when hard pressed by an enemy.

In this city is the most considerable university in the United Provinces, and was founded by the states in 1575. It is computed, that here are sometimes two thousand students, including foreigners.

There are fine gardens about this city, and their fruits, flowers, and garden-stuff are much admired.

About three leagues south-east of Leyden is the Hague, which is sometimes called a village, because it has no walls; but from its dominions, buildings, and beautiful public walks, it may be deemed equal, if not superior, to any of their cities. It is governed by its own magistrates, and enjoys every privilege in common with other cities, except that of sending a representative to the assembly of the States. Here the states general, and the states of the province of Holland assemble. Here the prince of Orange, the foreign ministers, and other persons of distinction reside. The Hague is so different from other Dutch towns, that strangers can scarcely believe they are in Holland. Here is a French comedy established for the entertainment of persons of distinction.

The city of Delft is pleasantly situated in the meadows, six miles from the Hague. Here are but two churches, in one of which is the tomb of William I. prince of Orange, with his statue of marble upon it, and arches of brass near it. He was shot in this city by Balthazar Gerard, a zealous popish bigot, as he sat at supper. There is the figure of a dog at the feet of the statue, that is said to have died of grief for the loss of his master.

The city of Delft is remarkable for the fine earthen ware manufactured here, but otherwise it has no considerable trade. This city was almost destroyed in the year 1650, by the blowing up of a magazine of powder, but was soon afterwards rebuilt.

Rotterdam is very remarkable for its wealth and traffick; it is situated on the north of the river Maese, upwards of thirty miles south of Amsterdam. Its harbour for shipping is very commodious, ships of burthen coming up to the merchants doors; and the harbour is usually open in winter, when others are frozen; for which reason the English chiefly resort to this port, and many families of that nation are settled here.

Rotterdam is a large, well-built, populous city, and has four churches, besides three for foreigners. Here is one English church, where divine service is performed according to the rites and ceremonies of the church of England; and there is another church, in which the Scotch presbyterians assemble.

The stadthouse, the exchange, the admiralty office,

and the East-India house, are the chief public buildings, besides the churches. The town is pleasantly situated, and from the top of the great church may be seen four cities, and a multitude of other towns and villages. This part of Holland is exceedingly populous.

Dort is situated on the river Maese. The streets are wide, the houses well built, and contain a great number of inhabitants. The British merchants have two churches here, and it is their principal market for cloth. In this city was held that famous synod of Dort, in the year 1619, which met principally at the instigation of king James the First, of Britain, where the Calvinists condemned the Arminians, and established Calvinism, who have had the sole power in the government of the United Provinces ever since. All other denominations of Christians are excluded from the magistracy. The famous bishop Hall was sent over by James, as his representative, in this synod, and he could not have placed the business in better hands.

Gertrudenburg, Goude, and Naarden, have nothing particular to distinguish them.

The town of Williamstadt was built by William the First, prince of Orange. It is situated on the Roovaert, a water which divides the island of Voorn from the continent. Here the English usually embark and disembark their troops. During the wars in Flanders, five thousand English horse were landed here at one time, in the reign of king William, to reinforce the English army in Flanders.

The port town of Helvoetsluys is about five miles south of Brice, and is one of the best harbours in Holland; a first rate man of war may lie close to the keys, in the middle of the town; this is therefore the usual station for their largest ships. The English packet carries the mail thither, and brings another from thence every week, at least, if the wind permits.

In the island of Overflackce the principal town is Somersdyke, which has nothing remarkable to distinguish it.

The chief town of the island of IJlomon bears the same name, and stands almost opposite to Rotterdam.

Samerdam, or Sardam, is situated on that arm of the sea called the Wye, and is about seven miles north-west of Amsterdam. On the opposite shore is the greatest magazine of timber and naval stores in Europe. Several hundred saw-mills are perpetually at work here, and they are constantly employed in sawing plank and timber for shipping, of which they have a great stock always in hand. By this means it is in their power to build a large number of ships in a short time.

Soudam, Hoorn, Enchuyfen, Medemblich, Alemaer, Edam, and Purmer, are the principal towns in the north of Holland, but have nothing particular to distinguish them.

A little to the northward of the continent is the Texel, which is a fruitful island, six miles long, and five broad. The strait between the island and the continent is the principal passage from the ocean to the Zuider sea, through which most ships sail which are bound to Amsterdam. There is a good harbour in the Texel, where the vessels ride secure from enemies as well as storms. It was in this harbour that the arch pirate, Paul Jones, lately took shelter with his prizes; and though frequent demands were made by Sir Joseph Yorke, that he should be given up to the English, on account of the depredations he had made on their coast, the Dutch acted, as they do upon almost all occasions, in an evasive manner; they were not willing to offend the rebellious Americans, with whom they trade considerably, nor their old enemies the French; very well knowing, that the English are not at present in a condition to revenge their bad conduct, nor make them fulfil those treaties which they are bound in honour and conscience to do. Interest is the prevailing motive with the Dutch, and they very readily sacrifice both their

honour and conscience, and even the Saviour himself, if they stand in the way. It is ardently to be wished by every lover of his country, that the day will soon arrive, when the English will be able fully to revenge this base perfidy of Holland; and not only of that state, but of all others, who dare insult her flag, or side with her rebellious subjects.

The province of Zeland is next to be described, which entirely consists of islands, and lies to the south of Holland Proper.

The chief of these islands is Walcheren, which lies at the mouth of the Scheld, and is about nine miles long, and eight broad. The principal town of this island, and indeed of the whole province of Zeland, is Middleburgh, which is a large, rich, and populous city, and has a communication with the sea by a deep canal. It contains twenty churches, of which the new church is the handsomest. The town is surrounded by a wall and bastions. The stadthouse is a magnificent structure.

Zouberg, or Ramekins, is another town in this province; it is a sea port, and was ceded to queen Elizabeth, of England, for security of the money she advanced the Dutch for their defence against the Spaniards; but it is now an inconsiderable place.

The town and harbour of Flushing was likewise ceded to that queen; they are both well defended by forts and batteries. Tervere is also a fortified town and harbour, of which, and Flushing, the princes of Orange are sovereigns, who have so great an influence, that they can appoint what deputy they please to represent the province of Zeland in the assembly of the states general.

Armuyden is another port town in the province; the harbour is now choaked up, and of little use.

The second island in the province of Zeland is called South Beveland; it is about fifteen miles long, and seven broad, and was much larger, till part of it was carried away by an inundation, in the year 1532. The only considerable town in this island is Ter Goes, which is situated on the north part of it; besides which, on this island there are several gentlemens seats, and about thirty villages.

The next islands are North Beveland and Wolferdyke, which have both been much damaged and lessened by inundations of the sea; the other islands, which are Sohorven, Duvelland, and Tolen, have nothing remarkable to treat of.

The third of the United Provinces is Friesland: this province is about forty miles long, and twenty-five broad, and is subdivided into the territories of Ostergo, Westergo, and Sevenwolden.

The chief town of Ostergo is Lewarden. This city is very much admired for its elegant buildings, spacious streets, fine bridges, and the gardens which surround it.

In the city of Frankes, which is a small one, is a university, founded by the states in 1585, and endowed with part of the abbey lands, which were sequestered a little before that time.

A little to the west of Frankes is Harlingen. It is strongly situated, and well fortified, and the avenues to it may be laid under water at the approach of an enemy.

Doceum is a fortified town, situated in a fruitful country, and is remarkable for a lofty bridge, which admits vessels to pass under with their sails standing.

In the south-west part of Friesland is Staveren, which was one of the Hans towns, and anciently the capital city of the kings of the Fisons. Its harbour is now choaked up, and its trade removed to other ports.

The next province is that of Groningen, which is about thirty miles long, and twenty broad. Groningen, the chief town, formerly one of the Hans towns, stands at the confluence of two rivers; it is well fortified, and carries on a considerable trade with Germany.

The city of Dam is large, and well built, but is without fortifications. Winschoten is a fortress near the Dollart Bay, and is situated in a morass.

The province of Overijssel received its name from lying beyond the river Yffel: it is about sixty miles long, and fifty broad.

One of the principal towns of this province is Deventer, which was formerly one of the Hans towns, and is still a town of good trade, and inhabited by people of distinction.

Zevell is situated twenty miles north of Deventer, is a fortified town: the buildings are elegant, and the ramparts are planted with trees.

To the eastward of Zevell is Campen, which is a handsome, well built city, and formerly had a considerable trade, before the mouth of the Yffel was blocked up.

Coverden is situated on the confines of Germany, thirty miles to the east of Zevell; it is a frontier town, and stands in an impassable morass.

The province of Guelderland comprehends Dutch and Prussian Guelderland: Dutch Guelderland is divided into three districts, viz. Velace, Betaee, and Zutphen.

The city of Arnheim is pleasantly situated on the river Lech, in good firm ground, and in a healthy air. The princes of Orange have a palace at Dieren, ten miles from this city; and about twenty miles from hence is Loo, where king William the Third used to reside in the hunting season, which is esteemed one of the most elegant palaces belonging to the house of Orange.

There is a university at Hardwick, which is situated on the coast of the Zuider sea.

The city of Nimeguen is large, populous, and well built. The castle was antiently esteemed a place of strength, and from it is a fine view of the adjacent country. This city is famous for a treaty concluded between the allies of France, in the year 1679, called the peace of Nimeguen.

On the frontier of Germany is a fortress called Skenkenfeans, where the Rhine divides into two branches.

Twenty-five miles west of Nimeguen, Bommel is situated, on an island formed by the Maese and Waal.

The city of Zutphen is situated on the river Yffel; it is a good town, and inhabited by substantial people.

Doel and Groll are good towns, and are situated near Zutphen.

The territories of Cleve separate Prussian from Dutch Guelderland. The city of Guelder is the capital; it is a strong, though small place, in the middle of a morass.

The town of Ruremond is large and populous, well built and fortified. Vento Watchtendenk and Stevenswart belong to Prussian Guelderland.

The province of Utrecht is about thirty miles long and twenty-five broad. The city of Utrecht is large and populous, and pleasantly situated; the air is healthy, and the town is well built; it is the residence of many substantial people. Thirty-five bridges are laid over the two principal canals, which run the whole length of the city. The market-place is in the centre of the town, where several of the capital streets meet. Several beautiful walks are made without the gates of the city. It is not a place of any great strength; it has been taken by, and retaken from the French. The university was founded here by the states in 1636, to which many English dissenters went for education. Perhaps it is here that they gain that prejudice in favour of republican government, which so much prevails in this, otherwise, respectable body of men; though one would think that the arbitrary disposition of the republican government in Holland, as well as in other republics, would induce them to prefer that limited monarchy under which we might so happily live, was it not for such turbulent spirits among us.

Fifteen miles from Utrecht is the city of Amersfort, which is situated in a country abounding in corn and pasture; the natives apply themselves chiefly to husbandry. It is a well built, populous city, about three

miles in circumference; and about four miles to the northward of it is the palace of Suesdyke, a hunting-seat of the late king William's.

Wych de Dueflude and Montfort, are small towns in the province of Utrecht.

In the United Provinces the houses are generally built with brick. Those Dutch towns that have canals running through them, the banks of which are planted with trees, are very pleasant, especially in summer, as they are kept very neat and clean: the pavement is floped, and every shower washes the dirt into the canal. The inside of their houses are remarkably neat and clean. In Holland they use the best and finest linen both for beds and tables. The sides of the rooms are adorned with pictures, and their yards and gardens are filled with flowers: the Dutch are great florists; witness the auriculas, hyacinths, &c. which are brought into this kingdom from thence, and bear so considerable a price.

In cold weather they heat their rooms with stoves, which give an equal heat all over them: a cheerful fire is very seldom seen. The women use small stoves or pans of lighted turf, which they put into a little square box, and place under their feet: these are carried after people of substance upon visits, and even to church, by their servants. It is no uncommon thing for a Dutchman to take one of these stoves from under a girl's feet, and either light his pipe, or blow the coals for her.

The Dutch are of a good stature, but are rather inclined to be corpulent. We need not tell our readers that their mien and deportment is very heavy and aukward; every one who has seen a Dutchman in the streets of London must have observed this; though an opinion of the whole country must not be taken from the sailors who are so numerous here.

The complexions of those who are not exposed too much to the weather are good, and their features are just. The young women are very beautiful, but before they arrive at twenty-five they have, in general, bloated faces; which, probably, proceeds from their making too free with drams.

The French fashions are very much imitated by the better sort of people, but the true Dutch load themselves with an immense quantity of cloaths.

The trading people are remarkably industrious: they make use of all their skill to take advantage of the folly or ignorance of those they deal with, and are great extortioners where there is no law to restrain them; but when they deal with persons equally knowing with themselves, and apprehend that they are within the reach of the laws, then they are the best and plainest dealers in the world.

The education of those who live on their estates, and the merchants and tradesmen, is very different, though there is a great similarity in their dress and parsimonious way of living. When they come from school, they are sent to the universities of Leyden or Utrecht, where they go through the common studies of those places, but apply themselves chiefly to the civil law. When young gentlemen have finished their studies at home, if their relations can afford it, they are sent to England or France. The principal end of their education is to make them useful to the public, with which honour they are very well contented.

The noblesse are not very numerous here, many of those families having been extirpated in the Spanish wars: those who remain are usually employed in the military service, or in embassies to foreign courts. These adopt the dress and manners of the courts they reside at, rather than those of their own country, and esteem themselves very highly on account of their noble descent: they look upon it in a very dishonourable light to marry beneath their rank, and will scarcely do it to repair the injuries of a broken fortune.

The poor are very well provided for, and at Enchuyfen is an excellent hospital for aged seamen, which is intended as a retreat for those who have passed

passed their lives in the hardships and inconveniences of the sea, and it is stored with all the conveniences and satisfaction that old age is capable of enjoying.

As the police of various countries respecting the poor has been a matter of much controversy and variety of opinion, we will subjoin the following sentiments on that subject by Lord Kaimes, who is justly esteemed for his universal knowledge of mankind, and his unbiassed judgment of states and governments. If the account be rather prolix, we trust the reader will be amply gratified by the nice and judicious remarks with which it abounds. He treats of the poor at large of all countries. Vide Sketches of the History of Man, vol. 2. p. 36.

“ Among those nations of Europe where government is a science, that part of public police which concerns the poor makes now a considerable branch of statute law. The poor laws are so multiplied, and so anxiously framed, as to move one to think, that there cannot remain a single person wanting bread. It is, however, a sad truth, that the disease of poverty, instead of being eradicated, has become more and more inveterate; England, in particular, overflows with beggars, though in no other country are the indigent so amply provided for. Some radical defect there must be in those laws, when, after endless attempts to perfect them, they all prove abortive. Every writer, dissatisfied with former plans, fails not to produce one of his own, which, in his turn, meets with as little approbation as any of the foregoing.

“ The first regulation of the states of Holland concerning the poor was in the year 1614, prohibiting all begging. The next was in the year 1649; ‘ It is enacted, that every town, village, or parish, shall maintain its poor out of the income of its charitable foundations and collections; and in case these means fall short, the magistrate shall maintain them at the general expence of the inhabitants, as can most conveniently be done: provided always that the poor be obliged to work, either for merchants, farmers, or others, for reasonable wages, in order that they may, as far as possible, be supported that way; provided, also, that they be indulged in no idleness nor indolence.’ The advice or instruction here given to magistrates is sensible; but falls short greatly of what may be esteemed a law, the execution of which can be enforced in a court of justice.

“ In France, the precarious charities of monasteries proving ineffectual, an hospital was erected in the city of Paris, anno 1656, having different apartments; one for the innocent poor, one for putting vagabonds to hard labour, one for foundlings, and one for the sick and maimed; with certain funds for defraying the expence of each, which produce annually much about the same sum. In imitation of Paris, hospitals of the same kind were erected in every great town of the kingdom.

“ The English began more early to think of their poor; and in a country without industry, the necessity, probably, arose more early. The first English statute bears date in the year 1496, directing, ‘ That every beggar unable to work, shall resort to the hundred where he last dwelt, or was born; and there shall remain, upon pain of being set in the stocks three days and three nights, with only bread and water, and shall then be put out of the town.’ This was a law against vagrants, for the sake of order. There was little occasion, at that period, to provide for the innocent poor; their maintenance being a burden upon monasteries. But monasteries being put down by Henry VIII. there was a statute in the 22d. year of his reign, cap. 12. empowering the justices of every county to grant licences to poor, aged, impotent persons, to beg within a certain district; those who beg without it to be whipt or set in the stocks. In the first year of Edward VI. cap. 3. a statute was made in favour of impotent, maimed, and aged persons, that they shall have convenient houses provided for them, in the cities or towns where they were born, or where they resided for three years, to be relieved

by the willing and charitable disposition of the parishioners. By 2d and 3d Philip and Mary, cap. 5. the former statutes of Henry VIII. and Edward VI. were confirmed, of gathering weekly relief for the poor by charitable collections. ‘ A man licenced to beg, shall wear a badge on his back and breast openly.’

“ The first compulsory statute was 5th Elizab. cap. 5. empowering justices of peace to raise a weekly sum for the poor, by taxing such persons as obstinately refuse to contribute, after repeated admonitions from the pulpit. In the next statute, 14th Elizab. cap. 5. a bolder step was made, empowering justices to tax the inhabitants of every parish in a weekly sum for their poor: and taxations for the poor being now, in some degree, familiar, the remarkable statutes 39th Elizab. cap. 3. and 43d Elizab. cap. 2. were enacted, which make the ground-work of all the subsequent statutes concerning the poor. By these statutes, certain householders, named by the justices, are, in conjunction with the churchwardens, appointed overseers for the poor; and these overseers, with consent of two justices, are empowered to tax the parish in what sums they think proper for maintaining the poor.

“ Among a people so tenacious of liberty as the English are, and so impatient of oppression, is it not surprising to find a law that, without ceremony, subjects individuals to the arbitrary will of men who seldom, either by birth or education, deserve that important trust; and without ever providing any effectual check against embezzlement? At present, a British parliament would reject with scorn such an absurd plan; and yet, being familiarized to it, they never seriously have attempted a repeal. We have been always on the watch to prevent the sovereign’s encroachments, especially with regard to taxes: but as parish officers are low persons, who inspire no dread, we submit to have our pockets picked by them almost without repining. There is provided, it is true, an appeal to the general sessions, for redressing inequalities in taxing the parishioners: but it is no effectual remedy; artful overseers will not over-rate any man so grossly as to make it his interest to complain, considering that these overseers have the poor’s money to defend themselves with. Nor will the general sessions readily listen to a complaint that cannot be verified but with much time and trouble. If the appeal have any effect, it will make a still greater inequality, by relieving men of figure at the expence of their inferiors, who must submit, having little interest to obtain redress.

“ The English plan, besides being very oppressive, is grossly unjust. If it should be reported of some distant nation, that the burden of maintaining the idle and profligate is laid upon the frugal and industrious, who work hard for a maintenance to themselves; what would one think of such a nation? Yet this is literally the case with England. I say more: the plan is not only oppressive and unjust, but miserably defective in the checking of mal-administration. In fact, great sums are levied beyond what the poor receive: it is esteemed a favour to be named a churchwarden; the nomination in London, especially, gives him credit at once, and, however meagre he is at the commencement of his office, he is round and plump before it ends. To wax fat and rich by robbing the poor! Let us turn our eyes from a scene so horrid.

“ Inequality in taxing and embezzlement of the money levied, which are notorious, poison the minds of the people, and impress them with a notion that all taxes raised by public authority are ill managed.

“ Those evils are great, and yet are but slight, compared with what follow. As the number of poor in England, as well as the expence of maintenance, are increasing daily, proprietors of land, in order to be relieved of a burden so grievous, drive the poor out of the parish, and prevent all persons from settling in it who are likely to become a burden: cottages are demolished, and marriages are obstructed. Influenced

by the present evil, they don't look forward to depopulation, nor to the downfall of husbandry and manufactures by the scarcity of hands. Every parish is in a state of war with every other parish, concerning proper settlements and removals.

“ The price of labour is generally the same in the different shires of Scotland, and in the different parishes: a few exceptions are occasioned by the neighbourhood of a great town, or by some extensive manufacture that requires many hands. In Scotland, the price of labour resembles water, which always levels itself; if high in any one corner, an influx of hands brings it down. The price of labour varies in every parish in England. A labourer who has gained a settlement in a parish, on which he depends for bread, when he inclines to be idle, dares not remove to another parish where wages are higher, fearing to be cut out of a settlement altogether. England is in the same condition with respect to labour, that France lately was with respect to corn; which, however plentiful in one province, could not be expected to supply the wants of another. The pernicious effects of the latter with respect to food, are not more obvious than of the former with respect to manufactures.

“ English manufactures still labour under a greater hardship than inequality of wages. In a country where there is no fund for the poor but what nature provides, the labourer must be satisfied with such wages as are customary: he has no resource; for pity is not moved by idleness. In England, the labourers command the market: if not satisfied with customary wages, they have an excellent resource, which is to abandon work altogether, and put themselves on the parish. Labour is much cheaper in France than in England: I have heard several plausible reasons; but in my opinion, the difference arises from the poor laws. In England, every man is entitled to be idle; and every idler is entitled to a maintenance. In France, the sums appropriated to the poor, yield the same sum annually; that sum is always pre-occupied: and France, with respect to all but those on the lists, approaches to the state of a nation that has no fund provided by law for the poor.

“ Depopulation, inequality in the price of labour, and extravagant wages, are deplorable evils. But the English poor laws are productive of evils still more deplorable; they are subversive both of morality and industry: this is a heavy charge, but no less true than heavy. Fear of want is the only effectual motive to industry with the laborious poor; remove that fear, and they cease to be industrious. The ruling passion of those who live by bodily labour, is, to save a pittance for their children, and for supporting themselves in old age: stimulated by a desire of accomplishing these ends, they are frugal and industrious; and the prospect of success is to them a continual feast. Now what worse evil can malice invent against such a man, under colour of friendship, than to secure bread to him and his children whenever he takes a dislike to work? which effectually deadens his sole ambition, and with it his honest industry. Relying on the certainty of a provision against want, he relaxes gradually, till he sinks into idleness: idleness leads to profligacy, profligacy begets diseases, and the wretch becomes an object of public charity before he has run half his course. Such are the glorious effects of the English tax for the poor, under mistaken notions of charity. There never was known, in any country, a scheme for the poor more contradictory to sound policy. Might it not have been foreseen, that, to a groveling creature, who has no sense of honour, and scarce any of shame, the certainty of maintenance would prove an irresistible temptation to idleness and debauchery?

“ The poor house at Lyons contained originally but forty beds, of which twenty only were occupied. The eight hundred beds it contains at present are not sufficient for the poor, who demand admittance. A premium is not more successful in any case than where it is given to promote idleness. A house for the poor was erected in a French village, the revenue of which,

by economy may become considerable. Upon a representation by the curate of the parish, that more beds were necessary, the proprietor undertook the management. He sold the house with the furniture, and to every proper object of charity he ordered a moderate proportion of bread and beef. The poor and sick were more comfortably lodged at home, than formerly in the poor house. And by the plan of management, the parish poor decreased, instead of increasing as at Lyons.

“ How few English manufacturers labour the whole week, if the work of four or five days afford them maintenance! Is not this a demonstration that the malady of idleness is widely spread? In Bristol, the parish poor, twenty years ago, did not exceed four thousand; at present they amount to more than ten thousand. But as a malady, when left to itself, commonly effectuates its own cure; so it will happen in this case: when, by prevailing idleness, every one, without shame, claims parish charity, the burden will become intolerable, and the poor will be left to their shifts.

“ The immoral effects of public charity are not confined to those who depend upon it, but extend to their children. The constant anxiety of a labouring man to provide for his children, endears them to him. Being relieved of that anxiety by the tax for the poor, his affection cools gradually, and he turns at last perfectly indifferent about them. Their independence, on the other hand, weans them from their duty to him. And thus affection between parent and child, which is the corner stone of society, is, in a great measure, obliterated among the labouring poor. In a plan, published by the earl of Hillsborough, there is an article, obliging parents to maintain their indigent children, and children to maintain their indigent parents. Natural affection must indeed be at a low ebb, where such a regulation is necessary; but it is necessary at least in London, where it is common to see men in good business neglecting their aged and diseased parents for no better reason than that the parish is bound to find them bread. *Proh. tempora! proh. mores!**

“ The immoral effects of public charity spread still wider. It fails not to extinguish the virtue of charity amongst the rich; who never think of giving charity when the public undertakes for all. In a scheme, published by Mr. Hay, one article is, to raise a stock for the poor by voluntary contributions, and to make up the deficiency by a parish tax. Will individuals ever contribute, when it is not to relieve the poor, but to relieve the parish? Every hospital has a poor's box, which seldom produces any thing. One exception I am well pleased to mention. The poor box of the Edinburgh infirmary was neglected two or three years, little being expected from it. When opened, upwards of seventy-four pounds were found in it, contributed probably by the lower sort, who were ashamed to give their mite publicly.

“ The great comfort of society is assistance in time of need; and its firmest cement is, the bestowing and receiving kindly offices, especially in distress. Now to unhinge or suspend the exercise of charity, by rendering it unnecessary, relaxes every social virtue by supplanting the chief of them. The consequence is dismal: exercise of benevolence to the distressed is our surest guard against the encroachments of selfishness; if that guard be withdrawn, selfishness will prevail, and become the ruling passion. In fact, the tax for the poor has contributed greatly to the growth of that groveling passion, so conspicuous at present in England.

“ English authors, who turn their thoughts to the poor, make heavy complaints of decaying charity,

* His Lordship's remark is not more just than true, for the father of a considerable tradesman in Cheapside resides upon charity in the Charter-house at this present time. The father is a sensible, honest, good kind of a man, and eats the bread of public charity. The son rolls in affluence, disregarding of his father's condition. How shockingly depraved must that man's heart be, who is thus callous to filial feelings!

and increasing poverty; never once dreaming that these are the genuine effects of a legal provision for the poor; which on the one hand eradicates the virtue of charity, and on the other is a violent temptation to idleness. Wonderfully ill contrived must the English charity laws be, when their consequences tend to sap the foundation of voluntary charity; to deprive the labouring poor of their chief comfort, that of providing for themselves and children; to relax mutual affection between parent and child; and to reward, instead of punishing idleness and vice. Consider whether a legal provision for the poor be sufficient to atone for so many evils.

“ There is not a single beggar to be seen in Pennsylvania. * Luxury and idleness have got no footing in that happy country; and those who suffer by misfortunes, have their maintenance out of the public treasury. But luxury and idleness cannot for ever be excluded; and when they take place, this regulation will be as pernicious in Pennsylvania as the poor's rates are in Britain.

“ Of the many proposals that have been published for reforming the poor laws, not one has pierced to the root of the evil. None of the authors entertain the slightest doubt of a legal provision being necessary, though all our distresses arise evidently from that very cause. Travellers complain of being infested with an endless number of beggars in every English town; a very different scene from what they meet with in Holland or Switzerland. How would it surprise them to be told, that this proceeds from an overflow of charity in the good people of England!

“ Few institutions are more ticklish than those of charity. In London, common prostitutes are treated with singular humanity; an hospital for them, when pregnant, disburdens them from their load, and nurses them till they are again fit for business; another hospital cures them of the venereal disease, and a third receives them with open arms, when, instead of desire, they become objects of aversion. Would not we imagine that these hospitals have been erected for the encouragement of prostitution? They undoubtedly have that effect, which is far from being intended.

“ Mr. Stirling, though superintendant of the Edinburgh poor house, deserves to be kept in perpetual remembrance, for a scheme he contrived to reform common prostitutes. A number of them were confined in a house of correction on a daily allowance of three-pence; and even part of that small pittance was embezzled by the servants of the house. Pinching hunger did not reform their manners; for being absolutely idle, they encouraged each other in vice, waiting impatiently for the hour of deliverance. Mr. Stirling, with consent of the magistrates, removed them to a clean house, and, instead of money which is apt to be squandered, appointed for each a pound of oatmeal daily, with salt water, and fire for cooking. Relieved now from distress, they longed for comfort; what would they not give for milk or ale! Work, said he, will procure you plenty. To some who offered to spin, he gave flax and wheels, engaging to pay them half the price of their yarn, retaining the other half for the materials furnished. The spinners earned about nine-pence weekly. A comfortable addition to what they had before. The rest undertook to spin, one after another, and before the end of the first quarter, they were all of them intent upon work. It was a branch of his plan, to set free such as merited that favour, and some of them appeared so thoroughly reformed, as to be in no danger of a relapse.

“ The ingenious author of the police of France, in the year 1753, observes, that notwithstanding the plentiful provision for the poor in that kingdom, mentioned above, there was a general complaint of the increase of beggars and vagrants; and adds, that the French political writers, dissatisfied with their own plan, had presented several memorials to their mi-

* Lord Kaimes published his book in the year 1774, which was before the American troubles rose to that height which they do at present.

nistry, proposing to adopt the English parochial assessments as greatly preferable. This is a certain fact; for at the very same time, the people in London, no less dissatisfied with these assessments, were writing pamphlets in praise of the French hospitals. One thing is certain, that no plan hitherto invented, has given satisfaction. Whether an unexceptionable plan is at all possible, seems extremely doubtful.

“ In every plan for the poor that I have seen, workhouses make one article; to provide work for those who are willing, and to make those work who are unwilling. With respect to the former, men never need be idle in England for want of employment; and they always succeed the best at the employment they chuse for themselves. With respect to the latter, punishment will not compel a man to labour seriously; he may assume the appearance, but will make no progress, and the pretext of sickness or weakness is ever at hand for an excuse. The only compulsion to make a man work seriously, is fear of want.

“ An hospital for the sick, for the wounded, and for the maimed, is an excellent establishment; being productive of good, without doing any harm. Such an hospital should depend partly upon voluntary charity, to procure which a general conviction of its being well managed is necessary. Hospitals that have a sufficient fund of their own, and that have no dependence on the good will of others, are commonly ill managed.

“ Lies there any objection against a workhouse, for training to labour destitute orphans, and begging children? It is an article in Mr. Hay's plan, that the workhouse should relieve poor families of all their children, except three. This has an enticing appearance, but is unsound at bottom. Children require the tenderness of a mother during the period of infantine diseases; and even after that period they are far from being safe in the hands of mercenaries, who study nothing but their own ease and interest. Would it not be better to distribute small sums, from time to time, among poor families overburdened with children, so as to relieve them from famine, not from labour? And with respect to orphans, and begging children, I am inclined to think, that it would be a more salutary measure to encourage mechanics, manufacturers, and farmers above all, to educate such children. A premium for each, the half in hand, and the other half when they can work for themselves, would be a proper encouragement. The best regulated orphan hospital I am acquainted with, is that of Edinburgh. Orphans are taken in from every corner, provided only they are not under the age of seven, nor above that of twelve: under seven, they are too tender for an hospital; above twelve, their relations can find employment for them. Besides the being taught to read and write, they are carefully instructed in some art that may afford them a comfortable subsistence.

“ No man ever called in question the utility of the marine society, which will reflect honour on the members as long as we have a navy to protect us: they deserve a rank above that of gartered knights. That institution is the noblest exertion of charity and patriotism that ever was known in any country.

“ Of all the mischiefs that have been engendered by over anxiety about the poor, none have proved more fatal than foundling-hospitals. They tend to cool affection for children still more effectually than the English parish charity. At every occasional pinch for food, away goes the child to the hospital; and parental affection among the lower sort turns so languid, that many, who are in no pinch, relieve themselves of trouble by the same means. It is affirmed, that of the children born annually in Paris, about a third part are sent to the foundling-hospital. The Paris almanack for the year 1768, mentions that there were baptized eighteen thousand five hundred seventy-six infants, of whom the foundling-hospital received six thousand twenty-five. The proportion originally was much less, but vice creeps on with a swift pace.

How

How enormous must be the degeneracy of the Parisian populace, and their want of parental affection!

“ Let us next turn to infants shut up in this hospital. Of all animals, infants of the human race are the weakest; they require a mother’s affection to guard them against numberless diseases and accidents; a wise appointment of Providence to connect parents and children in the strictest union. In a foundling-hospital there is no fond mother to watch over her tender babe; and the hireling nurse has no fondness but for her own little profit. Need we seek any other cause for the destruction of infants in a foundling-hospital, much greater in proportion than those under the care of a mother? And yet there is another cause equally potent; which is, corrupted air. What Hanway observes upon parish workhouses, is equally applicable to a foundling-hospital. ‘ To attempt (says he) to nourish an infant in a workhouse, where a number of nurses are congregated in one room, and consequently the air becomes putrid; I will pronounce, from intimate knowledge of the subject, to be but a small remove from slaughter, for the child must die.’ Down then with foundling-hospitals, more noxious than pestilence or famine. An infant exposed at the door of a dwelling-house must be taken up; but in that case, which seldom happens, the infant has a better chance for life with a kind nurse than in an hospital; and a chance perhaps little worse, bad as it is, than with an unnatural mother. I approve not indeed of a quarterly payment to such a nurse: would it not be better to furnish her bare maintenance for three years, and if the child be alive at that time, to give her a handsome addition?

“ I heartily approve of every regulation that tends to prevent idleness. Chief Justice Hale says, ‘ That prevention of poverty and idleness would do more good than all the gibbets, whipping-posts, and gaols in the kingdom.’ In that view, gaming-houses ought to be taxed heavily, as well as horse-racing, cock-fighting, and all meetings that encourage idleness. The admitting low people to vote for members of parliament, is a source of idleness, corruption, and poverty. The same privilege is ruinous to every small parliament borough. Nor have I any difficulty to pronounce, that the admitting the populace to vote in the election of a minister (a frequent practice in Scotland) is productive of the same pernicious effects.

“ What then is to be the result of the foregoing enquiry? Is it from the defect of invention, that a good legal establishment for the poor is not discovered? or is it impracticable to make any legal establishment that is not fraught with corruption? I incline to the latter, from the following reasons, no less obvious than solid; that in a legal establishment for the poor, no distinction can be made betwixt virtue and vice; and consequently that every such establishment must be a premium for idleness: and where is the necessity, after all, of any public establishments? By what unhappy prejudice have people been led to think that the divine Author of our nature, so beneficent to his favourite man, in every other respect, has abandoned the indigent to famine and death, if municipal laws interpose not? We need but inspect the human heart, to be convinced that persons in distress are his peculiar care. Not only has he made it our duty to afford them relief, but has superadded the passion of pity to enforce the performance of that duty. This branch of our nature fulfils in perfection all the salutary purposes of charity, without admitting any one of the deplorable evils that a legal provision is fraught with. The contrivance at the same time is extremely simple; it leaves to every man the objects, as well as measure of his charity. No man esteems it a duty to relieve wretches reduced to poverty by idleness or profligacy; they move not our pity; nor do they expect any good from us. Wisely, therefore, it is ordered by Providence, that charity should in every respect be voluntary, to prevent the idle and profligate from depending on it for support.

“ This plan is in many respects excellent. The

exercise of charity, when free from compulsion, is extremely pleasant. The pleasure, it is true, is scarce felt, where charity is rendered unnecessary by municipal law; but were that law laid aside, the gratification of pity would become one of our sweetest pleasures. Charity, like other affections, is invigorated by exercise, and no less enfeebled by disuse. Providence withal hath scattered benevolence among the sons of men with a liberal hand; and notwithstanding the obstruction of municipal law, seldom is there found one so obdurate as to resist the impulse of compassion when a proper object is presented. In a well regulated government, promoting industry and virtue, the persons who need charity are not many; and such persons may, with assurance, depend on the charity of their neighbours.

“ The Italians are not more remarkable for their charitable disposition than their neighbours. No fewer, however, than twenty thousand mendicant friars live in Italy upon voluntary charity; and I have not heard that any one of them died of want.

“ Would our ministry but lead the way, by shewing some zeal for a reformation, expedients would probably be invented, for supporting the poor without unhinging voluntary charity. The following expedient is proposed, merely as a specimen. Let a tax be imposed by parliament on every parish for their poor, variable in proportion to their number, but not to exceed the half of what is necessary; and directing the landholders to make up, quarterly, a list of the names and condition of such persons as, in their opinion, stand in need of charity; with an estimate of what each ought to have weekly. The public tax makes the half, and the other half is to be raised by voluntary contribution. To prevent collusion, the roll of the poor; and their weekly appointment, with a subscription of gentlemen for their part of the sum, shall be examined by the justices of peace, at a quarterly meeting; who, on receiving satisfaction, must order the sum arising from the public tax to be distributed among the poor contained in the roll, according to the estimate of the landholders. As the public fund lies dead till the subscription is completed, it is not to be imagined that any gentleman will stand out: it would be a public imputation on his character. Far from apprehending any deficiency, confident I am, that every gentleman would consider it as honourable to contribute largely. This agreeable work must be blended with what is rather disagreeable, that of excluding from the roll every profligate, male or female. If that rule be followed out with a proper degree of severity, the innocent poor will diminish daily; so as, in time, to be safely left upon voluntary charity, without any necessity of tax.

“ But must miserable wretches, reduced to poverty by idleness or intemperance, be, in a Christian country, abandoned to diseases and famine? It is this very argument, shallow as it is, that has corrupted the industry of England, and reduced multitudes to diseases and famine. Those who are able to work, may be locked up in a house of correction, to be fed with bread and water, but with liberty of working for themselves: and as for the remainder, their case is not so desperate, when they have access to such tender-hearted persons as are more eminent for pity than for principle. If by neglect or oversight any happen to die of want, the example will tend more to reformation than the most pathetic discourse from the pulpit.

“ Even at the hazard of losing a few lives by neglect or oversight, common begging ought absolutely to be prohibited: the most profligate are the most impudent, and the most expert at feigning distress. If begging be indulged to any, all will rush into the public. Idlers are fond of that wandering and indolent sort of life; and there is no temptation to idleness more successful than liberty to beg. In order to be relieved from common beggars, it has been proposed to fine those who give them alms. Little penetration must they have, to whom the insufficiency of such a remedy is not palpable. It is easy to give alms

without

without being seen; and compassion will extort alms, even at the hazard of suffering for it; not to mention, that every one in such a case will avoid the odious character of an informer. The following remedy is suggested, as what probably may answer better. An officer must be appointed in every parish, with a competent salary, for apprehending and carrying to the workhouse every strolling beggar; under the penalty of losing his office, with what salary is due to him; if any beggar be found strolling four and twenty hours after the fact comes to his knowledge. In the workhouse such beggars shall be fed with bread and water for a year, but with liberty of working for themselves.

“I declare resolutely against a perpetual tax for the poor; but if there must be such a tax, I know of none less subversive of industry and morals than that established in Scotland, obliging the landholders, in every parish, to meet at stated times, in order to provide a fund for the poor: but leaving the objects of their charity, and the measure, to their own humanity and discretion. In this plan there is no encroachment on the natural duty of charity, but only that the minority must submit to the opinion of the majority.

“In large towns, where the character and circumstances of the poor are not so well known as in country parishes, the following variation is proposed. Instead of landholders, who are proper in country parishes, let there be in each town or parish a standing committee, to be chosen by the proprietors of houses, the third part to be charged annually. This committee, with the minister, make up a list of such as deserve charity; adding an estimate of what, with their own labour, may be sufficient for each of them. The minister, with one or two of the committee, carry about this list to every family that can afford charity, suggesting what may be proper for each to contribute. This list, with an addition of the sum contributed, or promised, by each householder, must be affixed on the principal door of the parish church, to honour the contributors, and to inform the poor of the provision made for them. Some such mode may probably be effectual, without transgressing the bounds of voluntary charity. But if any one obstinately refuses to contribute, after several applications, the committee, at their discretion, may tax him. If it be the possessor who declines contributing, the tax must be laid upon him, reserving relief against his landlord.

“In the great towns, the poor, who ought to be prohibited from begging, are less known than in country parishes. And among the croud of inhabitants, it is easier for an individual to escape the eye of the public, when he with-holds charity, than in country parishes. Both defects will be remedied by the plan above proposed; it will bring to light, in great cities, the poor who deserve charity; and it will bring to light every person who with-holds charity.”

Thus far lord Kaimcs; return we now to Holland, where the police for the poor is much better regulated than in most countries; for, as has been observed before, common begging is absolutely prohibited by law.

Avarice excepted, all appetites and passions appear to run lower and cooler here than in any other country. Quarrels are very rare, revenge seldom heard of, and beating scarcely ever known. Their tempers are not light and airy enough for excessive joy, nor any unusual strains of pleasant humour; neither are they warm enough for love: this last named passion is indeed sometimes talked of among young fellows, as a thing they have heard of, but seldom or ever felt. It is very rare for any of them to be really in love, nor do the women seem to care whether they are or no. This may be accounted for, either because the men are such lovers of liberty as not to chuse the servitude of a mistress, or, what is most probable, because they are diverted from it by the attention every man pays to his business. The same causes

may have the same effects upon the married women, who have the whole care and management of their domestic affairs, and live generally in good fame; a certain sort of chastity being hereditary and habitual to them.

The dullness of the air in this country may dispose the inhabitants to that uncommon assiduity and constant application to every thing they undertake. One Dutchman employed four and twenty years in making and perfecting a globe; and another thirty about the inlaying of a table. Nor is it to be imagined how much may have been contributed to the great things achieved among them by this humour of never giving over what they imagine may be brought to pass, nor leaving one object to follow any other they may meet with; which is the fault of lighter and more unstable minds.

The custom of hard drinking, for which the Dutch are remarkable, may probably be owing to the same quality in the air. Few of the magistrates and ministers of state are guilty of this vice, and if they are ever inebriated, it is only at feasts and great entertainments, and then rather in compliance with the company than out of choice.

A considerable writer upon the manners of the Dutch, we mean Sir William Temple, who resided as ambassador there a long time, seems to applaud the Dutch for having their appetites and passions at such command, as seldom to ruin themselves in a love fit, as young fellows are apt to do in other countries. But we rather think, that were the same liberties allowed in other countries as are here established by public authority, our people might be guilty of as few extravagances of that kind as the Dutch. We will only just remark, that we are far from defending the propriety of such public license, but only observe its consequences.

The music houses in Holland are licensed by authority, for which a tax is paid, and the master of such a house may keep as many ladies of pleasure as he pleases. Those women also pay a tax to the government, on their admittance into those temples of Venus. People resort to these places as openly as we do to the playhouse, or to church; and when a sufficient company is assembled, they sup together in a common room, good wine and eatables being provided for them. After supper, a ball, or an entertainment of music and dancing succeeds, from which any couple are at liberty to retire to a private room, where they stay as long as they please, and then return to the company, no more notice being taken of it than if they had retired on some other occasion; and the entertainment concludes with dancing, or drinking, as is most agreeable to the company. Of these music houses there are several degrees. The government tolerate these places to prevent greater evils. As great numbers of sailors return to their port towns continually from distant voyages, if they did not indulge them in these liberties, they would probably make free with their wives and daughters. Government have likewise made several wise regulations, in order to prevent, as much as possible, any diseases being caught at these institutions of pleasure.

It has been remarked, that few of the Dutch know what honourable love means, and are not very nice in the choice of their wives; one may serve as an extinguisher as well as another. What they chiefly consider, is, if the woman is likely to assist them in their business, and manage their household affairs to advantage; for here the wife generally keeps the accounts and the cash, and acts in the quality of a steward, or rather director; and should the fair one prove unkind, the lover is so far from breaking his heart, or hanging himself, that he resorts to a music house, and thinks no more of her; but if she encourages his addresses, and designs him for her husband, it is no disgrace here if she admits him to her embraces before marriage; and it is a very common thing to see ladies great with child go to church to be married.

The wives here have not very precise notions of that subjection in which Providence has placed them; they are rather aspiring, and frequently usurp authority over the man. They carry their neatness to a great height, and will not suffer the husband to enter the best rooms in his house.

In large towns, the common people live pretty well, but the chief diet of the husbandmen is roots, herbs, and milk. In towns, the commonalty purchase an ox, about November, every year, and salt it up, or smoke-dry it, to eat with bread and butter and salt. They likewise eat pickled herrings, &c. in abundance.

The Hollanders play at bowls, billiards, chess, and tennis. They shoot wild fowl in winter, of which there are great quantities, and they angle a good deal in the summer season. Their principal diversion, in the depth of winter, is skating, which they perform with incredible celerity. The women go to market in sledges, which are either drawn by a horse, or pushed on by a man in skates. When the snow is on the ground, and the streets are frozen, young gentlemen and ladies appear abroad in the most magnificent sledges, which are of various shapes, gilt and varnished, and the horses' harness is rich and glittering. Numbers of these are seen in the streets together, especially in Amsterdam, and make a fine appearance.

Travelling is very cheap in Holland, but, as has been before remarked, does not afford much exercise, as you ride upon a smooth canal, drawn by a horse, which goes at the rate of three miles an hour. The fare does not amount to a penny a mile, and you have the conveniency of carrying your luggage into the bargain. These boats are covered, so that you are not subject to the rainy weather. There is scarce a town in Holland but there is a communication this way with another, and you may go backwards and forwards every day, and at some places every hour. The land carriage is not so convenient, as they use an open waggon instead of a coach; and skating, which the country people are so dextrous at, is not so soon learnt by foreigners. The inns and public houses are clean and neat, but travellers are subject to great impositions, from which there is no redress.

No country in Europe has richer pasture grounds; but then there is a great deal of barren land, bogs, and marshes. They do not grow corn enough to subsist the inhabitants.

The Dutch are very curious in flowers; they seem to adore a fine tulip root almost as much as their beloved mammon.

In this flat country they have no minerals; they have neither coals nor wood for firing; their coals are imported from England, which the Dutch smiths use in their forges, and they have them upon easier terms than we can in London, as the duties here are so high. On which account it is partly owing that the English hardware toys are not so cheap as the Dutch.

The Netherlands afford a large quantity of good horses and cattle; the cows give large quantities of milk, and the horses for carriages and the army are the largest of any in Europe: they are not so swift as ours, but would make good chargers. They have numerous flocks of sheep, but neither their flesh nor their wool are equal to that of the English sheep. They have some wild animals, particularly wolves and wild hogs.

They have large quantities of fresh water fish, as well as all kinds of sea fish, except oysters and herrings, which they take upon our coast. As the Dutch, French, and other nations, take vast quantities of fish upon our coast, we ought to lay them under tribute, or totally deprive them of it. What an additional sum of money would circulate in England, was the turbot fishery in our own hands; and what fools are the English, to permit this valuable trade to be engrossed entirely by the Dutch!

The storks visit the Netherlands in great abun-

dance; they build and hatch their young on the chimnies in the cities as well as villages. The Dutch have a superstitious veneration for these birds, and will not suffer them to be killed on any account. They fly away with their brood (to Africa, as some conjecture) in the beginning of August, annually, and return about the end of February. Quails also come over to Holland from Africa in the summer, as they do to England, and return thither in winter; they have great numbers of tame as well as wild fowls on their coasts.

The Dutch will not suffer an idle person among them; they set even the lame and blind to work, as well as old men, women, and children, and find a proper employment for every species of cripples; their maxim is, that every man may do something for his own support, as well as for the wealth of the state. They have hospitals indeed, but they do not seem to think it is any charity to keep people to do nothing. They observe very properly, that men are much better contented when employed, than when they are idle, and they therefore set the poor to work, out of mere compassion to them.

They breed up a vast number of mariners, which are of considerable service to the maritime state; this is one reason why they encourage the fisheries. They furnish them with more seamen to man their fleets than every other branch of traffick put together; and these fish are an inexhaustible fund of riches, with which they purchase the merchandize of almost every country. The preparing vessels, nets, boats, &c. for these fisheries, employs a multitude of their poor on shore, which would otherwise be an expence and burthen to the country.

Another numerous profession in Holland is their ship and house carpenters; they furnish our and many other countries with plank, though they have scarce any timber of their own growth. We often buy timber, ready sawed, in Holland, cheaper than we can import the timber from the countries where it grows, and saw it out at home. This is owing to the numerous saw-mills they have erected, by the help of which one man will prepare as much plank as forty can without these useful machines; and as the Dutch can afford their boards much cheaper than we can, every nation will lay out their money with them rather than with us, or any other country that have not such mills.

At Samerdam, or Sardam, near Amsterdam, there are always large quantities of timber, ready framed, for building ships and houses, as has been before observed; some have computed, that they can put a man of war together every day in the year. 'Tis amazing what expedition they use in building their ships; but every one knows, that, when built, they are not comparable to those of the English, either for strength, beauty, or expedition, but are heavy and bulky, like themselves.

If we excel the Dutch in ship building, their statuaries and painters are equal, if not superior to ours; they likewise excel in dyeing, sugar-baking, bleaching of linen, and their manufacture of paper and sail-cloth; and the linen, which we call holland, excels any thing of the kind we can produce. Neither their locks, arms, or any of their cutlery ware, is equal to what is made in the British islands. If we may credit the late accounts of a certain excellent admiral in the British navy, their powder is very much inferior to ours. The exigences of the state required the purchasing a large quantity of that commodity lately in Holland; and admiral B. says, that it had not strength enough to send the balls into D'Estaign's ships. Thank God, if we could not sink the ships in D'Estaign's Squadron, the late severe check he has received by the repulse given him at the Savannah lines, has, we hope, stopped his progress for a time, and the triumphs of our treacherous Gallic foes.

The manufactures of Holland enrich that country much more than the produce of it; for Holland produces little else but butter and cheese, and yet they

they are, without doubt, the richest merchants in the world.

Every province in Holland is sovereign and independent of the States General, and in each province there are several republics independent of that province, and which are not bound by the decrees or acts of the state of the province, until such acts are ratified by each particular city or republic, which sends deputies to the provincial assembly.

The States General can neither make war or peace, enter into new alliances, nor raise money, without the consent of every province; neither can the States Provincial determine these things without the consent of every city or republic, which, by the constitution of the province, hath a vote in the assembly.

The States are composed of the deputies or representatives of the nobility, and of eighteen cities, making in all nineteen voices, of which the nobility and gentry have only one. The nobility are not numerous, and are represented in the States Provincial by eight or nine of their own number; and when one of them dies, they elect another to succeed him; but these altogether have but one voice equal to the smallest of towns' representative. Notwithstanding this, they are very considerable in the government, possessing many of the best posts, both civil and military, and having the direction of all the ecclesiastical revenues, which were confiscated by the States upon the alteration of their religion.

The nobility always vote first in the assembly of the States, and influence, in a great measure, the cities, which give their voice afterwards. The representatives of the cities are elected out of the magistracy and senate of each town, and their number, more or less, according to the pleasure of those they represent; though they have all but one voice, and have a salary from the places which send them. One of the burgomasters and the pensioners are usually of the number. The States of Holland generally assemble at the Hague four times a year. Upon extraordinary occasions, they are summoned by the council of state of the province, consisting of several deputies. This council sits constantly at the Hague, and proposes to the States of the province, at their extraordinary assemblies, the matters proper for their deliberation, and execute their resolutions. One negative voice in the assembly of the States of the province hinders their coming to a resolution. When they are all agreed, they send some of their number to the respective towns they represent, to obtain their consent; and if it be a matter of any intricacy, and may take up time in debating in the several cities, the States usually adjourn for such a time as they have reason to think the deputies will return.

The land forces of the Dutch amount to between twenty and thirty thousand men. They have not many ships in commission, or fit for service, but can soon increase them.

Every religious sect is tolerated in Holland, though the Calvinists alone sit in the assemblies of the States. So various are their religious opinions, that it gave occasion to a person once to say, that if a man had lost his religion, he would not fail to find it here. There are so many Jews in Amsterdam, that it is called the New Jerusalem.

We shall now proceed to entertain our numerous readers with Mr. Twiss's travels through the kingdom of Ireland. As accurate travels through this part of our dominions are so very scarce, we are the more indebted to this valuable author, to whom we are under former obligations.

Mr. Twiss says, "When I was at Aberystwith, in Cardiganshire, I was acquainted that a vessel was ready to sail for Caernarvon: the wind was favourable, the weather fine, and the master of this vessel was soon prevailed on, for a bribe, to steer his course for Dublin, instead of the place of his original destination. I embarked on the fourth of June, 1775, and landed in Dublin, after a short and pleasant passage.

Though the entrance into the harbour of Dublin is very beautiful, yet it is inferior to the bay of Naples; but the latter is much heightened and augmented by the terrific grandeur of Mount Vesuvius, than which there is not such another object in the world: for an admirable description of which, we refer our readers to Mr. Brydone's travels through Sicily and Malta.

When I first thought of making the tour of Ireland, I was prepossessed with an opinion that the natives of that kingdom were prodigiously given to drinking, hospitality, and very prone to make bulls or blunders: in which opinion, however, I was mistaken. Drinking and hospitality went formerly hand in hand, but the excesses of the table have been judiciously abolished; and hospitality is not so customary as formerly.

"Each person now may drink and fill
 "As much or little as he will,
 "Exempted from the Bedlam rules
 "Of roaring prodigals and fools:
 "Whether in merry mood, or whim,
 "He takes a bumper to the brim;
 "Or better pleased to let it pass,
 "Grows chearful with the scanty glass."

When the English language was not so well understood and spoken in Ireland as it is at present, no wonder exists why they should be addicted to frequent blunders, and use improper words, or, as we say, put the cart before the horse. The same proneness still subsists among some of the natives of this country, but it is owing to the same cause; whereas, in general, the inhabitants now speak English tolerably well (though with some remains of the brogue), and are very little addicted to making bulls.

The Irish have been accused with a passion for duelling, insomuch that it has been said, 'An Irishman would rather fight than eat his breakfast': but this account has been too much exaggerated. A prudent traveller may as easily avoid any disagreeable rencounter of this sort in Ireland, as he may in any other part of Europe. Gaming is also said to be the general vice of the country, but I did not perceive any more of it in Dublin than in any other European city through which I have travelled. I am an enemy to all illiberal national reflexions: I agree with Churchill, when he said,

"Long from a country ever hardly us'd,
 "At random censur'd, and by most abus'd,
 "Have Britons drawn this spot with no kind
 "view,
 "And judged the many by the rascal few."

ROSCIAD.

Ireland is not upon a par with the rest of Europe, respecting her progress in the fine arts, which may be partly owing to the unsettled state in which that island was during the civil wars and commotions; it is, indeed, a matter of astonishment; all things considered, that they are in such forwardness as we find them. Out of the limits of Dublin, there is scarce a statue, building, or capital picture to be found in the whole kingdom; nor is musick cultivated to any degree of perfection out of the abovementioned limits. The beauties of nature, a few antiquities, and the ignorance and poverty of the lower class of people, are all that can be expected from making the tour of Ireland.

The city of Dublin is nearly circular, and is about eight miles in circumference, and is the largest city in his majesty's dominions, London excepted. This city is divided into two almost equal parts, by the river Liffy, over which are five bridges; Essex bridge is the most admirable; Queen's bridge is likewise a handsome structure, but the other bridges are not worth mentioning, being only built for the convenience of passing over, and seem to set every order of architecture at defiance.

St. Stephen's Green is probably the longest square in Europe, the outer walks are gravelled and planted

1658

on each side, with trees, and separated by a low wall from the coach road. In the centre of the square is an equestrian statue of George II. in brass, erected in 1758. This green in the centre of the square is swampy, and a great many snipes resort hither in the winter season.

The buildings in this square are extremely irregular, there are scarcely two houses alike. In the city of Dublin are two cathedrals, eighteen parish churches, besides several chapels, meeting-houses, &c. Neither of the cathedrals are remarkable for their architecture. That of the Trinity contains some good monuments; and in that of St. Patrick, Dean Swift lies buried. Near the altar of St. Patrick's, is an enormous pile of wood, representing, in figures as large as life, Boyle, earl of Corke, and his family, and was placed here so long ago as 1629. It is matter of astonishment to many, that this building is still allowed church room.

Some of the parish churches are modern, elegant buildings, but they have neither steeples nor spires. The university of this city consists of only one college, which is dedicated to the Trinity. The library is large and handsome, and contains many excellent marble busts. The provost's house is near the college, and is handsomely built with free-stone.

The parliament-house is built with stone, and is one of the greatest ornaments of the city. The house of lords is a plain room, the house of commons is octangular; and the benches are gradually elevated above each other, as in the British house of commons.

There is an equestrian statue of king William the third, in College-green, whom all the Protestants in Ireland adore to a man. There is likewise one of king George the first, behind the lord-mayor's house, which was formerly on Essex bridge.

In Smock-alley, and in Crow-street, are the two theatres; over the curtain of the former theatre, is a representation of a ship, sailing into port. This vessel is called, "The Smock-alley frigate," and on the sails is written, "For public favour," with "All's well that ends well." This is the theatre royal.

One of the handsomest buildings in the city of Dublin is the lying-in hospital, which is supported by grants from parliament, and private legacies and benefactions. There are public gardens behind it, with a rotunda, resembling our Ranelagh, but built upon a much smaller scale. Three times a week in summer, concerts of music are given; the profits which amounting to about four hundred pounds per annum, are applied to the benefit of the hospital.

Dean Swift bequeathed eleven thousand pounds to St. Patrick's hospital for lunatics and idiots. How astonishing and shocking is the thought that this truly great man, the first burlesque writer in any age, should unfortunately become a proper object for his own charitable foundation. To use his own words:

"He left the little wealth he had,
"To build a house for fools and mad;
"And shew'd by one satiric touch,
"The nation wanted it so much."

There is in Dublin; ten or twelve more hospitals, but they are not of such consideration as this of St. Patrick's. They may be useful, but I am sure they are not ornamental buildings.

At the western extremity of Dublin, near the river, the barracks are built, which are very large, and capable of containing a great number of soldiers.

The new exchange which is building in Dublin, bids fair to be one of the greatest ornaments of that city. It is a square building of white stone, with a cupola. The dome is decorated with twelve fluted semi-columns of the Corinthian order, placed against the walls.

The castle of Dublin is a place of great public resort, where there are balls every Friday evening in the winter. And in summer, Ranelagh gardens are much frequented, which are about a mile out of town.

These are much in the stile of our White Conduit-house, or Bagnigge Wells.

The Irish nobility rank as follow, viz.
The lord lieutenant,
Earl of Connaught (duke of Gloucester)
Earl of Dublin (duke of Cumberland)
Duke of Leinster,
Fifty-eight earls,
Forty-five viscounts, and
Thirty-seven barons,
Four archbishops,
Eighteen bishops, and
The lord chancellor for the time being.

There are about sixty baronets, and seventy-five privy counsellors, who are all styled right honourable. This is their present state, but their numbers are capable of increase or diminution, in proportion as some titles become extinct, or new ones are invented.

The lord-mayor of Dublin is also right honourable; but he is not a peer, any more than the chief magistrate of London.

By a late act of parliament, the streets of Dublin are to be new paved; which act did not take place before it was necessary, for the old pavement is shockingly bad. In consequence of this act, some of the streets are already new paved.

It is probable, from the best calculations, that Dublin contains one hundred thousand inhabitants. In 1749, there were in the city and liberties two thousand alehouses, three hundred taverns, and twelve hundred brandy shops. In 1766, the number of houses was thirteen thousand one hundred and ninety-four.

The noddies which ply about Dublin, are single horse two wheel carriages; but these, together with the hackney-coaches, are so insufferably bad, that you cannot ride in them without danger.

There are many mules made use of in the city of Dublin, and goods are conveyed about the city on small two wheeled cars, drawn by a single horse.

The outskirts or suburbs of Dublin make a very mean appearance, they consist chiefly of huts, very similar to those which Dr. Johnson relates he saw in Jutland; they are here termed cabins, and are made of dried mud, but are generally without chimney or window. The door serves to admit the light, and to convey away the smoke of their fires. In such miserable dwellings as these, far the greatest part of the inhabitants of Ireland linger out a wretched existence. The Irish poor are miserably poor indeed, but to what is it owing? The patriots say it arises from the indifferetion as well as the oppression of government, and the restrictions upon their trade, besides an immense load of taxes, and the pension list. On the other hand, the landholders are charged with the most rigid oppressions imaginable. Whoever lives many years longer, will see which are to blame. The present ministry, to their eternal honour, have lately taken off many restrictions upon their trade, and one would imagine this will be attended with the most salutary effects, when there is more commerce, and consequently a greater circulation of money. It is warmly recommended to the Irish noblemen and gentlemen, especially some who make a great noise in our parliament, and have considerable estates in Ireland, in this respect, to follow the example of the king's ministers, and let their poor tenants see that they are not only patriots in word, but in deed.

But to return to our description of these cabins. There is generally a small piece of ground annexed to each of them, which produces a few potatoes; with these and milk, the common Irish subsist throughout the year, without perhaps once tasting a bit of bread and meat, except it be at Christmas. The poor in England live like princes to them. The small pittance the men obtain by their labour, or the women by their spinning, is in general consumed in whisky. They seldom wear either shoes or stockings. Mr. Swift is of opinion, that their poverty is much greater than that

of the Spanish, Portuguese, or even Scotch peasants; if it exceeds the latter, they must be miserable indeed. Nevertheless, he says they appear very easy, and contented. And what more has the richest citizen in the world? It is indeed doubtful if he has so much.

The middling class of people in Dublin appear to be indigent, for there are many shops which serve for different trades, such as booksellers and silversmiths; milliners, &c. and their stock in trade bespeaks poverty. The keenness of necessity is very conspicuous, with regard to literature, for every printer is here left at liberty to print, and every bookseller to sell, as many vile editions of any book as they please.

It generally rains in Ireland four or five days in the week, for a few hours at a time, on which account the climate is more moist than in any other part of Europe, and rainbows are almost daily seen. The air is very temperate, to which, and the moisture of the air, the great and perpetual verdure of the grass is attributed; the grass is seldom either parched or frozen.

The moisture of the air, the numberless lakes, rivulets, and springs, occasion those bogs which abound so much in Ireland. These are almost inexhaustible sources of fuel for the inhabitants, which is obtained at a very trifling expence. They call it turf, and is of the nature of the English peat.

It is very remarkable, that there are no snakes, nor any venomous animals, or insects in Ireland, nor are there any toads nor moles. They have many frogs, which the Irish say were first imported in the year 1699. It is impossible to assign a sufficient reason for this total exemption from noxious animals. Many conjectures have been formed, and conjectures alone they have hitherto remained. Were it owing to the moisture of the ground, then North America would be as free as Ireland; but the most enormous serpents are generated in the swamps of that country. It is no less astonishing than true, that snakes have been imported into Ireland, but they always died in a short time. The same remark holds good with respect to the island of Malta. See our remark in Brydone's Tour.

The Irish constantly eat boiled eggs for breakfast with their tea, and they universally eat potatoes instead of bread.

The custom of forging franks is very universal, the ladies in particular use this freedom. They assign many excuses, but they are far from satisfactory.

The tutelary saint of Ireland is St. Patrick. This gentleman was born in the middle of the fourth century. It is recorded in his life, that he daily rehearsed the Psalter, with a great number of prayers; and to such a pitch did he carry his mortification, that he said every night fifty psalms in water. What could induce the saint to this species of self-denial, is impossible to ascertain. St. Patrick is said to have been canonized for having illustrated the Trinity by the comparison of a shamrock, or trefoil. It is in honour of this apostle of the Irish, that *paddy* is the popular Christian name.

Most of the common people, and few of the better sort, speak the Irish language; the books which are printed in it are only a few devotional tracts. Mr. Vallancey will have it that the Irish language is the Thule of the antients.

The Irish females are remarkably prolific, and it is not uncommon for a woman to have fifteen or twenty children. Mr. Twiss says, I was acquainted with a clergyman and his wife, in the county of Fermanagh, who, in twenty-nine years, had thirty-two children.

The ladies in Ireland are very beautiful, and are extremely well educated; they have little besides their beauty and merit to recommend them, for their fortunes are inconsiderable. Notwithstanding this, they, in general, expect a handsome settlement, which occasioned a wit to say, that though they had slender fortunes, they had great expectations.

Gentlemen of an affluent fortune, and who is un-

der no necessity to be mercenary in their choice, may find much happiness in an union with these ladies, if they can convince themselves that their offers are disinterestedly accepted. On the other hand, the polite education which the Irish ladies receive, prevents many of them from being suitably married: men of middling fortunes cannot afford to maintain them in the style to which they have been used, which is often greatly superior to their station, and they are not very well calculated for the wives of tradesmen. Our neighbours, the Dutch women, of whom we have been lately treating, are quite a contrast to the Irish ladies; their joys, if they have any, are entirely domestic, and their ideas seem to extend no farther than prudence and cleanliness; but an Irish lady is quite a citizen of the world.

The Irish ladies are very engaging to travellers, for they are neither disgustingly reserved, nor too familiar. Gallantry is not much practised in this country: a *cicisbeo*; in the libertine sense of the word, is almost as uncommon as a snake. Some people wish that the climate would prove as fatal to the former as the latter. Debauching a married or a single woman are certainly mortal sins.

The kingdom of Ireland is divided into four provinces, viz. Ulster, Leinster, Munster, and Connaught, which provinces are subdivided into thirty-two counties. They do not pay any land-tax in Ireland; instead of which, two shillings is paid annually for every hearth, or fire-place.

In Dublin, a penny-post office is lately established, and twenty stage-coaches are appointed for the conveyance of passengers to various parts of the kingdom. There are no stages for the exchange of horses on the Irish roads, except between Dublin and Belfast; so that the best method of travelling is, to hire a coach and horses by the week or the month, I paid four guineas per week for a post-chaise and pair, with which I made the tour of the island, and the driver maintained himself and his horses.

The Irish roads are generally as good as those about London, and the inns are very commodious, and well supplied with provisions: it is not requisite that the traveller should be over-nice or delicate; sometimes he may find that sense rather put to the trial. The Irish landlords are not cloyed with too numerous guests, and are consequently more civil than those in England. Travelling is perfectly secure in Ireland, which may be partly owing to the scarcity of travellers. Excepting in and about Dublin, there are never any highway or foot-pad robberies.

The Dublin soldiers and butchers are at eternal enmity, and behave in the most barbarous and inhuman manner to each other. They frequently hamstring each other; and notwithstanding many of these barbarians have been executed, this savage practice has not yet been put a stop to.

Mr. Twiss says, Before I began to make my intended tour through the country, I made the following short excursions.

About six miles from Dublin, I came to a road leading through a chasm, cut through a rock, consisting of a heap of enormous stones, which very much resemble those of the rock of Ciutra near Lisbon. This forms one of the most striking natural objects in Ireland.

The seat of Lord Powerscourt is seven miles further, and is situated in the county of Wicklow. There is a very beautiful cascade in his lordship's park, which falls from a circular amphitheatre of hills covered with wood, of a considerable height. This prospect is pleasing and picturesque, but is not very grand, nor by any means comparable to some in Italy.

The country about his lordship's seat is beautiful beyond expression, and may justly vie with any part of Italy, and from the variety of pleasing objects, may very properly be called the garden of Ireland. Near this beautiful spot is the striking contrast of a nearly square tract of ground, each side of which is no less than eight miles, and consists wholly of barren mountains

tains and bogs, and is totally uninhabited. In the midst of these mountains are the ruins of seven churches, and a round tower. Four hundred acres are here let for a guinea annually, and there is scarce such a desert so near the capital of a kingdom in the world.

In Stillorgan Park, is a square obelisk of stone, upwards of a hundred feet high, which is placed on a rustic base, to each side of which is a double stair-case leading to a platform at top, which encompasses the obelisk, and commands the prospect of the bay of Dublin and the Irish channel: this park is only three miles from Dublin. The hill of Hault, on the opposite shore, appears, from this eminence, exactly like the rock of Gibraltar.

At the western extremity of Dublin is the Phoenix Park; in the midst of it is a Phoenix burning in her nest, on a fluted stone column, which was placed there by the famous Earl of Chesterfield, whilst he was lord lieutenant of this kingdom.

The town of Drogheda is situated on the river Boyne, and is about a mile from the sea: it consists of two chief streets, which intersect each other at right angles. This town resembles Chichester in Suffex. The town-house is a handsome stone building. About two miles from Drogheda is a square stone obelisk; it is erected on a rock, on the edge of the river Boyne. As this obelisk is rather remarkable, we will give the inscriptions upon it, after saying that it is about one hundred and fifty feet high, and each side of the base is twenty feet.

INSCRIPTIONS.

Sacred to the glorious Memory
of

King William the Third,

Who, on the first Day of July, 1690, passed the River, near this Place, to attack James the Second, at the Head of a Popish Army, advantageously posted on the South Side of it, and did on that Day, by a successful Battle, secure to Us, and to our Posterity, our Liberty, Laws, and Religion:

In consequence of this Action, James the Second left this Kingdom and fled to France.

This Memorial of our Deliverance was erected in the Ninth Year of the Reign of King George the Second; the First Stone being laid by Lionel Sackville, Duke of Dorset, Lord Lieutenant of the Kingdom of Ireland: 1736.

This Monument was erected by the grateful Contribution of several Protestants of Great Britain and Ireland.

Reinard, Duke of Schomberg,
in passing this River,
died bravely fighting
in Defence of Liberty.

First of July,
MDCXC.

This obelisk is certainly one of the grandest in Europe, and was erected upon one of the most glorious occasions that ever occurred in the annals of any country.

From Drogheda I proceeded to Dunbar; the country produces potatoes, wheat, flax, and oats. Over the doors or chimneys (the same aperture serving for both occasions) of many of the huts or cabins, I observed a board with this inscription, 'Good dry Lodgings'; but as I was sure that hogs could not read, I avoided mistaking them for pig-styes.

Whisks of straw serve for bridles, stirrups, and cruppers to the peasants horses; however, I procured a horse with leather accoutrements, and proceeded to Monesterborie, which is about three miles from Dunlur, in order to see the round tower which is there. As I was obliged to take shelter during a violent shower of rain, I retreated into a cabin where the cocks and hens familiarly perched upon my knees, to

be fed, and they seemed to be disposed to roost in the same condition.

At Dunkalk I visited Lord Clanbrassil's gardens, and then went to Newry, where I found nothing to observe but two shabby bridges. From thence I rode ten miles along the canal, and spent the night at Armagh, where I saw, in the market-place, a cross of two stones, with old basso relievo's, representing Christ on the cross between the two thieves. This town is an archbishoprick, and the metropolitan see of Ireland, yet it contains only a single church.

From Armagh, I went through Laugan to Hillsborough. The earl of Hillsborough, who takes his title from this town, has built here an elegant church at his own expence.

I passed by Lisburne and rode to Belfast, which is a regular built town, and the streets are broad and strait. Here is a bridge of twenty-one arches.

The city of Antrim is situated about half a mile from the Lough Neagh, which is the largest lough in Europe excepting the Leman near Geneva, and two in Muscovy. The Lough Neagh is about twenty miles long and twelve broad.

Coleraine is a neat little town on the river Bann, over which is a bridge, and near it an artificial mount, like that on Salisbury Plain, and other parts of England. The mounts in Ireland are very numerous, and were raised by the Danes.

Our traveller says, I then continued my journey to Londonderry, and ferried over the river Foyale. This city consists chiefly of two streets, which cross each other, and the Royal Exchange is built in the centre. Here I saw nothing remarkable.

From Londonderry I went to Raphoe, and, after traversing bogs and mountains, I arrived at Donegal, where there is a tolerable bridge of six arches, and the ruins of a large old castle.

I was very much pleased with Bally Shannon, which is a small town situated near the sea, and has a bridge of fourteen arches, over a river which falls down a ridge of rocks about twelve feet, and exhibits, at low water, a very fine picturesque cascade. This place is rendered still more singular and interesting by being the principal salmon leap in Ireland.

Every necessary of life is remarkably cheap in these parts. Salmon is fixed at six shillings a hundred weight, other kinds of fish may be had for the trouble of catching them: you may buy a couple of rabbits for three-pence, and a turkey or goose for a shilling, and all other articles are in proportion: house-rent is very reasonable. If a family could forego the sweets of society, and be contented to live in a dull lifeless tranquillity, there is scarcely a spot in the world more suitable for economical retirement.

The town of Inniskillen is joined to the main land by two bridges, one of eight, the other of six arches. Inniskillen, implies the island of a shilling, which, perhaps, was descriptive of the circular form of the land on which the town is built.

From Inniskillen I went to Swalingbar, which is only a small village, with a sulphurous spring, which changes the colour of silver, and tastes like the Harrowgate water. From thence I went through Killishandra to Granard, where I observed numbers, of the fair sex especially, sitting before their doors, with their heads in each others laps, parting with their disagreeable guests. I then passed through Edgeworth Town, Ballymaken, Athlone, and Frisbane.

The river Shannon is very noble, and is the most considerable that is to be found in any of the islands of Europe. It takes its source from a spring among the mountains, near Swanlingbar. Over this river there are fourteen bridges. The Shannon runs to Limerick, and from thence is navigable to the sea.

Birr is a neat little town, where I passed a day, in the midst of which is a stone column, of the Doric order. On the top is placed an equestrian statue of the late duke of Cumberland, in a Roman habit. I then proceeded through Nenagh, and passed what are called

called the silver mines; though, I fancy, nothing but lead is extracted from them.

The city of Limerick contains three churches; the town is moderately large, but that part of it, called Irish town, is beggarly and filthy beyond description. The other part is not despicable, especially about the quays, on one of which a neat custom-house is erected.

Adare is a little village, pleasantly situated, and is embellished with the ruins of several churches and convents, overgrown with ivy. I passed through Newcastle, and arrived at the town of Killarney, which is situated on the edge of the celebrated lake of that name. In this town there are only two inns, and those are very indifferent; it would surely be worth any one's while to build an elegant inn here, in order to accommodate those who come to visit this renowned lake.

From Killarney I went to Corke, which city is about three miles long, and nearly two broad. It is the second city in the kingdom, and is situated on a marshy island, surrounded by the river Lee. The harbour of Corke is very safe and secure. All the environs of Corke are very pleasant; the lands rise in gentle hills, and are ornamented with many country houses, gardens, and plantations. The hills are so thickly set with houses, rising gradually above each other, that the prospect is equal to that of Lions, or Oporto.

Corke contains six churches beside the cathedral. Several canals are cut through the streets, over which are small drawbridges, somewhat like those in Holland. Corke is supposed to contain about eighty thousand inhabitants, of which a great portion are Roman catholics. The exchange is a good building. Here is likewise a theatre, and some assembly rooms. I saw in the mayoralty house a statue of white marble, as large as life, representing that great statesman, lord Chatham; and, what I am sure will astonish every reader, I actually saw a house painter at work, in painting it in oil colours. Mr. Wilton, the statuary, was paid four hundred and fifty pounds for it.

The citizens of Corke are not so famous for their painting, sculpture, &c. or such trifles, as they are in the slaughter of hogs, oxen, &c. which they export in great quantities. From Corke I went to Mallow, which is a small town, and is much resorted to in the summer months, for the benefit of drinking the waters. This water is warm, and is said to possess the qualities of those of Bristol hot wells. This place is called the Irish bath.

The towns of Doneraile, Mitchel's-town, Clogheen, and Clonmell, have nothing worth describing; the latter is famous for being the birth-place of Sterne, whose writings are too well known to need commendation from this pen.

At Cashel the cathedral is built on the top of a rock, though it is much decayed. Here is likewise a high round tower, quite entire. The town of Cashel is very small and dirty, though it is the see of an archbishop.

Kilkenny is a pleasant little town, and has a river running through it, over which are two bridges. Here is an old castle, and near the cathedral stands a round tower. The roof of the cathedral is supported by eight large quadruple columns of black marble, which the ingenious people of Kilkenny have whitewashed, in order to embellish them.

I passed through the disagreeable filthy town of Knocktopher, and arrived at Waterford, which is built on the south side of the river Suire; this river is broad and rapid, but has no bridge over it. The quay of Waterford is half a mile in length, and very broad.

Those ruffians, called White Boys, over-run the counties of Kilkenny, Waterford, Wexford, and Carlow. These people are peasants, who do not chuse to pay either tythes or taxes, and have large nocturnal assemblies, on horseback and on foot, well armed, and with shirts over their cloaths, from whence

the appellation of White Boys is derived. They stroll about the country, burying people alive, cutting their noses and ears off, firing farm houses and barns, and committing other depredations and barbarities. They never rob nor molest travellers, but the principal objects of their revenge and cruelty are tythe and tax gatherers, as well as landlords, who attempt to raise their rents. Many considerable rewards have been offered for apprehending any of them, and now and then one or more are escorted to the gallows by a regiment of soldiers. These people are so numerous in these counties, that it is not likely they will be soon extirpated. Thundering excommunications are read against them from the pulpits, but these are of little use, and they treat them with deserved contempt.

Another set of insurgents, who called themselves Oak Boys, rose some years ago in the north of Ireland. These people refused paying the tythe of their potatoes, and told the priests, that they ought to be satisfied with the tythe of what grew above ground. These people were so numerous, that they carried their point, and in those parts their potatoes are tythe free.

From Waterford I went over the Noire at New Ross, and arrived at Wexford, which consists of a main street, and is not unlike Falmouth for size, situation, and dirtiness.

This ingenious writer proceeds to tell us of the towns he did not go through, and, consequently, could not describe; but as this will neither satisfy us, nor our readers, we shall collect, from the best travellers and historians, some further account of Ireland, and its inhabitants.

The province of Connaught is very mountainous, very thinly inhabited, and the few who live in this province are very unpolished and ignorant. Amazing numbers of sheep and bullocks are bred here, particularly in the counties of Clare and Galway: it is well supplied with fish, being watered by several rivers.

In this province Galway is the largest county, and is nearly equal to Corke: it is in general very fertile both in corn and pasturage. The city of Galway is seated on a noble bay, and has many harbours and roads on every side. The city is neat, strong, and flourishing, and well situated for trade to France, Spain, and the West-Indies. The harbour is about two miles from the city, to which the goods are brought in lighters. This city was once the see of a bishop, but is now in the archbishoprick of Tuam. This is almost the only place on their coast that carries on any foreign trade. Here is a very considerable herring fishery.

Tuam, though now but a poor inconsiderable place, was once a famous city. It has been the see of an archbishop ever since the beginning of the sixth century.

The county of Clare contains very few towns, but the air and soil are good. At the town of Clare are barracks for two companies of foot.

The county town is Ennis, and is by much the best in it. Killaloe is a bishop's see, and has the privilege of a fair market; it stands on the Shannon, and was once much more considerable than it is at present. This diocese contains one hundred parish churches beside chapels.

The county of Sligo is very mountainous, and the air is unhealthy in the plains and villages, owing to its being so full of bogs. Sligo is the capital town which stands in a bay. The town is not very large, but is pretty populous. The harbour is deep and good, but the trade is inconsiderable. In this county are many caves and recesses, which are called the giants houses, and are supposed to have been made by the Danes.

The county of Mayo is on one side inclosed by the sea, and abounds in lakes; the air is moist and cold, especially upon the mountains. Mayo, the county town, was formerly a bishop's see, but is now annexed to the archbishoprick of Tuam. This

5 Longitude West from A London

PART OF ENGLAND

town stands on the borders of Sligo, at the mouth of the river Mayo.

The only parliamentary borough in the county is Castlebar, which contains barracks for a troop of horse, and stands on a little river.

The county of Roscommon is very healthy; the air is clear, and the soil is good. The county town, which bears the same name as the county itself, is very insignificant, and contains nothing worth observation.

Ballina Sloe is a small town in this county, and has a very large beast fair, which is kept twice a year.

The county of Leitrim is very mountainous; the town was formerly a good one, but is now run to decay. This county is famous for grazing large numbers of cattle.

We will conclude our account of Ireland with some further observations on its religion, government, language, manners, customs, trade, &c.

The same religious establishment prevails in Ireland which does in England: but popery, of the most absurd and ridiculous kind, is prevalent in the interior and uncultivated parts of the country, and indeed with the bulk of the people all over the kingdom. The papists in Ireland retain their nominal dignities and bishopricks, but there is no salary annexed to them, and they are obliged to subsist upon voluntary contributions. Though the papists are very blind in their submission to their priests, yet conversions to the protestant faith are numerous and frequent in large towns and communities. Ever since the reign of king James the First, great efforts have been made in erecting free schools, for the converting and civilizing the Irish papists. The incorporated society for promoting English protestant working-schools has been amazingly successful.

The kingdom of Ireland contains nearly as many sectarists as England, particularly presbyterians, baptists, quakers, &c. Mr. John Wesley has disseminated his strange tenets here; and he has succeeded beyond his most sanguine expectations, in reclaiming many of the inhabitants, particularly the Roman catholics.

The government of Ireland is much the same as that of England. The viceroy is styled lord lieutenant, and supports great dignity and grandeur. He has a privy council to assist him on all important occasions, which are composed of the great officers of state, and such others as the king chuses to appoint. The Irish parliament is convened, prorogued, and dissolved at the king's pleasure. The laws made by the Irish parliament are sent to England for the royal sanction, and, if approved of by the king and council, they pass the great seal of England, and are returned. It may be said, that the government of Ireland is composed of four states, viz. king, council, lords, and commons; as the approbation of our privy council is necessary to the establishment of any Irish law.

The Irish, Welsh, and Highlanders, can understand each others language, which proves that they are fundamentally the same. The present inhabitants of Ireland are certainly a medley of the antient Irish, and of English and Scotch emigrants. Their music is the bagpipe, but their tunes are generally melancholy. Some of their old customs still prevail in the interior parts of the country, particularly their funeral howlings. The lower sort of people place the corpse of a friend or relation on a table before their doors, having a plate on the body, in order to excite the charity of passengers. This custom prevails even in the vicinity of the capital. The Irish pay a very slender regard to the sabbath.

The trade of Ireland consists chiefly of linen cloth, yarn, lawn, and cambric, and they export and import a great number of articles too tedious to enumerate.

Having completed our account of Ireland, we will in the next place present our readers with an impartial description of the kingdom of Scotland, and the islands thereto belonging, and close the history of

Europe, with travels through Wales, England, and the adjacent islands.

The latest traveller through Scotland, of any consequence, is Dr. Samuel Johnson, a gentleman very well known in the republic of letters. He has written many celebrated political pieces, particularly one upon the breaking out of the present rebellion in America, entitled, Taxation no Tyranny; and his literary fame is fully established by his very famous dictionary. Many other productions have been sent into the world by this great and witty man; and it may not be amiss to tell our readers, that his present majesty, seeing the doctor viewing his (the king's) library, said to him, "Dr. Johnson, I wonder you have never written more." "Sire," replied the doctor, "I think I have written enough." "So should I too," said his majesty, "if you had not written so well."

The above writer tells us, that he determined to make the tour of Scotland, which he began in company with Mr. Boswell, in the autumn of 1773.

Edinburgh is a city too well known to need much description; but for the benefit of our readers, who are not acquainted with this capital of Scotland, we will give a summary account of it.

At the east end of the city stands Holyrood-house; from whence a large, spacious, and handsome street leads up to the castle, which is about a mile from the palace. This street must be steep, as the castle is very high, and Holyrood-house is situated at the lowest part of the city. On each side of this street there is a considerable descent through windings and alleys, so that which way soever you turn, you go down hill immediately: by which description you will perceive that the city of Edinburgh stands upon the narrow ridge of a long ascending mountain.

On the north side of the city was formerly a lake of water, but it is now quite drained. A very handsome bridge is built over this vast cavity: this is a late erection, and a very handsome one it is; the late bridge, in the year 1769, unfortunately fell in, and several people were buried in the ruins. This bridge connects the old and new town of Edinburgh, and renders it very convenient to passengers, who must otherwise descend this amazing declivity, and ascend it on the opposite side. A new road is begun, over this bridge, to the town of Leith, which is a seaport, and is about a mile and a half from Edinburgh. On the Leith side of this bridge they have nearly completed the new town of Edinburgh, which, for the magnificence and elegance of the buildings, may vie with any other place of its size in the known world. The houses are all of stone and very large, the pavement is remarkably good; and what with its cleanliness and grandeur, it is quite a contrast to the old town, and the admiration of all who behold it.

The city of Edinburgh is so ancient, that no history has recorded when it was built; yet it seems natural to conclude, that such a situation could not be chosen but for a retreat from the outrages of enemies and invaders, particularly the Britons, Saxons, and Danes; for having an almost impregnable castle at the west end, and a lake on each side, the inhabitants had nothing to defend but the entrance at the east end, which it was very easy to fortify in a short time.

No reason but this, could have induced the builders of this famous city to chuse such an extraordinary situation (which, in many respects, is very inconvenient), when they had a delightful and pleasant valley so near it, with the sea flowing up to one side, and a river running through the middle of it; such as that space of ground between Edinburgh and the sea, where the town of Leith stands. Here they would have had a pleasant, as well as useful situation, a good harbour for their trade, a good road into the Forth for their ships of burthen, and a pleasant river, which, with a little art and expence, might have been drawn round the town, have filled its ditches, and made its fortifications almost impregnable.

The

The houses in Edinburgh are in general built with a rough kind of stone, undressed, which is very durable, and are mostly covered with blue slate. Every stair-case is called a turnpike, and the whole building is termed a land. Families of the most consequence only possess a floor of this building, and the turnpike is the common stair-case for all the inhabitants, which are very numerous, as the houses are in general nine or ten stories high. The nobility and gentry have lately grown tired of this inconvenient way of living, and have whole houses to themselves, in some of the new squares, or else in the new town.

The parliament-house is a convenient and large structure, and stands in a square called the Parliament-Close. The courts of justice, the council-chamber, exchequer, and several other courts, are kept in the Parliament-House.

The Royal Exchange is a handsome building, which has lately been erected; it forms a large square, and is intended for the merchants to assemble in; but, for some cause or other, the merchants prefer standing in the open street, even in wet weather, to transact their business. The merchants of Edinburgh are not singular in this practice; for those at Bristol, and some other places, do the same.

The university of Edinburgh stands near the Potter-Row Port: it consists of three courts, two lower and one upper, which is equal to the other two. These courts are encompassed with buildings for the use of those students who chuse to reside in them: they do not live in common, as at other universities, but only attend their classes at certain hours. The public schools are large and commodious, and the dwellings for the professors are extremely handsome. This university was founded anno 1580, by James VI. The persons established by the foundation were, a principal, a primate, a professor of divinity, four regents or masters of philosophy, and a professor of philology or regent of humanity. In 1640, the town added a professor of mathematics; to which have been lately added professors of ecclesiastical history, civil law, theoretical and practical medicines, chemistry, rhetoric, and the belles lettres. The dignity of chancellor, and vice-chancellor of the university is vested in the lord provost and town council.

There is a good library in the university, which has lately been increased by the donations of persons of quality, citizens, &c. Over the books, which are very neatly kept, are the portraits of several princes and reformers. The original of the Bohemian protest against the council of Constance, for burning John Hus and Jerom of Prague, anno 1417, is preserved in this library, with one hundred and five seals of Bohemian and Moravian grandees annexed to it.

The hospital is a large and stately building, and pleasantly situated: it is a nursery for an indefinite number of the sons of freemen, who are maintained, clothed, and educated in useful learning, till they are fit for apprenticeship, or to go to the university.

They have likewise an infirmary at Edinburgh, which is a good building, it is well founded, and very convenient both for the patients and the chirurgical operations upon them. This building was erected by the inhabitants, and they undertook it with great spirit; the proprietors of several stone quarries made presents of stone, others of lime; merchants contributed timber; wrights and masons were not wanting in their contributions; the neighbouring farmers agreed to carry materials gratis; the journeymen masons contributed their labours for a certain quantity of hewn stones; and, as this undertaking is for the relief of the diseased, lame, and maimed poor, even the day labourers would not be exempted, but agreed to work a day in the month gratis towards the erection. The ladies contributed, in their way, to it, for they appointed an assembly for the benefit of the work, which was well attended, and every one contributed bountifully.

In the way to Leith, on the north side of the city, is a botanic garden, which contains a great number of

exotic plants and simples. Buildings for pleasure, as well as profit, are erected in Edinburgh, and we must not forget that there are many places of devotion. The established religion being presbyterian, the churches are unornamented and exceedingly dirty; in short, they contain nothing worthy notice, we shall therefore pass them over.

A theatre is built at the end of the new bridge, on the new town, which was raised by the subscriptions of a certain number of gentlemen, who let it originally to a manager for four hundred pounds a year. The building is a good one, and capable of containing a great number of people. Mr. Ross was the first person who took it, and his name was inserted in the patent, which made him manager as long as he chose. Formerly plays were not in that estimation here in which they are now held: the ministers, zealous for the good of their flocks, preached against them, and the poor players were quite routed; they have now, however, once more taken the field, and the clergy leave them to their own ungodliness. During these contests, Mr. Ross found that the benefits of the theatre did not answer the expences of it, and accordingly founded a retreat.

The late Mr. Foote, who thought he had wit enough to laugh the Scotch out of their money, took it of Mr. Ross at the price he originally paid for it. He brought on all his own comedies successively, but as most of the humour was local and particular, only few people understood it: but when, in the course of acting, Mr. Foote attempted to play the Minor upon the stage, the ministers, who had long lain dormant, rose up in arms: the character of Mrs. Cole gave them offence. The Scotch clergy, not content with damning the play itself, very piously pronounced damnation on all who went to the performance. Parties were raised, and many were so wicked as to insist on its being played; the unrighteous triumphed, and the poor play was performed. Foote, however, found that to gain only half the town did not answer his purpose, the whole of it being necessary; and therefore, when he found that he could not bring them into good humour, he retired with a moderate sum of money, and let the theatre to Mr. Digges for five hundred pounds a year.

The theatre is of an oblong form, and is capable of containing about a hundred and thirty pounds. The ornaments are few, and in an unaffected plain stile: it is lighted with wax, and the scenery is well painted. The whole of their machinery is, unluckily, very bad, and therefore they seldom exhibit any harlequin entertainments. The upper galleries, what we in London term the gods, are very compassionate divinities: you sometimes hear the murmurings of displeasure at a distance, but they never rain down oranges and apples on the heads of the unfortunate actors. Probably, from an attention to these small and trivial circumstances, we discover more of the real manners of a people than from the greater; and more public events in life, where the passions are naturally excited, and the men act under a disguise. A boisterous Englishman, who thinks it a part of his privilege to do what he thinks proper, provided neither the laws nor no magna charta forbid it, when he takes a dislike to an actor, drives all the players off the stage, puts an end to the performance, and insults the whole audience. A Scotchman and a Frenchman, whom the remains of an arbitrary government in one instance, and an established one in the other, has softened and humbled, keep their quarrels to themselves, consider the poor players as incapable of resistance, and shew their dislike to them only by not applauding them.

One instance of Scotch partiality to their own nation the writer of this work cannot avoid mentioning, as it was so glaringly partial. The entertainment of Love a la Mode was to be exhibited, and Mr. Woodward was destined to fill the part of Sir Archy M'Sarcasin: because this character rather reflects upon the Scotch, the audience would not suffer

suffer him to perform it, and the evening's amusement was accordingly broken up.

In the summer evenings you may amuse yourself at Edinburgh by visiting Comely garden, which is a newly established place. There is an orchestra in the garden for music and singing: fireworks are sometimes exhibited, and the entertainment concludes with dancing, in two ball-rooms built for that purpose. Comely garden is situated near Arthur's seat and other adjacent hills, which form a natural amphitheatre, well adapted for the purpose to which this spot is now appropriated.

The city of Edinburgh is governed by a lord provost, whose office is much the same with that of the lord mayor of London: four bailties, who, besides the power of aldermen in the government of this city, have that of sheriff; and a common council, ordinarily consisting of twenty-five persons, but extraordinarily of thirty-eight. All these are chosen annually, and the provost, dean of Guild, and treasurer, must be merchants; or, if any tradesman is chosen, he must quit his trade, and not return to it; without leave of the magistrates and town-council; he must also have been a year or two a member of the common council.

The trained bands of the city consists of sixteen companies; besides which, they have a standing company of town-guards, who do not cut a very respectable appearance; they very much resemble the Chelsea pensioners, or one of the oldest companies of invalids.

Besides the twelve established churches of Scotland, there are several meeting-houses, where episcopalians, methodists, seceders, &c. perform divine worship. The churches are always full, and the sabbath is much more regarded in Scotland than in England; though their former strictness, in this respect, is very much worn away.

The castle of Edinburgh is very strong; it is situated at the west end of the city, where the rock rises to a high and large summit; it is inaccessible on the south, west, and north; the entrance is from the town, where the rock is also very high; it is defended by a round battery, and an outwork at the foot of it, with a draw-bridge. In the upper part of the castle is a guard-house, and the fortress is defended in different parts by several batteries of heavy cannon. In the castle is a royal palace of hewn stone, where the regalia, and the chief records of state are said to be kept: The governor, fort-major, ordnance-storekeeper, and many officers, both civil and military, have habitations in the castle, which forms a complete garrison. The ordnance and store-houses are, to the credit of Mr. Bartlett, the present storekeeper, in very nice order. He is a sensible and obliging man.

From the castle is a delightful prospect over the city and neighbouring country, and to the river of Forth, from whence it is saluted by such men of war as come to anchor in Leith roads. The governor of the castle is always a person of rank, and general of the forces.

Holyrood-House is a handsome building; it may be called the scerial of Scotland, being both a royal palace and an abbey; it was founded by King David I. for canons regular of St. Austin, who named it Holyrood-House. The entrance is adorned with pillars of hewn stone, under a cupola in the form of an imperial crown, balustraded on each side: the fore-part has two wings, on each side of which are two turrets: that towards the north was built by King James the Fifth; and that towards the south, as well as the west, by King Charles the Second; Sir William Reeve was the architect.

Our traveller says, We left Edinburgh on the eighteenth of August, and directed our course northward along the coast of Scotland: as we passed the Frith of Forth, we took notice of Inch Keith, which is a small island: here, by climbing with some difficulty over shattered crags, we made the first experi-

ment of unfrequented coasts; at least they were so to us. This island is nothing more than a rock covered over with a thin layer of earth, not wholly bare of grass, and produces abundance of thistles. A small herd of cattle graze upon it in the summer, but it seems never to have afforded to man or beast a permanent habitation. Here are only the ruins of a small fort, not so much injured by time but it might easily be brought to its former strength: it was never very strong, but seems designed only to cover a few soldiers, who might have had the charge of a battery, or were appointed to give signals. There is no provision of water within the walls, though the spring is very near it, and might easily have been inclosed.

After we left this island, our thoughts were employed on the different appearance it would have made had it been placed at the same distance from London as it is from Edinburgh, and with the same facility of approach. A few rocky acres would there be so novel, that the purchase would have been very considerable, and it would have been cultivated and adorned with very expensive industry.

We passed through Kinghorn, Kirkaldy, and Calpar, which places are not unlike the straggling market-towns in England, where opulence has not been produced by commerce or manufactures.

We met but few passengers, though the distance is so small from the capital: the roads are neither rough nor dirty, and you travel very commodiously without the interruption of turnpikes. The bottom of these roads is rocky, and it requires a great deal of labour to make them smooth at first, but they seldom or never want repairs. The carriages in common on the Scotch roads are each drawn by a small horse, and a driver of a two-horse-cart acquires some degree of consequence and importance.

We arrived at St. Andrew's at a late hour: this city was once archiepiscopal; and that university still subsists, where philosophy was formerly taught by Buchanan, whose name has a fair claim to immortality.

Lodgings were provided for us, by the interposition of some invisible friend, at the house of one of the professors, where we quickly forgot that we were strangers, on account of the easy civility with which we were treated. During our stay here, we were entertained with all the elegance of lettered hospitality, and gratified by every mode of kindness.

On the morning after our arrival we rose to perambulate the city, which history alone shews to have once flourished: we surveyed the ruins of ancient magnificence, and these cannot long be visible unless some care is taken to preserve them: the pleasure of perceiving such mournful memorials cannot be very great. Till very lately, these ruins have been so much neglected, that every person carried away the stones who fancied that he wanted them.

A small part of the wall, and the foundations of the cathedral, are still visible; it appears to have been a spacious and majestic building, and not unsuitable to the primacy of the kingdom: It is well known that this, with many others, suffered by the tumult and violence of Knox's reformation.

A fragment of the castle stands near the cathedral; on the margin of the water, in which the archbishop antiently resided. This castle was never very large, and was built with more attention to security than convenience.

Eager and vehement as the change of religion in Scotland was, it raised an epidemical enthusiasm, compounded of warlike ferocity and sullen scrupulousness, which (in a people whom idleness resigned to their own thoughts, and who, conversing with each other, suffered no dilution of their zeal from the gradual influence of new opinions) was long transmitted from father to son in its full strength, but now, by trade and intercourse with England, it is visibly abating and giving way too fast to their laxity of practice and indifference of opinion, in which men not sufficiently instructed to find the middle point too easily shelter themselves from rigour and restraint.

When the city of St. Andrew's lost its archiepiscopal pre-eminence, it gradually decayed. One of its streets is now entirely lost; and in those that remain, there is the silence and solitude of gloomy depopulation and inactive indigence.

The university till lately consisted of three colleges, but they are now reduced to two: St. Leonard's college was dissolved, and its revenues appropriated to the professors of the two others. This dissolution was necessary, but of that necessity there is reason to complain. It is surely not without just reproach, that a nation, of which the commerce is daily extending, and the wealth increasing, should deny any share of its prosperity to its literary societies; and should suffer its universities to moulder into dust, whilst its merchants or its nobles are raising palaces.

One of the two colleges yet standing is appropriated to divinity, and is capable of containing fifty students. The library is not very spacious, but elegant and luminous. This university seems eminently adapted to study and education; it is situated in a populous, yet cheap country, and the minds and manners are not exposed to the gross luxury of a commercial town, nor to the levity and dissoluteness of a capital city; these places are naturally unpropitious to learning; in one, the desire of knowledge is in danger of yielding to the love of money, and in the other it too easily gives way to the love of pleasure. The students of both the colleges do not at present exceed an hundred; perhaps their number would be increased, were there an episcopal chapel in the place. There is no reason to impute the fewness of the numbers to the present professors; nor can the expence be any reasonable objection, for a student of the highest class may keep his session or term, which lasts seven months, for about fifteen pounds, and one of a lower class may do it for ten, in which are included board, lodging, and instruction.

The vice-chancellor, or chief magistrate of this university, was formerly styled lord Rector, but being addressed only as Mr. Rector by the present chancellor, he has fallen from his former dignity of style. Our ancestors very liberally annexed the title of lordship to any station or character of dignity. They used to say, *Lord Ambassador* and *Lord General*; and we still say, *My Lord*, to a judge upon the circuit, and retain in our liturgy, *The Lords of the Council*.

As we were walking among the ruins of religious buildings, we came to two vaults, over which the house of the subprior formerly stood. One of these vaults was inhabited by an old woman, who claimed the right of abode there, or the widow of a man whose ancestors had possessed the same gloomy mansions for the four preceding generations. The old woman lives undisturbed; the right, however it began, was considered as established by legal prescription. The old woman thinks, likewise, that she has a claim to something more than sufferance; for as her husband's name was Bruce, she is allied to royalty, and told us, that when there were persons of quality in the place, she was distinguished by some notice; that indeed she is now neglected, but she spins a thread, has the company of her cat, and is troublesome to nobody.

We left this city with good wishes, having reason to be highly pleased with the attention that was paid us; though the kindness of the professors did not contribute to abate the uneasy remembrance of an alienated college and a declining university. Had this university been destroyed two centuries ago, we should not have regretted it; but to behold it struggling for life, and pining in decay, fills the mind with ineffectual wishes, and mournful images.

It was now our business to pursue our journey, as we knew that sorrow and wishes were in vain. The traveller finds very little amusement in the roads of Scotland; he seldom sees himself either overtaken or encountered, and has nothing to contemplate but grounds that have no visible boundaries, or are separated by walls of loose stone. From the bank of the Tweed to St. Andrew's, are very few trees that have

not been planted within this century. Undoubtedly, the lowlands of Scotland had once their portion of woods with other countries; as architecture and cultivation prevail by the increase of people and the introduction of arts, forests are every where gradually diminished. Few regions have been denuded like this, and many centuries must have passed in waste, without the least thought of future supply. No other account can be given of this improvidence, than that it probably began in times of tumult, and continued because it had begun. Long established custom is not easily broken, till some great event shakes the whole system of things, and life seems to recommence upon fresh principles. It is no valid apology, that before the union, the Scotch had little trade and little money, for plantation is the least expensive of all methods of improvement.

We went over the frith of Tay, where, though the water is not wide, we paid four shillings for ferrying the chaise. The necessaries of life in Scotland are easily procured, but elegancies and superfluities are of the same price as in England, and therefore may be considered as much dearer.

We stopped a while at Dundee, which stands at a little distance from the Tay; but they are joined by a causeway or wall, well paved with free-stone, and rows of trees are planted on either side of the walk, which make it very agreeable. On one part of this walk are very good warehouses for merchandises, especially for heavy goods, and also granaries for corn, of which they have sometimes large quantities laid up here. They are famous at Dundee for their thread manufacture. This town was stormed and plundered by Cromwell and the English army.

They have lately built a new church at Dundee, in a style which does credit to the place. There is not a relic left of the antient castle.

We mounted our chaise again, and came about the close of the day to Aberbrothick; the monastery of which is of great renown in the history of Scotland. Ample testimony of its antient magnificence is afforded by its ruins. Its extent must have been considerable, and its height is known by some parts yet standing. The arch of one of the gates is entire, and a square apartment of great loftiness is yet standing. Two corner towers particularly attracted our attention. One of the company scrambled in at a high window, but discovered nothing but a pair of broken stairs. Men skilled in architecture, might form an exact grand plot of this venerable edifice, but this we did not attempt.

We travelled on to Montrose, leaving the fragments of magnificence at Aberbrothick. Montrose is well built, airy, and clean: the town house is a handsome fabric, and the English church is remarkably clean and neat; it has commodious galleries; and what is very uncommon in Scotland, it has an organ.

From the commercial opulence of the place, we apprehended we should be well entertained at our inns, but in this we were disappointed. We observed that the innkeeper was an Englishman, and made all the apologies for him we could.

An opportunity offered of observing what had never been known before, that common beggars were very numerous in this country. The proportion in Edinburgh is not less than in London, and in the country towns much greater than in English towns of the same extent; they are not, however, so importunate and clamorous as the English beggars, they solicit alms very modestly, and therefore, though their behaviour may strike the heart of a stranger, yet they are in danger of losing the attention of their own countrymen; an unaccustomed mode of begging excites an uncommon degree of pity, and novelty has always some power.

The town of Montrose has several good buildings, and an hospital for the poorer inhabitants. It consists of one long street, and another shorter at the end of it. The street is broad and well paved, and the Presbyterian kirk is tolerably decent. This town gives
the

the title of duke to the antient and noble family of Graham.

We left Montrose, and in the afternoon, observed, that we were not far from the house of lord Monboddo. The persuasive nature of his conversation easily drew us out of our way, and the entertainment we received at his lordship's would have amply recompensed a much greater deviation.

One would imagine, that the further you went from Edinburgh, the roads would be rougher, but hitherto they were far from incommodious; we travelled on with the gentle pace of a Scotch driver, who, having no rivals in expedition, neither gives himself nor his horses any unnecessary trouble. As we did not feel any impatience, we did not affect any, but were mutually satisfied with each other's company, as well riding in the chaise as sitting at an inn. The night and the day were equally safe and equally solitary, for where there are few travellers, consequently there are few robbers.

When we came to Aberdeen, we found the inn so full, that had not a friend been acquainted with the landlord, we should not have gained admission. After he discovered himself, we found a very good house and civil treatment.

The next day I received a very kind letter from Sir Alexander Gordon, with whom I was formerly acquainted in London, and after a cessation of all intercourses for near twenty years, I met here the professor of physic in the king's college. These unexpected renewals of acquaintance and friendship must certainly be numbered among the most pleasing incidents of this mortal life.

My acquaintance with Sir Alexander soon procured me the notice and attention of the rest of the professors, and I did not want any token of respect or regard, as I was conducted wherever there was any thing which I desired to see, and was at once entertained with the kindness of communication, and the novelty of the place.

It has the appearance of very frivolous ostentation to write of the cities of our own island with all the solemnity of geographical description, as if we had been cast upon a newly discovered coast; yet as Scotland is very little known to the greater part of those who may happen to read these observations; it is not superfluous to say, that Aberdeen is divided into the Old and New town, but is governed by the same magistrates.

The Old town of Aberdeen is the antient episcopal see, where the remains of the cathedral are still to be seen. It has the appearance of a city in decay, having been erected in times when commerce was yet unstudied.

The chief ornament of this town is the king's college, on the south side of it, which is a neat and stately structure. The church and steeple are built of hewn stone, and the summit of the latter resembles an imperial crown. The windows of the church were formerly esteemed for their paintings, and something of their splendor still remains. Near the church is a library, well furnished with books.

There is likewise a college in New Aberdeen, or, in stricter language, an university; for there are professors of the same parts of learning in both, and they hold their sessions, and confer their degrees independently of each other.

New Aberdeen is about a mile distant from the Old, situated at the mouth of the river Dee. It is the county town, and consequently the seat of the sheriff's court. This town exceeds all in the north of Scotland, for largeness, extent, and beauty. The houses are large and lofty, and the streets spacious and clean. They build almost wholly with the granite used in the London pavement, which is well known not to want hardness, yet they shape it easily. It is beautiful, and must be very lasting. This town stands in a wholesome air, has a great revenue from its salmon fishery, and its inhabitants are very courteous and polite. It stands upon three hills, the main part

upon the highest, and the skirts of it extend into the plain.

Great numbers of the people of Aberdeen, and indeed of almost all this country, are of the episcopal persuasion; so that were it not for the legal establishment, the presbyterian preachers would have but slender incomes. At Aberdeen and Petershead they have beautiful chapels with organs. There are in this place two meeting-houses of the English church, viz. St. Paul's chapel and the Trinity church; two of the non-jurors under a titular bishop of Aberdeen; two of the Roman catholics; one of the seceders or dissenters from the established kirk; one of the Quakers, and one of the Independents. The principles of methodism have likewise spread thus far, and Mr. John Wesley has erected a handsome octagon chapel here.

The herring fishery is a common blessing to all the shore of Scotland, and were it properly improved, would be like the Indies, at their doors.

Here is a very good linen manufacture, also of spun silk and worsted stockings, which they send to England in large quantities, as well as to Holland and the north seas. They likewise export a good deal of pork, pickled and put up in barrels, which they sell chiefly to the Dutch, for the victualling the East-India ships, &c. The Aberdeen pork has the reputation of being the best cured, for keeping on very large voyages, of any in Europe. In a word, the people of Aberdeen are universal merchants.

The king's college, as before-mentioned, stands in Old Aberdeen. Boethius was the first president, who may be justly revered as one of the revivers of the antient learning. He was acquainted with Erasmus, when he studied at Paris, who afterwards complimented him with a public testimony of his esteem, by inscribing to him a catalogue of his works. Though the stile of Boethius may not always be elegantly pure, yet it is founded upon antient models, and is wholly uninfected with monastic barbarity. His fabulousness and credulity are justly blamed, though his history is written with elegance and vigour. If he was the author of the fictions, his fabulousness was a fault, for which no excuse can be made; but his credulity may be apologized for in an age when all men were very credulous. Learning was then rising in the world; but ages, so long accustomed to darkness, were too much dazzled with its light to see any thing distinctly. The writers of the fifteenth century were, for the most part, learning to speak rather than to think, and were therefore more studious of elegance than veracity. The cotemporaries of this great man thought it sufficient to know what the antients had delivered. The examination of tenets and facts were received as matter of discussion for future ages or generations.

When Boethius was president of the college, he enjoyed a revenue of forty Scottish marks, which is about two pounds four shillings and sixpence sterling. It is difficult now so to raise the value of money, or so to diminish the value of the necessaries of life, as to imagine forty-four shillings a year an honourable stipend; yet it was probably equal, not only to the necessities, but the rank of Boethius. The wealth of England at that time was undoubtedly to that of Scotland, in the same proportion as five to one, and it is known that Henry the Eighth, amongst whose crimes avarice was never reckoned, granted to Roger Ascham a pension of ten pounds a year, as a reward of his learning.

The college in the New town of Aberdeen, is called the Marischal college. The hall is spacious and well lighted: here is the picture of Arthur Johnston, who was president of the college, and who holds among the Latin poets of Scotland the next place to the elegant Buchanan. In the library of this college are some curious manuscripts, particularly a Hebrew one of excellent penmanship, and a Latin translation of Aristotle's politics, by Leonardus Aretinus, written in the Roman character with great beauty and nicety. As the art of printing has rendered manuscripts no longer necessary, they are not now to be found. This

was one of the latest performances of the transcribers, for Aretinus died about twenty years before the art of printing was invented.

The methods of instruction in both these colleges are nearly the same: the students wear scarlet gowns, and the professors black, which is the academical dress in all the Scottish universities, Edinburgh excepted, for there the scholars are not distinguished by any particular habit. A public table is kept in the king's college, but the students of the Marischal college are boarded in the town. According to the best information I could obtain, the expence of living here is somewhat more than at St. Andrew's.

The course of education is extended to four years, at the end of which, those who take a degree, become masters of arts; and he may, if he pleases, immediately commence doctor; this title, however, was for a long time only bestowed upon physicians. The ministers were not ambitious of titles, nor were afraid of being censured for ambition; but they are now reconciled to distinction, and think graduation a proper testimony of uncommon acquisitions or abilities. It is to be wished that academical honours, or any others, might be conferred with an exact proportion to merit, but that is more than human judgment or human integrity has hitherto given us any reason to expect. It may be, that degrees in universities cannot be better adjusted, than by the length of time passed in the public profession of learning. An English, or an Irish doctorate cannot be obtained by a very young man; and it is reasonable to suppose, that he, who is by age qualified to be a doctor, has in so much time gained learning sufficient not to disgrace the title, or sense sufficient not to desire it.

The universities in Scotland hold but one session in the year. That of St. Andrew's lasts eight months, and that of Aberdeen only five.

We were invited into the town hall of Aberdeen, where I had the freedom of the city given me by the lord provost. This honour had all the decorations that politeness could add; and, what I am afraid I should not have had to say of any city south of the Tweed, here were no petty officers bowing for a fee: the parchment, which contained the record of admission, is, with the seal appending, fastened to a ribband; and it is expected that it should be worn for one day by the new citizen in his hat.

The earl of Errol was informed of our arrival by a lady, who saw us at chapel, and his lordship invited us to his seat, called Slane's castle. The road beyond Aberdeen grew more stony, and was quite naked of all vegetable decoration. We went over a track of ground near the sea, which suffered a very uncommon and unexpected calamity not long ago. The sand of the shore was raised by a tempest in such quantities, and carried to such a considerable distance, that an estate was totally overwhelmed and lost. So general was the consequent barrenness, that when the owner of the estate was called upon for the usual taxes, he desired rather to quit the land than pay them.

We arrived at Slane's castle, which is built upon the margin of the sea, inasmuch that the walls of one of the towers seemed only a continuation of a perpendicular rock, the foot of which is beaten by the waves. It seemed impracticable to walk round the house. From the windows of this castle the eye wanders over the sea that separates Scotland from Norway, and, when the winds beat with violence, must enjoy all the majestic and terrific grandeur of the tempestuous ocean. It would seem like inhumanity to wish for a storm, because many must suffer by it; but as storms, whether wished for or not, will sometimes happen, I may say, without any violation of its established principles, that I should willingly look out upon them from Slane's castle.

We were about to depart, but this was prohibited by the countess, till we should have seen two places upon the coast, which she properly judged to be worthy our curiosity; the Buller of Buchan, and Dun

Buy, to which we were kindly conducted by Mr. Boyd.

No man can see the Buller of Buchan with indifference, who has either the sense of danger, or delight in rarity. It is a perpendicular rock, united on one side with a high shore, and on the other, rising steep to a great height above the main sea. From the top, which is open, may be seen a dark gulph of water, which flows into the cavity through a breach made in the lower part of the inclosing rock. It has the appearance of a large and deep well, bordered by a wall. The edge of the Buller is not wide, and to those who walk round, appears very narrow. Whoever ventures to look down, fees, that if his foot should happen to slip, he must fall from his amazing elevation into the water on one side, or upon stones on the other. Notwithstanding these dangers, we went round, and were very glad when the circuit was completed.

By the assistance of some boats and rowers, we explored the Buller at the bottom. When we entered the arch which the water had made; we found ourselves in a place which, though there was no real danger, we could scarcely survey without some recoil of the mind. The basin on which we floated was nearly circular, and about thirty yards in diameter. We were inclosed by a natural wall, rising steep on every side to so considerable a height as to occasion the idea of insurmountable confinement. Here was a dismal gloom; round us was a perpendicular rock, above us the distant sky, and below an unknown depth of water. Had I any malice against a walking spirit, I would condemn him to reside in the Buller of Buchan, instead of laying him in the Red Sea.

Terror without danger is only one of the sports of fancy; it is a voluntary agitation of the mind, permitted no longer than it pleases. We examined the place with minute inspection, and found many caverns, which, we were informed, went backwards to a depth never explored. We had not time nor inclination to try them; they are said to serve different purposes: ladies in summer bring hither their collations, and smugglers make them convenient storehouses for their clandestine merchandize. It is very probable, that the pirates of antient times used them as repositories of plunder, or magazines of arms.

Don Buy, which is said to signify the yellow rock, is a double protuberance of stone, parted from the land by a narrow channel on one side, and open to the main sea on the other. Its name and colour arise from the dung of innumerable sea fowls, which in the spring resort hither to lay their eggs, and their young are taken in great abundance.

We continued our journey next morning, much pleased with our reception at Slane's castle, of which we have had leisure to recount the elegance and the grandeur; for our way afforded us very few topics of conversation. The ground was neither uncultivated nor unfruitful, but it was still all arable: of flocks or herds there was no appearance.

Before we could enter the town of Bamff, we were obliged to ford the Deveron, which is a very broad river. On its banks we had a fine prospect of the town; adjoining to which is a grand modern building of the earl of Fife, of the kingdom of Ireland: this building is high, square, and full of columns of noble architecture on every side; it has also towers at every corner, and also in the middle.

Bamff is a neat town, consisting of two long streets, and several short ones; there are also some neat buildings in it, and two small harbours for shipping, but large vessels cannot come near them.

At Bamff nothing particularly claimed our attention. The antient towns of Scotland have generally an uncommon appearance to Englishmen. The houses, whether large or small, are generally built of stone: their ends are now and then next the streets, and the entrance into them is frequently by a flight of steps, which reaches to the second story, and the floor,

floor, which is level with the ground, is entered by stairs descending within the house.

The Scotch are more frugal of their glass than the English, and they often compose a square of two pieces, not joining like cracked glass, but with one edge laid half an inch over the other. Their windows do not move upon either hinges or pullies, but are pushed up and down in grooves; and he who would have his window open, must hold it with his hand, unless he is a good contriver, and sticks a nail into the hole to keep it from falling.

It generally happens, that what cannot be done without some uncommon trouble, or particular expedient, will not often be done at all. The incommodiousness of the Scotch windows keeps them shut; and though there is an absolute necessity for ventilating human habitations, this necessity has not yet been perceived by our northern neighbours. A stranger may sometimes be forgiven, even in houses well built and elegantly furnished, if he allows himself to wish for fresher air.

Some people think, that these diminutive observations, if I may so call them, take away from the dignity of writing, and therefore are never communicated without hesitation, and a little fear of contempt. These people should recollect, that life consists not in a series of illustrious actions, or elegant enjoyments; the major part of our time passes in the performance of daily duties, in compliance with necessities, in the removal of small inconveniences, and in the procurement of petty pleasures. We are pleased or displeased, as the main stream of life glides on smoothly, or is ruffled by small obstacles and frequent interruption. The state of common life is the true state of every nation. The manners of a people are not to be found in the palaces of greatness, nor in the schools of learning, where the national character is obliterated, or obscured, by travel or instruction, by vanity or philosophy; nor is public happiness to be estimated by the banquets of the rich, nor the assemblies of the gay. They who compose the greater part of nations are neither rich nor gay, but are to be found in the streets and in the villages, in the shops and in the farms; from these people, collectively considered, the measure of general prosperity must be taken. A nation is refined as they approach to delicacy; and a commercial nation must be denominated wealthy, as their conveniences are multiplied.

No particular engagements detained us at Bamff; we accordingly decamped the next morning, breakfasted at Cullen, and arrived about noon at Elgin, where we had but indifferent accommodations.

The cathedral of Elgin is in ruins, and afforded another proof of the waste of reformation. Enough remains of it to shew that it was once magnificent. On the north side of the choir the chapter house remains entire; and on the south side, another mass of building, which we could not enter, is preserved by the care of the family of Gordon.

This church had, in the intestine tumults of the barbarous ages, been laid waste by the irruption of a Highland chief, whom the bishop had offended; it was gradually restored to its former state, and though at last not destroyed by the tumultuous violence of Knox, yet was suffered more shamefully to dilapidate by frigid indifference, and deliberate robbery. In the books of the council there is still extant an order, dated since the reformation, directing that the lead, which covers the two cathedrals of Aberdeen and Elgin, shall be taken away, and sold for the support of the army. In those times a Scotch army was certainly maintained at a very cheap rate; yet the lead of two churches must have borne so small a proportion to any military expence, that it is hard not to believe the reason alledged to be merely popular, and the money intended for some private purse. This order was obeyed; the two churches were accordingly stripped, and the lead was shipped for sale in Holland. Dr. Johnson says, I hope every reader will rejoice, when he hears that this cargo of sacrilege was lost at sea.

VOL. II. No. 90.

It is not right to be hasty in condemning our neighbours; our own cathedrals are mouldering away very fast. It seems to be part of the despicable philosophy of the times, to despise monuments of sacred magnificence, and we are in danger of doing that deliberately which the Scotch did in the unsettled state of an imperfect constitution.

The town of Elgin is but thinly inhabited, and has but little trade. I believe the episcopal cities of Scotland generally fell with their churches, though some of them have since recovered by the convenience of their situation for commerce. In the chief street of Elgin, the houses project over the lowest story, so that there is sometimes a walk for a considerable length under a portico. Gentlemen of the Highlands leave their habitations in the winter season, and reside at Elgin, where they live in a very amicable manner.

We travelled onwards to Fores, the town to which Macbeth was going when he met the weird sisters in his way. This to an Englishman is classic ground; our imaginations were heated, and our thoughts recalled to their old employments.

Here we had a prelude to the Highlands, and left fertility and cultivation behind us; nothing but heath was to be seen for a great length of road. At Fores we found good accommodation, but nothing worthy of particular remark; and next morning we entered upon the road on which Macbeth heard the fatal prediction.

Nairn is a royal borough, which, if once it flourished, is now in a state of miserable decay. Here we may fix the verge of the Highlands, for here I saw peat fires, and first heard the Erse language. We had no inducement to stay at Nairn longer than to breakfast; and went forward to the house of Mr. Macaulay, the minister, who published an account of St. Kilda, and, by his direction, visited Calder Castle, from which Macbeth drew his second title.

Calder Castle was formerly a place of strength; the draw-bridge is still to be seen, but the moat is quite dry. The tower is very antient, and its walls are of great thickness; they are arched on the top with stone, and are surrounded with battlements.

Fort George is the most regular fortification in the island, and well deserves the notice of a traveller. We were favoured with a letter from a gentleman, who lives at Calder Castle, to one of the officers at Fort George; we went thither the next day, and found a very kind reception. We were led round the works by a gentleman, who explained to us the nature and use of every part, and was entertained by Sir Eyre Coote the governor, with such elegance of conversation, that we had no attention left to the delicacies of his table.

As to the fortifications of Fort George, I shall not attempt to delineate at them scientifically, and a loose and popular description is of use only when the imagination is to be amused. All I shall say is, that there was every-where the appearance of strength, neatness, and regularity.

In consequence of our delay at the first, we came somewhat late to Inverness, which may be called the capital of the Highlands. Hither the inhabitants of the inland parts come to be supplied with what they cannot make for themselves; and hither the young nymphs of the mountains and valleys are sent for education; and, as far as I am any judge, they are not sent in vain.

The town of Inverness was the last place which had a regular communication with the southern counties, and I believe all the ways beyond it have been made by the soldiers of this century. It was here, therefore, that Oliver Cromwell, when he subdued Scotland, stationed a garrison as the boundary of the Highlands. The soldiers seem to have incorporated themselves with the inhabitants, and to have peopled the place with an English race; for at Inverness they talk much better English than in any other town in Scotland.

The walls of the castle of Macbeth are still standing,

ing; it was never any capacious edifice, but stands upon a rock so high and steep, that I think it must have been inaccessible. Over-against this castle Cromwell built a fort, which is now totally demolished, for no party in Scotland ever loved the name of Cromwell, or wished that his memory should be perpetuated.

Cromwell did that in a great degree to the Scotch, which the Romans did to other nations; he civilized them by conquest, and introduced by useful violence the arts of peace. They informed me, at Aberdeen, that Cromwell's soldiers taught them how to make shoes, and to plant kail. How they lived without kail, seems a mystery, for they hardly cultivate any other plant for common tables; and when they had not kail, probably they had no vegetables. The numbers that go barefoot are a sufficient proof that shoes may be dispensed with, and they are not yet considered as necessaries of life; for large boys, not otherwise badly clothed, run without them in the streets; and in the islands, gentlemen's sons pass several of their first years with naked feet.

It may be peculiar to the Scotch to have attained the liberal without the manual arts; to have excelled in ornamental knowledge, and to have wanted not only the elegancies, but the conveniences of common life. Soon after the revival of literature it quickly found its way to Scotland, and from the middle of the sixteenth century to the middle of the seventeenth the politer studies were very diligently pursued. Yet men thus ingenious and inquisitive were contented to live in almost total ignorance of the trades by which human wants are supplied, and to supply them by the grossest means. It is very certain, that, before the union made them acquainted with English manners, their lands were unskilfully cultivated, and their domestic life was quite unformed; their tables were coarse, and their houses filthy.

Since the Scotch have known that their condition was capable of improvement, their progress in useful knowledge has been rapid and uniform. They do what remains to be done with a great deal of dispatch, and then wonder, likewise, that it was so long delayed, being at the same time both easy and necessary to be performed. It must always be allowed, that they are under obligations to the English for that elegance and culture which, if they had been vigilant and active, the English might have owed to them.

At Inverness, the appearance of life began to alter. At Aberdeen I had seen a few women with plaids, but here the Highland manners are quite common. Here is a kirk, in which the Erse language alone is spoken: here is likewise an English chapel, which is meanly built, but on Sunday we saw a very decent congregation.

It was now time to bid an adieu to the luxury of travelling, and to enter on a country upon which it is probable no wheel has ever rolled. We might have used our post-chaise one day longer along the military road to Fort Augustus, but we could not hire any horses beyond Inverness: therefore we procured here three horses for ourselves and a servant, and one more for our baggage, which was not very heavy. In the course of our journey we found the convenience of having disencumbered ourselves, by laying aside what we could spare; for it is not to be conceived, without experience, how much a little bulk will hinder, and a little weight will burden, in climbing trees and treading bogs, and winding the narrow and obstructed passages; or how often a man who has pleased himself at home with his own resolution, will, in the time of darkness and fatigue, will be content to leave behind him every thing but himself.

We took two highlanders to run beside us, who shewed us the way. One of them was a man of great liveliness and activity, of whom his companion said that he would tire any horse in Inverness. Both of them were civil, and ready to any thing they were ordered. Civility seems to constitute a great part of the national character of Highlanders; for there every chieftain is a monarch; and politeness, which is the

natural product of royal government, is diffused from the laird through the whole clan: but they are not in general hardy or dexterous; the narrow sphere in which they move confines them to a few operations; and they are accustomed to endure little wants, more than to remove them.

We directed our guides to conduct us to Fort Augustus, which is built at the head of Lough Ness, of which Inverness stands at the out-let. The way between them has been cut by the soldiers; and the greater part of it runs along a rock, which is levelled with great pains and labour near the water-side. The greatest part of this day was very pleasant: though the day was bright, it was not hot; and the appearance of the country, if I had not seen the Peak in Derbyshire, was wholly new. On the left hand were high and steep rocks shaded with birch, which is the hardy native of the north, and covered with fern or heath. On the right hand, the limpid waters of Lough Ness were beating their banks and waving their surface by a gentle agitation; beyond them were rocks, sometimes covered with verdure, and at others towering in barrenness. When we saw a corn-field, it only served to impress more strongly the general want of cultivation.

Lough Ness is about twenty-four miles long and about two miles broad. It is very remarkable that Boethius, in his description of Scotland, says it is twelve miles broad. When geographers or historians exhibit false accounts of places far distant, they may be forgiven, because they can only tell what they have been told; and that their account exceeds the truth may be easily imagined, because most men exaggerate to others if not to themselves; but Boethius lived at no great distance: if he never saw the castle, he must be destitute of curiosity; and if he did see it, his veracity must have yielded to very slight temptations indeed.

Lough Ness fills a large hollow between two ridges of high rocks, and is supplied partly by the torrents which fall into it on either side, and partly, as is supposed, by springs at the bottom. Its water is said to be medicinal; it is remarkably clear and pleasant. We were told, that, in some places, it is a hundred and forty fathom deep, which is a profundity scarcely credible; it is very likely that the relaters never founded it. It produces salmon, pike, and trout.

They told us, at Fort Augustus, that Lough Ness is open in the hardest winters, though a lake not far from it is covered with ice. These exceptions from the course of nature naturally occasion a doubt, whether or not the fact is justly stated. A pleasing error is not willingly detected, and that which is strange is delightful. Accuracy of narration is not very common, and there are few so rigidly philosophical as not to represent as perpetual what is only frequent, or as constant what is really casual. Should it be true, that Lough Ness never freezes; it must be owing to its shelter from the cold blasts by its high banks, or its being kept in perpetual motion by the rush of streams from the rocks that inclose it. Though its depth should be such as is represented, it can have little part in this exemption from freezing; for though deep wells are not frozen, because their waters are excluded from the external air, yet where a wide surface is exposed to the full influence of a freezing atmosphere, I know not why the depth should keep it open. As natural philosophy is now one of the favourite studies of the Scottish nation, I would recommend Lough Ness to their diligent examination.

We travelled on a road which was of itself a source of entertainments; it is made along the rock, in the direction of the Lough, sometimes by cutting the great mass of stone to a considerable depth, and sometimes by breaking off protuberances: part of it is bordered with low hazle-trees, from which our guides gathered nuts, and it would have had the appearance of an English lane, except that an English lane is generally dirty. The road has been made with great labour; but it has this advantage, that it cannot without equal labour be broken up.

There were goats feeding or playing within our sight. The mountains have red deer, but they did not come within our sight: if what is said of their vigilance and subtilty be true, they have some claim to that palm of wisdom which the antient philosophers gave to those beasts who are farthest from men.

We espied a cottage near the road. This was the first Highland hut we came to; and as our business was with life and manners, we were disposed to visit it. It seems with us to be considered as a matter of rudeness and intrusion to enter a habitation without leave or acquaintance with its inhabitants; but here it is not so, the old laws of hospitality give this licence to a stranger.

A Highland hut is constructed with loose stones, and is generally of a circular form; it must be placed where the wind cannot blow upon it with violence, because it has no cement; and where the water will run easily away, because it has no floor but the naked ground. The wall, which is about six feet high, declines from the perpendicular a little inward. Rafters are raised and covered with heath, which makes a strong and warm thatch, kept from flying off by ropes of twisted heath. No light is admitted but at the entrance, and through a hole in the thatch, which gives vent to the smoke: this hole is not made directly over the fire, lest the rain should extinguish it, therefore the smoke fills the place before it escapes. Such is the general structure of the houses in which one of the nations of this opulent and powerful island has hitherto been contented to live. The hut we inspected was far from the meanest, for it was divided into several apartments, and its inhabitants possessed such property as a pastoral poet might exalt into riches.

Upon our entrance into the hut, we found an old woman boiling goat's flesh in a tea-kettle: she very willingly displayed her whole system of oeconomy, she spoke but little English, but we had interpreters at hand. She had five children, of which none were yet gone from her: the eldest, a boy of thirteen, and her husband, who was eighty years old, were at work in the wood; her two next sons were gone to Inverness to buy oatmeal, which she considered as expensive food; and told us, that in spring, when the goats give milk, her children could live without it. She is mistress of sixty goats, several kids, and some poultry. By the lake we saw a potatoe garden, and a small spot of ground, on which stood some barley-ricks. She had all this from the labour of their own hands, and she sends her kids and chickens to market for what is necessary to be bought.

She asked us to sit down and drink whisky, with true pastoral hospitality. She is religious; and though the kirk is four Scotch miles, which is equal to six English ones, she goes thither every Sunday. We gave her a shilling, and she asked for snuff, which is the luxury of a highland cottage.

Soon afterwards we came to the general's hut, which is so called, because it was the temporary abode of general Wade, when he was appointed superintendant of the works upon the road. It is now a house of entertainment for passengers, and is very well stocked with provisions, at least it was so when we were there.

From thence we went to see the fall of Fiers: towards evening we crossed by a bridge over the river, which make this celebrated fall. The country at the bridge strikes the imagination with all the gloom and grandeur of Siberian solitude. The way makes a flexure; and the mountains, covered with trees, rise at once on the left hand and in the front. We desired our guides to shew us the fall; and dismounting on steeds, clambered on very rugged crags, till I began to wish that our curiosity might have been gratified with less trouble and danger. We at last came to a place where we could overlook the river, and saw a channel apparently torn through black piles of stone, by which the stream is obstructed, till it comes to a very steep descent, of such a dreadful depth, that I could not look down with any pleasure.

Had we visited this place at another season of the year, we should have found much more dignity and terror; but nature never gives every thing at once. The pleasant dry weather, which had rendered our journey hitherto so agreeable, prevented the pleasure we expected from the fall of Fiers. Here was no water but what the springs supplied, which shewed us only a swift current, clear and shallow, fretting over the asperities of the rocky bottom, and we could only conceive the effect of a thousand streams, poured from the mountains into one channel, struggling for expansion in a narrow passage, exasperated by rocks rising in their way, and at last discharging all their violence by a sudden fall, through this horrid chasm. Such a picturesque and terrific scene must the fall of Fiers exhibit after a good deal of wet weather.

Our way grew more troublesome, we descended by an uneven declivity, but without either dirt or danger. We did not arrive at Fort Augustus till late in the evening. One of our company, who, between his father's merit and his own, is sure of reception wherever he comes, sent a servant before to beg admission and entertainment for that night. Mr. Trapound, the governor, treated us with that complaisance which is almost necessarily connected with the military character. He came out of the Fort to meet us beyond the gates, and apologized, that at so late an hour the garrison rules suffered him only to give us entrance at the postern.

We viewed Fort Augustus in the morning, which is much smaller than Fort St. George, and is said to be commanded by the neighbouring hills. It is not long since it was taken by the Highlanders. If its situation is not calculated for defence, it certainly is for pleasure; for it stands at the head of the lake, and is supplied with provisions, &c. from Inverness by a sloop of sixty tons burthen.

We set forward in order to cross the Highlands towards the western coasts, and were obliged to be contented with such accommodations as a way so little frequented could afford. This intended journey of two days was very unequally divided, for the only house of entertainment was only a third of the way. We soon came to a high hill, which we mounted by a military road cut in traverses; and as we ascended, we saw the baggage following us below, in a contrary direction. In order to make this road passable, the rock has been hewn to a level, with labour that might have broken the perseverance of a Roman legion.

By the stumps, both of oaks and firs, it is very certain that this country was once a forest of large timber, but it is now entirely denuded. I do not remember seeing any animals; but was told, that in the mountains there are roe-bucks, stags, rabbits and goats.

As we passed on through the dreariness of solitude, we found a party of soldiers from the fort, working on the road, under the superintendance of a serjeant; we informed them how kindly we had been treated at the garrison, and as we enjoyed the benefit of their labours, shewed our gratitude by a small present, which was not unacceptable.

We came to Anoch early in the afternoon, which is a village in Glenmollison of three huts, one of which is distinguished by a chimney; at this place we were to dine and lodge, and were conducted, through the first that had the chimney, into another, lighted by a glass window. We were attended by the landlord with great civility, and found some books upon a shelf, one of which was a volume of Prideaux's Connection of the Old and New Testament. I mentioned this to the landlord as something unexpected, but I found it did not please him; I made some amends by praising the propriety of his language; and was answered, that he learned it by grammar rules.

I had afterwards frequent opportunities of observing, that my host's language had nothing peculiar, for those Highlanders who can speak English in general, speak it well, with few of the words and little of the accent by which a Scotchman is distinguished. They seem to have learned the language either in the army or navy, or by some communication with those who could

could give them good examples of pronunciation. They would not willingly be taught by their Lowland neighbours, for the Highlanders have long considered them as a mean and degenerate race of men; but these prejudices are wearing away very fast: yet so much of them remains, that when I asked a very learned minister in the islands, which they considered as their most savage clans, he said, "Those that live next the Lowlands."

We had sufficient time to survey this place, as we came hither so early in the day. The house was built like other huts, and near it was a garden of turnips, and a field of potatoes; it stands in a glen or valley, pleasantly watered by a winding river. However pleasant this country may be to the naturalist, it is of no great advantage to its owners. Our host informed us of a gentleman, who possesses a space of at least a hundred square English miles, and after having raised his rents to the danger of depopulation, and exerted every art of augmentation, he has only obtained a yearly revenue of four hundred pounds, which is about three halfpence an acre.

After dinner, we were surprised by the entrance of a young woman, not inelegant, either in deportment or dress, who asked us if we would have tea. We found that she was the daughter of our host, and desired her to make it for us. Like her appearance, her conversation was gentle and pleasing; and as we know that all the Highland girls are gentlewomen, we treated her with great respect, which she received as customary and due, and was neither elated by it nor confused, but repaid my civilities without any embarrassment. She told me how much I honoured her country by coming to survey it.

At Inverness, she had gained the common female qualifications, and, like her father, she had the English pronunciation. I presented her with a book which I happened to have about me, and should not be pleased to think that she forgot me.

The soldiers whom we had passed upon the road, came in the evening to spend at an inn the little money we had given them. They had the true military impatience of coin in their pockets, and had marched at least six miles to find the first place where liquor could be bought. As I had never before been in a place so wild and unfrequented, I was glad of their arrival, because I knew that we had made them friends, and to gain still more of their attachment, we went to them where they were carousing in a barn, and added something to our former donation. All we gave was not much, yet it detained them in the barn, either merry or quarrelling all night, and in the morning they went back to their work with great indignation at the bad qualities of whisky.

Our host was so much pleased with our company, that when we left his house in the morning, he walked by us a great way, and entertained us with conversation both on his own condition and that of the country. His life seemed to be merely pastoral, and his wealth consisted of one hundred sheep, as many goats, twelve milch cows, and twenty-eight beeves ready for the drover.

It was from this intelligent landlord that we first heard of the general dissatisfaction which prevails among the Highlanders, and which is now driving them into the other hemisphere*. He seemed displeased when I asked him whether they would stay at home if they were well treated, and said that no man willingly left his native country. The rent of the farm which he himself occupied had, in the course of twenty-five years, been advanced from five to twenty pounds, which he found himself so little able to pay, that he would be glad to try his fortune in another place. He owned the reasonableness of raising the rents in the Highlands to a certain degree, and said he was willing to pay ten pounds for the ground which he formerly had for five.

At length, after having amused us for some time, he resigned us to our guides: the way was difficult, and

* This was written in the year 1773.

the journey appeared larger than it really was. Being now in the bosom of the Highlands, we had full leisure to contemplate the properties and appearance of mountainous regions, such as have been in many countries the last shelters of national distress, and are every where the scenes of adventures, surprises, stratagems, and escapes.

Such countries as these are not passed without difficulty, not merely from the labour of climbing the mountains, but because that which is not mountain is commonly bog, through which the way must be picked with caution.

As we journeyed, we passed many rivulets and rivers, which commonly ran with a clear shallow stream over a hard pebbly bottom. These channels are framed by the violence of wintry floods, but appear in summer to be much wider than the water they convey would naturally require. Such capacious and temporary waters cannot be expected to produce much fish, for the rapidity of the wintry deluge sweeps them away, and the scantiness of the summer stream would scarcely contain them above ground.

A great part of the earth consists of regions mountainous and wild, thinly inhabited and little cultivated; and he who has never seen them, must live unacquainted with much of the face of nature, and with one of the great scenes of human existence.

We entered a narrow valley; as the day advanced towards noon, it was not very flowery, but sufficiently verdant. We were informed by our guides, that the horses could not travel all day without rest or meat; and desired us to stop here, as no grass would be found in any other place. As the request was reasonable, and the argument cogent, we willingly dismounted, and diverted ourselves as the place gave us opportunity.

A writer of romance could not have figured a more delightful bank than that on which I sat. No trees indeed whispered over my head, but a clear rivulet streamed at my feet. The day was calm, the air was soft, and all was rudeness, solitude, and silence. I was surrounded by high hills, which, by hindering the eye from ranging, forced the mind to find entertainment for itself. I know not whether I spent the hour well or ill, but here I first conceived the thought of this narration.

We had no evils in this place to suffer or to fear; yet the imagination excited by the view of an unknown and untravelled wilderness are not such as arise in the artificial solitude of gardens and parks, a placid indulgence of voluntary delusions, a flattering notion of self-sufficiency, a secure expansion of the fancy, or a cool concentration of the mental powers. The phantoms which haunt a desert, are want, misery and danger, the evils of dereliction rush upon the thoughts; man is unwillingly made acquainted with his own weakness, and meditation shews him only how little he can sustain or perform. Here were no traces of inhabitants, except now-and-then a hut erected for shelter for the herdsmen in favourable seasons. Whoever had been in the place where I then sat, were he ignorant of the country and without provisions, he might have wandered among the rocks till he perished with hardship, before he could have found either shelter or food; but these hillocks bear no comparison to the ridges of Taurus, or these desolate spots to the wilds of America.

We continued our journey along the side of a lough kept full by many streams, which, with more or less rapidity, crossed the road from the hills on the other side of the wood. After several dry months, these currents afford an unusual and delightful spectacle, especially to one who has always lived in level countries. I suppose in the rainy season this road is impassable.

Beyond this lough is a valley called Glensheals, which is inhabited by the clan of Macrae. Here is a village called Auknaehals, consisting of about twenty huts, built with stones piled up without mortar.

By the advice of the officers at Fort Augustus, we had

had taken bread for ourselves, and tobacco for those Highlanders, who might shew us any civility. At this place we could obtain milk; but we must have wanted bread, had we not brought it with us. Our guides now became doubly necessary, as interpreters. A woman, who occupied the largest hut, brought out some pails of milk. The villagers gathered round us in considerable numbers, certainly without any evil intention, but with a very savage wildness of aspect and behaviour. When we had finished our meal, one of our company cut the bread in slices, and distributed it amongst them, as he supposed them never to have tasted a wheaten loaf before. He then gave them little twisted pieces of tobacco, and distributed a handful of halfpence among the children, which they were very willing to receive. I have since been informed, that the inhabitants of this valley are by no means indigent. The woman from whom we had the milk, seemed unwilling to take any price, but, being pressed, she named a shilling. Honesty is not greater where elegance is less. We were afterwards told, that a bystander advised her to ask more, but she said a shilling was enough. We gave her half a crown, and I hope got some credit by our behaviour; for the company said, if our interpreters did not flatter us, that they had not seen such a day since the old laird of Macleod passed through their country.

The clan of Macraes was originally an indigent and subordinate one; and having neither stock nor farms, many of them were servants to the Maclellans, who, in the war of Charles the First, took arms at the call of the heroic Montrose, and were in one of his battles almost all destroyed. The women who were left at home, being thus deprived of their husbands, like Scythian ladies of old, married their servants, and thus the Macraes became a considerable race.

We had leisure to extend our speculations as we continued our journey, and to investigate the reason of those peculiarities, by which such rugged regions as these are generally distinguished.

The oldest race of inhabitants generally occupy the most mountainous countries, for they are not easily conquered, because they must be entered by narrow ways, which are exposed to every power of mischief from those who occupy the heights. Every new ridge of mountain is a new fortress, where the defendants have a fresh advantage. Should the assailants force the strait, or storm the summit, they only gain so much ground; what is the consequence? their enemies are fled to take possession of the next rock, and the pursuers stand and look at them, knowing neither which way to escape, nor where the bog has firmness to sustain them. In addition to these advantages, mountaineers have an agility in climbing and descending, quite distinct from courage or strength, and easily attainable by use.

Should this mountainous war be of any continuance, the invaders are dislodged by hunger; for in these anxious and toilsome marches, provisions are not easily to be carried, and can never be found. All the wealth of mountains consist in cattle, which, while the men stand in the passes, the women drive away. And should they at length prove victorious, the conquest of these lands is not worth the expence, and therefore perhaps have not been so often invaded by the mere ambition of dominion; as by resentments of robberies and insults, or the desire of enjoying in security the more fruitful provinces.

The inhabitants of mountainous countries take as long time in civilizing as in conquering. Men are softened by intercourse mutually profitable, and instructed by comparing their own notions with those of others. When Julius Cæsar invaded this island, he found the maritime parts of Britain made less barbarous by their commerce with the Gauls. No stranger is brought either by the hope of gain or pleasure, into a barren and rough country. The inhabitants having neither commodities for sale, nor money for purchase, seldom visit more polished places, or, if they do visit them, they seldom return.

VOL. II. No. 91.

By gradual refinement, or by conquest, it may sometimes happen, that the cultivated parts of a country change their language. Then the mountains become a distinct nation, cut off by dissimilitude of speech from conversation with their neighbours. Thus in Delecarlia, the old Swedish, and in Biscay the original Cantabrian still subsists. The Highlanders and Welsh speak the tongue of the first inhabitants of Britain, while the other parts have received first the Saxon, and in some degree afterwards the French, and then formed a third language between the two.

It is not a necessary consequence, that primitive manners should continue where the primitive language is spoken, for the manners of mountaineers are commonly savage, but they are rather produced by their situation than derived from their ancestors.

Whatever makes a distinction, produces rivalry; this is the general disposition of man. Before other causes of enmity were found, England was disturbed for some centuries by the contests of the northern and southern countries; at Oxford, the peace of study could only be secured, by chusing annually one of the proctors from each side of the river Trent. A tract of land, intersected by many ridges of mountains, naturally divides its inhabitants into petty nations, which are made enemies to each other by a thousand causes. Each will exalt its own chief, each will boast the valour of its men, and the beauty of its women, and every claim of superiority introduces competition; sometimes injuries will be done, and perhaps be more injuriously defended; retaliation will be attempted, and the debt exacted with too much interest.

It was formerly a law in the Highlands, that if a robber was sheltered from justice, any man of the same clan might be taken in his place. Though this was necessary in savage times, it could hardly fail to end in a feud, and that feud perhaps burnt on for ages in open violence, or sullenly glowed in secret mischief. There are not wanting memorials of the bad effects of this violent judicature. There is now to be seen a cave in which one of the Campbells, who had injured the Macdonalds, retired with a body of his own clan. The Macdonalds required the offenders, and, on being refused, they made a fire at the mouth of the cave, by which he and his adherents were suffocated together.

By feuds and competitions, mountaineers consider themselves as surrounded by enemies, they are therefore warlike, and are always prepared to repel incursions, or to make them. Till very lately, the Highlanders went always armed, and carried their weapons to visit and to church; so did the Greeks in their unpolished state.

Mountaineers are poor, and have neither manufactures nor commerce, they are therefore thievish, and can only grow rich by robbery. Their neighbours are in general their enemies, and they regularly plunder them. Having lost that reverence for property, by which the order of civil life is preserved, they consider all as enemies whom they do not consider as friends, and think themselves at liberty to invade whatever they are not obliged to protect.

This disposition to thieving is very much repress'd, since the laws have been introduced into the Highlands. Not many years since, no herd had ever been conducted through the mountains, without paying a nightly tribute to some of the clans; passengers travel, and cattle are now driven, without fear, danger, or molestation.

The quality of highest esteem among warlike people, is personal courage; and with the ostentatious display of courage, are connected closeness, quickness of resentment, and promptitude of offence. Before the Highlanders were disarmed, they were so addicted to quarrels, that the boys used to follow any public procession or ceremony, however festive or solemn, in expectation of the battle which was sure to happen before the company dispersed.

The sovereign has very little influence over mountainous

tainous regions, which are sometimes very remote from the seat of government, and very difficult of access; they are not within the reach of national justice. Law is nothing without power; the sentence of a distant court could not be easily executed, nor safely promulgated, among men habitually violent, ignorantly proud, unconnected with the general system, and accustomed only to reverence their lords. It has, therefore, been necessary to erect many particular jurisdictions, and commit the punishment of crimes, and the decision of right, to the proprietors of the country, who could enforce their own decrees. Though such judges will be often partial and ignorant, yet no better expedient could be found in the immaturity of political establishments. Provincial judicature will, in every empire, be gradually abolished, as government advances towards perfection.

One defect in provincial judicature is, that those who have the dispensation of law are themselves lawless; their vassals have no shelter from outrages and oppressions; but are condemned to endure, without resistance, the rage of cruelty, and the caprices of wantonness.

This was the case in the Highlands; for some great lords had an hereditary jurisdiction over counties; and some chieftains over their own lands; till the final conquest of the Highlands afforded an opportunity of crushing all the local courts, and of extending the general benefits of equal law to the low and high in the obscurest corners, and in the deepest recesses.

Before this event took place, the chiefs had such a resemblance of royalty, that they had little inclination to appeal on any question to superior judicatures. A claim of land between two powerful lairds, was decided like a contest for dominion between sovereign powers; they drew their forces into the field, and fight attended on the strongest. This was the common practice in ruder times, which the kings of Scotland in vain attempted to controul.

Even so lately as the last years of king William, a battle was fought at Mull Bay, between the clans of Macdonald, of Keppoch, and Mackintosh. Colonel Macdonald refused to pay the due demanded from him by Mackintosh, who was his superior lord. They each called his followers to maintain the dignity of the clan, and fought a regular battle, in which several considerable men fell on both sides, and neither obtained a complete victory. These Highland chiefs disdained the interposition of judges and laws. This is reported to be the last open war made between the clans by their own authority.

Besides this self-assumed authority of making war amongst each other, they made treaties and formed alliances, of which some traces may still be found, and some consequences still remain as lasting evidences of petty regality. The terms of these confederacies were sometimes very curious, particularly one by which it is agreed, that each should support the other in the right or in the wrong, except against the king.

Genealogies are carefully preserved by the inhabitants of mountains, who form distinct races. In a small district, men necessarily mingle blood by intermarriages, and at last combine into one family, with a common interest in the honour or disgrace of every individual. That union of affection, and co-operation of endeavours, then begins, that constitute a clan. Those who consider themselves as ennobled by their family, will think highly of their progenitors; and those who, through a number of successive generations, live altogether in the same place, will preserve local stories and hereditary prejudices. As an instance of this, every Highlander can talk of his ancestors, and recount the outrages which they suffered from the wicked inhabitants of the adjacent valley.

Such were the qualities of Highlanders, and such are the effects of habitation among mountains, while their rocks secluded them from the rest of mankind, and kept them an unaltered and discriminated race.

They are now hastening to mingle with the general community, and are losing these distinctions.

In the afternoon we left the Macraes and Aukna-shaels, and in the evening came to Ratiken, which is a high hill, on which a narrow and steep road is cut. Here my horse staggered a little, and I called hastily to the Highlanders to hold him. This was the only time in my journey that I apprehended myself in the least danger.

When we came to an inn, the negative catalogue of provisions was very copious, and we did not express much satisfaction: Here was neither bread, meat, milk, eggs, nor wine: whiskey there was plenty of, and at last they caught a fowl and killed it: we had some bread with us, and with that we prepared ourselves to be contented, for it did not signify repining. When so, a very eminent proof of Highland hospitality was at hand; a gentleman's servant, who kept us company some miles of the way without much notice on our side, and left us near Glentz, from whence we thought no more of him, but in about two hours he came to us again, with a present from his master of rum and sugar. This man had mentioned his company to his master, whose name was Gordon; and the gentleman, well knowing the penury of the place, paid this attention to two men whose names he never heard, by whom his kindness was not likely to be repaid, and who had no recommendation to him but their necessities.

Our lodging was not the best in the world; my fellow-traveller and I slept in our clothes upon hay. We had no inducement to stay here, and, in the morning of September the twentieth, we found ourselves on the edge of the sea. Here we dismissed our Highlanders, whom I would recommend to the service of any future travellers; they took back the horses we hired. Having procured a boat, we were ferried over to the isle of Sky, and landed at Armidel, where we were met on the sands by Sir Alexander Macdonald, who, with his lady, was at that time preparing to leave the island and reside at Edinburgh.

We were entertained, as we sat at Sir Alexander's table, with the melody of the bag-pipe; and as every thing in this country has its history, an elderly gentleman informed me, whilst the bag-pipe was playing, that in some remote time, the Macdonalds of Glengary having been injured or offended by the inhabitants of Culloden, and resolving to have vengeance, came to Culloden on a Sunday, where finding their enemies at worship, they shut them up in the church, which they set on fire; and this, said he, is the tune that the piper played while they were burning.

These are the only records of a nation that has no historians, and therefore deserve the notice of a traveller; they afford the most genuine representation of the life and character of the antient Highlanders.

All the inhabitants of Scotland, who speak the Erse language, or retain the primitive manners, are comprehended under the denomination of Highlanders; and in that sense I use the name, when there is no apparent reason for making a distinction.

Brogues are a kind of artless shoes, stitched with thongs so loosely, that, though they guard the foot from stones, they do not exclude water: I first observed the use of them in Sky; they were formerly made of raw hides, with the skin inwards; but they are said not to have lasted the wearer above two days; they are now tanned with oak bark, as in other places. My enquiries about brogues gave me an early specimen of the uncertainty of Highland information. I was told one day, that to make brogues was a domestic art, which every man practised for himself, and that a pair of brogues was made in an hour. From this information, I apprehended that the husband made brogues as the wife made an apron; but I afterwards found that a brogue-maker was a distinct trade, and that a good pair would cost half a crown. It will probably occur that both these representations may be true, and that in some places men may buy them,

them, and in others make them for themselves; but I received both the accounts in the same house within two days.

The like uncertainty attended my subsequent enquiries upon more interesting topics. Whoever travels in the Highlands may solace himself with intelligence, if he rests satisfied with the first account. The Highlander answers every question propounded in so apt and peremptory a manner, that scepticism itself is awed into silence, and the mind sinks before the reporter in unresisting credulity; but the enchantment is broken if you venture a second question, and you immediately discover that what was told so confidently was told at hazard, and that such fearlessness of assertion was either the sport of negligence, or the refuge of ignorance.

No wonder the accounts of different men are contradictory, if individuals are thus at variance with themselves. The traditions of savage and ignorant people have been, for many centuries, unskillfully related, and negligently attended to. The actions of one man have been ascribed to another, and distant events have been mingled together. No man is now to be censured for these deficiencies in story. It would be well, if what there is yet opportunity of examining were accurately inspected, and justly represented; but of so lax a nature is Highland conversation, that the inquirer is kept in continual suspense, and knows less as he hears more.

In the islands of Scotland the plaid is rarely worn; we only saw one gentleman completely clothed in the ancient habit, and by him it was worn only occasionally, and in a frolic. The fillibeg, or lower garment, is still very common, and the bonnet is almost universal. What we have long been used to, we naturally like, and for this reason the Highlanders were unwilling to lay aside their plaid when the law was made for abolishing the dissimilitude of appearance between the Highlanders and the other inhabitants of Britain. To an unprejudiced spectator, the plaid must appear a cumbersome and incommodious dress. The Romans always laid aside their gown when they had any thing to do: it was a dress so unsuitable to war, that the same word which signified a gown signified peace. The principal use of a plaid seems to be, that they could wrap themselves in it when they were obliged to sleep, without a better cover.

We were met with a shower of rain, for the first time, in our passage to the isle of Sky. This was the beginning of the Highland winter, after which, they told us, we were not to expect a succession of three dry days for many months.

We received an invitation to the island of Raafay, the third or fourth day after our arrival at Armidel. It is astonishing how soon the knowledge of any event is propagated in these narrow countries by the love of conversation, which much leisure produces. The arrival of strangers, in a place so unfrequented, quickens curiosity and excites rumour. Fame prepared us a reception at every corner we touched.

We were obliged to pass over a large part of Sky, in order to gain a commodious passage to Raafay. We furnished ourselves therefore with horses and a guide; for a guide is always necessary in the islands, where there are no roads, nor any marks by which a stranger may find his way. These guides are always natives of the place, who, by pursuing game, or tending cattle, or being otherwise employed, have learned where the ridge of the hill has breadth sufficient to allow a horse and his rider a passage, or where the moss, or bog, is hard enough to bear them.

Journies that are made in this manner are rather tedious than long, and a very few miles require several hours. We arrived at night at Coriatachan, which is a house very pleasantly situated between two brooks, with one of the highest hills in the island behind it. A Mr. Mackinnon resided here, by whom we were treated with very liberal hospitality, among a more elegant and numerous company than it could have been supposed easy to collect.

We did not climb the hill behind the house, for the weather was rough, and the steepness dismayed us. We were informed that there is a cairne upon it, which is a heap of stones piled upon the grave of one eminent for splendor of achievements or dignity of birth. It is said that an urn is always found under these cairnes; they must therefore have been piled by a people who were accustomed to burn the dead. It is a Roman custom to burn the body, and a northern one to pile the stones; but I never heard when these two acts of sculpture were united.

We did not continue our journey the next day, because the weather was boisterous, but we had no reason to complain of the interruption. What we chiefly desired to know, was the manners of the people, and that we saw in every place. Here we had company, and had a chosen retirement; here were also books.

Literature is not neglected by the higher rank of Highlanders. I never was in any house of the islands, where I did not find books in more languages than one.

It is scarcely necessary to mention, that in countries so little frequented as these, there are no public houses for the entertainment of travellers. Whoever wanders about the wilds, procures recommendations to those habitations which lie near his way, or takes the chance of general hospitality when either night or weariness comes upon him. If he stumbles upon a cottage, he can expect little more than a shelter; for the cottagers have little more for themselves: but if he is so fortunate as to be brought to a gentleman's house, he will be glad of a storm to prolong his stay. At Sconfor, in Sky, there is one inn, where the post-office is kept.

Neither plenty nor delicacy is wanting at the tables, where a stranger is received; they have great quantities of wild fowl, and I hardly remember to have seen a dinner without them; the sea abounds with fish, and, as they send very numerous droves of oxen yearly to England, it cannot be supposed that they want beef at home. They have likewise abundance of sheep and goats, and common domestic fowls.

Every family must kill its own meat, as here is nothing to be bought; and must roast some part of it sooner than Apicius would prescribe. All kinds of flesh are undoubtedly excelled by the variety and emulation of the English markets; but that which is not best, may yet be very far from bad: he that complains of his fare in the Hebrides, has improved his delicacy more than his manhood.

The bread in the Hebrides is made of oats or barley. The oat bread, unaccustomed palates are not easily reconciled to; the taste of the barley-bread is not disagreeable. They have wheat flour in several houses, with which we were sure to be treated, if we staid long enough to have it kneaded and baked. Their bread of every kind is unfermented, as they use neither yeast nor leaven.

It is the custom of the men of the Hebrides, as soon as they appear in the morning, to drink a glass of whiskey, which they call a skalk; yet they are by no means a drunken race; at least, I never was present at much intemperance: yet no man is so abstemious as to refuse this morning dram.

Soon after the dram, breakfast is expected, which is a meal in which the Scots certainly excel us. The tea and coffee are accompanied not only with bread and butter, but also with honey, conserves, and marmalades. If an epicure could remove by a wish, in quest of sensual gratifications, wherever he had supped, he would breakfast in Scotland.

In a place where many questions are to be asked, some will certainly be omitted; I forgot to inquire how they came to be supplied with so many articles of foreign luxury. Perhaps the Dutch may give them tea and coffee at the fishing-season, in exchange for fresh provision; and the French may bring them wine for wool. Here is no custom-house officer to demand tribute, therefore they must have these articles very cheap.

We came into the Highlands at too late a period to

see what we expected, a people of peculiar appearance, and a system of antiquated life. There was, perhaps, never any change of national manners, so quick, so great and so general, as that which has operated here by the last conquest and the subsequent laws. The clans retain but little of their original character; their military order is nearly extinguished, their ferocity of temper is softened, their dignity of independence is depressed, their contempt of government subdued, and their reverence for their chiefs abated. Only their language and their poverty remain of what they had before the late conquest of their country. And even their language is attacked on every side. Schools are erected, in which English alone is taught; and some people lately thought it reasonable to refuse them a version of the bible, that no monument of their mother tongue might remain*.

I wish I could say, that their poverty is abating as fast as their change of manners has been rapid; however, it certainly does so in some degree. They are more acquainted with money, and the love of gain will, no doubt, by degrees, make them industrious. I would recommend it to him, whose curiosity pants after savage virtues, and barbarous grandeur, to take a longer journey than to the Highlands to gratify it.

As soon as the stormy weather abated, we were informed that the boat, which was to convey us to Raafay, attended us on the coast. From this time we were much entertained and delighted with the company of Mr. Macqueen, minister of the parish in Sky, whose knowledge and politeness entitle him to every mark of kindness and respect.

Mr. Malcolm Macleod, a gentleman of Raafay, undertook the management of the boat. The rowers were vigorous, the water was calm, and our passage consequently quick and pleasant. As we approached the island, we saw the laird's house, which is a neat and modern fabric, and found Mr. Macleod, the proprietor of the island, with many gentlemen, expecting us on the beach.

Here our reception greatly exceeded our expectations; we found nothing but elegance, civility, and plenty. After we had refreshed ourselves, and the usual conversation was over, the evening came upon us. The carpet was then rolled from the floor, the musician was called, and the whole company was invited to dance; nor did ever fairies trip with greater alacrity. The general air of festivity, which predominated in this place, so far remote from all those regions which the mind had been used to contemplate as the mansions of pleasure, struck the imagination with a delightful surprise, analogous to that which is felt at an unexpected emersion from darkness to light.

The dance ceased when it was time to sup, and six and thirty persons sat down to two tables in the same room. The ladies sung Erse songs after supper, to which I listened in the same manner as an English audience to an Italian opera, delighted with the sound of words which I did not in the least understand.

This happy family consists of Mr. Macleod, his lady, three sons, and ten daughters. There is a tutor in the house for the sons, and the lady is very skilful and diligent in the education of her daughters. A more pleasing appearance of domestic society, or more gentleness of manners, is not to be found in any country.

Mr. Macleod is the owner of the islands of Raafay, Rona, and Fladda, and possesses an extensive district in Sky; and his estate has not, for the term of four hundred years, either gained or lost a single acre.

Macleod, of Dunvegan, is acknowledged as his chief, though this pre-eminence was disputed by their ancestors.

There still subsists an alliance between Macleod of Raafay, and Macdonald of Sky, and has done so in these families for two hundred years past; in consequence of which, the survivor always inherits the arms of the deceased. When the late Sir James Macdonald died, his sword was delivered to the present Mr. Macleod, laird of Raafay; a natural memorial of military friendship.

The islands of Rona and Fladda afford only pasture for cattle, of which one hundred and sixty winter in Rona, under the superintendence of only one solitary herdsman. Raafay is the only inhabited island in Mr. Macleod's possession.

By computation, Raafay is fifteen miles long, and two broad. These countries have never been measured, and the computation by miles is uncertain and arbitrary; and we frequently observed in travelling, that the nominal and real distances between places bore very little relation to each other. It is very probable, that Raafay contains near an hundred square miles. Notwithstanding its extent, it does not afford much ground either for tillage or pasture, as it is rough, rocky, and barren. The cattle often perish by falling from the precipices; and it is, like the other islands, generally naked of shade, but it is so only by neglect, for the laird has an orchard, and many large fruit trees grow about his house. The islands abound with rivulets, which produce trouts and eels; the trouts are not large, and the eels are said to be unwholesome.

The principles upon which mankind have agreed to eat some animals and vegetables, and to reject others, are not very easily ascertained, and are by no means uniform. One country selects that as delicate, which another rejects with abhorrence. The Neapolitans lately refused to eat potatoes in the time of a famine. An Englishman is not easily persuaded to dine on frogs with a Frenchman, on snails with an Italian, or on horseflesh with a Tartar. Pork, bacon, and eels, are held in abhorrence by the inhabitants of Sky; and I never saw more than one hog during my tour through the Hebrides, and that was at Dunvegan.

There are neither deer, hares, nor rabbits, in Raafay, but wild fowl in abundance. To ask why they are not here, would be leading the way to endless enquiries. Why does any nation want what it might have? Why does tea continue to be brought from China? Why are not spices transplanted to America? There remains much in every place to do, for life improves but by slow degrees. The inhabitants of Raafay have made many attempts to raise roebucks in that island, but hitherto without effect; the old ones can very seldom be taken alive, and the young ones it is very difficult to rear.

They might more easily obtain hares and rabbits; they impute the want of them in Sky to the ravage of the foxes, and have therefore, for some years past, set a price upon their heads, which has gradually increased, as the number of foxes have diminished, from three shillings and six-pence to a guinea per head, which is a sum of money so considerable in the Hebrides, that foxes must shortly be as totally annihilated in Sky as the wolves which formerly infested England. The farmers levy contributions among themselves, and pay these rewards with great cheerfulness.

* In this place we must beg leave to recommend to our readers a work lately published, which we believe to be the most literal and correct translation of the Holy Scriptures now extant. We have extracted the following general account of it from the title-page, &c. and heartily recommend the work itself to every family:

The cheapest FAMILY BIBLE ever offered to the public: elegantly printed in a large folio volume, embellished with capital engravings, esteemed the most uniform and elegant set of copper-plates ever given with a work of the kind, price 1l. 16s. handsomely bound:

The BISHOPS' BIBLE; containing the Sacred Texts of the OLD and NEW TESTAMENT, Explained and illustrated with Notes theological, historical, critical, and practical: being the joint labours of Theodore Beza, and others of our zealous reformers, bishops, &c. Printed for Alex. Hogg, No. 16, Pater-noster Row, London, and sold by most other Bookfellers.

N.B. To accommodate such whose circumstances or inclinations hinder them from buying the *Bishop's Family Bible* complete at once, it is divided into sixty six-penny numbers, and may still be had by one or two numbers at a time, including the forty elegant and uniform copper-plates, which are alone intrinsically worth more than one shilling each.

This island produces but little corn; I saw the harvest of a small field. The women reaped the corn, and the men bound up the sheaves. The strokes of the sickle were timed by the modulation of the harvest song, in which all their voices were united. In the Highlands they accompany every action, which can be done in equal time, with an appropriated strain, which, they say, has not much meaning, but its effects are cheerfulness and regularity.

There are a great number of black cattle in the island of Raafay, for which it is much fitter than for corn. The laird keeps a herd of four hundred, one hundred of which are annually sold. He holds an extensive domain in his own hands, and calculates that the sale of cattle pays him the rent, and with the remaining product he supports a very plentiful and liberal table.

On one side of Raafay they shew caves, into which the rude nations of the first ages retreated from the weather; and from this, as well as other circumstances, they judge that Raafay has been very long inhabited. These dreary vaults might have had other uses. There is still a cavity near the house, called the Oar Cave, where the seamen, after their piratical expeditions, used to hide their oars.

A very strong proof of the distance of time in which the first possessors of this island lived, is afforded by the stone heads of arrows, which are very frequently picked up. The present inhabitants call them elf-bolts, and believe that the fairies shoot them at the cattle. They very much resemble those which Mr. Banks lately brought from the savage countries in the Pacific Ocean, and the makers of them must have been unacquainted with the use of metals.

The number of inhabitants on this island cannot be exactly ascertained. The late laird let out one hundred men upon a military expedition. According to the calculation, that the sixth part of a people is capable of bearing arms, Raafay must have had six hundred inhabitants; but as it is not likely that every man able to serve in the field would obey the summons, or that the laird would leave his lands totally defenceless, or take away all the hands qualified to labour, it may very justly be supposed, that half as many might be permitted to stay at home. The number will then be nine hundred, which is about nine to a square mile; this is a degree of populousness greater than these tracks of desolation can often shew. These people are, at present, faithful to their chiefs, contented with their country, and are uninfected with the fever of migration.

Here is a chapel unroofed and ruinous, which has long been used as a place of burial. About the churches in the islands are small squares, inclosed with stone, which are repositories of the dead, and belong to several families.

Martin informs us, that at the death of the lady of the island, it has here been the custom to erect a cross; but we have an opportunity of contradicting him. The stones that stand about the chapel, some of which have crosses cut upon them, are believed to be antient boundaries of the consecrated ground, and not funeral monuments.

Martin was certainly a man of education; as he was an inhabitant of Sky, he was within the reach of intelligence; yet, with all his advantages, he has often suffered himself to be deceived. He lived in the last century, when the chiefs of the clans retained their original influence. No inlet was then open to foreign novelties; the mountains were yet unpenetrated, and the feudal institutions operated upon life with their full force. As he had these opportunities, he might have displayed a series of subordination, and a form of government, which, in more enlightened and improved regions, have been long forgotten; and might have pleased his readers with many uncouth customs, which are now disused, and wild opinions, which prevail no longer. But it is most probable, that he had not knowledge of the world sufficient for

judging what would gain the attention of mankind; and that the mode of life, so familiar to himself, he did not suppose unknown to others, and thought the world must certainly be well informed of what he was so conversant in.

This neglect of Martin's is quite irreparable, for what is once out of sight in nations that have hardly the use of letters, remains so for ever. As they think but little, few of their thoughts are wasted on the past, in which they are neither interested by hope nor fear. Stated observances and practical representations are their only registers. On this account, an age of ignorance is an age of ceremony. Processions, pageants, and commemorations gradually decline, as better methods of recording events and preserving rights are introduced.

An eminent writer says, he remarked that the chapel of Pouefay is unroofed and useless; but this island is not singular in this respect: through those few which we visited, we neither saw nor heard of any house of prayer, except in Sky, that was not in ruins. Ceremony and decency are blasted together; and if the remembrance of papal superstition is obliterated, the monuments of papal piety are likewise effaced.

The lazy devotion of the Romish clergy has been the subject of conversation for many years: over the sleepy laziness of men who erected churches, we may indulge our superiority with a new triumph, by comparing it with the fervid activity of those who suffer them to fall.

The decay of religion must in time be the consequence of the destruction of churches; a very small number can be present while the public acts of the ministry are performed in houses; and as the greater part of the Highlanders make no use of books, all those who want the opportunity of vocal instruction must live in total ignorance.

It has been conjectured from these remains of antient sanctity, which are every where to be found, that for the last two centuries the inhabitants of the island have increased in number. This argument would have some force, if the houses of worship still remaining were sufficient to contain the people. But since they have now no churches at all, these venerable fragments do not prove the former inhabitants to be more numerous, but to have been more devout.

It is said, that some of these dilapidations are to be found in islands now uninhabited; but the inference is uncertain, whether or not they were ever peopled. Too much hope was placed in lonely austerities by the religion of the middle age. The great art of propitiation, by which crimes were effaced and conscience appeased, was voluntary servitude; it is therefore not at all unlikely that oratories were built in those places; where retirement was sure to have no disturbance.

Except the laird and his family, Raafay has little to detain a traveller; but their prevalence wants no auxiliaries. Such a seat of hospitality amidst the winds and waters, forms a delightful contrast, and fills the imagination with a number of pleasing images. Without is the rough ocean and the rocky land, the beating billows and the howling storm; within is elegance and plenty, beauty and gaiety, the song and the dance. If I could have found an Ulysses in Raafay, I had fancied a Phœacia.

It was our good fortune to meet at Raafay the chief of the clan of Dunvegan, whose name is Macleod, and by him received an invitation to his seat at that place. At Raafay is a stout boat, which was built in Norway; in which, with six oars, we were conveyed back to Sky. We landed at Port Re, which is so called, because James the Fifth of Scotland came into it, when he had the curiosity to visit the islands. The port is made deep and narrow by an inlet of the sea, where a ship lay waiting to dispeople Sky, by carrying the natives to America.

In our journey we dined at a public house, and I believe the only one in the island, and came to a place called Kingborough, because the king lodged there when he landed at Port Re. We were entertained

with the usual hospitality, by Mr. Macdonald, and his lady Flora Macdonald, whose name will be mentioned in history, and, if courage and fidelity be virtues, be mentioned with honour. She is of a middle stature, soft features, gentle manners, and elegant presence.

Next morning, we sent our horses round a promontory to meet us, and spared ourselves part of the day's fatigue by crossing an arm of the sea. To Dunvegan we came very willing to be at rest, and found our fatigues in travelling over an extensive marshy moor amply recompensed by our reception. Lady Masters, who had lived many years in England, was lately come hither, with her son and four daughters, who know all the modes of English œconomy, and southern elegance. Here we settled, and were determined not to spoil the present hour with thoughts of a departure.

Dunvegan is situated on the west side of Sky; it is a rocky pre-eminence, which projects into a bay. The principal seat of Macleod is partly antient, and partly modern; it is built upon the rock, and looks upon the water. It forms two sides of a small square, on the third side is the skeleton of a castle of unknown antiquity; when the Danes were masters of the island, it is supposed this was a Norwegian fortress. It is very nearly entire, and might easily have been made habitable, were there not an ominous tradition in the family, that the owner shall not long survive the reparation. In defiance of prediction, the grandfather of the present laird began the works, but desisted in a short time, and applied his money to worse purposes.

The chief of every clan used to reside in a fortress, when the inhabitants of the Hebrides lived in continual expectation of hostilities, for they had not only reason to be afraid, of declared wars, and authorized invaders, or of roving pirates, but of inroads and insults from rival clans, who, in the plenitude of feudal independence, asked no leave of their sovereign to make war on one another. A feud between the two mighty powers of Macdonald and Macleod has ravaged Sky. Macdonald, having married a Macleod, upon some discontent, dismissed her, probably because she brought him no children. Before the reign of James the Fifth, a Highland laird made trial of his wife for a certain time, and if she did not please him, the laws allowed him to put her away. This conduct, however, was sure to offend the wife's relations, and Macleod resented this injury, declaring, that though the wedding had been solemnized, without a bonfire, the separation should be better illuminated, and raising a little army, set fire to the territories of Macdonald, who returned the compliment in a short time, and at last prevailed.

The disorderly state of insular neighbourhood may be further illustrated by the following story. The inhabitants of the isle of Egg, meeting a boat, manned by Macleod, tied the crew hand and foot, and set them adrift. Macleod landed upon the isle of Egg, and demanded the offenders; the inhabitants refused to surrender them, and retreated to a cavern, where they thought their enemies unlikely to follow them. Macleod set fire to the mouth of the cavern, which choked them with smoke, and left them lying dead by whole families; similar to the affair with the Campbells.

We were confined at Dunvegan for some time, by the violence of the weather, but not at all to our inconvenience or discontent. We wanted to visit the islands near this place, but the weather would not permit the boat to live, and we were condemned to listen in idleness to the wind, except when we were better engaged by listening to the ladies.

We here suffered the severity of a tempest, without enjoying its magnificence, for we had more wind than waves. The sea is broke by a multitude of islands, and does not roar with so much violence and noise as we have heard on the Sussex coast.

At Dunvegan we saw some traces of antient manners, and heard some standing traditions. In the house is

kept an ox's horn, hollowed so as to hold near two quarts, which the heir of Macleod was expected to swallow at one draught, as a test of his manhood, before he was permitted to bear arms, or associate with the men. The people here suppose that the return of the laird of Dunvegan, after any considerable absence, produces a plentiful capture of herrings, and that the herrings will desert the coast if any woman crosses the water to the opposite island; though this tradition is not uniform, for some hold that *no* woman may pass, and others that none may pass but a Macleod. One way or other, we suppose it has much the same effect.

Whilst we were at Dunvegan, a visit was paid by the laird and lady of a small island south of Sky, of which the proper name is Muack, which signifies swine. It is commonly called Muck, which the proprietor not liking, has endeavoured, without effect, to change to Monk. Gentlemen in Scotland are usually called by the name of their possessors; a practice necessary in countries inhabited by clans, where all that live in the same territory have one name, and must therefore be distinguished by some addition. This gentleman's name was Maclean, and should regularly be called Muck, but, as he thought the appellation too coarse for the island, he certainly does so for himself. He is now invariably addressed by the title of laird of Muck.

The isle of Muck is of considerable value, however it be named: it is about two English miles long and three quarters of a mile broad: the land is chiefly arable. Half this little dominion, the laird retains in his own hand, and one hundred and sixty persons subsist on the other half, who pay their rent by exporting corn; we could not decently enquire what rent they paid, and the laird did not tell us. The most fertile countries do not commonly maintain such a proportion of the people.

The laird of this district seems very attentive to the happiness of those people who are under his immediate view. He has disarmed the small pox of its terror, by inoculating eighty of his people, at the expence of two shillings and six-pence per head. The devastation of that cruel disorder, when it visits places where it comes but seldom, is well known, and this precaution of the laird's is a proof both of his benevolence and his attention to his own interest. They cannot have many trades among them; a smith and a taylor visit them about six times a year.

Here I was in danger of forgetting that I was to depart, till a gentleman present severely reproached me with my softness and sluggishness. I made no very forcible defence, and agreed to pursue our journey. We were accompanied to Ulinisk by Macleod, where we were entertained by the sheriff of the island.

We were directed to every thing worthy of attention by Mr. Macqueer, who travelled with us, and went with him to see an antient building, called a dun or borough. It was a circular inclosure, about forty-two feet in diameter, walled round with loose stones to the height of about nine feet. The walls are very thick, and diminish a little towards the top; and though in these countries stone is not brought very far, this building must have been raised with much labour. Within the great circle are several smaller rounds of wall, which formed distinct apartments. We could neither find out its use nor its date: Mr. Macqueer thought it a Danish fort, but some suppose it to be the original seat of the Macleods.

The entrance is narrow, and covered with flat stones. These stones were probably raised by putting large pieces of wood under them, to which the action of a long line of lifters might be applied. Savages, in all countries, have patience in proportion to their unskilfulness, and are contented to attain their end by very tedious methods.

It might once have been a dwelling, if it was ever roofed, but it could not have been a fortress, as there is no provision for water. Here, as in every other place, there is an ambition of exalting whatever has survived memory, referring it to very remote ages,

and designating it to some important use. It is very probable, that, in lawless times, when the inhabitants of every mountain stole their neighbour's cattle, these inclosures were used to secure the herds and flocks in the night.

If the whole building were once a house, the interior inclosures were the chambers of the chief inhabitants; and if it were a place of security for cattle, they were probably the shelters of the keepers.

We were afterwards conducted to another place of security, a cave carried a considerable way under ground, which had been discovered by digging for a fox. These caves are commonly formed by taking advantage of a hollow, where banks or rocks rise on either side: the ground must not be cut away, if no such place can be found. The walls are made by piling stones against the earth on each side: it is then roofed by larger stones, laid across the cavern, which therefore cannot be wide. Turfs were placed over the roof, and grass suffered to grow, and the mouth was concealed by bushes or some other cover.

We are by no means persuaded that these caves were the cabins of the first rude inhabitants. No man could stand upright in them; by their construction, they are all so narrow, that two people can never pass along them abreast; and they must always be damp, being subterraneous: they are formed with as much art as the construction of a common hut requires, and are not the work of an age much ruder than the present. It is most likely they were places of only occasional use, when the islander, upon a sudden alarm, hid his utensils or his cloaths, and perhaps his wife and children.

We would not proceed the whole length of the cave, and went away without knowing how far it was carried. We shall perhaps be blamed for this omission, as we have blamed other travellers; but the day was rainy and the ground damp, which we thought sufficient excuses.

The chief records of an illiterate nation are edifices, either standing or in ruins. At no great distance from our way, stood a shattered fortress, of which Mr. Macqueer gave the following account.

These, said he, are the walls of a place of refuge, built in the time of James the Sixth, by Hugh Macdonald, who was next heir to the fortune and dignity of his chief. Hugh Macdonald being so near his wish, was impatient of delay, and had art and influence sufficient to engage several gentlemen in a plot against the laird's life. Something must be stipulated on both sides; for they would not dip their hands in blood merely for his advancement. The compact was formally written, signed by the conspirators, and placed in the hands of one Macleod.

It happened that Macleod had sold some cattle to a drover, who not having ready money, gave him a bond for payment. The debt was discharged, and the bond re-demanded; which Macleod, who could not read, intending to put into his hands, gave him the conspiracy. The drover, when he had the paper, delivered it privately to Macdonald, who being thus informed of his danger, called his friends together, and provided for his safety. He made a public feast, and inviting Hugh Macdonald and his confederates, placed each of them at the table between two men of known fidelity. The compact of conspiracy was then shewn, and every man confronted with his own name. Macdonald acted with great moderation: he upbraided Hugh both with his disloyalty and ingratitude, but told the rest, that he considered them as men deluded and misinformed. Hugh was sworn to fidelity, and dismissed with his companions; but he was not generous enough to be reclaimed by lenity; and finding no longer any countenance among the gentlemen, endeavoured to execute the same design by meaner hands. In this practice he was detected, and taken to Macdonald's castle, and imprisoned in the dungeon. When he was hungry, they set down a plentiful meal of salted meat; and when, after his repast, he called for drink, conveyed to him a covered cup,

which, when he lifted off the lid, he found empty. From that time they visited him no more, but left him to perish in solitude and darkness.

Our next stage from Ulinisk was to Talisker, where we were entertained at the house of Colonel Macleod, an officer in the Dutch service, who, at that time of universal peace, had, for several years, been permitted to be absent from his regiment. As he was bred to physick, he was consequently a scholar; and his lady, by attending him into different places, is become acquainted with several languages. Here the gay and the jovial seem utterly excluded, and the hermit may expect to grow old in meditation, without possibility of interruption or disturbance. Talisker is situated near the sea, but upon a coast where no vessel lands, but when it is driven on the rocks by a tempest. Towards the land are lofty hills, streaming with water-falls. The present inhabitants have planted many firs and pines, which grow so prosperously that some are very high and thick.

Here we happily met with Mr. Donald Maclean, a young gentleman, the eldest son of the laird of Col, who is heir to a very great extent of land, and spent a considerable time amongst the Herefordshire and Hampshire farmers, that he might improve his inheritance. That he might not deceive himself with a false opinion of skill, he worked with his own hands at the principal operations of agriculture. If the world has agreed to praise the travels and manual labours of the czar of Muscovy, let the laird of Col have his share of the like applause, in the proportion of his dominions to the empire of Russia.

This young gentleman repaired for lodgings to Talisker, after being weary with following his game in the mountains of Sky. He missed one of the dogs at night, and when he went to seek him in the morning, found two eagles preying upon his carcase.

When this young gentleman heard we intended to visit Jona, he offered to conduct us to his chief, Sir Allen Maclean, who lived in the isle of Inch Kenneth, and would readily find us a convenient passage. Our acquaintance with young Col, which was begun by kindness, was accidentally continued by constraint. We derived a great deal of pleasure from it, and I hope we gave him no reason to repent it.

We were obliged to snatch some happy intermission from the almost continued storm, in order to be conveyed to Mull, the second island of the Hebrides, lying about a degree south of Sky, whence we might easily find our way to Inch Kenneth, where Sir Allan resided, and from thence to Jona.

The most commodious station we could take for this purpose was Armidel, which Sir Alexander Macdonald had now left to a gentleman, who lived there as his steward. We stopped at Coriatachan, where we had already been, and were therefore very willing to return. A great part of our journey was performed in the gloom of the evening, having staid so long at Talisker. In travelling even thus almost without light through naked solitudes, when there is a guide whose conduct may be trusted, a mind not naturally disposed to fear may preserve some degree of cheerfulness; but what must be the solitude of him who should be wandering among the crags and hollows, benighted, ignorant, and alone!

I am inclined to believe that the fictions of the Gothic romances were not so remote from a credibility as they are now thought. In the full prevalence of the feudal institution, when violence desolated the world, and every baron lived in a fortress, forests and castles were regularly succeeded by each other; and the adventurer might very suddenly pass from the gloom of woods, or the ruggedness of moors, to seats of plenty, gaiety, and magnificence: if giants, dragons, and enchantments are excepted, whatever is described in the wildest tale would be felt by him, who, wandering on the mountains without a guide, or upon the sea without a pilot, should be carried amidst his terror and uncertainty, his amazement and distress, to the elegance and hospitality of Raafay or Dunvegan.

We were welcomed at Cuiatachan as before, where we staid two days, and made such inquiries as curiosity suggested. Mr. Macpherson and his sister composed part of the company with which the house was filled, and distinguished themselves by their politeness and accomplishments. He invited us to Ofig, a house not far from Armidel, where we might easily hear of a boat when the weather would suffer us to leave the island.

Mr. Macpherson is minister of Ofig, where we were hospitably entertained for some days, and then removed to Armidel, and finished our observations on the isle of Sky.

The air cannot be supposed to have much warmth in this island, which lies in the fifty-seventh degree. Great heat is produced sometimes in northern latitudes, by the long continuance of the sun above the horizon; but this can only happen in sheltered places, where the atmosphere is to a certain degree stagnant, and the same mass of air continues to receive, for many hours, the rays of the sun and the vapours of the earth.

Sky is cooled in the summer by perpetual ventilation, and in the winter is kept warm by the same blasts. It lies open on the west and north to a vast extent of ocean. Notwithstanding these apparent advantages, their weather is not pleasing, for half the year is deluged with rain. From the autumnal to the vernal equinox, a dry day is scarcely known, except when the showers are suspended by a tempest. No great exuberance of vegetation can be expected under such skies. Their winter overtakes their summer, and their harvest lies upon the ground drenched with rain: the autumn struggles hard to produce some of our early fruits. In September we gathered gooseberries, but they were very small, and their husk was thick.

The winter in Sky is seldom so severe as to put a full stop to the growth of plants, or to reduce the cattle to live entirely upon the summer produce. They had a severe season in the year 1771, from which this land has not yet recovered; they call it the black spring. The snow lay long upon the ground, which was a calamity they hardly ever knew before. Part of their cattle were unseasonably sold to buy sustenance for the owners; part of them died for want, and the kine that survived were so dispirited and emaciated, that they did not require the male at the usual time. This is a piece of natural history that we never heard nor read of before.

As in other countries, the soil here has its diversities. In many parts there is only a thin layer of earth spread upon a rock, which bears nothing but a short brown heath. We did not observe any aquatick plants in those places where there are many bogs and mosses. Some happy spots of earth are capable of tillage, and some grafs is interspersed in different places.

Their agriculture is unskilful, but laborious; their chief manure is sea-weed, which lies and rots on the earth. Their corn-grounds often lie in such intricacies among the crags, that there is no room for the action of a team or a plough: they then turn up the soil by manual labour, with an instrument called a crooked spade, which is capable of great improvement. According to the different manner of tillage, the farms are distinguished into long land and short land: long land is that which will admit of a plough, and short land is that which is turned up by a spade.

Oats or barley is the grain which their lands produce. When they sow barley, they always manure the ground very copiously, and their increase is equal to that of more fertile countries; but they generally content themselves with sowing oats, because the manuring the ground is too tedious and laborious; of these they have only a triple increase. It is in vain to hope for plenty, when the third part of the harvest must be reserved for seed.

In harvest time, they do not cut but pull up the barley by the roots; to the oats they apply the sickle. Their harvest is laid upon a frame of timber, which

is drawn by a single horse, for they have no wheel carriages. Their sheaves are often conveyed home in a kind of open panier or frame of sticks upon the horse's back.

Their method of drawing their oats from the husk, is by parching them in the straw, and then totally destroying that fodder, for want of which their cattle often perish. How improvident is this! for that which is obtained with so much labour ought never to be wasted. Two small conveniences arise from this practice: the grain is so dried, that it is easily reduced to meal, and they escape the theft of the thresher.

Few vows are made to Flora in the Hebrides. They are not studious of beauty or fragrance in their gardens; but the common greens are not wanting, and we suppose, by chusing an advantageous situation, the more hardy esculent plants might be raised.

The hay they make is very bad, and would by most English farmers be thrown away. It is so often almost dry and wet again, that before it is turned, it becomes a collection of withered stalks without taste or fragrance. No cattle will eat it that can get any thing else.

Where there are mountains, there are commonly minerals, but I never heard of any subterraneous treasures in the islands. One of the rocks in Col has a black vein imagined to consist of the ore of lead; but it was never yet opened or assayed. They accidentally picked up a black mass in Sky; and brought it into the house of the owner of the lands, who would very willingly have persuaded himself that it was coal, but unfortunately it would not burn.

Common ores would here be of no great value, for they must be carried away in their mineral state, here being no fuel for the melting house or forge. By diligent search, it is probable that marble might be found in this world of stone. But neither commercial industry nor philosophical curiosity have yet fixed their abode here, where the importunity of immediate want, supplied but for the day and craving on the morrow, has left little room for exercise, knowledge, or the pleasing imagination of distant profit.

A lucrative manufacture has indeed lately been established here; the rocks abound with kelp, which is a sea plant, and the ashes are melted into glass. They burn it in great quantities, and then send it away in ships which come regularly to purchase it. This new source of riches has raised the rent of many maritime persons, but the tenants pay the additional rent with much reluctance. They consider the profits of the kelp as the mere product of personal labour, to which the landlord contributes nothing. The landlord thinks, that he may be said to give what he gives, the power of gaining, and that he certainly has as much right to profit by the price of kelp, as by any thing else found or raised upon his ground.

Since this new manufacture has been established, there has been an eager litigation between Macdonald and Macleod, for a ledge of rocks, which, till the value of kelp was known, neither of them desired the reputation of possessing.

The breed of cattle in Sky is not so small as some people imagine, for since they have driven them in such numbers to southern markets, the breed has been improved. The annual growth of cattle is at stated times driven to a fair by a general drover, and the rents are paid with the money which he returns to the farmer.

It is astonishing to think, for what a small sum of money a Highland drover will travel a considerable number of miles. An English grazier who goes twice a year into the Highlands to purchase cattle, told the writer of this work with an air of the greatest veracity, that they will travel, at least, four hundred miles, and spend no more than five shillings each. If they have large droves, the drovers club together their general stock of oatmeal; and they take advantage of a brook, where they sit down and mix it with water. This is the principal sustenance they receive during the whole journey.

The cattle generally bring from two to three pounds a head; there was once one fold for five pounds. They are generally fatted in English pastures before the butcher purchases them.

Their horses are, like the cattle, rather small; perhaps no care is taken to prevent that diminution of size, which must always happen where the greater and the less copulate promiscuously, and the young animal is restrained from growth by the penury of sustenance.

The goats of the Hebrides are like others; I did not hear any thing remarkable of their sheep. The goats and the sheep are milked like the cows. The goat is a general inhabitant of the coast, and complies with every difference of soil and climate.

The stags of the mountains very much resemble our venison in taste, but are not so large as the stags of our parks or forests. The roebuck I never saw nor tasted. These are not countries for a regular chase; the deer are not driven with hounds and horns; but a sportsman with his gun in his hand watches the animal, and, after he is wounded, traces him by the blood.

Their greyhounds are larger and stronger than those with which we chase hares, and these are the only dogs they use for the chase.

By the use of fire-arms man is made so much an over-match for other animals, that in all countries where they are in use, the wild part of the creation sensibly diminish. It is very probable, that in the course of a few years there will be neither roebucks nor stags in the islands. Had it not been for laws for the preservation of game in countries well inhabited, all the beasts of the chase would have been lost long ago.

In regions of barrenness and scarcity, the human race is hindered in its growth by the same causes as the animals. The inhabitants of Sky are commonly of the middle stature. The tallest men are among those of higher rank. The ladies here have as much beauty as in other places; but bloom and softness are not to be expected among the lower classes, whose features are exposed to the rudeness of the climate, are contracted by want, and sometimes hardened by the blasts. Where no real hardships are suffered, and as supreme beauty is seldom found in cottages or workshops, it seems necessary, that the mind should cooperate by placidness of content, or consciousness of superiority, in order to expand the human face to its full perfection.

No soldiers can be better qualified for a campaign in America than the Highlanders. Their strength is proportionate to their size, but they are accustomed to run upon rough ground, and therefore can with great agility clamber the mountain, or skip over the bog. As they have little work to do, they do not seem willing to endure a long continuance of manual labour, and are therefore considered as habitually idle.

They supply their wants by very insufficient shifts, and endure many inconveniences which a little attention would easily relieve: they have never been supplied with those accommodations which life extensively diversified with trades affords. I have seen a horse carrying home the harvest on a crate; under his tail was a stick for a crupper, held at the ends by twists of straw. Ropes may be had in the islands, for hemp will grow there; and if they had wanted hemp, better cordage is made of rushes than of straw.

They are not exposed to any particular diseases, nor is perpetual health secured to them. The physicians in the islands all practice surgery, and compound their own medicines. I found no instance here of extraordinary longevity, though it is generally supposed that life is longer where there are few opportunities of luxury. A cottager grows old over his oaten cakes like a citizen at a turtle feast; though indeed he is seldom burdened by corpulence. Poverty preserves him from sinking under the burden of himself, but he escapes no other injury of time.

People are more willing to credit, than examine, re-

lated instances of long life. To be told that any man has attained a hundred years, gives hope and comfort to him who stands trembling on his own climacteric. Length of days is distributed impartially to very different modes of life in very different climates; and the mountains have no greater examples of health and age than the Lowlands, where I was introduced into the company of two ladies of high quality; one of whom attained her eighty-fourth year without any diminution of her vivacity, and with little reason to accuse time of depredations on her beauty; and the other, in her ninety-fourth year, presided at her table with the full exercise of all her powers.

The inhabitants are of different rank in the islands as in most other places, and one does not encroach here upon another. He that is born poor can scarcely become rich, in a place where there are neither manufactures or commerce; and if none are able to buy estates, he that is born to land cannot annihilate his family by selling it. This was once the state of these countries, but since money has been brought amongst them, they have found, like others, the art of spending more than they receive; and I beheld with grief, the chief of a very eminent clan, whose island was condemned by law to be sold for the satisfaction of his creditors,

Laird is the title of highest dignity in this part of the world. In the extensive island of Sky there are only three, Macdonald, Macleod, and Mackinnon, Where no man lives but by agriculture, the natural power of the laird who is owner of that land must be very great. The laird has all those in his power who live upon the farms. Kings can for the most part only exalt and degrade; but the laird at pleasure can feed or starve, can give bread or withhold it. By the kindness of consanguinity, and the reverence of patriarchal authority, this inherent power was further strengthened. The laird was the father of the clan, and his tenants commonly bear his name. An exclusive right of legal jurisdiction was adapted to these principles of command,

It is scarcely credible with what force this extensive and multifarious obligation operated. Affection and adherence to the chief absorbed every duty moral and political. Not many years have passed since the clans knew no law but the laird's will. He told them to whom they should be friends or enemies, what religion they should profess, and what king they should obey,

In the year 1715, when the Scotch first rose in arms against the succession of the house of Hanover, Lovat the chief of the Frasers was in exile for a rape. The Frasers were very numerous, and great enemies to the government. A pardon was sent to Lovat, he came to the English camp, and the clan deserted to him.

The tacksmen is next in dignity to the laird: he is a large taker or leaseholder of land, of which he keeps part in his own hand, and lets part to under-tenants; he is necessarily a man capable of securing to the laird the whole rent, and is commonly a relation of his. Ministers are next in rank, who frequently improve their livings by becoming farmers.

There are different orders of tenants, as they have greater or less stock. The condition of domestic servants, or the price of occasional labour, I do not know with certainty. I was informed that the females have sheep, and are allowed to spin for their own cloathing.

Such is the system of insular subordination, which having little variety, cannot afford much delight in the view, nor long detain the mind in contemplation. Perhaps the inhabitants were for a long time contented; but their happiness was a mixture of ignorance, pride, and indifference for pleasures which they did not know, a strong conviction of their own importance, and a blind veneration for their chiefs.

The heavy hand of a conqueror has crushed their pride; and though the laws which followed the conquest cannot be called cruel, they have produced much discontent, because they operate chiefly upon

the surface of life, and make every eye bear witness to subjection. Their being compelled to wear another kind of dress is very painful to them.

As their chiefs are deprived of their jurisdiction, they have lost much of their influence; and as they gradually degenerate from the dignity of patriarchal rules to that of rapacious landlords, they will soon divest themselves of the little that remains.

The law which has disarmed them, has abated the dignity which they derived from an opinion of their military prowess. An old gentleman who pleased himself with the recollection of better days, told me, that about forty years ago a chieftain walked out attended by ten or twelve followers with their arms rattling. That animating rabble has now ceased. The chief has lost his formidable retinue, and the Highlander walks his heath unarmed and defenceless, with the same peaceable submission as an English cottager or a French peasant.

Their knowledge increases every day, but it is of little other use than to shew them their wants. They are now in the period of education, and feel the uneasiness of discipline, without yet perceiving the benefit of instruction.

Of the first statutes made with a design of depriving the Highlanders of their arms, the execution was very feeble, and the effect inconsiderable; but the last law has operated beyond expectation. Concealment was formerly practised, and perhaps often with connivance. There was an obstinacy on one side, and a tenderness and partiality on the other. But the law which followed the victory of Culloden, found the whole nation intimidated and dejected; informations were given without fear and without danger, and the arms were collected with such rigour, that every house was despoiled of its defence.

There could be no reasonable cause of complaint, that part of the Highlands were despoiled; for every government must be allowed the privilege of taking away the weapon which was lifted up against it. But the loyal clans murmured with some degree of justice, that after having defended the king, they were forbidden for the future to defend themselves; and that sword should be forfeited, which had been legally employed. This was undoubtedly hard; but in political regulations, good cannot be complete, it can only be predominant.

They burn nothing but peat in the islands, for all their wood is nearly consumed, and they have not yet found any coals.

Except to the hardy sportsman who can tread the mountain or climb the moor, the islands afford few pleasures. Frequent intercourse is impracticable, where the distance from one family to another, in a country like this, is so great. Visits are commonly paid by water, and last several days.

They have long enjoyed that peace which the bag-pipe can give, but its use begins to be forgotten. Some of the chief families still retain a bag-piper, whose office was anciently hereditary. The tunes of the bag-pipe are traditional. A college of pipes has been established time immemorial, under the direction of a master, which is not quite extinct. Hither the students of music repaired for instruction.

When a stranger comes into a place where a stranger is seldom seen, he asks the people questions, of which they cannot guess the motive, and gazes with surprize on things which they do not suspect of any thing wonderful, having always had them before their eyes. On this account, it has been supposed that the inhabitants of the islands have great curiosity and inquisitiveness, but it does not appear certain that they are at all particular in this respect. This stranger appears to them like some being of another world, and then wonders that they take their turn to inquire whence he comes, and whither he is going.

Parochial schools are now established in the islands, to which the lord of every manor pays a certain stipend. Formerly none but the sons of gentlemen had any literature. In these schools they only teach English.

The education of the ladies is generally domestic, for there is no boarding-school nearer than Inverness. Women must here study to be either pleasing or useful, for their deficiencies are seldom supplied by very liberal fortunes. No young lady, but the laird's daughter, has hope of any portion beyond a hundred pounds. It is not often, indeed, that they give any money with their daughters; the question is how many cows a young lady will bring to her husband. Two cows are a decent fortune for one who pretends to no distinction, and a rich maiden has from ten to forty.

The kirk of Scotland is the established religion of the Highlands. Those gentlemen with whom we conversed, seemed to prefer the English liturgy; but they are obliged to maintain the established minister, and the country is so poor that they cannot support another.

As often as a visit from their minister, or the practicability of travelling will give them an opportunity, they attend the worship of the kirk. Their pastors are neither deficient in learning, nor irregular in life. Though all are not equally enlightened, the ancient rigour of puritanism is very much relaxed. The knowledge which the ministers of the islands have obtained is such as may justly be admired in men who have no motive to study, but generous curiosity, or the desire of usefulness; and they have attained such a degree of politeness and affability, which could not have been supplied in so narrow a circle but to minds naturally disposed to elegance.

We were not curious to investigate the political tenets of the islanders, and they did not obtrude them upon us. Their conversation is decent and inoffensive, and there is no disaffection at their tables. We never heard a Highlander offer a health that might not have been drank in the king's palace.

By the indefatigable diligence of the ministers, the various kinds of superstition which prevailed here, as in all other regions of ignorance, are nearly extirpated.

Martin mentions Brawny, who was a sturdy fairy, and if he was well fed and kindly treated, would, as they said, do a great deal of work. He has not been heard of for many years; they pay him no wages, and more wisely work for themselves.

Within these three and thirty years, the inhabitants of Froda used to set milk every Saturday for Greogack, or the old man with the long beard. The minister is now living, by whom the practice was abolished.

They pretend to cure different diseases by a number of charms: they are all invocations, which might probably be transmitted to them from the times of popery, which increasing knowledge will bring into disuse.

The moon has great influence in vulgar philosophy, and the Highlanders expect better crops of grain if the seed is sown during the moon's increase. It is not above thirty years ago that it was a precept annually given, in one of the English almanacks, to kill hogs when the moon was increasing, and the bacon would prove the better in boiling.

Had we not endeavoured with peculiar attention to examine the question of second sight, we should have had little claim to the praise of curiosity. It is desirable that the truth should be established, or the fallacy detected of an opinion received for centuries by a whole nation, and supposed to be confirmed through its whole descent by a series of uninterrupted facts.

To describe the second sight as they mean it should be, is neither more nor less than an impression made either by the mind upon the eye, or by the eye upon the mind, by which things distant or future are perceived and seen as if they were present. For instance, a man, on his journey, far from home, falls from his horse, another, which is perhaps at work about the house, sees him bleeding on the ground, generally with a landscape of the place where the accident befalls him: another sees, wandering in idleness, driving home

home his cattle, or musing in the sunshine, is suddenly surpris'd by the appearance of a funeral procession, and counts the mourners or attendants; or by that of a bridal ceremony. Of both these processions, if he knows the attendants, he tells their names; and if he knows them not, he can describe their dresses. Things distant are seen at the instant they happen. Of things future, there is no rule for determining the time between the second sight and the event.

These appearances have no dependence upon choice, they cannot be summoned, detained, or recalled. The effect is often painful, and the impression sudden. Good as well as evil have the same proportion in these visionary scenes, as it obtains in real life: almost all remarkable events have evil for their basis, and are either miseries incurred, or miseries escaped. The idea of pain predominates in almost every mind, because our sense is so much stronger of what we suffer, than what we enjoy. What is history but a record of wars, treasons, and calamities? What is recollection but a revival of vexations? The greatest good, be it what it will, is the lot but of a part; and death, which is considered as the greatest evil, is the common portion of us all.

Because death is an event frequent and important, it is no wonder that they should often see such appearances. But more pleasing incidents present themselves to view. A gentleman who went once far from his own island, was predicted to return, by one of his labouring servants, who described the livery of his attendant, which he had never worn at home, and which had been occasionally given him without any previous design.

The Islanders, of all degrees of rank and understanding, universally believe in the second sight, except the ministers, who as universally deny it. But they are suspected to deny it, because they steel themselves against conviction. One of them honestly said, that he came to Sky with a determined resolution not to believe it.

Many objections will readily occur: one is, that the faculty of seeing things out of sight is local and useless; the second is, that it is an infringement upon the common order of things, without any visible reason, or perceptible benefit; and a third, because it is ascribable only to a people very little enlightened.

In answer to these objections, it may be replied, that by presuming to determine what is fit and beneficial, more knowledge of the universal system is presupposed than man has attained; and therefore depends upon principles too complicated and extensive for our comprehension; and there can be no security in the consequences, when the premises are not understood. The second sight is wonderful only, because it is uncommon; for, considered in itself, it involves no more difficulty than dreams, or, perhaps, than the regular exercise of the thinking powers. We must be contented to yield to the force of testimony, that sudden impressions, which the event has verified, have been felt by more than one, who have published them: and that particular instances of this sort have been given, which neither Bacon nor Boyle have been able to resist.

No profit was ever sought or gained by pretension to second sight. Neither hope nor fear are known to have any part in this involuntary affection. It is neither boasted of as a privilege; nor are those who profess to feel it, considered by others as advantageously distinguished. The hearers have no motive to encourage the imposture, nor have the relations any temptation to feign the story.

It is not easy to converse with any of these seers. There is one living in Sky, but he was grossly ignorant, and knew no English. If this quality is accidental, it can very rarely happen to a man of education, where the proportion of the poor to the rich is such as in these countries; and yet on such men it has sometimes fallen. A second-sighted gentleman is now living in the Highlands, who complains of the terrors to which he is exposed.

Prescience is not always the foresight of the seers; they are impressed with images, of which the event only shews them the meaning. They tell what they have seen to others, who are at that time not more knowing than themselves, but may become at last very adequate witnesses, by comparing the narrative with its fulfilment.

It would have required more time than we could bestow to collect sufficient testimonies for the satisfaction of either the public or ourselves. One principal argument against it, is the seeming analogy of things, confusedly seen, and little understood; and for it, the indistinct cry of national persuasion, which may, perhaps, at last be resolved into prejudice and tradition. Our curiosity could never be advanced to conviction, but we came away at last only willing to believe.

The Highland armour antiently consisted of the glaymore, or great two handed sword, and afterwards the two edged sword and target, or buckler, which was sustained on the left arm. In the midst of the target, which was made of wood, covered with leather, and fenced with nails, a slender lance, of about two feet long, was sometimes fixed; it was very heavy and cumbrous, and has been gradually laid aside. They likewise have the lockhabar ax, and the dirk, or broad dagger. Several of these Highland arms are still to be seen in the tower of London, which were taken from them in the year 1715.

The art of defence with the Highland broad sword is no part of common education. The common men have no other powers than those of violence and courage; though some of the gentlemen may be skilful gladiators. Though it is well known that the first onset of the Highlanders is very formidable, yet as an army cannot consist of philosophers, a panic is easily excited by any uncommon mode of annoyance.

Soldiers who are accustomed only to exchange bullets, and rather would hear their enemies than see them, are amazed and discouraged when they find themselves encountered hand to hand, and catch the gleam of steel flashing in their faces.

Many exertions of personal courage, and sometimes single combats, arise from the use of Highland weapons. At the battle of Falkirk a gentleman, now living, was, after the retreat of the king's troops, engaged, at a distance from the rest, with an Irish dragoon. As they were both skilful swordsmen, the contest was not easily decided; at last the dragoon had the advantage, and the Highlander called for quarter, which the dragoon refused him, and the Highlander was at last reduced to fight upon one knee. At this critical moment one of the Macleod's came to his rescue, who, as it is said, offered quarter to the dragoon; but he thought himself obliged to reject what he had before refused, and, as battle gives little time for deliberation, was instantly killed. His bravery was certainly singular.

We were flattered at last with a wind that promised to convey us to Mull, after having waited some days at Armidel, but were doomed, like others, to experience the danger of trusting to the wind, which blew against us, in a short time, with such violence, that we, being no seasoned sailors, were willing to call it a tempest. Our difficulties might, perhaps, have filled a very pathetic page, had not Mr. Maclean, of Col, who is a very skilful mariner, piloted us into his own harbour.

We passed the first day and night in the isle of Col with captain Maclean, who has lived some time in the East-Indies; but as he has dethroned no nabob, is not too rich to settle in his own country. From the habitation of this gentleman we went to Grissipol, and called by the way on Mr. Hector Maclean, the minister of Col, who has the reputation of great learning: he is seventy-seven years old, but not infirm, and has a very venerable appearance. His conversation was suitable thereto. He was not very well pleased with some hints dropped in favour of an heretical writer, and his aspersions were not very censurable.

cenfurable. A man, who has fettled his opinions, does not like to have them difturbed; and at feventy-feven it is high time to be in earneft.

This venerable and respectable man has no opportunity of preaching to more than a room will contain, as there is no public edifice for the exercife of his miniftry. Two fkeletons of chapels remain, which now ftand faithful witneffes of the triumph of reformation. The want of churches is not the only impediment to the public exercife of piety, but there is likewife a want of minifters. A parifh often contains more iflands than one, and each ifland can have the minifter only in its turn.

Griffipol is a houfe and farm, occupied by Mr. Macfweyn, where we faw more of the antient life of a Highlander than we had found before.

The ifle of Col is computed to be about thirteen miles long, and three broad. The middle belongs to Maclean, who is called Col, as the only laird; but both the ends are the property of the duke of Argyle.

Col is one continued rock, whose furface is much diversified with protuberances, and covered with a thin layer of earth, which is often separated, and difcovers the ftone. The uncultivated parts are clothed with heath, among which induftry has interfperfed fpofts of grafs and corn.

We waited fome days at Col, liftening to the tempeft, and wandered about the ifland till our curiofity was fatisfied. We found a floop laying on the coaft, in which we embarked for the ifle of Mull. We fpent the night, neither very elegantly nor pleafantly, on board the veffel, and were landed next day at Tobar Morar, a port in Mull, which appears formed for the fecurity of fhips; here feveral veffels were at anchor, and the port had a very commercial appearance.

The ifle of Mull is perhaps the third part of the Hebrides: it is a folid and compact mafs, not broken by waters, nor fhut into promontories, and may contain about three hundred fquare miles.

We found a ftrong inclination to vifit Tana, or Tulmhill, which was the great fchool of theology to the early ages, and is fupposed to have been the place of fepulture for the antient kings.

We were obliged to traverse a great part of Mull in order to perform this expedition. As we had no experience of a journey in Mull, we had no doubt of reaching the fea by day-light, and therefore did not fet out very early: but we found the country very difficult to pafs. We were always ftruggling with fome obftruction or other, and our vexation was not balanced by any gratification of the eye or the mind; our minds were only employed on our own fatigue.

When we came to the fea-fide, we were happily efpyed from an Irish fhip that lay at anchor in the fraights. The mafter faw we wanted a paffage, and with great civility fent us a boat, which quickly conveyed us to Ulva, where we were very liberally entertained. We came here in the dark, and left it before noon next day, fo that a very exact defcription of Ulva cannot be expected. We were informed that this ifland is of no great extent, rough and barren, and inhabited by the Macquany, a fmall, but antient clan. Mr. Macquany is owner of Ulva and fome adjacent iflands, among which is Staffa, fo lately raifed to renown by Mr. Banks.

The wonders of Staffa excite no curiofity nor furprife in the inhabitants of thofe iflands: they had always feen it, and had therefore confidered it but little. None but philofophers are ftruck with wonder, otherwife than by novelty. An unenlightened ploughman would be very much furprifed to hear a company of fober men inquiring by what power the hand toffes a ftone, or why the ftone, when it is toffed, falls to the ground!

The piety of antient times did not neglect Ulva; it has ftill to fhew what was once a church.

Next morning we landed at Inch Kenneth, an ifland about a mile long and half a mile broad, re-

markably pleafant and fertile; it is fit both for paffure and tillage, is verdant and graffy, but has no trees. The only inhabitants of this fmall fpot are Sir Allan Maclean, and two young ladies his daughters, with their fervants.

Such a fcene, romance itfelf does not exhibit, as this little defert among the depths of weftern obfcurity; occupied, not by a grofs herdsman, or amphibious fifherman, but by a gentleman and two ladies, of high birth, polifhed manners, and elegant converfation; who, in a habitation raifed not very far above the ground, but furnifhed with unexpected neatnefs and convenience, praftifed all the refinement of courtefy, and, what to us was full as agreeable, all the kindnefs of hofpitality.

The clan of Maclean, of which Sir Allan is the chief, is faid to claim the fecond place among the Highland families, and yields only to Macdonald. Moft of the extenfive territory which would have defcended to him has been alienated, owing to the mifconduct of his anceftors, notwithstanding he ftill retains much of the dignity and authority of his birth.

We were met by Sir Allan and the ladies when we landed, and walked to the manfion, where we found one cottager for Sir Allan and two more for the domeftics and offices. Here we wanted little that palaces afford. The room we entered was neatly floored, and well lighted, and our dinner was plentiful and delicate. Sir Allan reminded us in the afternoon, that the day was Sunday, which he never fuffered to pais without fome religious diftinction, and invited us to partake in his domeftic worfhip; we immediately acquiefced. The elder of the ladies read the Englifh fervice.

A feminary of ecclefiaftics was once fettled at Inch Kenneth, fubordinate to Icolmhill. A venerable chapel engaged our attention, which ftands yet entire, except that the roof is gone. This chapel is about fixty feet long and thirty broad: on one fide of the altar is a bas relief of the Virgin Mary, and by it is a little bell, which, though crooked and without a clapper, has remained there for ages, guarded only by the venerablenefs of the place. This continues to be a place of fepulture; all the ground round the chapel is covered with grave-ftones of chiefs and ladies.

It was not without fome mournful emotion that we contemplated the monuments of the dead and the ruins of religious ftructures. Inch Kenneth is a proper prelude to Icolmhill.

Sir Allan diligently provided us a boat the next day, and himfelf accompanied us. We could very willingly have ftaid longer at Inch Kenneth, but life cannot be all paffed in delight.

Sir Allan victualled our boat for the day, and provided able rowers. Here we parted with the young laird of Col, who had attended us hitherto, and treated us with fingular kindnefs: he concluded his favours by configning us to Sir Allan. It was here we had the laft embrace of this amiable gentleman, who, whilft thefe pages were preparing to attelt his virtues, perifhed in the paffage, between Ulva and Inch Kenneth.

Having failed the whole day, and feen feveral curiofities which Sir Allan pointed out to us, fuch as a cave, and large black rocks, &c. the evening approached, and we were yet at a confiderable diftance from the end of our expedition: we therefore could not flop to make any remarks, and fet forward with fome degree of eagernefs: the day foen failed us, and the moon prefented a very folemn and pleafing fcene. The eye commanded a wider circle, for the fky was clear; the fea was neither ftill nor turbulent, the wind neither loud nor filent. We were never far from one coaft or another, on which we could have found fhelter had the weather become violent; we were therefore quite at eafe to contemplate the region through which we glided in the tranquillity of the night, and faw now a rock, and now an ifland, grow gradually confpicuous and gradually obfcure.

At Gulmkill we found no convenience for landing:

our

our Highlanders carried us on their backs over the water.

We now set our feet on sacred ground, and trod that illustrious island, which was once the luminary of the Caledonian regions, from whence savage clans and barbarous rovers derived the blessings of religion and the benefits of knowledge. It would be impossible to abstract the mind from all local emotions, if it were endeavoured; and if it were possible, it would be foolish. We are advanced in the dignity of thinking beings by whatever withdraws us from the power of our senses; and by whatever makes the past, the distant, or the future, predominate over the present. Far from us be such frigid philosophy, as may conduct us indifferent and unmoved over any ground which has been dignified by valour, wisdom, or virtue. He is little to be envied, whose piety would not grow warmer among the ruins of Iona, or whose patriotism would not gain force upon the plain of Marathen.

The churches of the two convents are both standing, though unroofed. The episcopal church consists of two parts, separated by the belfrey, and built at different times. There are some walls remaining of the chambers, or cells, belonging to the monks, but nothing approaching to a complete apartment.

We could make no discoveries of curious inscriptions, because the bottom of the church was so incumbered with mud and rubbish. The place is said to be known where the black stones lie concealed, on which the old Highland chiefs, when they made contracts and alliances, used to take the oath, which was considered as more sacred than any other obligation, and which could not be violated without the blackest infamy.

The inhabitants use the chapel of the nunnery as a kind of general cow-house. The chancel of the nun's chapel is covered with an arch of stone, to which time has done no injury. In one of the churches was a marble altar, which the superstition of the inhabitants has destroyed. Their opinion was, that a fragment of this stone was a defence against shipwrecks, fire, and miscarriages. The basin for the holy-water, in one corner of the church, is yet unbroken.

Till very lately, the cemetery of the nunnery was regarded with such reverence, that only women were buried in it. Some mournful pleasure is always produced by these reliques of veneration.

The walls of a large room stand south of the chapel, which was, probably, the hall or refectory of the nunnery, which is capable of repair, but the other parts are mere fragments.

There are five chapels yet standing, besides the two principal churches, and three more are remembered. There are also two crosses, which bear the names of St. Matthew and St. John.

Several grave-stones cover a large space of ground about these consecrated edifices, few of which have any inscription. Iona has long enjoyed the honour of being the reputed cemetery of the Scottish kings. It is not unlikely, that when the opinion of local sanctity was prevalent, the chieftains of the isles, and perhaps some of the Norwegian or Irish princes, were reposed in this venerable inclosure. It is utterly unknown by whom the subterraneous vaults are now peopled. Some of the graves, undoubtedly, contain the remains of men who did not expect so soon to be forgotten.

The gardens of the monastery and the fish-pond are yet discernible, and the aquaduct which supplied them is still in use.

This island is remarkably fruitful, and confirms an observation frequently made, that ecclesiastical colleges are always in the most pleasant and fruitful places. That the monks chose well, when the world gave them that liberty, is surely no dishonour. The fruitfulness of Iona is now its whole prosperity; the inhabitants are very ignorant, and much neglected; no minister visits them. This island has now no temple for worship, nor any school for education, though

it was once the metropolis of learning and piety. There are but two inhabitants that can speak English, and not one that can either read or write. Who knows, but in the revolutions of the world, Iona may again be the instructress of these western regions?

Under Sir Allan's protection, we proceeded to Mull, where we landed in the evening, and was entertained by Mr. Maclean, the minister, who lives upon the coast. This gentleman, by the elegance of his conversation and the strength of his judgment, would be rendered conspicuous in much more celebrated places.

We were entertained at Lochbury, and were now to leave the Hebrides, where we had passed some weeks with sufficient amusement, and had amplified our thought with new scenes of nature and new modes of life. More time would have given us a more distinct view, but it was not proper to live too long upon hospitality, however liberally imparted.

It must be confessed that these islands have not many amusements but to the mere lover of nature. We rode a few miles from Lochbury to the side of Mull, which faces Scotland, where we took leave of our kind protector, Sir Allan Maclean, embarked in a boat, and, on the twenty-second of October, reposed ourselves at a tolerable inn on the main land. Next day we proceeded, and, at Inverary, found an inn not only commodious but magnificent. The difficulties of peregrination were at an end, and we had the honour of being very kindly entertained by the duke of Argyle, at his splendid seat, and supplied with conveniences for surveying his spacious parks, and rising forests.

We staid two days at Inverary, and proceeded southward over Glencroe, which, is a black and dreary region: from Glencroe we passed through a pleasant country to the banks of Loch Lomond, and were received at the house of Sir James Colquhoun, who is owner of almost all the thirty islands upon the Loch, which we went in a boat next morning to survey. The heaviness of the rain shortened our voyage, but we landed on one island planted with yew, and stocked with deer, and on another remarkable for the ruins of an old castle, on which the osprey builds her annual nest.

It is ungrateful to omit, yet tedious to repeat, the civility and respect which we found at every place. A fresh instance of hospitality and kindness we met with at Mr. Smollet's, a relation of Dr. Smollet's, to whose memory he has raised an obelisk, on the bank near the house in which he was born. Here we found a chaise ready to convey us to Glasgow.

Glasgow is a large, stately, well built city, standing on a plain. The four principal streets are very well built with stone, and perhaps rival those of every other city. The houses are uniform, as well in height as in front. The lower stories stand, for the most part, on square Doric columns, with arches which open into the shops, which add to the strength and beauty of the building.

Glasgow is situated on the east bank of the Clyde, which is not navigable to the town but by small vessels. The ports of Glasgow are Greenock and Port Glasgow, about twenty-four miles down the river Clyde.

There is a new bridge lately built at Glasgow, of seventeen arches, with circular holes between each, to carry off the superfluous waters in the great floods.

In the centre of the four principal streets stands the cross, where there is an equestrian statue of King William. Near to this is the tolbooth or guild-hall, which is a noble structure of hewn stone, with a very lofty tower.

The prosperity of the commerce of Glasgow appears by the greatness of many private houses, and a general appearance of wealth. It is the only episcopal city whose cathedral was left standing in the violence of reformation, and this was owing to a species of prudence in one of Knox's followers; he artfully said to the rest of his company, ' Before we pull this church down,

let us try if we can build another equal to it.' This speech had the desired effect, and they left it standing. It is now divided into many separate places of worship, which, taken altogether, compose a great pile of building, which had been many centuries about, but was never finished; for the change of religion intercepted its progress before the cross aisle was added, which seems essential to a Gothic cathedral.

The university is a magnificent and stately building, consisting of several courts. The front to the city is of hewn stone, and excellent architecture. The division of the academical year into one session and one recess, seems better accommodated to the present state of life than that variegation of time by terms and vacations, derived from distant centuries, in which it was probably convenient, and still continued in the English universities. So many solid months as the Scotch scheme of education joins together, allow and encourage a plan for each part of the year; but in England, he that has settled himself to study in the college, is soon tempted into the country; and he that has adjusted his life in the country, is summoned back to college.

Near the cathedral of Glasgow stands a ruinous castle, formerly the residence of the archbishop St. Mungo, who was legal lord, or superior of the city, which stands on his ground, and from whom it received its first charter, and many privileges. It is encompassed with a very high wall of hewn stone, and has a fine prospect of the city. The great archbishop Leighton resided here.*

They have a theatre at Glasgow, but it does not defray the proprietors expenses.

At length we returned to Edinburgh, where we passed some days with men of learning, whose names want no advancement from their commemoration; and with women of elegance, who may perhaps disclaim all pretension to praise, though they so highly deserve it.

The peculiarities of the Scotch wear fast away, and their conversation grows every day less displeasing to the English: their dialect is likely to become, in half a century, provincial and rustic even to themselves. The learned, the great, the ambitious, and the vain, all cultivate the English phrase and pronunciation; and Scotch is not much heard in splendid companies, except now and then from an old lady.

Edinburgh furnishes one subject of philosophic curiosity, which no other city can shew. Here is a school of the deaf and dumb, who are taught to speak, read, and write, and practice arithmetic. The improvement of these pupils is wonderful; they not only speak, write, and understand what is written; but if he that speaks looks towards them, and modifies his organs by distinct and full utterance, they know so well what is spoken, that it is an expression scarcely figurative to say, they hear with the eye. They have nearly attained the power of feeling sounds, by laying a hand on the speaker's mouth.

How pleasing to see one of the most desperate of human calamities capable of so much help! who would be afraid, after having seen the deaf and dumb taught to speak, hear, and cast accounts, to cultivate the Hebrides?

Having finished our account of this celebrated tour, we shall, in the next place, give a geographical account of the remaining parts of Scotland, extracted from the best and most accurate travellers and historians; or rather we shall give a complete account of the whole kingdom, as our late traveller was more attentive in describing the customs and manners of the Highlanders, than the situation and divisions of the kingdom in general.

The most northern county of Scotland is Caithness, which is very rocky, and includes many bays and promontories. The principal place is Wick, which

is a royal borough and market; though Thurso, a town in the opposite county, is reckoned more populous.

South-west of Caithness is Sutherland, which is mountainous and barren, but contains above sixty lakes, including various small islands. The royal borough of Denrock is the principal place, which is the seat of the presbytery, contains a cathedral gone to decay, and consists of nine parishes.

To the south-west of Sutherland, Ross is situated, which includes Tain and Cromartie. The vallies are fertile, and the air is good. Channeric is the principal place; and though it is the seat of a presbytery, it is but an inconsiderable market-town.

To the south of Rosshire is that of Inverness, which is a barren country, but produces iron, wood, and plenty of game. Inverness is the seat of the presbytery, contains thirteen parishes, and may justly be esteemed the key and capital of the islands.

To the south-east of Rosshire is that of Nairn, which has a salubrious and tempestuous air, and here is some tolerable pasture land. Though a royal borough, it is poor and mean, and the harbour is quite choked up.

To the east of Nairn is Elgin, which has a tolerable air, and the low country is fertile. The town of Elgin is the seat of a presbytery, includes thirteen parishes, is a royal borough, and is situated in a verdant plain.

To the south-west of Inverness is Argyleshire, which is a wild barren country. The town of Argyle is the seat of a provincial synod, which consists of five presbyteries and forty-nine parishes, and gives the title of duke and earl to the noble family of Campbell, the most powerful of all the Scottish nobility.

In about the centre of Scotland Perthshire is situated, which is one of its most fertile provinces. The people are polished and industrious, and their habitations are neater than in any other parts of the kingdom: the town of Perth is agreeable and populous, and is situated on the south of the river Tay. This town formerly gave title of earl to the family of Drummond, which is now forfeited. It is a royal borough, and the seat of a large presbytery.

The royal palace of Scone stands on the north bank of the Tay, famous, in former times, for the adjoining abbey, founded for the monks of the order of St. Augustine. The kings of Scotland were formerly crowned here, in a chair, which was said to be brought by Fergus from Ireland, which has in its bottom a rough marble stone: King Edward the First, of England, removed it from here to Westminster-Abbey, where it still remains. Scone gives the title of baron to Viscount Stormont, a branch of the family of Murray. He is also hereditary keeper of this palace, which is large, spacious, and magnificent. Here it was that Charles the Second took the covenant, when he was invited into their kingdom; and here the pretender kept his court for three weeks during the late rebellion, while his forces lay at Perth.

To the west of Aberdeenshire, the shire of Banff is situated, which is a very pleasant fertile country.

The shire of Aberdeen has a wholesome air, &c. See our account of Aberdeen, page 1067.

Kincairdineshire, which is situated to the south of Aberdeen, is a fertile country. The principal place is Stonehive, the seat of the county courts; a small town, with a good haven. Kincairdine stands on the river Dee, and gives the title of earl to the family of Bruce.

To the south-west of Kincairdineshire is Forfarshire; the county town bestows its name upon the shire, and gave the title of earl to the noble family of Douglas, but the title is now extinct. The town is a royal borough, and the seat of a presbytery, though inconsiderable. Dundee is the principal town of this county.

* If the reader is fond of a description of the principal tenets of the Christian religion handled in a moderate, pious, and masterly manner, he is recommended to purchase the work of this primitive and excellent archbishop Leighton. They are comprized in two large volumes in 8vo. price 14s. bound, and are a compendium of apostolic Christianity. Printed for ALEX. HOGG, No. 16, Pater-noster Row, London.

Clackmannan, though a very small county, is very fertile. Alloa is the only place of note, and that is a considerable sea port.

The county of Fife is tolerably fertile. Coupar is the county town, and is situated on the river Eden; but the most celebrated place is the city of St. Andrew, which we have already described.

To the south of Perthshire, Sterlingshire is situated, which is a pleasant fertile country. The town of Sterling is large and populous, and is inclosed by a wall, except towards the north.

To the north of the frith of Clyde, Dumbartonshire is situated; the county town, which gives name to the shire, is a small inconsiderable royal borough. The castle of Dumbarton is very large, and almost impregnable.

East of Dumbartonshire is Renfrewshire, from which it is separated by the river Clyde. It is tolerably fertile, and has several opulent inhabitants: the town of Renfrew is an inconsiderable place.

The shire of Lanerk and the barony of Glasgow are united; the soil is diversified, in some places fertile, in others barren. Vide our description of Glasgow.

To the south of Stirlingshire is Linlithgowshire, which is very pleasant, and tolerably fertile. In the castle of Linlithgow the unfortunate Mary queen of Scots was born. Linlithgow is a neat town, a royal borough, and the seat of a presbytery.

West Lothian, or Edinburghshire, is very fertile, well cultivated, and pleasant. Edinburgh is a county of itself, and the capital of the whole kingdom. Vide our account of Edinburgh.

About two miles north of Edinburgh, Leith is situated, which is the port and warehouse of Edinburgh.

To the north-east of Edinburghshire is Haddingtonshire, which is a very fertile and improved country. The town of Haddington is a royal borough, large, and tolerably well built, and the seat of a presbytery.

Dunbar, which is a royal borough in this county, is a neat small town, has a secure harbour, a good market, and a considerable trade.

Adjoining to England, Berwickshire is situated, which is a rough moorish country, irregularly diversified with vallies and woods. The town of Berwick is now annexed to England, and consequently governed by English laws, though the majority of its inhabitants are Scotch. The principal town of this county is Duns, which is a large populous barony, in the centre of the shire; has a castle for its defence, and is the seat of a presbytery.

Ayrshire is a level pleasant country. The county town is Ayr, which is a royal borough, commodiously situated for trade, and composed of the new and old town, which are joined together by a bridge of four arches.

To the south of Edinburghshire, Pables, or Tweeddaleshire, is situated, which abounds in pasturage, and produces some grain. The town of Pables is situated on the Tweed, over which there is a stone bridge.

Tiviotdale, or Roxburghshire, is a well inhabited country, though rather barren. Roxborough is the county town.

To the west of Tiviotdale is Selkirkshire, which is a very hilly country, but abounds in cattle and good pasturage. Selkirk is a royal borough, famous for its shoe manufactory.

The shire of Dumfries is hilly, but produces abundance of cattle, consequently the pasturage is good. Annan was once the principal town of this county, but it now is rivalled by Dumfries, which is a large flourishing royal borough, and, in the opinion of the writer of this work, is the best built, most neat and pleasant town, for its size, of any in the kingdom of Scotland. There are many excellent gardens in Dumfries; the town is quite surrounded by them, and they seem to pay a great deal of attention to that useful and pleasant science; indeed they have arrived

to great perfection therein. The houses of Dumfries are well built and commodious, the streets open and spacious, and the town has several very capital buildings. Here are two very good inns for the accommodation of travellers, the King's Arms, and the George. Dumfries gives the title of earl to the chief of the family of Crichton: it is a provincial synod, and the seat of a presbytery.

The shire of Wigtown is to the south of Ayrshire, and abounds in cattle and horses, &c. Wigtown is the capital of the shire, and bestows the title of earl to the family of the Flemings. Here the sheriff holds his courts: it has a tolerable harbour, but the town is poor, and thinly inhabited.

Having now finished our account of the kingdom of Scotland, we shall give a concise and comprehensive description of

The Principality of WALES.

We cannot particularly say at what time Wales was first divided into counties: Caernarthenshire, Glamorganshire, Pembrokehire, Cardiganshire, Flintshire, Caernarvonshire, Anglesea, and Merionethshire, seem to have been of antient date in king Edward the First's reign; and the following four have since been added by act of parliament, Radnorshire, Brecknockshire, Montgomeryshire, and Denbighshire.

In the time of the Saxons, that form of government was established in Wales which has continued ever since, with some circumstantial variations.

During the heptarchy, there was, in each of the seven kingdoms, a council that assisted the sovereign; and there was also, on particular occasions, a general council, consisting of representatives, deputed by the particular councils, to assist in such affairs of government as concerned the whole heptarchy, considered as a common interest. These assemblies are supposed to have been the foundation of the British parliament; though it is not clearly determined whether in these assemblies the commons had representatives; whether the legislative powers was in the person of the king, in the general council, or in both together.

We also owe to our Saxon ancestors that inestimable privilege of Englishmen, the trial by jury.

After the Norman conquest, many alterations were made from time to time in the form of government, and the manner in which it was administered.

The character of the antient inhabitants of Wales is given us in very unfavourable terms by many English writers. But in those times the English were almost always at war with these people, and therefore much impartiality is not to be expected.

In former times the inhabitants of Wales were described to be a nation of soldiers; every man being obliged to take up arms in times of distress. Thus, though a small country, they could bring large armies into the field. They used very light armour, as they carried on the war by incursions and forced marches, and conquered their enemies rather by surprise than by strength or courage.

They had only a small target to defend the breast, and used the javelin as a weapon of defence. Thus armed, and thus defended, they were no way equal to the English in a pitched battle, who fought with heavy armour, helmets, and targets, and armed at all points.

They always fought on foot, like all other undisciplined soldiers; they made one furious onset, which, if resisted, they were immediately put in confusion, and could not be rallied. They then fled to the mountains, where they waited for another opportunity to fall upon their enemies.

They despised trade and mechanical arts, as their descendants do to this day. Though they had no money among them, yet there were no beggars in the country, for they were all poor. They are described to have been impetuous in their dispositions, fickle, revengeful, and bloody. But this character is given them by their enemies.

Their

Their superstition was excessive. They paid the greatest veneration to their priests, and looked upon them and their habitations as sacred.

Having premised these few observations relating to the country, and antient inhabitants of Wales, we shall now describe the several counties in the manner we passed through them in our tour.

Flintshire derives its name from Flint, the county town. This is the smallest county in Wales, being only eight miles broad, and thirty-three long. It is divided into five hundred and twenty-eight parishes; in which are included one city, three market towns, two parks, and four castles; about eight thousand houses, and thirty-two thousand inhabitants.

The principal rivers are the Dee, the Wheeler, the Allen, the Clwyd, and the Sevon.

The inland navigation of this county is very trifling. No attempt has ever been made to render either of the rivers navigable by art. Indeed there are no towns of sufficient importance to defray the expences attending all works of this kind.

The air of Flintshire is healthy and pleasant, but very cold, owing to the north wind, to which it is generally exposed. The land is fruitful, the hills are not very high, and fall gently into fertile plains.

Some parts of Flintshire, particularly the vallies, are very well cultivated. In several places they have lately adopted some new improvements in husbandry.

The city is St. Asaph, which is an episcopal see; and the market towns are Flint, Caerwys, and Holywell.

This county sends two members to parliament.

Denbighshire derives its name from Denbigh, the county town. It is divided into twelve hundreds, in which are four market towns, fifty-seven parishes, about six thousand four hundred houses, and thirty-eight thousand inhabitants.

The principal rivers are the Llwyd, the Elwy, and the Dee.

Neither of the rivers of this county are navigable, though part of the northern boundary is the sea: nor is there any harbour, except for boats, on the whole coast. There is, however, a very considerable bay, where ships, bound to Liverpool and Chester, often come to an anchor, in southerly and south-west winds.

The air of Denbighshire is esteemed healthy, but it is rendered sharp and piercing by a vast chain of mountains, which almost surrounds the county. The soil is various, and almost in the extremes of good and bad. The middle part of the county consists of a flat country, and is one of the most delightful spots in Europe. It is extremely fruitful, and well inhabited; surrounded by high hills, except upon the north, where it lies open to the sea, and is called the vale of Clwyd, from its being watered by the river of that name.

The soil, in the western part of this county, is rather barren, but thinly inhabited, and full of heaths and craggy bare hills; the middle is very fruitful, but the eastern parts are not so fertile, except where they are watered by the river Dee.

The rivers afford plenty of fish of various kinds. The hills and heaths feed infinite numbers of sheep and goats, and produce plenty of rye. This county has likewise a variety of fowls, both wild and tame, and contains several lead mines.

The manufactures of this county are chiefly of gloves and flannels; the former at Denbigh, and the latter at Wrexham.

The market towns are Denbigh, Llancroft, Ruthin and Wrexham.

Denbighshire sends two members to parliament.

Merionethshire extends thirty miles in length, and twenty-five in breadth, and is divided into six hundreds, four market towns, thirty-seven parishes, two thousand five hundred and ninety houses, and seventeen thousand inhabitants.

The principal rivers of this county are the Dyffi, the Avon, the Drwrydly; and the Dee.

The lake, called Pymble, is of considerable extent, and, according to Camden, has been accurately described by an antiquarian and poet, in a few Latin verses, which have been thus translated into English:

Where eastern storms disturb the peaceful skies,
In Merioneth, the famed Pimble lies.
Here a vast lake, which deepest vales surround,
His wat'ry globe rolls on the yielding ground:
Increas'd with constant springs, that gently run
From the rough hills, with pleasing murmurs down.
This wond'rous property the waters boast,
The greatest rains are in its channels lost;
Nor raise the flood; but when loud tempests roar,
The rising waves with sudden rage boil o'er,
And conq'ring billows scorn th' unequal shore.

This being a rocky mountainous country, the air is extremely cold and bleak; it is also esteemed unhealthy, from the many noxious vapours that arise from the Irish sea; but these can have no great effect on account of the sharp winds which almost continually blow.

Merionethshire affords mountains of extraordinary height, inaccessible rocks, a variety of lower hills, woods and plains, and some fruitful vallies, and likewise a prospect of the sea, and of several lakes and rivers.

There is very little good land in this county, and they are not very careful to cultivate what they have.

The only manufacture in this county is Welsh cotton.

The market towns are Bala, Dolgathe, Harlech, and Dinasmonday.

Merionethshire sends but one member to parliament.

Caernarvonshire takes its name from the county town Caernarvon, which is about forty miles long, and twenty broad. It is divided into seven hundreds, and into sixty-eight parishes; in which are included one city, one borough, five market towns, and three castles; about two thousand houses, and between sixteen and seventeen thousand inhabitants.

The principal rivers of this county are the Conway and the Sciont.

The air of this county is rendered bleak and cold, not only by the great number of lakes which it contains, but by the very high mountains, which, towards the middle of the county, rise one above another, so as to have acquired the name of the British Alps.

The extremities of the county are fruitful and populous, and yield great plenty of fine barley, and feed vast numbers of cattle and sheep.

The hills of Caernarvonshire are beautifully described by Mr. Pope, in the following lines:

So pleas'd at first, the tow'ring Alps we try,
Mount o'er the vales, and seem to tread the sky;
Th' eternal snows appear already past,
And the first clouds and mountains seem the last.
But these attain'd, we tremble to survey
The growing labours of the lengthen'd way;
Th' increasing prospect tires our wand'ring eyes,
Hills peep o'er hills, and Alps on Alps arise.

The city of this county is Bangor, which is a bishop's see, though it scarcely should be called a city; and the market towns are Aberconway, Caernarvon, Puliheli, Newin, and Crickeith.

The county of Caernarvon sends two members to parliament.

Anglesea is an island in the Irish sea; its length is thirty miles, and its breadth twenty-six. It is divided into six hundreds, in which are two market towns, seventy-four parishes, about eighteen hundred and forty houses, and twelve thousand inhabitants.

If you ask the inhabitants of Anglesea how they spend their time, they will tell you, they drink, dance, and are merry. Perhaps there are few people so much addicted to mirth. They sing, dance, and drink, not by hours, but by days and weeks, and

measure

measure time only by the continuance of their mirth and pleasure.

The men estimate their strength not by feats of activity, as in other places, but by the quantity of ale they can drink; and it is no uncommon thing for a lover to boast to his mistress what feats he has performed in that way. Such is the mark of prowess by which the women judge of their paramours strength and vigour.

From hence we may conclude, that Bacchus does more in this country than Mars does in a continental war, or Neptune in a sea engagement. Those persons, whose happy poverty preclude them from procuring these liquors, which are the destruction of the more opulent, live to an advanced age, whilst most of the gentry are carried off in their youth.

Unembarrassed with the pedantry of learning, and the disgusting forms of politeness, the rustic inhabitants of Anglesea are free, hospitable, and cheerful.

The air of this island is esteemed healthy, except in autumn, when it is frequently foggy, and apt to produce agues, and other disorders, that arise from a cold rapid air. The soil, though it appears rough, being stony and mountainous, is so fruitful in corn and pasturage, that the Welsh call it the mother, or nurse, of Wales.

The market towns are Beaumaris and Newburgh.

The isle of Anglesea sends two members to parliament.

Montgomeryshire is an inland mountainous country, thirty miles in length, and twenty-five miles broad; It is divided into seven hundreds, in which are five market towns, forty-seven parishes, about five thousand six hundred houses, and thirty-four thousand inhabitants.

The principal rivers in this county are the Severn, the Tanat, and the Turgli. The only navigable river is the Severn.

This county, in many parts, exceeds any other of North Wales for fertility, and richness of soil. The air is sharp and cold in the mountains, but in the vallies remarkably pleasant and healthy.

The breed of black cattle and horses is much larger here than in the neighbouring Welsh countries. This county abounds with fish and fowl; and here are some mines of lead and copper.

The market towns are Llandiles, Llanvilling, Mechnyleth, Montgomery, and Welsh Pool.

This county sends two members to parliament.

Radnorshire derives its name from Radnor, the county town: it is about twenty-four miles long, and twenty-two broad. It is divided into six hundreds, in which are three market towns, fifty-two parishes, about three thousand houses, and nineteen thousand inhabitants.

The principal rivers of Radnorshire are the Wye, the Temd, and the Ython.

The air is cold and piercing. The soil of the northern and western parts is but indifferent, as they abound in rocks and mountains, which are well provided with wood, and afford pasture for sheep. The eastern and northern parts are well cultivated, and pretty fruitful in corn.

The market towns are Radnor, Presteign, and Knighton.

This county sends two members to parliament.

Brecknockshire is about thirty-five miles long, and thirty-four broad. It is divided into six hundreds; in which are four market towns, sixty-one parishes, about six thousand houses, and thirty-three thousand inhabitants.

The principal rivers of this county are the Wye, the Usk, and the Yrvan.

The air of Brecknockshire is remarkably mild every where, except on the hills. The hills are very stony, but the vallies are very fruitful.

This county produces not only abundance of black cattle, but a great number of deer and goats, as well as abundance of fowl; and the rivers are well stored with fish.

VOL. II. No. 92.

The market towns are Brecknock, Bealt, Crickhowel, and Hay.

This county sends two members to parliament.

Caermarthenshire, which derives its name from the county town, is about thirty-five miles long, and twenty broad.

The principal rivers are the Towy, the Cothly, and the Tave. The Towy and the Tave only are navigable.

The air is esteemed very mild and healthy, and the soil is fruitful in corn and grass.

The market towns are Llanelly, Kidwelly, Caermarthen, Langharn, Newcastle in Emlyn, Llanin-clovery, Llangadock, and Llandilovaur.

This county sends two members to parliament.

Cardiganshire takes its name from Cardigan, the county town, and is forty miles long, and eighteen broad. It is divided into five hundreds, in which are six market towns, seventy-seven parishes, about three thousand houses, and thirty-five thousand inhabitants.

The principal rivers are the Teivy, the Rydal, and the Istwyth.

In the south and west parts of Cardiganshire the air is mild and temperate, and the soil fruitful; but the north and east are bleak and barren, when compared with the rest. Several rich lead mines were discovered in this county in the latter end of the last century, some of which yield silver; and the ore often appears above ground. The ore has been so rich in silver as to produce seventy or eighty tons of metal.

In queen Elizabeth's time, a company of Germans worked in these mines to their great advantage; Sir Hugh Middleton also, in the reign of James the First, made a vast fortune here, which he afterwards spent in bringing the New River water to London.

The market towns of this county are Lampeter, Tregaron, Llanbadarnyawr, Aberithwyth, Llan-narth, and Cardigan.

Cardiganshire sends two members to parliament.

Pembrokeshire takes its name from the county town; it is twenty-six miles long, and twenty broad. It is divided into seven hundreds; in which are one city, eight market towns, one hundred and forty-five parishes, about four thousand five hundred houses, and twenty-six thousand inhabitants.

The principal rivers are the Teiry, the Clethy, and the Dougledye.

The air of this county is esteemed remarkably salubrious, and the soil is fertile.

The city is St. David's, which is an episcopal see, and the market towns are Fishgard, Haverford West, Killgaring, Newport, Pembroke, Tenby, Whiston, and Narbreth.

This county sends three members to parliament.

Glamorganshire is forty-eight miles long, and twenty-seven broad. It is divided into ten hundreds; in which are one city, seven market towns, one hundred and eighteen parishes, about ten thousand houses, and fifty-eight thousand inhabitants.

The principal rivers of this county are the Rhymny, the Taff, the Ogmere, the Avon, the Cledaugh, and the Tave.

The air towards the sea is temperate and healthful, but the northern part is cold and piercing, full of thick woods, very barren, and thin of inhabitants.

The city is Llandaff, which is a bishop's see; and the market towns are Cardiff, Cowbridge, Llan-trissant, Bridge End, Neath, Swansea, and Penrife.

Glamorganshire sends two members to parliament.

As we have now finished our account of Wales, we shall proceed to describe the islands of Jersey, Guernsey, Alderney, and Sark, having furnished ourselves with the best materials and travels for that purpose.

J E R S E Y.

This is one of the islands and old remains of the duchy of Normandy, in France, belonging to the English crown ever since the conquest. It lies in the English channel, pretty near the French coast.

In the time of the Romans Jersey was called *Cæsarea*, probably from the Dictator, in confirmation of which the name of one of its present forts is *Le Fort de Cæsar*; and in the north of the island, at *Rosel*, is an entrenchment, retaining the appellation of *La Petite Cæsarie*. That the Romans were here, as well as almost every-where else, is evident from an ancient camp, near the manor of *Dilamont*, and from several of their coins, found in different parts of the island.

Jersey is not above twelve miles long, and between six and seven broad; it is defended by rocks and quicksands, which prove dangerous to its navigation. The upper lands of Jersey are strong, and diversified in some parts with good soil; the soil of the lower parts is deep, heavy, and rich. The vallies are well watered with a great number of brooks, on which are several corn mills.

The island abounds with cattle and sheep, which, though they are small, the wool is fine, and their flesh is remarkably sweet. They have good draught horses, but few of them are fit for the saddle. The only wild game are hares and rabbits. The island produces roots and herbs, but does not grow corn enough for the inhabitants, who have it either from England or France, and sometimes from *Dantzic*. The woollen manufacture of stockings, caps, &c. and the culture of apple-trees, with the increase of inclosures and highways, take the inhabitants from the tillage of the land.

They make vast quantities of cyder in the island, but export little, being very fond of it themselves.

The whole island is one entire rock, and every house has a spring near it. The butter produced here is very good, and the honey is incomparable. They have abundance of sea fowl and fish.

The climate is, in general, very healthy, and the temperate inhabitants live to a great age, though they are sometimes subject to the ague. The tides here are rapid and strong, and the water is never still on account of the vast chain of rocks which surround the island.

Jersey is extremely well situated for trade in time of peace, and for annoying the French by privateers in time of war.

The inhabitants are computed at twenty thousand, and are chiefly descended from French ancestors, with some mixture of English. French is the language both of the pulpit and of the bar, but is not spoken with much purity.

The courts of judicature in England have no power here, as they are governed by the old Norman laws.

The buildings in Jersey are all of stone. Their churches and finest edifices are covered with blue slate, and the ordinary dwellings are thatched with long wheat straw.

The governor of Jersey is the chief officer, and represents the king's person. The island is defended by a greater or less establishment of soldiers, as the circumstances require. The civil government is administered by a *bailey*, assisted with twelve *jurats*.

The apostle of Jersey is *St. Maglaire*, who lies buried in this island. Here are several druidical monuments, which are flat rag stones, of vast weight, raised thereon four feet from the ground, and are sustained by others of less bulk. Besides these, here are several monuments of popish superstition.

G U E R N S E Y.

Guernsey is an island on the coast of Normandy, in France, and in the English channel; though it is part of the county of *Hants*. It is thirteen miles and a half long, and twelve and a half broad. The air of Guernsey is healthy, and the inhabitants are remarkably long lived; and the land is naturally rich and fertile. The inhabitants cultivate a sufficient quantity of corn for their own consumption, and for the supply of their shipping; but do not export any, as they devote the principal part of their time

to commerce. Its trade is more considerable than that of Jersey, and has a commodious pier on the east side, near the town of *St. Peter le Port*, with two castles for its defence; on which accounts here is a greater number of merchants than at Jersey. This island, as well as Jersey, is very well situated for annoying the French in time of war, which the history of the present depredations on the shipping of that country sufficiently testifies, many rich French prizes having lately been carried into this port.

Guernsey was formerly part of Normandy, and some of the remains of the Norman conquerors estates are still governed by the laws of that province. Its natives commonly speak French, though subject from the conquest to the crown of Great Britain.

The island is well planted with gardens and orchards; the common people drink cyder entirely, but the genteeler drink French wine, which they have remarkably cheap.

The whole island is divided into small inclosures, by mounds and hedges, which the inhabitants not only consider as an improvement, but a kind of security against any invader. They burn sea weed for fuel, except what coals they have from England or Wales.

Guernsey gives the title of baron to the earl of *Aylesford*.

This island is not so well set with trees as Jersey, neither is it so populous. The Geneva church discipline was, for a good while, their rule in ecclesiastical matters; but now the liturgy of the church of England is universally received in all the island, and there are hardly any dissenters amongst them.

A L D E R N E Y.

This island is subject to the crown of Great Britain, though on the Norman coast. It is about eight miles in circumference, lies high, and has a harbour for small vessels on the south side. There is a church on this island, and one town, which contains about two hundred houses, and one thousand inhabitants. Here is good corn land and pasturage, which they manure with sea weed. It is divided from the Isle of France by a streight, which is called the *Race of Alderney*. This is reckoned a dangerous passage in stormy weather, when the wind encounters the strong currents in this channel. In calm weather it is very safe, and there is a great depth of water. Part of the French fleet escaped this way after the blow which they met with at *La Hogue*, in 1692-3.

This island is dependent on Guernsey. To the westward of it is a large range of rocks for three leagues together, which have several eddies, and are dreadful to mariners, who call them the *caskets*. Here the sons of *Henry the First* were cast away in their passage to Normandy.

On the east side of the harbour is an old fort, with a dwelling-house near it, built at the charge of the *Chamberlains*, one of whose ancestors having recovered this island from the French, had the fee-farm rent of it granted him by *Queen Elizabeth*, and was made governor of Guernsey and this island, as dependent upon it.

An appeal lies from the *bailiff*, and other officers of justice here, to the courts of Guernsey. The inhabitants are in general very poor.

S A R K.

The small island of *Sark* is likewise situated on the coast of Normandy, belongs to the crown of England, and is dependent upon Guernsey. This island stands in the middle of all the rest, is about four or five miles long and three broad: it does not contain above three hundred inhabitants, who have one minister, and are all tenants of one person, *Carleret Lord St. Ouer*. This island produces great quantities of corn, which is excellent in its nature.

Philip Lord St. Ouer cut a way through the cliffs under ground, which is called La Soguien, for the conveniency of draught carriages, which passage is secured by a gate and some cannon.

On account of the vast rocks and cliffs which surround this island, it is impregnable, and is only accessible by the aforefaid artificial passage, and by La Frickeree, where only one person can climb at a time.

In the reign of Queen Elizabeth, this island was taken from the French by stratagem. A sea-captain, with one hundred men, under pretence of burying a corpse, carried a coffin for that purpose containing arms, which was carried into the church by only twenty men at first, but their companions afterwards landed and reduced the island, and it has remained subject to England ever since.

The sky is clear, and the air healthy; the inhabitants are remarkably long lived. The island abounds with fine springs of water: all sorts of roots grow on this island, and it is very well planted with apple-trees. The grass is in general short, and produces excellent mutton. They have great numbers of wild fowl, fish, and rabbits.

We will now close our account of Europe with an accurate but concise description of England, extracted from the latest and best travels through that kingdom.

E N G L A N D.

This island is situated in the western ocean, between the parallels of fifty and fifty-six degrees, north latitude, and between two degrees east, and six degrees west, longitude; it is bounded on the north by that part of the same island called Scotland, on the east by the German ocean, on the west by St. George's Channel, and on the south by the English channel, which separates it from France.

Cornwall is the western extremity of England, which is divided into nine hundreds, in which are twenty-one parliamentary boroughs, twenty-seven market-towns, eighty-nine vicarages, one hundred and sixty-one parish churches, exclusive of chapels of ease, and between twelve and thirteen hundred villages.

According to the most accurate computations, it is one hundred and fifty miles in circumference, and contains nine hundred and sixty thousand acres. Formerly it contained some thousands more, which have, at different times, been washed away by the sea. It is not improbable that the island of Scilly was once joined to Cornwall, though since separated from it by the sea.

The Tamar and the Camel are the principal rivers in this county. There are also several navigable rivers in Cornwall, though none of them are improved by art, notwithstanding they are very capable of it.

The air of Cornwall is moist and loaded with vapours, and rain is very frequent. Storms are very violent and frequent here, and, owing to the number of mines, the air is filled with mineral particles. The winters are generally milder than in any other part of England.

The principal product of the Cornish mines is copper and tin.

The pilchard fishery is peculiar to Cornwall, and great sums of money are derived from that article.

The western parts of Cornwall, especially, are very populous. The inhabitants are of the middle stature, healthy, strong, and active.

Cornwall sends forty-four members to parliament.

Devonshire is about sixty-nine miles long and sixty-six broad, and is two hundred miles in circumference. It contains about one million nine hundred and twenty-seven thousand acres; in which are thirty-three hundreds, twelve parliamentary boroughs, forty market towns, three hundred and ninety-four parishes, one thousand seven hundred and thirty-three villages, and near fifty-seven thousand houses.

The principal rivers in Devonshire are the Ex, the Tamar, the Touridge, the Taw, the Oak, the Dart,

the Plym, the Otter, and the Axe. Most of the rivers are navigable some distance from their mouths, but the Ex is only rendered so by art.

The air of Devonshire is in general healthy and pleasant; though it is sharp upon the hills, it is mild in the vallies: it was formerly famous for its tin-mines, but they are nearly exhausted.

Diodorus Siculus, speaking of the inhabitants of Devonshire, says, 'They are a civil and courteous people, considering the barbarity of the times; strong and robust, like the soil itself, and emboldened by roughness of their country; at the same time they are so powerful, that they were not subdued by the Saxons till the year 465.'

They have not deviated from the qualities of their ancestors; they are still a bold, hardy, and intrepid people: they are quick of apprehension, and easily instructed in any employment. Queen Elizabeth said of the Devonshire gentlemen, that 'they were born courtiers.' The lower class of people are very robust, diligent, and industrious, but are clownish in their behaviour, and too much addicted to drinking.

Devonshire sends twenty-six members to parliament.

The county of Somerset is very extensive, being about sixty miles in length and fifty miles broad; it is near two hundred miles in circumference, and contains about one million seven hundred and fifty thousand acres, forty-two hundreds, three hundred and eighty-five parishes, thirty market towns, and seventeen hundred villages.

The principal rivers in Somersetshire are the Avon, the Bry, and the Parrot. The first and the last of these only are navigable.

The air of this county is remarkably mild and healthy in most parts, especially amongst the hills. The soil is various, and yields great quantities of corn, by which several markets are amply supplied. Wood thrives here remarkably well, and the oxen and the sheep bred in this county are particularly fine and large. There are several lead-mines in it.

The inhabitants of this county, especially in the inland parts, are plain, honest, and hospitable, but are unpolished and reserved in conversation. They seem to entertain a kind of indifference for the rest of the world, which may probably arise from the good opinion they have of their own share of it. Their manners are more polished in the large towns, by conversation and intercourse with strangers, and are polite, affable, and easy, much addicted to trade and commerce, and seldom omit any opportunity of enriching themselves.

Somersetshire sends eighteen members to parliament.

Dorsetshire is about fifty miles long, forty broad, and one hundred and fifty in circumference. This county is divided into thirty-four hundreds, and contains seven hundred and seventy-two thousand acres, in which are twenty-two market towns, two hundred and thirty-six parishes, six castles, and about twenty-five thousand houses, and one hundred and thirty-two thousand inhabitants.

The principal rivers in Dorsetshire are the Stour, the Frome, the Piddle, the Lyddon, the Dulish, and the Allen.

The air of Dorsetshire is very healthy; on the hills it is rather sharp and piercing, but it is mild and pleasant in the villages and on the sea-coast: the soil is rich and fertile. The hills afford pasturage for great numbers of black cattle, and the downs feed great numbers of sheep, which are remarkable for the sweetness of their flesh, and fineness of their wool. The valleys produce abundance of corn, flax, and hemp.

The inhabitants are open, generous, kind, and hospitable to strangers, very communicative, and ready to gratify the curiosity of those who are desirous of knowing any particulars of their county. The merchants are very assiduous in trade, and the common people in manufactures, agriculture, and the breeding and feeding of sheep and cattle. Drinking to excess is not quite banished from these otherwise happy regions,

gions, and smuggling is too much encouraged by all ranks of people.

Dorsetshire sends twenty members to parliament.

Wiltshire is forty miles long and thirty broad, it is one hundred and forty miles in circumference, and contains one city, twenty-four boroughs and market towns, three hundred and four parishes, about twenty-eight thousand houses, and eight hundred and twenty-six thousand inhabitants.

The principal rivers of this county are the Thames, the Willy, the Bourne, and the Nadder.

The air of Wiltshire is sweet and healthy, sharp upon the hills, but mild in the valleys, even during the winter. The soil is a strong clay, and produces excellent corn.

The present inhabitants of Wiltshire are a rough, hardy, hospitable, and ingenuous people. In the towns they are a good deal refined. They are in general civil to strangers, and ready to do them any good offices.

Wiltshire sends thirty-four members to parliament.

The county of Southampton, or Hampshire, is about sixty-four miles long, thirty-six broad, and one hundred and fifty in circumference. It contains thirty-nine hundreds, one city, eighteen market towns, two hundred and fifty-three parishes, nine forests, twenty-nine parks, about thirty thousand houses, and eighty thousand inhabitants.

The principal rivers are the Avon, the Tert, and the Itching.

The air of Hampshire is generally pure and healthy, especially upon the Downs. The hilly parts are barren and fit only for sheep, great numbers of which are fed on these upland pastures; but the lower grounds produce great quantities of grain, particularly wheat and barley. The Hampshire hogs are reckoned to excel all others, and make the finest bacon in England. Hampshire is also famous for its honey, great quantities of which are there collected.

Hampshire sends twenty-six members to parliament.

Suffex is about sixty-nine miles long, twenty-nine broad, and one hundred and seventy in circumference. It contains sixty-five hundreds, in which are three hundred and twelve parishes, one hundred and twenty-three vicarages, one city, eighteen market towns, one thousand and sixty villages, hamlets, and chapelries, and about twenty-one thousand houses, and about one hundred thousand inhabitants.

The principal rivers in Suffex are the Arun, the Adur, the Ouse, and the Rother.

The air of Suffex, especially along the sea-coast, is reckoned agreeable to strangers, but the inhabitants are healthy; in some parts it is foggy and moist, but upon the Downs it is very sweet and pure.

The county of Suffex sends twenty-eight members to parliament.

Kent is fifty-six miles long and thirty broad, is divided into sixty-eight hundreds, which contain two cities, one hundred and sixty-three vicarages, four hundred and eight parish churches, thirty considerable towns, eleven hundred and eighty villages, near forty thousand houses, and two hundred and twenty thousand inhabitants.

The chief rivers in Kent are the Medway, the Stour, and the Darent.

The county of Kent is nominally divided into three districts, viz. East-Kent, West-Kent, and South-Kent. East-Kent is said to be healthy, but not rich; South-Kent is said to be rich, but not healthy; and West-Kent is said to be both rich and healthy.

Some iron mines are found in Kent, and it produces abundance of hops, corn, &c.

The county of Kent sends eighteen members to parliament.

Middlesex is about twenty-four miles long, eighteen broad, and ninety-five in circumference; but as it comprehends the two cities of London and Westminster, which, joined together, may be very justly called the metropolis of the world, this county is certainly the wealthiest and most populous in England.

It is divided into six hundred and two liberties, containing seventy-three parishes, besides a great number of chapels of ease, and five market towns, exclusive of the cities of London and Westminster.

The rivers in this country are the Thames, the Lee, the Colne, and the New River.

The air of Middlesex is very pleasant and healthy, to which a fine gravelly soil does not a little contribute. The soil produces plenty of corn, and the county abounds with fertile meadows and garden-grounds. The natural productions of this county are corn, cattle, and fruit, and its manufactures are too many to be enumerated.

The cities of London and Westminster are too well known to need particular description. Suffice it to say what no one, who has seen them and compared them with other cities in the known world can doubt, that they form the metropolis of the universe.

This county sends eight members to parliament.

The county of Surry is thirty-four miles long, twenty-four broad, and one hundred and twelve miles in circumference. It is divided into thirteen hundreds, which contain one hundred and forty parishes, eleven market towns, thirty-five vicarages, five hundred and fifty villages and hamlets, and about one hundred and seventy thousand inhabitants.

The principal rivers are the Thames, the Mole, the Wey, and the Wendal.

The air and soil are very different in the extreme and middle parts of this county. Towards the borders of Surry the air is mild and healthy, and the soil fruitful in corn and hay, with a beautiful mixture of woods and fields; but in the heart of the county the air is bleak, and though there are some delightful spots, the tract consists chiefly of open and sandy ground, and barren heaths. Surry produces great quantities of box-wood and walnut-tree, the meadows prodigious crops of excellent hay, and the arable lands very fine corn. The Downs feed vast numbers of sheep, the meat of which is remarkably sweet.

Surry sends fourteen members to parliament.

The county of Berks is about thirty-nine miles long, twenty-nine broad, and one hundred and twenty in circumference. It is divided into twenty hundreds, and contains twelve market towns, one hundred and forty parishes, sixty-two vicarages, six hundred and seventy-one villages, and eighty-five thousand inhabitants.

The principal rivers in Surry are the Thames, the Kennet, the Loddon, the Boke, and the Lambourne. The Thames and the Kennet are the only navigable ones.

The air of Berkshire is healthy even in the vallies; and though the soil is not very fertile, it is very pleasant, and is delightfully variegated with hills and vales, wood and water, which are seen in almost every prospect.

Berkshire sends nine members to parliament.

The county of Oxford is about forty-two miles long, twenty-six broad, and one hundred and thirty in circumference. It is divided into fourteen hundreds; in which are two hundred and eighteen parishes, one city, twelve market towns, about nineteen thousand seven hundred houses, and one hundred and twenty thousand inhabitants.

The principal rivers are the Thames, the Charwel, the Everlode, the Windrust, and the Tame. The first of which only is navigable.

The air of Oxfordshire is equally good with any part of England: the soil is naturally dry, free from bogs, fens, and stagnated waters; and abounds with quick limpid streams, which must necessarily render the air sweet and healthy. The soil is, in many places, very fertile. It abounds with meadows, which are not surpassed by any pastures in England. This county produces corn, cattle, fruit, free-stone, &c. It is but thinly planted with wood, and consequently firing is very scarce.

Oxfordshire sends nine members to parliament.

Buckinghamshire is about thirty-nine miles long, eighteen

eighteen broad, and one hundred and thirty-eight in circumference. It is divided into eight hundreds; in which are fourteen market towns, one hundred and eighty-five parishes, fifteen parks, about eighteen thousand three hundred and ninety houses, and one hundred and eleven thousand three hundred inhabitants.

The Thames is the only considerable river in this county.

The air of this county, especially upon the hills, is very healthful; though some of the low lands about the banks of the Thames is rather aguish. The vale of Buckinghamshire is extremely fertile. The gentlemen of this county find grazing so lucrative, that they generally keep their estates in their own hands; and the lands that are let fetch more rent than most others in any part of the kingdom.

Buckinghamshire sends fourteen members to parliament.

Hertfordshire is about thirty-six miles long, twenty-eight broad, and one hundred and thirty in circumference. It is divided into eight hundreds, which contain nineteen market towns, one hundred and twenty parishes, about sixteen thousand five hundred houses, and ninety-five thousand inhabitants.

The principal rivers are the Lee, the Stort, the Ver, and the New River.

The air of Hertfordshire is very pure, and consequently healthy. The soil is, for the most part, rich, and, in several places, mixed with marl, which produces excellent wheat and barley. Many of the pastures, however, are but indifferent.

This county sends six members to parliament.

Essex is about forty-seven miles long, forty-three broad, and one hundred and fifty in circumference. It is divided into twenty hundreds, and four hundred and fifteen parishes; in which are twenty-four market towns, forty-six parks, about thirty-four thousand eight hundred and nineteen houses, and two hundred and eight thousand eight hundred inhabitants.

The principal rivers in Essex are the Stour, the Lee, the Colne, the Blackwater, and the Chelmer.

The soil, in many parts is excellent, and remarkably fruitful; the air is healthy, except in the hundreds near the sea side, which is very aguish and unwholesome.

This county sends eight members to parliament.

Suffolk is about forty-eight miles long, twenty-four broad, and is one hundred and fifty-six miles in circumference.

This county is watered by the Ouse, the Waveney, the Stour, the Deben, the Orwel, the Ald, and the Blith.

The air of Suffolk is pure, healthy, and pleasant; the soil is various. This county, and Norfolk, are famous for their breed of turkies. The milk of this county is esteemed the best in England, and the butter is incomparable. We will not say so much in favour of the cheese.

This county sends sixteen members to parliament.

Norfolk is about fifty-seven miles long, thirty-five broad, and one hundred and forty in circumference. It is divided into thirty-one hundreds; in which are one city, thirty-two market towns, one hundred and sixty-four vicarages, six hundred and sixty parishes, seven hundred and eleven villages, and about forty-seven thousand one hundred and eighty houses.

The principal rivers are the Greater and the Smaller Ouse, the Yare, and the Waveney.

The air of this county, near the sea coast, is aguish and unwholesome, but in the inland parts it is both healthy and pleasant. The soil is very various, and comprehends all the sorts that are to be found in the island.

This county sends twelve members to parliament.

Cambridgeshire is forty miles long, twenty-five broad, and about one hundred and thirty in circumference. It is divided into seventeen hundreds; in which are one city, nine market towns, one hundred

and sixty-three parishes, about seventeen thousand four hundred houses, and eighty-nine thousand inhabitants.

The Ouse is the principal river of this county.

The air and soil of this county is various; in some places remarkably good; in others, to the full, as bad.

This county sends eight members to parliament.

Bedfordshire is about twenty-two miles long, fifteen broad, and near seventy-three in circumference.

The Ouse is the principal river in this county.

The air is pure and healthy, and the soil, in general, is a deep clay.

Bedfordshire sends four members to parliament.

Huntingdonshire is twenty-four miles long, eighteen broad, and sixty-seven in circumference. It contains four hundreds, six market towns, seventy-nine parishes, about eight thousand two hundred and fifty houses, and fifty thousand inhabitants.

The principal rivers of this county are the Ouse and the Nen, the former of which only is navigable.

The air of this county is rather unwholesome, owing to the number of fens and moors which it contains. The soil is, in general, very fruitful.

Huntingdonshire sends four members to parliament.

Northamptonshire is about forty-five miles long, and twenty-six broad; it is also one hundred and twenty-five miles in circumference. It contains one city, three hundred and thirty parishes, eleven market towns, twenty-five thousand houses, and one hundred and fifty thousand inhabitants.

The principal rivers are the Nen, the Welland, the Ouse, the Leam, and the Charwell; the only navigable ones are the Nen and the Welland.

The air of Northamptonshire is remarkably healthy and pleasant. The soil is very fruitful both in tillage and pasturage. It abounds with sheep and other cattle, and there is very little waste ground in this county.

This county sends nine members to parliament.

Lincolnshire is about sixty miles long, sixty-five broad, and one hundred and eighty in circumference. It is divided into thirty hundreds, one city, thirty-one market towns, six hundred and thirty parishes, about forty thousand five hundred houses, and two hundred and forty thousand inhabitants.

The principal rivers are the Welland, the Wilham, the Trent, the Dun, and the Ankam.

The air of Lincolnshire is various in different parts of the county. In the middle, and along the borders of the Trent, it is very healthy; but upon the sea coast it is bad, and full of fens. Here are great numbers of wild fowl, which are taken in decoys. The soil of Lincolnshire is, in general, rich and fertile.

This county sends twelve members to parliament.

Nottinghamshire is about forty-three miles long, and twenty-four broad, and is one hundred and ten miles in circumference.

The principal rivers are the Trent, the Erwash, and the Idle; the only navigable one is the Trent.

The air of this county is esteemed as good as in any other county in England, but the soil is various.

This county sends eight members to parliament.

Leicestershire is about thirty miles long, twenty-five broad, and ninety-six in circumference.

The principal rivers are the Welland, the Sour, and the Anker.

The air is sweet and healthy, and the face of the country is agreeable. The soil is, in general, very good, and yields plenty of corn, grass, and beans; the beans are excellent to a proverb.

This county sends four members to parliament.

Rutlandshire is fifteen miles long, ten broad, and forty in circumference.

The principal rivers are the Welland and the Gevash.

The air of this county is very good, and the soil is fruitful.

This county sends only two members to parliament.

Warwickshire is thirty-three miles long, twenty-six broad, and one hundred and twenty-two in circumference; in which are five hundreds, one city, thirteen market towns, and one hundred and fifty-eight parishes.

The principal rivers are the Avon and the Tame.

The air of Warwick is mild, pleasant, and healthy, and the soil is rich and fruitful.

Gloucestershire is about fifty-six miles long, twenty-two broad, and one hundred and fifty-six in circumference. It is divided into thirty hundreds, in which are one city, twenty-five market towns, two hundred and eighty parishes, about twenty-seven thousand houses, and one hundred and sixty-three thousand inhabitants.

The principal rivers in this county are the Severn, the Wye, the Stroud, and the two Avons.

The air of Gloucestershire is equally healthy throughout, but in other respects it is very different; upon the hills the air is very sharp, but in the vales it is mild and pleasant even during the winter. The hills afford excellent pasturage, and the vales are very rich and fertile: all the world knows that this county is famous for producing the best cheese in England. This county abounds with large fine oaks, particularly in the forest of Dean; also with corn of every sort, cattle, fowl, and game. Most excellent bacon and cyder are made in this county, and the rivers afford great quantities of fish, especially the Severn, which abounds with salmon, lampreys, and eels.

This county sends eight members to parliament.

Monmouthshire is twenty-nine miles long, twenty broad, and eighty-four in circumference.

The principal rivers are the Severn, the Wye, the Mynow, the Runney, and the Uik.

The air of this county is temperate and healthy, and the soil rich and fruitful.

Monmouthshire sends but three members to parliament.

Herefordshire is thirty-five miles long, thirty broad, and one hundred and eight in circumference.

The principal rivers are the Wye, the Mynow, and the Lug.

The air of this county is pure and healthy, and the soil is fertile, and produces great abundance of apple-trees, of which the best cyder in the kingdom is made.

This county sends eight members to parliament.

Worcestershire is thirty-six miles long, twenty-eight broad, and one hundred and thirty in circumference.

The principal rivers are the Severn, the Avon, the Stour, and the Tame.

The air is exceeding sweet and healthy, and the soil remarkably rich, both in tillage and pasturage.

This county sends nine members to parliament.

Shropshire is forty miles long, thirty-three broad, and one hundred and thirty-four in circumference.

The principal rivers are the Severn, the Teme, and the Clun.

The air is pure and healthy, but in many places cold and piercing: the soil is various.

This county sends twelve members to parliament.

Staffordshire is forty miles long, twenty-six broad, and one hundred and forty-one in circumference.

The principal rivers are the Trent, the Dove, the Tame, and the Sow.

The air is generally pure and healthy: the soil is tolerably good.

This county sends ten members to parliament.

Cheshire is about forty-five miles long, twenty-five broad, and one hundred and twenty in circumference.

The principal rivers are the Mersee, the Wever, and the Dee.

The air is serene and healthful, the soil naturally fertile. Here they make excellent cheese.

This county sends only four members to parliament.

Lancashire is about forty-five miles long, thirty-two broad, and one hundred and seventy in circumference.

The chief rivers are the Mersee, the Ribble, the Wire and the Lune.

The air of this county is more serene than any other maritime one, and the soil produces great plenty of wheat and barley.

This county sends fourteen members to parliament.

Derbyshire is forty miles long, thirty broad, and one hundred and thirty in circumference.

The principal rivers are the Dove, the Derwent, and the Erwash.

Both the air and the soil are various in this county; in some places pleasant and fertile, in others cold and barren.

This county sends four members to parliament.

Yorkshire is much the largest county in England, and is one hundred and fourteen miles long, eighty broad, and three hundred and sixty in circumference.

The principal rivers are the Don, the Calder, the Aire, the Wharfe, the Nydd, the Ure, the Swale, the Ouse, the Derwent, the Hull, the Humber, the Ribble, and the Tees.

The air of Yorkshire is in general sharp, but healthy; and the soil is in many places very fertile, but there is a great deal of barren land in the county.

This county sends thirty members to parliament.

Durham is thirty-nine miles long, thirty-five broad, and one hundred and seven in circumference.

The chief rivers are the Tees and the Were.

The air is healthy and pleasant, the soil is a strong heavy clay.

This county sends eight members to parliament.

Northumberland is about fifty miles long, forty broad, and one hundred and fifty in circumference.

The principal rivers are the Tweed, the North and South Tyne, the Coquet, and the Read.

The air of this county is not so cold as might be imagined, but is warmed by the sea-vapours, except in the more northern parts. The soil is various.

This county sends eight members to parliament.

Cumberland is fifty-five miles long, thirty-eight broad, and one hundred and sixty in circumference.

The Derwent is the principal river, and there are many smaller ones.

The air is cold and sharp, but the soil is tolerably fruitful.

This county sends six members to parliament.

The isle of Man is situated about half way between England and Ireland: it is about thirty miles long and fifteen broad: it is very mountainous, and the hills are amply stored with heath.

The inhabitants are civil, hospitable, and charitable.

Westmoreland is about forty-seven miles long, forty-five broad, and one hundred and thirty in circumference.

This county is watered by lakes, of which there are several.

The air is in general sharp and cold, and the soil is not very fertile.

Westmoreland sends four members to parliament.

We have been particularly explicit in our account of England, supposing the generality of our readers to have a sufficient knowledge of that country (the native country of many of them); and shall now proceed to record the Russian discoveries in the northern hemisphere.

A SUCCINCT NARRATIVE OF THE VOYAGES AND TRAVELS

Undertaken by Command of the Czar Peter the Great, upon the FROZEN SEA, and through ANADIRSK to KAMSCHATKA, in Search of a North-east Passage; and published by Order of her most Serene Highness the present Empress of Russia: In the Prosecution of which Undertaking, many important Discoveries were made, particularly the New Archipelago.

IT has been a subject of much curiosity by geographers of every nation, and they have been very desirous fully to determine, whether Asia and America formed one continued continent towards the North-east. The full ascertainment of this material point is certainly a most desirable object; but most of the European nations are so remote from those regions, that the undertaking must be both difficult and dangerous, if not utterly impracticable. In all such attempts, the navigation must be made either through the Frozen Sea, or the Southern Ocean; and upon the latter, either by way of America, or round from the East Indies.

The Russian empire is much better situated for such a design, than any other, and to it was reserved this distinguished honour. Peter the Great, during his residence in Holland in the year 1711, was requested, not only to encourage, but to promote this useful attempt, by some persons whose interest and curiosity induced them to lay this affair much to heart. This renowned Emperor some time after, with his own hand, drew up particular orders on that head, and delivered them to his chief Admiral, Count Fedor Apraxin.

At that time, the Imperial Court of Petersburg, and the greatest part of the inhabitants of Siberia, were entirely unacquainted with the progress which had been made in those discoveries about seventy years before, by voyages of the natives of Jakutzk to the north-eastward of that province. The north-easterly isthmus of Siberia had been sailed round long before the Russians had, by this navigation, reached as far as Kamtschatka. That there was no connection between these two parts of the world, was thus already decided; had not the editor of this work had the happiness, in the year 1736, during his stay at Jakutzk, to find, in the archives of the town, some original writings, in which this voyage is described, with circumstances that leave no room for doubt.

They began to navigate the Frozen Sea from Jakutzk, in the year 1636. The rivers Jana, Indigirka, Alasca, and Kolyma, were discovered one after the other. In the year 1646, the first navigation from the river Kolyma, towards the East, was made by a company of volunteers. They found the sea full of ice, yet between the ice and the continent, free and navigable; however, they proceeded for forty-eight hours together, when they arrived at a bay where they came to an anchor. The inhabitants proved to be of the nation of the Tschuktshi, to whom they exposed their merchandise upon the strand. These people took what pleased them, and in return, gave them sea horses teeth, or things made of them. None of the crew would venture ashore; and besides, an interpreter was wanted, as they did not understand each other's language. With this first discovery they were contented, and returned to the river Kolyma.

A second voyage was made by some more volunteers the ensuing year, to which they were induced by the intelligence relating to the teeth of the sea horse. Fedot Alexcew joined them, who thought it requisite to desire the governor upon the river Kolyma to send with him one of the Cossacs that were in his service, to take care of the interest of the crown during the voyage: one Semoen Deschnew offered himself for this purpose, and received the governor's orders. In 1647, four ships sailed at once from the river Kolyma.

It was the common opinion, that the river Anadir was well inhabited, and that it emptied itself into the Frozen Ocean; consequently one of the objects of this voyage was, to discover its mouth. All these designs miscarried, because the sea was too full of ice to admit a free navigation.

Notwithstanding this disappointment, the hopes originally conceived were not abandoned. Those who favoured this project increased the ensuing year, and seven ships were equiped all with the same view. It is unknown what became of four of these vessels; on board the remaining three were Semoen Deschnew, and Gerasim Ankudinew, the chiefs of the Cossacs, and Fedot Alexcew, the chief among the volunteers.

On the twentieth of June, 1648, they set sail on this remarkable voyage. As we have but little knowledge of these parts, it is much to be regretted that all the circumstances of this navigation are not particularized. Deschnew, in relating his adventures by letter to Jakutzk, speaks only accidentally of what happened to him by sea. He mentions no event till he reached the great isthmus of Tschuktshi, and takes no notice of any obstructions from the ice, for he remarks that the sea was not usually so clear as at that time.

Speaking of the isthmus, he says, 'This isthmus is quite different from that which is found by the river Tschukotschia, west of the river Kolyma. It lies between the north and north-east, and turns circular towards the river Anadir. On the Russian, or west side of it, there runs a brook into the sea, near which the Tschuktshi have erected a scaffold, like a tower, of the bones of whales. Over-against the isthmus there are two islands in the sea, upon which were seen people of the Tschuktshi nation, through whose lips were run pieces of the teeth of the sea-horse. One might sail from the isthmus to the river Anadir, with a fine wind, in three days and three nights, and it might be travelled by land within the same time, since the river Anadir empties itself into a bay.'

On this isthmus, the ship which Ankudinew was on board of was wrecked, but her crew were saved, and taken up by the other ships. Deschnew and Fedot Alexcew went on shore, and had an engagement with the inhabitants, in which the latter was wounded. The two ships lost sight of one another and never after re-joined. Deschnew was driven about on the sea by the winds and waves till October, when he suffered shipwreck, pretty far to the southward of Anadir, somewhere about the river Olectora. What became of Fedot Alexcew and his ship's company will be mentioned hereafter.

Deschnew, with his ships crew, which consisted of twenty-five men, after this disaster, went in search of the Anadir; but being utterly unacquainted with the country, he wandered about for ten weeks; at the end of which time he reached the banks of that river, not far from its mouth, where he neither found inhabitants nor woods. Here he fixed his habitation, and sent twelve of his men up the river, who, after twenty days fruitless travel, determined to return; but being quite worn out with hunger and fatigue, most of them perished on the road.

The following summer Deschnew, with the remainder of his company, went up the river by water, and found a people who called themselves Anauli, with whom

whom he had several skirmishes; but having destroyed great numbers of them, in the end forced them to pay tribute. He then built a fort, which he named Anadirskoi Ostrog, where he fixed his residence.

After Derchnew departed from the river Kolyma, many others vigorously exerted themselves in preparing and regulating new expeditions by sea and land. Amongst these, one made by sea deserves notice, not so much on account of the discoveries made thereby, as the occasion which gave rise to it.

Michael Stadutchin, a Cossack of Jakutzk, with some of his companions, in the year 1644, had built the lowermost Ostrog, on the river Kolyma; and in the year following returned to Jakutzk, with some accounts which seemed to deserve examination. He was informed, that there was a great island in the Frozen Sea, which extends from the river Jana opposite to Kolyma, and could be observed from the continent. The Tschuktchi, inhabiting round the river Tschuktchia, which falls into the Frozen Sea to the westward of Kolyma, used to go with reindeer, in the winter, in one day's time, to this island, there to kill sea-horses, the heads and teeth of which they brought back and worshipped. Michael Stadutchin himself had not seen such teeth amongst the people, but he heard from the volunteers that such were found among them; and that some rings belonging to the sledges, which the reindeer drew, were made of the teeth of sea-horses: but he was confirmed in the opinion of the reality of such an island, and imagined it to be a continuation of the land of Nova Zembla.

On the fifth of June, 1647, Stadutchin was dispatched for the second time. But he could neither discover nor procure any further intelligence of the island in the Frozen Sea; all the benefit he reaped from this voyage was, the information that the nearest way to the river Anadir was by land.

This information encouraged a company of volunteers to desire permission from the commander of Kolymskoi Ostrog to let them go to the river Anadir, in order to make the people tributary; which they obtained, and immediately set out upon the expedition.

On the twenty-third of March, Semoen Motora, the leader of this company, on the upper part of the river Aruci, took a person of distinction prisoner, whom he carried along with him to the Anadir on the twenty-third of April, 1650, on which day he was joined by Deschnew; but Michael Stadutchin, being jealous of some of the company, quitted them, and went to the Penschina, since which nothing further was ever heard of him.

Motora died just when Deschnew and himself had finished vessels, in which they intended to put to sea, in order to discover more rivers. He lost his life in an engagement with the Anaules, at the latter end of the year 1651.

Deschnew sailed, in the summer of 1652, to the mouth of the river Anadir, where he observed, that on the north side of it a sand bank extended itself far into the sea. On the mouth of this river Deschnew got several sea-horses teeth, and thereby thought himself sufficiently rewarded for his labour.

In the year 1654 a second voyage was made to the Korga, on account of the sea-horses teeth, wherein Juchko Seliwerstow engaged, who had accompanied Michael Stadutchin in his voyage; and being sent by him to Jakutzk, with a proposal to have a search made after the sea-horses teeth, was now provided with an order for that purpose. Next to Anadir, in his instructions, is also named the river Tentshendon, which empties itself into the bay of Penshinsky. On these two rivers he was to make the people tributary, because the transactions of Deschnew at Jakutzk were not yet known. New discontents were occasioned by this. Seliwerstow wanted to ascribe to himself the discovery of the Korga, as if this was the place where he had arrived by sea with Stadutchin in the year 1649; but Derchnew proved

that they had not so much as reached the great Nofs of Tschuktchi, which consisted of nothing but rocks, and was but too well known to him, since Ankudinew's ship was wrecked there. "This, said he, was not the first cape which occurred under the name of Swator Nofs. The islands where the teeth are found, situated opposite the Nofs of Tschuktchi, were the proper mark thereof. The inhabitants of this place Deschnew had seen, but Stadutchin and Seliwerstow had not; and the Korga, on the mouth of the river Anadir, was not far from it."

Derchnew taking at the same time a view of the sea coast, found the habitations of the Koreki, and in them a Jakutzk woman, whom he knew to have belonged to Fedot Alexcew. He asked her where her master was? She replied, that "Fedot Alexcew and Gerasim Aukudinew had died of the scurvy; others of their company had been slain, and some few had made their escape in small vessels, but she could not tell what course they steered."

Some remains of these latter were afterwards discovered on the river Kamschatka. It is certain, that the inhabitants of Kamschatka had some knowledge of the Russians before the year 1697, when Woldemar Atlassow laid the foundation of the conquest of that country. A common tradition had been handed down among them, that long before Atlassow, a certain Fedotew, who probably was the son of Fedot Alexcew, had, with some of his comrades, lived amongst them, had connexion with this woman, and still shewed the place of the Russian habitations, near the mouth of the small river Nikul, which falls into the Kamschatka, and is called Fedoticha in the Russian language.

The inhabitants of Kamschatka imagined that no human hand could hurt these Russians, and held them in so much honour as almost to deify them; but they found their mistake in this particular, when the Russians began to quarrel among themselves, for they then perceived the blood to flow from the wounds they mutually received. This was the cause, that when some of them went afterwards over to the sea of Penshinsky, the remainder were all of them slain. Not one remained when Atlassow arrived.

Upon the river Fedoticha were seen, at the time of the first expedition to Kamschatka, the ruins of two habitations, where Fedotew, with his companions, were supposed to have lived, but nobody could tell the way by which these Russians first came there, and it was not known till the year 1736, when the particulars of this affair were found in the archives of Jakutzk.

In the voyage of Michael Stadutchin, in the year 1645, mention was made of an island in the Frozen Sea, but which, at the same time, was not confirmed; we must therefore observe, that though many descriptions of voyages between the rivers Jana and Kolyma were found in the archives of Jakutzk, yet not the least notice of this island has been taken in any of them; notwithstanding, had any such island been situated there, it must necessarily have been seen by several vessels, which had been driven by contrary winds far enough from the shore to have perceived it. This may be proved by two voyages made in the year 1650.

Andrei Goreloi was dispatched from Jakutzk in July 1650, and ordered to proceed by sea to the river Indigeika, in order to make the people tributary who lived above that and the river Moma. He arrived, on the last day of August, over against the mouth of the river Chroma, where he was frozen in, according to his own account, two days voyage from the continent, to which he intended to have gone on foot over the ice; but he was prevented, for the ice broke again, and a violent tempest ensued, which drove him further into the sea, where he was frozen in again, and then had a journey of a fortnight over the ice on foot, in order to reach the land. While he was performing this journey, the ship was wrecked between the ice. Goreloi and his man had drawn with

with them, upon sledges, great part of the naval stores and provisions having been lost in the sea. They set out, with sledges drawn by dogs, on the fifth of October, from the place where they reached the continent, and in four days arrived at the mouth of the river Indigirka; from thence they proceeded, on the twelfth of November, to Ujanidac Simavic, where a pound of meal cost eight rubles, which they were obliged to purchase, because they had lost the case they had brought out with them, and no other supply had been sent them.

In the year 1649, Timofci Buldakow made the second voyage. He was sent as commander to the river Kolyma, but had passed the winter at Schigani, on the river Lona. On the second of June, 1650, he arrived at the mouth of that river, and sailed from thence to the gulph of Omolawa. There he met with the ice, and was driven between it for eight days together in the sea: he was obliged to beat his way through the ice for two days, in order to reach one of the islands formed by several branches of the Lona. It appeared at last that the sea was quite free from ice; wherefore they sailed again towards the gulph of Omolawa, but found greater shoals of ice there, among which he was driven about in the sea for four days more, without any reasonable hopes of getting forward: he therefore endeavoured to get clear of the ice and return to Lona, at the mouth of which several ships lay ready to put to sea. Soon after a land wind arose, which removed the ice; and all the ships mentioned, which were nine in number, passed the gulph of Omolawa at the same time. The usual navigation, at this time, was behind an island, which lies beyond the gulph near the land. When they were going to enter the streights that separated this island from the continent, they found a shoal of ice, and the several crews of the vessels joined to remove this obstacle before they could proceed; soon after a favourable wind sprung up, which brought them to the mouth of the river Jana: but at this place, the wind from off the sea brought such quantities of ice together, that the ships were nearly jammed to pieces.

As the coasts of the Frozen sea are sloping in these parts, those large shoals of ice, which sink deep into the water, cannot come nigh the shore, they worked themselves therefore very safely through by keeping near to the land, and on the twenty-ninth of August passed the cape, which was formerly reckoned to be a very difficult navigation, because of its northerly situation, and was therefore called Sevatoï Nofs.

They were now almost opposite the mouth of the river Chroma, when the sea froze over again, on the night of the thirtieth of August. It was then proposed that part of the crews should, as soon as the ice should be strong enough, transport their effects over it to the land; but these hopes also vanished, for, on the first of September, a violent land-wind arose, and bore the ice up again, driving the ship, entangled among the ice, into the open sea for five days together: afterwards a calm came on, and the sea froze over again; on the third day, the ice was so thick that they might easily pass over it. A survey was then taken nearest the land side, by which it was found that one ship was nearer the shore by a day's voyage than the rest. On board this ship they embarked for the present, with their provisions and other necessaries, that in case the sea should break up again, the way to the continent might be so much the shorter; but when every thing was nearly prepared, the sea suddenly began to swell, the ice broke in pieces, and the ships were driven still farther into the sea than before. After five days storm, the wind again ceased, and they were frozen in a third time.

They were finally obliged to leave their ships, and proceed on foot over the ice to the continent, every one taking, upon a small sledge, as much provisions and implements with him as he could draw. This undertaking was not performed without much danger and fatigue: the ice often broke under their feet, which obliged them to leap from one shoal to another, to

throw over their provisions and implements, and to pull each other over with their poles and ropes. At length they reached the shore, near the mouth of the Indigirka, and from thence proceeded up the river Simowic, &c.

Another voyage for this purpose was soon afterwards made, but no account of the discoveries are to be found in the archives of Jakutzk. Lately this affair has been renewed, and the expeditions are treated in such a manner, that the reality of such an island seems to gain some appearance of credit.

The following accounts were taken down in writing, in the chancery of Jakutzk, on the twentieth of February, 1710, in relation to this and to other islands, situated opposite the coast of Kamschatka, upon the interrogations and depositions of several Cossacs of Jakutzk.

It was deposed by Nikiphar Malgin, that between the years 1667 and 1675, he had proceeded by sea, with a merchant named Andrei Woripaew, from the Lona to the river Kolyma; during which voyage they had mostly sailed along the continent of Sevatoï Nofs, but were afterwards obliged to keep out to sea, on account of the great quantity of ice which barred up the shore. During this voyage, their pilot had shewn them an island, lying at a great distance on this side the mouth of the Kolyma, which was plainly discerned by all on board their vessel. On their arrival at Kolyma, a merchant, named Jacob Wiatha, told them in what manner nine vessels, in company together, had sailed from the Lona to the Kolyma, when some of these vessels were driven to that island; that some of the people who were sent ashore had observed the impresson of the hoofs of unknown beasts, but saw no inhabitants; three ships had arrived at the Kolyma, but he had never heard of an island situated opposite the mouth of the river Lona.

The deposition of this mariner also contains an account of an island supposed to lie open to the country of Kamschatka, but the circumstances are so uncertain, that it requires almost conjuration to make them agree with the accounts afterwards published.

A merchant of the name of Tarou Stardutchin, is said to have told Malgin, that, many years before, he had sailed with ninety men in a ship from the river Kolyma, to make discoveries relative to the cape of Ischuttschy; that they were not able to double the cape, but went over it on foot to the other side, where they built vessels, in which they proceeded along the coasts, and came to the mouth of the river Penschina; that the place was very narrow where they crossed over; on going farther, they said, that opposite to the mouth of the Penschina we might see an island in the sea, which, according to the relation of a woman, is inhabited by people who wear long beards, and call the Russians brethren.

It is possible that they may have mistaken the name of the river Penschina for that of Kamschatka, for it is very certain that there is no island opposite Penschina; and though there is none to be seen from the mouth of the river Kamschatka, yet the Kamschatkans may have had an account of the islands known in those parts. The long cloaths and great beards, which resemble the Russians, seem to be borrowed from the nation of the Kurilies, who inhabit the island situated to the south of Kamschatka. But it is a mistake that they call the Russians brethren, for at this time it is most probable they had never heard of them. It is likely that Taras Staduchin adopted the title of brotherhood from the similitude of their form of body and dress, and Malgin might have ascribed it to the Kamschatkans from a failure of memory.

In the year 1700, Iwans Schamaew deposed, that he was sent to Kamschatka with Timofci Koblew, the commander of that country; that they made use of rain-deer from Anaduisck to the river Penschina, where they built vessels, and from thence proceeded by sea to Pustoi Ostrog, where they again got rain-deer, with which they passed over a chain of mountains to the river Kamschatka; and that there was a

small island in the sea, opposite to the mouth of the Penschina; and that, in their return from thence, he had seen an island opposite to the mouth of the river Karaga, at the distance of a day's rowing from the continent, on which three people landed, where they found inhabitants, but as they refused to pay tribute, they did not venture farther on shore.

In the year 1702, Michael Nafetkin said, that he had been sent to Kamschatka, when they took the same route as Anadirsk did to the river Penschina, from thence by water to the river Lesnaia, and from that place upon sledges to the river Kamschatka. An island might be seen from the mouth of this river, lying at a distance in the sea, but it was uncertain whether or not it was inhabited, for the Russians had never been upon it. He said he had seen islands from the south promontory of Kamschatka, such as he had likewise observed on his return to Jakutzk, in his voyage between the rivers Kolyma and Indigirka.

In the year 1704, Alexei Porotac was at Kamschatka, and said the same as Iwan Schamaew with respect to the island over-against the mouth of the river Karaga.

This completes the interrogations and depositions made in the chancery of Jakutzk.

The Stolnick and chief commandant, Knjas Warilei, Iwanowitch Gagarin, were present at Jakutzk at the same time, being dispatched by the governor, his father's brother, with full power to make discoveries and better regulations. On the seventeenth of March he delivered an order to the Waywode Fauernicht, consisting of several heads, one of which was as follows, 'That he should make diligent inquiries about the island situated opposite the mouth of the river Kolyma, and the land of Kamschatka; what people inhabited them, under whose jurisdiction they were, what was their employment, how large the islands were, and how far distant from the continent.

The Cossacs and commanders who were sent to these places, were to receive positive instructions with regard to these inquiries, together with a promise of a particular reward, which they might expect from the Czar, to whom an express should be sent, with an account of what had been done therein.

In pursuance whereof, orders were issued from the chancery of Jakutzk to the commanders of Ust-Jana and Kolyma, dated the twentieth of August, and ninth of September, 1710, to make these discoveries their particular business. A deposition in writing was received in consequence hereof, from Jacob Pumakow, which mentioned that he had once sailed from Lona to the river Kolyma, and that on the southern side of the Sevatoi Nofs he had seen an island in the sea, but could not tell whether it was inhabited or not. There was likewise situated directly opposite to the river Kolyma an island that might be seen from the continent, and mountains were observed upon it, but that it was also uncertain whether it was inhabited.

The following is a letter from the governor, positively enjoining the Waywode to prosecute these discoveries.

'I have heard by Cossacs and Deworanes from Jakutzk, that you intend to send a party of volunteers and Cossacs to the new country, an island opposite to the mouth of the river Kolyma; but that you hesitated about doing it without orders; therefore I have found it necessary to tell you, that you should by no means neglect to do it; and if the islands may be discovered, you will be pleased to do the same with respect to them. But, above all things, the expedition is to be made this present year, 1711. This I write to you by order of his Czarish majesty.'

Jan. 28, 1711.

Kujas Matfei Gagarin.

Upon this order, the Waywode prepared for two expeditions, one to the mouth of the river Jana, and the other to the river Kolyma, in order to search for this supposed island from both places at once; for which purpose the commanders received orders either to proceed by sea, or to travel over the ice, till they

should obtain a certainty whether there really was such an island, or not.

The editor of this work found several writings in the archives of Jakutzk, concerning the first expedition made under the conduct of the Cossac Merkurei Wagin, but they must be critically examined, and ample credit must not be given to every thing therein contained.

On the eleventh of August, 1711, Wagin departed from Jakutzk, in company with eleven other Cossacs, and in May 1712, made a voyage from Ust-Jankoe Simowic to the Frozen Sea, in which Jacob Pumakow, before mentioned, served as a guide. They went in sledges drawn by dogs, in which they followed the coast to Sevatoi Nofs; there they entered the sea, directly towards the north, and sailed to an island which he found to be from nine to twelve days journey in circumference, destitute both of wood and inhabitants. It is said, that from this island they saw another great island or land, lying farther out in the sea, but Wagin durst not go over it, as the spring was too far advanced, and he was short of provisions; he therefore returned to the continent, intending to provide himself with a sufficient supply of fish, during the summer, for making the voyage the following winter.

When he returned, he reached the continent between Sevatoi Nofs and the river Chroma. From thence he set out to the river Chroma to catch fish; but on their voyage, he and his company were in such extreme want of provisions, that at first they eat their dogs which drew their sledges, and afterwards mice and other unclean animals. Despairing to reach the Chroma in this distress, they returned to the sea-coast, where they subsisted upon a few fishes, wild ducks, &c.

The Cossacs who had come with Wagin from Jakutzk, remembered the hunger they had suffered, and being afraid of still more miserable circumstances, were embittered in such a manner against him and their guide, that they murdered Wagin, his son, Jacob Pumakow, and a volunteer. An accomplice discovered this fact, the murderers were seized, and, on their examination, it appeared that Jacob Pumakow did not take that second great island, which was imagined to have been seen from the first, to be really land, but that he thought it to be no more than vapours arising from the sea. It is not unlikely that some doubt may likewise be raised against the reality of the first island.

Two expeditions were made in 1712 and 1713, from Kamschatka to the Kurilean Islands, both founded on an order from Jakutzk. Both expeditions were performed under the conduct of Iwan Kosirewskoi, the Cossac, who seems to have been very assiduous in getting intelligence from the shipwrecked Japanese: several Japanese ships having been stranded on the coast of Kamschatka. In the year 1717 he turned monk, and was afterwards called Ignatei Kosirewskoi. In 1720 he came to Jakutzk, and in 1730 to Moscow; from whence an account of his merit was sent, and inserted in the Petersburg gazette of the twenty-sixth of March. The intelligence which he delivered to the Kamschatka commanders, to the chancery of the waywode of Jakutzk, and to captain Bering, are very remarkable: these informations he accompanied with charts, in order to make his narrations plainer. From these accounts the following are extracts.

In the first place; a low promontory extends from the south end of Kamschatka, some distance into the sea; it is about four hundred fathoms broad, and is called Lopatha (which signifies a shovel), on account of its square form.

The first island, called Schumtschu, which is inhabited by the Kurilies, may be rowed over to from this promontory in about three hours. The Kurilies on this island differ from those who inhabit the islands situated farther towards the south, who wear long hair; but these have their heads shaved to the neck, and when they salute each other, they bend their

their knees. The Kurilies from the south sometimes came hither for the sake of trade, and carry back with them sea-beavers; foxes, and eagles' feathers, with which they plume their arrows.

The second island, named Purumuschor, is of the same nature, and is situated at a small distance from the first. The inhabitants make a sort of stuff wove from nettles, with which they clothe themselves, but they get silk and cotton stuffs by trading with the remote Kurilies, and a sort of vessels, which must be porcelaine. Their valour and dexterity in war are admirable. They are covered with armour, and use bows and arrows with pikes and sabres.

The third island is Muschu or Onikutan, which is also inhabited by Kurilies, who manufacture stuffs made of nettles, and catch sea beavers and foxes. In fair weather the streight may be passed over in half a day to this island. On this and the two forementioned islands no fables are to be found; but the inhabitants go for the sake of hunting to some islands situated on the side thereof, and sometimes visit the continent of Kamtschatka, where they purchase beavers, foxes, and other animals and merchandise, with which they trade to the more southern islands. Many of these people understand the language of the Kamtschatkans, with whom they trade and marry.

There are three uninhabited islands on the west side of these three inhabited ones, viz.

Ujachkupa; on which stands a high mountain, which in clear weather may be seen from the mouth of the river Bolschia. To this and the next uninhabited islands, the people from the two first mentioned inhabited ones come frequently to hunt.

Sirink. This island separates the second and third islands.

Kukumiwa, is a small island situated to the south-west of the former.

We will now proceed to describe the islands that extend themselves towards the south.

The fourth is called Araumakutan, and is uninhabited, having a volcano upon it.

The fifth island, called Siaskutan, has a few inhabitants. This is the market place for the inhabitants of all the islands, where they meet to trade.

There are three small uninhabited islands to the south-east of Siaskutan, which are not reckoned in following the order in which they extend to the south. They are called Ikarma, Maschautsch, and Igaitu.

The sixth island is Schokoki.

The seventh is Motogo.

The eighth is Schashorva.

The ninth is Ushischir.

The tenth is Kitui.

In these islands, which are all small, there is nothing worthy observation, they lie very near each other, and it takes but a short time to remove to any of them. On the island of Kitui, great quantities of weeds grow, with which they make their arrows.

The eleventh island is Schimuschor, and is inhabited.

Tschispui is an island out of the number. Upon it is a high mountain.

The twelfth island Iturpu is large and well peopled; their language and manner of living differ from the other Kurilies; they shave their heads, bend their knees when they salute, and are valourous and dextrous in war. Various sorts of wild beasts, particularly bears and large ferrets; are found here. Here are likewise several rivers, the entrances of which afford commodious bays, where large ships may safely anchor. This island is divided only by a small streight from

The thirteenth island, Urup, the inhabitants of which, are the same with those of Iturpee. They manufacture stuffs spun from nettles, but purchase cotton and silks at Kunaschir, with which they trade to the first and second islands, receiving in exchange the skins of sea beavers, foxes, and eagles feathers. It has been asserted, that they are under no subjection; but this may be more truly affirmed of the inhabitants of Iturpu.

The fourteenth island is Kunaschir, which is larger than any of those already mentioned. The inhabitants are very numerous, and resemble those of Iturpu and Urup. It is not certain whether they are a free people or dependent on the town of Matmai, which stands on the island of the same name. The inhabitants of Matmai and this island traffic considerably with each other.

The fifteenth island is Matmai, which is larger than either of the former. It concludes this range, and is inhabited by the same kind of people as the former three. On this island the Japanese have built a town, called Matmai, which stands upon the south-west shore, and is inhabited by the Japanese. From Japan, people are banished hither, and a garrison is here kept for the defence of the place, which is well provided with cannon and warlike stores. On the east and west coasts, strong guards are kept, which observe narrowly all events. The inhabitants of this island bring into the town for sale, fish, blubber, and skins of beasts.

The editor of this work says, though many pieces of intelligence have been received concerning the island of Japan, yet he shall only mention the principal ones.

Nippon is the chief island after which the whole empire is named. Japan is a name entirely unknown in that island, and is only to be attributed to those who pronounce it thus. The chief town in which the King has his residence, lies on the river Jedo, which empties itself into a great bay at a small distance from the town. These accounts seem worthy of credit, as they properly agree with others.

We shall now proceed to mention some other islands, situated to the south of the river Ud, on the continent of Siberia. These are called Schantarian islands; and though the name seems old, we do not find in any written account, that any body had taken the pains to make an exact inquiry about them, till the year 1710. At this time the Prince Wasilei Iwanowitsch Gagarin committed this affair to the Waywode Trauernicht.

The Waywode gave orders to the commander Wasilai Ignatieu, concerning the navigation of the Schantarian islands, and provided him with materials for ship-building, and every thing requisite for the voyage. Some Cossacs were charged with this commission, who in the year 1712, sailed in two boats from Udskoi Ostrog, and followed the coast as far as the river Tugur, where they remained the whole summer, to obtain a supply of fish for their support during the voyage. Another company of Cossacs, who had been dispatched from Udskoi for the same purpose, joined them. They agreed to build a larger vessel of the same construction with those used in the Frozen Sea; in which they sailed in March 1713. Semoen Anabara was their leader; they followed the coast to a promontory, from whence they rowed over in three hours to the first island, where they found neither man nor beast, except a solitary black bear. They passed the night on this island, and the next day went to a second, which passage they were half a day in making. Here also they saw nothing but bears. On the 29th of June, they arrived at the third island, and found fables and foxes; here they resolved to stay during the winter, in hopes of obtaining great advantages by hunting. On this island they found a woman, whose language they could not understand. They kept her for a month, but she at last gave them the slip.

Anatara sent some of his people to the river Tugur, to bring a fresh supply of fish, but they never returned, and only four then remained with him on this island, who were hindered from gaining any intelligence of its extent and other properties, by the want of provisions; no one went above a day's hunting from their place of abode. The hunting of fables required this, for on all sides at that distance, traps were set, which required to be looked after every day, to see if any fables were caught in them. There were also wolves and bears on the island.

There are several woods on this island, which consist of birch trees, firs, beech, and aspens. On this island, two of the company died, and on the 29th of June, 1714, three sailed back to the continent, where they arrived on the first of July following, without landing at any other islands. In ten days they came to the river Ud, and afterwards went to Udskir Ostrog. Depositions of their voyage were taken down in the chancery of Jakutzk, on their arrival there on the twentieth of October, in the same year. From these materials this relation is compiled.

Before this æra, there was not any other way to Kamschatka, but by Anadirsk, which was attended with great fatigue and expence, as well as danger. This occasioned the proposal of a way to discover it by sea from Ochotzk.

A Dutch sailor, a native of Hoorn, named Henry Bush, was alive at Jakutzk, in 1736, and related the following particulars to the editor of these pages.

Upon the arrival of the people at Ochotzk, who were sent by Prince Gagurin, the carpenters built a vessel, after the manner of the Russian loddies, with which they formerly used to sail from Archangel to Nova Zembla, &c. They were employed in this work all the year 1715. The vessel was strong, eight fathoms and a half long, three fathoms broad, and drew, when laden, three feet and a half water. In June, 1716, they undertook their first voyage, and followed the northern coast as far as the country about the river Ola, and would have continued this course still further, but a contrary wind drove the vessel across the sea to Kamschatka. They first got sight of a promontory, situated north of the mouth of the river Tigil, where they cast anchor. On this shore they only found empty huts; the Kamschatkans had observed the approach of the vessel, and fled into the woods and mountains out of fear. The navigators set sail again, and passing the Tigil, arrived in one day at the brook Chariufowka, near the mouth of which two islands are situated. From thence they

proceeded the following day to the river Itscha, and made the land next morning. Here they put some people ashore, but finding neither inhabitants nor habitations, they soon returned. They followed the coast still further, and came to the river Krutogorowa. They intended to make this river, but unfortunately missed its mouth, and anchored in a convenient bay to the south of the river.

Upon examining the country, they found a Kamschatkan girl who was searching the fields for eatable roots; she shewed them some habitations, in which dwelt twelve Kamschatkan Coffacs, who were there in order to receive tribute; these served for guides and interpreters. They brought the vessel to the mouth of the river Kompakowa, where they determined to winter. The sea happened at this time to cast ashore a whale, that had in its body an harpoon of European workmanship, marked with Roman letters. In the beginning of the month of May, 1717, they put to sea again, but it was full of ice. They were jammed between the ice four days after their departure, where they were obliged to continue five weeks and three days, before they could proceed on their voyage, at last, they regained the coast of Ochotzh.

From this time, there has been a constant navigation between Ochotzh and Kamschatka.

The editor of this work was informed by Sin-bojarkoi Procofski Philkeow (who in the year 1718, was sent to discover the Schantarian islands), that their number is not determined.

The Czar sent two navigators, in the beginning of 1719, to Kamschatka, with instructions in his own hand-writing, and ordered the Siberian commanders to assist them with every thing they wanted. In May, 1720, they arrived at Jakutzk, went over to Kamschatka the same summer, and returned to Jakutzk in 1721; but they kept their transactions secret. It is most probable, from all circumstances, that their expedition was limited merely to the Kurilian islands.

VOYAGES PERFORMED BY COMMAND OF
THE CZAR, PETER THE GREAT, AND HER MOST SERENE HIGHNESS
THE PRESENT EMPRESS OF RUSSIA,
From ASIA; for completing the Discoveries on the North-west Coast of AMERICA.

AS it is a matter of importance to the curious, to know whether America is a continuation of the continent of Asia, or separated from it, we need not be surpris'd that so great a monarch as Peter the Great, should be induced to make some attempts towards a discovery, and also to have the breadth of the channel ascertained, by which they were separated in case a passage was found.

Count Fedor Apraxin, the Czar's chief admiral, received instruction to build boats at Kamschatka, or at any other convenient place. To make enquiry in relation to the northerly coasts, to see whether they were not contiguous to America; and whether they could not somewhere find an harbour belonging to the Europeans, or an European ship. The name and situation of the coasts discovered were to be inquired after, and an exact journal of the proceedings were to be kept, with which they should return to Petersburg.

These orders were seconded by the Empress Catharine, who endeavoured in all points to execute the plans of her deceased husband.

A captain of a ship, named Titus Bering, was appointed commander of this expedition, having under him two lieutenants, with other sea officers of inferior rank; they had also ship-builders along with them, with materials for that purpose.

On the fifth of February, 1775, they departed from Petersburg, and on the 16th of March they arrived at Tobolski, the principal town of Siberia, where they waited till the 16th of May, for the convenience of a passage by water, and to take with them several mechanics and materials which were necessary for their intended voyage. They navigated several rivers the following summer, and were obliged to winter in the Ilinfk, and take in provisions for a longer voyage.

They sailed down the river Lona to Jakutzk, in the spring of 1726; one of the lieutenants went before them upon the rivers Aldam, Maia, and Judoma, with the heavy naval stores and part of the provisions. Captain Bering followed him by land with another part of the provisions packed on horses; while the other lieutenant staid at Jakutzk, in order to bring the rest of the provisions by land.

The first lieutenant's voyage was as unfortunate as captain Bering's was prosperous, for he did not reach the place to which he was bound, viz. Judomskoi Krest, but was frozen up in the river Judoma, at the mouth of the Gorbei. On the fourth of November he set out to go over land to that place, but suffered so much hunger by the way, that he was forced to eat leather bags and shoes, in order to support life. On the first of January, 1727, he arrived at Ochotzk. He returned to the Judoma the beginning of February, in order to fetch the remainder of his lading; but his party not being sufficient, another was dispatched with horses, who transported every thing safely. The other lieutenant arrived at Jakutzk on the thirtieth of July.

During this time a vessel was built at Ochotzk, called the *Fortuna*, in which the first lieutenant sailed on the thirtieth of June, to transport to Bolschertzkoi the most necessary naval stores, and some ship carpenters. This ship returned, together with an old vessel, which had remained there ever since the year 1716, when the navigation between Ochotzk and Kamschatka first began.

Captain Bering, and the second lieutenant, began their voyage on the twenty-first of August, and entered the mouth of the river Bolschia on the second of September, and went the following winter, together with the first lieutenant, to Nischnei Kamschatkoi Ostrog, whither the ship's carpenters had been sent before them in the summer, to cut down wood for ship building; they took with them as much provisions and naval stores as they thought necessary, with which they travelled very slowly, on account of the carriages being drawn by dogs. They launched a vessel on the tenth of July, 1728, and called it the *Gabriel*, which being provided with necessary stores and provisions for forty men, for a year's voyage, they immediately set out upon the execution of their intended plan.

On the twentieth of July, captain Bering sailed from the mouth of the river Kamschatka, and steered north-east, mostly in sight of the coast of Kamschatka. He endeavoured chiefly to describe this coast as exactly as possible upon a map, in which he succeeded very well. On the eighth of August, eight of the Tschuktschi rowed from the shore in a leathern canoe, in order to inform themselves of the intention of this voyage. A Korjak interpreter invited them on board the ship, to which they swam by means of two blown up seal skins, tied to a pole. Information was obtained from these people of the situation of the coast, which, they said, turned towards the west. They heard of an island, which was said to lie at no great distance from the continent, to which they gave the name of St. Lawrence; it being the tenth of August, that saint's day, when they passed by it. They did not land upon this island, and observed nothing upon it besides the cottages of a few fishermen.

On the fifteenth of August they discovered, in 67 deg. 18 min. north latitude, a promontory, behind which the coast extended towards the west. From this the captain drew a probable conclusion, that he had now reached the extremity of Asia towards the north-east. He was of opinion, that the coast must continually run from that cape towards the west, and if this was the case, no connection with America could take place. He believed he had fulfilled his orders, and therefore proposed to the officers and ship's company, "That it was time to think of their return. If they should sail further to the north, it was to be feared, they might meet with ice, in which they might be jammed, so as not easily to extricate themselves; the usual thick fogs in autumn, which already began to appear, might deprive them of a free prospect; and in case contrary winds should arise, it would be almost impossible for them to return to Kamschatka that summer; and yet it was not adviseable to winter in these parts, since the well known want of wood in all the northerly regions

towards the Frozen Sea; the savages of the country not being yet reduced to the Russian government; and the steep rocks every-where found along the shore, between which there was neither anchor nor harbour, rendered it too dangerous."

The circumstances on which the captain founded his impediments, were certainly false; for it was afterwards found, that this was the promontory which, by the inhabitants of Anadirskoi Ostrog, is called *Serdze Kamen*, on account of a rock upon it in the shape of a heart. In the chief point, however, there was no mistake, for Asia is really separated from America by a channel which connects the Frozen Sea with the Pacific Ocean.

They returned without any thing material happening, and took up their winter quarters at Nischnei Kamschatkoi Ostrog.

Captain Bering made proposals for a second expedition, which deserves a particular description, as it surpasses all those that went before it.

The captain, together with his two lieutenants, declared they would travel a second time to Kamschatka, and undertake those discoveries that remained to be made in those seas. In the beginning of the year 1732, the captain was made a commodore, and the lieutenants were raised to the rank of captains. They received orders to make voyages eastward to the continent of America, and southward to Japan; and to discover, if possible, the north passage through the Frozen Sea. The senate, the admiralty office, and the academy of Sciences, all united to complete this important undertaking.

On the seventeenth of April, 1732, the first imperial order from the cabinet to the senate was made in relation to these discoveries. Several sea officers were appointed to join the commodore. All the officers were appointed to their different stations, and a third captain was appointed, because it was ordered that four ships put to sea from Kamschatka.

The first captain was sent before, on the twenty-first of February, 1733, with a party, and the heaviest materials. On the eighteenth of April, the commodore set out from Petersburg, and went as far as Casan by water, and afterwards by Catharineburg to Tobolsk. The same route was taken by the academical travellers, who began their journey on the eighth of August, and in January, 1734, overtook the commodore at Tobolsk. The commodore travelled from thence to Irkutsk, from whence he went to the Lena, and took advantage of the water carriage as far as Jakutzk. The second captain did not set out till the summer of 1734, and arrived at Jakutzk the following year.

The academical travellers made several tours, which were very advantageous to natural history and geography, while the ship building at Ochotzk went on. The commodore remained at Jakutzk, and constantly sent provisions from thence to Ochotzk. The first captain staid with the ship-builders at Ochotzk, but every thing went on so slowly, that it was impossible to foretel when the voyage would take place.

Various expeditions were made to discover a passage through the Frozen Sea, but they were all fruitless, and the description of them would afford neither profit nor entertainment to our readers: which expeditions being finished, no other has been undertaken in these parts.

We will now proceed to the chief business of the Kamschatka expedition, which consisted in the intended navigations that were to be made from Ochotzk and Kamschatka to the east and south.

The first captain, who in the month of June, 1734, arrived at Jakutzk, prosecuted his voyage, in order to reach Judomskoi Krest before the winter; but he was frozen in, and proceeded on foot with a few men. An hundred horses, laden with meal, had been sent in the spring of 1735, by the commodore, that nothing might be wanting that was most necessary. They likewise endeavoured to transport,

from

from Jakutzk to Judomskoi Krest the naval stores and provisions, in vessels and by land, part of the way.

The first captain ordered two vessels to be built at Ochotzk, for a voyage to Japan, which were finished by the end of the summer, 1737. The commodore had two more packet-boats built for the American voyage, and also two vessels for provisions, which were only to serve as far as Kamschatka. These were finished in the year 1740, and were called St. Peter and St. Paul. In the mean time they went on, without interruption, in transporting the provisions from Jakutzk to Ochotzk.

In 1738, they were able to make a beginning with the navigation to Japan: the first captain commanded the hucker Michael, and one of the lieutenants the double shallop, called the Hope. The command of the boat Gabriel was entrusted to the care of a mid-shipman. These set sail in June, 1738. The sea was so full of ice, that the captain could not get out sooner, and even then he had much trouble to go through it. He first sailed towards Kamschatka, entered the river Bolschaia Reka, and made preparations for his future winter quarters. He shortly directed his course to the Kurilian islands, but returned to Kamschatka, intending to put to sea earlier the following summer. During the winter, he built another shallop, which he called the Bolschaia Reka, which he proposed to make use of in discovering the islands; the captain judging that this vessel would be more convenient than either of those he had with him.

They put to sea with the four vessels on May the twenty-second, 1739, and rendezvoused at the first Kurilian islands, where the captain gave the other officers instructions and proper signals. They prosecuted their voyage the first of June, and, on the fourteenth a violent storm separated the lieutenant from the captain, and, notwithstanding their repeated signals, were not joined again during the voyage. Each made his navigation for himself, and landed in Japan in different places: after their return, they gave the following accounts to commodore Bering.

On the eighteenth of June, the captain came to anchor under the land of Japan. The shore appeared pleasant, being interspersed with vallies, and covered with woods, at a distance; they perceived a great number of vessels, two of which rowed towards them; but when they were about forty fathoms distance, they lay on their oars, and would not approach any nearer. When the ship's company beckoned to them, the Japanese did the same, signifying that the people should go ashore. The captain carefully avoided this, and did not remain long in one place, for fear of surprize.

Several Japanese vessels were again seen on the twentieth of June, each of which contained ten or twelve men. The captain anchored at another place on the twenty-second, and there two fishing boats came on board; and the men exchanged fresh fish, rice, large tobacco leaves, pickled cucumbers, and other things, for various Russian goods, with which the ship's company were provided. The Japanese seemed to be most fond of cloth, and cloaths made of cloth, and bits of blue glass; but did not set any value upon cotton, or silk stuffs; nor on looking-glasses, scissars, needles, and such like implements, that were shewn them, having all these in their own country. The Japanese were civil, and reasonable in their prices. The ship's company got from them some oblong gold coin, somewhat like a Dutch ducat.

The next day seventy-nine such boats were seen at a distance, which were all sharp at the head, and flat at the stern; about twenty-four feet long, and four feet and a half broad. In the midst was a deck, on which a small hearth was placed; the rudder might be taken out, and stowed away, when not used. Some vessels had two rudders. They were provided with grapplings, and used their oars standing.

The people of Japan are of small stature, swarthy complexions, flat noses, and black eyes. The large boys, and the men, shave their hair from the forehead to the crown; the rest is combed back, and made to shine with glue; it is tied behind, and wrapped up in a paper. The little boys are distinguished by a shaved patch in the middle of the crown, about two inches over, and the rest of their hair is dressed in the same manner as the larger boys. Their cloaths are long and wide, like the European night-gowns, and they wrap up the lower parts of their bodies in linen, instead of breeches.

Before the captain left this place, a large canoe came to his ship, with four men, besides the mariners, who, by their superb dress, appeared to be persons of condition. On entering the captain's cabin, they bowed down to the ground, held up their hands, folded over their heads, and kneeled, till the captain desired them to rise. He entertained them with brandy, and such eatables as they seemed fond of. The captain shewed them a chart of those parts, and they immediately knew their country, which they called Nippon. They likewise pointed out the islands Matimai and Sado; also the capes Songar and Noto. They bowed to the ground again at parting, and expressed their thanks, as well as they could, for what they had received.

The captain now thought that the chief purpose of his voyage, which was the discovery of the proper situation of Japan, with respect to the county of Kamschatka, was now fulfilled. He therefore returned, making observations on the islands he had seen before, and by which he was obliged to repass. From those observations the following are extracts.

The captain sailed to the north-east, and arrived at a large island on the third of July, in latitude 43 deg. and 50 min. Before this island he anchored, in thirty fathom water, and sent his birch yacht with a boat on shore, in search of fresh water; they found no landing-place, on account of the steep rocks, of which the coast consisted. From another place he again sent them on shore, and they returned with thirteen casks of good water on board. On this island grew birch, fir, and other trees, which were entirely unknown to the Russian sailors. Here they saw some inhabitants, who ran away upon the sight of the Russians; they likewise found leathern boots, and the bottoms of sledges, made like those of the Kamschatkans. This induced the captain to sail nearer, and he came to an anchor in a sandy bottom, in a bay at eighteen fathoms water. Here was a village, to which the captain sent a shallop, which returned with eighteen of the inhabitants.

These people spoke the same languages with the Kuriles, whom they also resembled in aspect and stature. The principal difference consisted in this, that they had pretty long hair all over their bodies; the men of a middling age had black, and the old men had grey beards; some of them wore silk earrings. Their cloaths were made of silk stuffs, of various colours, and reached to their feet, which were bare. They drank brandy, and were much pleased with the various trifles given them. When they saw a live cock on board the ship, they fell upon their knees, clapped their hands together over their heads, and bowed down to the ground. They were afterwards set on shore.

The captain left this island on the ninth of July, and failed to discover the situation of the other neighbouring ones, which was not done without danger and inconvenience. They had frequently very shallow water; many of the ship's company fell sick, and several died soon after. At the island Matimai he arrived on the twenty-third of July, where he found three large Japanese buffes; he prepared for an engagement, in case they should attack him, and was so cautious, that he would neither send ashore, nor come to an anchor; but on the twenty-fifth set sail on his return to Kamschatka. He reached the mouth of the river Bolschaia Reka on the fifteenth

of August, which he entered, in order to give his people a little rest. He set sail again on the twentieth, on his return to Ochotzk, where he arrived the twenty-ninth, and found the lieutenant, who had separated from him in a storm.

The following are the particulars of the lieutenant's report.

The lieutenant having been separated in a fog and tempest from the captain, as we before remarked, and having endeavoured in vain to rejoin him, determined, without loss of time, to seek the land of Japan; and, on the sixteenth, he got sight of it, in 38 deg. 17 min. north latitude. He steered southwards along the coasts, and on the seventeenth of June, being near the shore, thirty-nine Japanese vessels, of the size of galleys, appeared, seeming to come out of harbour, but soon separated for different places. The lieutenant pursued one of them, in search of a harbour, and arrived before a large town, where he anchored in thirty fathom water. On the nineteenth a Japanese vessel, with eighteen persons on board, came to the Russian ship. The lieutenant sent the second mate and the quarter-master ashore, with six armed soldiers, in a yawl, and gave them two empty casks, which they were to fill with water; they were also provided with presents for the Japanese, in order to gain their friendship. The lieutenant was encouraged to do this, as the people, who came on board his ship, appeared civil, and gave them to understand, that they might come on shore.

As the people, whom the lieutenant sent, approached the shore, a vast number of vessels came out to meet them, which crowded so hard upon the yawl, that they could scarcely use their oars. The Japanese rowers were naked to the girdle. They shewed a great number of pieces of gold, indicating their inclination to trade. A vast multitude of people were assembled on the shore, who all bowed to the new comers. They filled their water casks for them, and brought them back into the yawl.

The second mate and the quarter-master, with four soldiers, went on shore and left two soldiers to take care of the yawl. The second mate went into the houses where he saw them carry the water casks, and was even received by the landlord in a very friendly and hospitable manner; he was conducted into an apartment, and entertained with wine and deserts, which were both served in porcelain vessels. The desert consisted of grapes, apples, oranges, and preserved radishes. He went into another house, where he was treated in the same manner, and had boiled rice presented him to eat; the same was done to the quarter-master, and the soldiers, who went with him. The second mate presented them with glass beads, and other trifles. He walked about the town, which consisted of fifteen hundred wooden and stone houses; and observed every-where, both in the houses and the streets, a great deal of cleanliness and good order. He met with several shops, where cotton stuffs were chiefly sold. In his hurry he did not observe any silk stuffs. The fruits of the field consisted in wheat and pease, and he found horses, cows, and hens in abundance.

The second mate returned to his yawl again, and saw before him two men with sabres, and one of them had two sabres in his hands. This filled him with some apprehensions, and he was glad to get to the ship as fast as possible.

As he went towards the ship, upwards of a hundred small vessels followed him. A gentleman sat in one of them, who ordered a rope to be thrown into the yawl to have his vessel drawn near the ship. By his raiment and the respect shewed him by his attendants, he appeared to be the governor of the place. He came on board the ship, and made a present to the lieutenant of a vessel with wine, which the lieutenant brought with him to Ochotzk. The wine was of a dark brown colour, a little strong and well tasted, though rather tart, which might be owing to the heat at sea. The lieutenant returned other presents for

these civilities, and entertained his guest and attendants with victuals and drink. The Japanese did not think the taste of Russian brandy amiss. The ships crew carried on a trade with the Japanese, for whatever the Russians had; the Japanese liked even old shirts, stockings, &c. They paid for them in their copper coin, which had a square hole in the middle, and were strung together in the Chinese manner.

This person of consequence seemed very well pleased with his reception, and returned to the town. The lieutenant observed in the mean time, that the number of small vessels which surrounded his ship, continually increased, and therefore thinking himself in some danger, weighed anchor, and put to sea again, having first fired a gun in token of his taking leave.

He made land again on the twenty-second of June, and anchored in twenty-three fathom water, but as the anchor would not hold, they were obliged to weigh again and seek for a more convenient landing place, but the coast was every where steep and rocky. They observed vessels in one place, which were drawn ashore for want of a harbour, though they were not small.

The lieutenant returned to the place where he could not succeed before in anchoring, when some vessels came off to his assistance. He gave the Japanese to understand, that he was in want of water, and they immediately took the vessels which were given them to the shore, and returned with them filled. They likewise produced a written paper, which our people took for an order, by virtue of which, they were under obligations to be kind to strangers. The Japanese appeared to the lieutenant, as if they wanted him to approach nearer the shore; but before he resolved upon it, a Japanese guard boat came from the shore, which forbade the people any farther communication.

Considering the great heat of the summer, they could not lay in too much water, and besides, this furnished fresh opportunities of obtaining intelligence about the country. They therefore came to anchor in another place near the shore, in two fathoms water, where the ground consisted of coarse sand and muscle shells.

On the twenty-fourth of June, the lieutenant sent the second gunner with some men and a surgeon's apprentice, in the yawl, on shore. They found no water, but saw Japanese, who were clothed in long white linen frocks. The horses were of a dark brown and black colour. They brought back an orange tree, pearl shells, and the branch of a pine tree. The apprentice gathered herbs, and provided himself with the buds of fir trees, of which he afterwards made decoctions for the use of the sick on board the ship. The lieutenant returned to Ochotzk, and arrived there the twenty-first of August.

On the fourth of June, 1741, commodore Bering, and captain Tschirikow, set sail in two ships, all necessary regulations being finished, and the ships stored with as much provisions as they could contain. It was agreed upon that they should steer south-east by south till the twelfth of the same month, when they found themselves in north latitude 46 deg. This was one proof of the non-existence of the lands of Gama. They went with a northerly course as far as 50 deg. north latitude, intending to go from thence easterly, in order to discover the continent of America, but on the twentieth instant, the captain was separated from the commodore in a violent storm and fog.

By this misfortune, the ships was deprived of the mutual assistance which otherwise they might have afforded each other. The commodore did all in his power to find the captain, but in vain: the captain took an easterly course, and made discoveries in which the commodore and himself perfectly agreed in.

On the eighteenth of July, the commodore, having steered more northerly, got sight of the continent of America, and the captain had reached the same course three days before.

The coast which the captain made was very rocky
and

and sleep, without any islands, on which account he did not venture an approach, but anchored at some distance. He sent the mate, Abraham Dementiew, ashore, with ten of his boat-men, having furnished them with provisions for several days, likewise arms, accoutrements, and every necessary instruction. They saw the boat row into a small bay behind the cape, and concluded that she was fortunately arrived. After several days, the boat did not come back, and the people on board the captain's ship thought the boat might have received some damage in landing; they therefore sent the boatswain, Sidor Sawelew, ashore, with three men in a small boat, amongst whom were carpenters, well armed, and provided with the necessary materials. These were sent ashore on the twenty-first of July. Sawelew had orders, when he had given the necessary assistance to Dementiew, to return to the ship, either with or without the mate. These orders were not obeyed, and a great smoke was perceived arising from the shore.

The ship's company perceived, the next day, two vessels rowing towards the ship, one of them much larger than the other; and concluded that it was Dementiew and Sawelew with the two boats: the captain therefore ordered all the men upon deck, and directed them to prepare for sailing. It unfortunately happened that these boats contained Americans, who perceiving many people upon deck, ceased rowing, and lay on their oars; they then stood up, and with loud voices cried out, 'Agai, agai,' and immediately returned to the shore.

All hopes of seeing their comrades was now given up, though the captain took a great deal of pains for that purpose. He had no more boats to send ashore, and the coast was so rocky he dared not venture near it with his ship. It was resolved, in a council of the rest of the sea-officers, to return to Kamtschatka, which was done on the twenty-seventh of July.

Commodore Bering attempted to get a better account of the coast which he had discovered, and wanted a supply of fresh water. The country had very high mountains, which were covered with snow. He reached it the twentieth of July, and anchored under a pretty large island, in twenty-two fathom water, and a soft clay bottom. They called a point of land which projects into the sea, St. Elias's Cape, on account of its being Elias's day. They called another point of land, which appeared opposite the first, St. Hermogenes. Between these there was a bay, in which they promised themselves security, did circumstances require it.

Chitrow, the master of the fleet, was sent by the commodore, with some armed men, to reconnoitre this bay; and Steller, the adjunctus, was sent, at the same time, in another boat to fetch water. Chitrow found good anchorage between some islands, secure from all winds. He also found some empty huts in an island, which was formed of smooth boards, some of which were carved. In the huts he found a small box made of poplar; a hollow earthen ball, in which a stone rattled, like a toy for children; and a whetstone, on which it appeared that copper knives had been sharpened.

Steller met with a cellar, which contained a large quantity of red salmon and a sweet herb, which is dressed for food, in the same manner as in Kamtschatka; likewise ropes, and all sorts of household furniture. At the place he came to, some Americans had just before dined, who fled at his approach, and left behind them an arrow and a wooden instrument to procure fire, such as they use in Kamtschatka. He gathered a great variety of herbs, and regretted that he had no more time to look about the American coast; his whole stay was only six hours, for he was obliged to return on board as soon as he had taken in fresh water.

The sailors who fetched the water, likewise related that they saw two fire-places, in which a fire had just been made; they also found hewn wood, and perceived the steps of a man in the grass; they also saw

five red foxes, which went along quite tame. They brought on board some smoked fish, about the size of carp, which tasted very well.

They left the Americans some presents on shore. On the twenty-first of July, it was resolved to put to sea again, but the voyage was troublesome and dangerous. On the twenty-ninth of July, about midnight, they came into twenty fathom water, but as it was quite dark, they could not tell whether it was a sand-bank, the continent, or an island. They still found less water, but dared not come to an anchor; as the wind was strong and the waves was high; they likewise feared that they might be too far from the shore, as well as too near it. They sailed to the south, and regained a secure sea.

On the thirtieth of July they discovered an island, in foggy weather, which they called Tumanoi Ostrog, which means the foggy island; here they came to anchor in eight fathom water. The commodore, and the ship's crew, began to be much afflicted with the scurvy.

On the twenty-ninth of August, they steered to the north, and again discovered the continent, with a multitude of islands before it, between which they anchored. These were called the Schumagins Islands, after the name of the first of the ship's company, who died in the voyage and was buried there.

Andrew Hesselberg, the pilot, was sent, on the thirtieth of August, to one of the largest islands, in search of water; he brought two samples, but they both had a brackish taste. To this water was afterwards attributed the scurvy, and other distempers which prevailed among the sailors.

Chitrow, with five men and an interpreter, were sent ashore in a small boat, they were all well armed, and had some trifles given them by way of present to the inhabitants, should they find any. They reached the island on the thirtieth of August, about noon; there were fires to be seen, but the people were gone: Chitrow intended returning to the ship the same afternoon, but a strong contrary wind drove them on another island, and detained them till the second of September, when the storm ceased. As Chitrow did not return the same day, the large boat was sent for him the next morning, in which he came back to the ship. The same boat received so much damage that she was left on the shore.

They made several attempts to sail, but were driven back by the winds, and they anchored in the former place. On the morning of the fourth of September, they heard, on one of the islands, a loud cry of men, and observed fire burning. Soon afterwards, two Americans came rowing towards the ship, in two canoes, shaped like those used by the savages in Greenland, but they stopped at some distance. These people had calumets, which are used to express their peaceable sentiments by the Americans, and they seemed to invite the mariners ashore, as well by words as gestures. The mariners, on the other hand, invited them on board the ship, but they would not venture, and returned back to the island.

Lieutenant Waxel, accompanied by nine men, well provided with arms, went to the island. The lieutenant wanted the Americans to come on board, by a friendly behaviour, and offering various presents; but as this proved fruitless, and the Americans on their part invited the Russians to go on shore, Waxel ordered three men of his company to debark, among whom was a Korjak interpreter, and to fasten the boat with a rope to the stones which lay on the shore.

The Americans wanted to regale the Russians with whales' flesh, which was the only provision they had. It seems they were here only on account of the whale fishery, for there were as many canoes as there were men, but neither huts nor women. It is most likely their habitations were on the continent. They had neither bows, arrows, nor any weapon among them that could give the Russians any uneasiness; they therefore staid a good while on shore, and went about with the Americans, but not out of sight of their boats.

An old man had the courage to come to lieutenant Waxel in the boat: Waxel gave him a cup of brandy, but it was disagreeable to him; as immediately upon tasting it he spit it out again, and cried aloud, as if he was complaining to his countrymen how ill he had been used. They could not appease him by any means, notwithstanding they tried almost every method; he only desired to return to the island, and it was not thought proper to detain him. Waxel called his people to come back.

The Americans attempted to detain them; at last they let the two Russians go, and kept the interpreter. Some of them laid hold of the rope which fastened the boat, and wanted to pull it ashore; to prevent which, Waxel ordered the rope to be cut. The interpreter cried aloud, and desired they would not abandon him; but the Americans persisted in detaining him. Waxel discharged two blunderbusses, merely with a design to frighten them, and it had the desired effect; for the unusual noise of the report, which was greatly increased by an echo from the neighbouring mountains, so amazed the Americans, that they fell flat on the ground, and the interpreter taking advantage of their surprize, made his escape to the boat; they however soon recovered themselves, and expressed their discontent. Waxel returned to the ship in the evening.

One of the Americans had a knife hanging by his side: their upper garments were made of whales' guts, their breeches of seal-skins, and their caps of the skins of sea-lions, which were adorned with hawks' feathers. Their noses were stoped with grass, which they sometimes took out, when a great deal of matter issued from them, which they licked up with their tongues: some of them had their faces painted red, and others of various colours; their features were different from each other, and they were all rather tall. They feed chiefly on sea-animals and roots of the earth.

The next morning they prepared for their departure; when seven Americans appeared in separate canoes, and approached near the vessel. Two of them rose up and laid hold of the rope-ladders of the ship, and delivered, as presents, two of their caps, with the image of a man carved out of bone, which appeared to be an idol. Presents were reciprocally made, and they would have ventured on board if the wind had not arisen, which obliged them to return to shore. After the ship sailed, the Americans made a great noise, which at once seemed to testify their friendship, and their rejoicing at the departure of these strange guests.

They had very stormy weather during their voyage, many of the ship's company were taken sick and died, and a sufficient number was barely left to manage the ship.

On the twenty-ninth and thirtieth of October, they made two islands, which they left without names, imagining them to be the two first Kurilian Islands, but we shall call them Seducing Islands. They had continual rains, which were now exchanged for hail and snow. Notwithstanding the weakness and sickness of the men, they were obliged to work continually in the cold and wet; and the sickness was so dreadful, that the two sailors who governed the rudder were obliged to be led to it by two others, who could hardly walk. The nights grew longer and darker, they knew not in what latitude they were in, or how far from Kamtschatka.

Land appeared at last, to their great joy, for which they made; but it was at so great a distance, that before they could get near enough, the night began to come on, and it was judged adviseable to keep the sea, that they might not endanger the vessel.

They found most of the rigging, on the starboard side, damaged the next morning, and the people were so weakened by sickness that they could not remedy the disaster.

A council was called, wherein the immediate danger of their present situation was taken into consideration. The ship was adjudged unfit for further navigation:

the want of water, and the sickness of the crew increased; the weather was cold and wet, and no mitigation of its severity was promised. It was under these calamitous circumstances determined, that, if possible, they should make the land, and both save their lives and preserve the ship; but if the whole of their design was not practicable, they might at least save their lives, and submit their future fate to that Providence from whence alone they could expect succour.

They cast anchor in twelve fathoms water, but their cable was torn in pieces; the ship was driven on a rock, which she touched twice, notwithstanding they found by the lead five fathoms water. They feared the ship would go to pieces, for the waves broke over her with such violence, that nothing else could well be expected. Upon letting out their second anchor, the cable broke before the anchor had taken ground.

The vessel was thrown on the other side of the rock by a high sea, just as they were preparing to let out another anchor, and the vessel got at once into still water. They anchored about three hundred fathoms from the shore, in about four fathoms and a half water.

Their first care was, to look about the shore, and choose the most convenient place for taking up their winter quarters. They rested till noon, as the ship's company was quite weak; they then hoisted out the boat, but not without great difficulty.

Lieutenant Waxel, and adjunctus Steller, went on shore on the sixth of November, which they found quite covered over with snow. They found a brook running from the mountains and falling into the sea, not far from the landing-place: this proved to be clear wholesome water; but they could find no fire-wood, except what was thrown on shore by the sea. They did not know how to defend themselves from the cold, and they could not build any houses or barracks to shelter their sick. Necessity pointed out to them many sandy hills near the brook just mentioned, between which were pretty deep ditches; these they resolved to clear towards the bottom, and cover them with sails, till they could build themselves better habitations. Waxel and Steller returned in the evening, and gave an account to the commodore of what they had seen.

The next morning they concluded to send ashore as many men as were able to stand on their legs, in order to prepare, as soon as possible, a ditch between the said hills for the reception of the sick. A beginning was made, on the eighth of November, to land the sick, but several died as soon as they were brought from between decks, some in the boat, and several more when they were brought on shore.

It was with great difficulty that they could keep the stone foxes, with which that place abounded, from the dead bodies. The foxes did not run away when any body approached them, which gave occasion to suppose, as it afterwards proved, that this was an island.

Commodore Bering was brought ashore on the ninth of November. They continued to bring the sick on shore, some of whom died every day. Waxel and Chitrow remained tolerably healthy whilst they were at sea, but in a few days they also grew sick; but were afterwards restored to perfect health. The commodore died on the eighteenth of December, and had the honour to have the island called Bering's Island, after his name. He was a Dane by birth, and in his youth made several voyages to the East and West Indies, but was at last tempted to seek his fortune in Russia.

Captain Tschirikow sailed on the twenty-seventh of July, on his return from the American coast, and suffered nearly the same accidents as the commodore. He met with contrary winds and other impediments from the coasts and islands, which they were very sorry they did not discover in their outward passage. He lost his two boats, and therefore could not provide himself with fresh water; in this he was put to greater

inconvenience

inconvenience than the commodore. On the twentieth of September he arrived on a coast, which they supposed to have been the same that the commodore also arrived at four days after. This coast was surrounded with rocks, the tops of which reached above the water, and they were obliged to anchor at two hundred fathoms distance from them. Several of the inhabitants came in canoes with a friendly mien, and seemed full of astonishment at the ship; but nobody could converse with them, neither dared they stay, because the cable was cut to pieces by the rocks, and the crew were forced to endeavour to regain the open sea. In this attempt they succeeded, but it was of little advantage to their passage, on account of contrary winds.

They tried the method of distilling salt water when their fresh water began to decrease; the bitterness remained after this operation, though it was deprived of the salt. They mixed the distilled water with equal portions of fresh, and supplied the ship's company with it; to the great joy of all on board, it rained, which gave them a temporary supply.

Many were swept away by the scurvy on board this ship; the captain himself lay sick with it a long time. At length, they saw the land of Kamschatka, and on the ninth of October entered the bay of Awatscha. There remained only forty-nine men living out of the seventy which they took out. The pilot brought the ship into the harbour of St. Peter and Paul on the eleventh instant, after she had been four months upon her voyage.

The captain recovered from his sickness in the ensuing spring, and cruised about the sea, in hopes of meeting with the commodore, and then sailed to Ochotzk, from whence he travelled to Jakutzk, where he expected to receive orders from Petersburg how to proceed. He was appointed commodore on his return to Petersburg, but died soon after.

But to return to the late commodore Bering's crew. Soon after the commodore's death, they had the misfortune to lose their vessel, on which were placed their only hopes of returning. She rode at anchor in the open sea, and not a soul left to guard her, as none could be spared from attending the sick and other business. On the night of the twenty-ninth of November, a violent storm arose, which tore the cable to pieces, and drove the ship on shore; for an unfortunate circumstance like this, it was attended with one favourable event, for the wreck came near the place where the people lay. They saved a great deal of provisions, but they were rather damaged. The crew did not despair, but still conceived hopes, that though the ship itself could not be refitted for service, yet they might with the materials construct a new vessel, sufficient to carry them to Kamschatka.

They thought it necessary to search the country, in order to discover whether it was a continent or an island. The rocky mountains seemed to indicate that it was a continent, which indeed it might have formerly been, but by some dreadful convulsion of nature, may have been separated from it. They sent out people (as soon as their strength would permit) to the north and south, to see if they could find any inhabitants, forests, or animals. They returned, saying, they could no where find any traces of the human race, but they had met with many sea beavers, and a multitude of stone foxes, which were not in the least shy of men.

Others were sent soon after this, who brought intelligence, that they discerned the open sea from a very high mountain; they were therefore convinced that it was an island. They found no forests, and they were very hardly put to it for firing during the winter.

The extent of this island cannot be well ascertained, but it lies in the same direction with the mouth of the river Kamschatka. On it there are many high mountains and rocks, and in the valleys there is good grass and spring water. They could not discover any har-

bour about this island, where ships might ride in safety from the winds.

At length they ventured to examine what store of provisions they had left, that they might compute the time they would last, and regulate the daily shares in proportion. Had they not been providentially supplied with the flesh of sea animals, they must have perished with famine. They however reserved some meals, in order to execute their intended voyage, should they be able to construct another vessel.

No respect of persons was observed in this island; officers and men had the same portions, and messed together. The state of natural liberty and equality of men seemed to be restored; for though lieutenant Waxel took the command after the commodore's death, yet he did not chuse to execute it, for fear of retaliation. In the month of March, 1742, lieutenant Waxel called the ship's company together, which was forty-five in number, that they might come to some resolution about returning. They unanimously agreed to break up the vessel and build a smaller one, in which they might return. They were employed the whole month of April, in unrigging and breaking her to pieces. In the beginning of May, they put her on the stocks, and by the end of the month of July she was ready for launching, which was done on the tenth of August, and named St. Peter, after the ship out of the wreck of which she had been built. Considering the difficulties they were under, and the want of several materials which they must have experienced, it is really astonishing how they finished her. Happily for them, the weather was calm, if it had not been so, they would not have succeeded. She lay exposed to the open sea; and if a storm had arisen, she might easily have been again stranded on the coast. She drew five feet water, and was able to carry a greater burthen than they had to put in her.

On the tenth of August they put to sea, towards the evening. They towed the boat of the other ship with them, resolving to set her adrift if they could not preserve her. They passed by several rocks and other shallow places, the same evening, after which they took to their oars. A gentle breeze from the north luckily sprung up, with which they were enabled to proceed on their voyage.

They were obliged to set the boat adrift on the 18th of August, owing to a strong contrary wind; and the vessel began to be very leaky the same day, two pumps were not sufficient to keep her free, they were therefore obliged to use buckets and throw their heavy goods overboard, in order to discover the leak, as well as to lighten the vessel. Very fortunately they found out the leak and stopped it; so that afterwards they only used one pump, and that not constantly.

They came in sight of Kamschatka on the twenty-fifth of August, and on the twenty-seventh; entered the harbour of St. Peter and Paul. We need not say, what joy they experienced on this occasion; here they found plenty of provisions, which captain Tschirikow had left; here they wintered in commodious dwellings, very different from those they had lived in on Bering's island.

Waxel went from the harbour of St. Peter and Paul to Jakutzk, and having wintered there, proceeded to Jeniscisk; where on his arrival in October, 1744, he found captain Tschirikow, who had received orders from the senate to take up his residence there, till a resolution should be taken, with respect to the prosecution of the Kamschatka navigation. Waxel stayed at Jeniscisk; and when Tschirikow was ordered to Petersburg, in 1745, Waxel then took upon him the command of the mariners there, and did not arrive with them at Petersburg, till January in the year 1749, which time may be fixed as the end of the second Kamschatka expedition. This lasted near sixteen years.

The result of these discoveries seems to be this, that though much has been done already, there remains something considerable to be performed, which may possibly

possibly be brought to perfection by enterprising spirits. These accounts and discoveries already made, will serve as a guide to others; they are published by the express command of her most serene highness the present empress of Russia, for the use of the whole world, who must applaud her conduct in this and almost every other particular. Few such women, so well calculated to govern, are to be found. The

designs she has in view are of a very difficult nature indeed; they are no other than increasing her commerce, extending her conquests, making new discoveries, and civilizing a barbarous people.

We shall now entertain our numerous readers with a general, yet comprehensive account of the various expeditions for discovering a north-east passage to China and Japan.

A GENERAL YET COMPREHENSIVE RECITAL

Of the several VOYAGES undertaken for the

DISCOVERY OF A NORTH-EAST PASSAGE TO CHINA AND JAPAN;

Which we shall consider as a necessary Introduction to the Voyage of the Honourable Commodore PHIPPS, now Lord MULGRAVE.

THERE is implanted in man's nature a degree of novelty, which no present gratification can satisfy; when he has visited one region of the globe, he is still impatient till he explores another; and after having escaped one danger in his progress, he is still desirous to encounter others: these principles of action and enterprise are certainly very fortunate for commerce, and the intercourse of nations.

Voyages to the poles are so replete with disagreeable circumstances, that one would wonder how men could seriously engage in such undertakings, especially as the relation of former hardships remain uncontradicted. These dreary regions are so unaccustomed to feel the kindly influences of the enlivening sun, and are so entirely destitute of the ordinary and necessary productions of the earth in happier climes; so great a part is rendered uninhabitable by human beings, and but thinly occupied by an inconsiderable number of the race of quadrupeds; no relief can be expected in traversing these solemn deserts, and almost insuperable difficulties are sure to be met with, and nothing but the merciful interposition of Providence can, in any degree, be relied on: all these circumstances put together, would be (in some people's opinion, at least), sufficient to stagger the resolution of the most intrepid, and to cool the ardour of the most enterprising.

A brief recapitulation of the voyages undertaken to find out a north-east passage to China and Japan, will make good our remarks; and shew, that notwithstanding many are of this opinion, who sit at home in comfort by their fire sides, there are such enterprising spirits, who are not to be dismayed by all the frightful pictures which can be drawn by gloomy and apprehensive persons.

Sir Hugh Willoughby was the first who attempted this discovery, with three ships, so early as the year 1553, which was the æra of perilous enterprises. Sir Hugh proceeded as far as the latitude of 75 degrees, as it is imagined, within sight of New Greenland, now called Spitzbergen; but he was driven back by a storm, and obliged to winter in the river Arzena, in Lapland, where he, and all his company, were frozen to death. A concise account of all his discoveries he left upon his table, in which he mentions, that he failed in sight of a country of very high latitude, about which geographers are divided, some saying that it could be no other than New Greenland, since called, by the Dutch, Spitzbergen; and others, that it was only a fog bank: of this latter opinion was captain Wood, that able navigator.

Captain Burroughs succeeded Sir Hugh Willoughby; this gentleman was afterwards comptroller of the navy

to queen Elizabeth. He attempted the passage with better fortune, and returned full of hope, but without success. In 1556, he passed the north cape, and advanced as far as the 78th degree; he discovered the strait that divides Nova Zembla from the county of the Sammoys, now subject to Russia. He passed the easternmost point of that strait, and arrived at an open sea, from whence he returned, imagining he had discovered the passage so ardently desired. It is affirmed, by some people, that his discoveries extended as far as the 80th degree north latitude.

Queen Elizabeth was encouraged, by his favourable report, to fit out two stout vessels to complete the discovery. Captains Jackman and Pitt had the command of these ships, who sailed through the same strait in 1580, and entered the eastern sea. The weather became tempestuous, and the ice poured in so fast upon them, that after sustaining the most dreadful shocks, and enduring incredible hardships, they were driven back, and separated. Neither captain Pitt, nor any of his crew, were ever heard of afterwards.

The desire of visiting the Frozen Seas to the north-east began to abate among the English, after this disaster and disappointment. However, the Dutch attempted it with a great degree of perseverance. John Cornelius was the first Dutchman who failed to make discoveries in those parts; he failed in 1595, but we have a very imperfect account of his voyage. In 1606 he was followed by William Barrens, who was an able and experienced seaman and mathematician: prince Maurice supplied him with necessaries for his voyage, and he proceeded in the same course which had been pointed out by English navigators. He passed the strait before mentioned by captains Burroughs, Jackman, and Pitt; but found the like circumstances and tempests which the English had experienced. Thoroughly convinced that he should not be able to surmount these difficulties, and that he could not attain the desired purpose, he returned. In traversing the coast of Nova Zembla, he gave names to several promontories and head lands, and marked out, on paper, a new course he meant to steer in another voyage, by which he hoped to accomplish what he had now failed in discovering, and what those had also failed in who went before him.

William Barrens was rather animated than discouraged by disappointment, and in 1607 entered upon a second voyage, with a spirit fully prepossessed with success. He was informed, that some of the whalers, who now began to frequent the north seas, had, either by accident or design, advanced much further to the northward than any of those ships that had

had been sent on discoveries. He therefore determined to steer to the northward of Nova Zembla, till he should arrive at the height of the pole, under which, he was fully persuaded, he should find an open sea; and avoid those obstructions, by changing his course to the southward, which had retarded his passage to the north-east.

Till he arrived on the coast of Nova Zembla, he continued in this hope; but before he had reached the 77th degree, he was so attacked by the mountains of ice, and not being able to withstand their fury, his ship was dashed to pieces. William Barrens, and part of his crew, got safe to land, but it was only to endure greater hardships, and share a much worse fate than those who immediately perished. They were obliged to winter in a country where no living creature subsisted besides themselves. In this miserable place, the flesh perished from the bones of some of them; and others died of the most excruciating pains, notwithstanding they used their utmost efforts to preserve their bodies from the cold.

Some of the crew, who yet survived, had still the fortitude and ingenuity to frame a pinnace from the wreck of their broken ship, notwithstanding the extreme anguish they endured. Having completed this vessel, when summer approached, they set sail in her for Lapland, but before they arrived there, the captain died, and with him the hopes of perfecting his discovery.

Notwithstanding the relation of these hardships, this was the active season for naval enterprizes. Ships for the north seas were now fitted out by private adventurers; they were allured to it by the desire of gain, as they were informed that innumerable sea-animals were observed to bask upon the ice, the tusks of whose jaws were found to excel the finest ivory in whiteness, and their carcases yielded plenty of excellent oil. These were pursued with the same eagerness in the infancy of the whale fishery, as that extensive and profitable trade is now carried on both by the English and Dutch. Many islands were discovered; to which these ships resorted, and in course of time, by following them, the seas that were formerly so formidable, became frequented by every nation at the proper seasons of the year.

The hopes of finding a passage to the north-east were not now so sanguine as those of a north-west passage, and it was not till many unsuccessful trials to discover the latter, that the former was again attempted. Hudson, who is so celebrated for discovering the straits that lead to the great western bay, which still bears his name, after he had exerted his skill in vain to find a passage westward, was persuaded to undertake a voyage of discovery to the north-east. In 1610 he failed on this plan, but was discouraged by the miscarriages of others, and the fatal issue that attended their obstinate perseverance; and more so when he saw the face of the country, examined the currents, and traversed an immense continent of ice. He concluded that no passage was practicable, which was all the discovery he made.

The English totally neglected the prosecution of the discovery till the year 1676, and the Dutch whalers amused the world with wonderful relations of their near approach to the pole; yet very little credit was given to their reports, till the arrival of one John Wood, who had accompanied Sir John Narborough in his voyage to the south sea. Mr. Wood was an able and enterprising navigator, he was also an excellent mathematician and geographer. He read in the Philosophical Transactions a paper, by which the existence of a north-east passage to the Eastern Ocean was plausibly asserted. This exactly coincided with his own notions of the construction of the globe, and he was induced, by this and other reasons, to apply to King Charles the Second, for a commission to prosecute the discovery. He flattered the king that the accomplishment thereof would add to the glory of his reign, and to the wealth and prosperity of his subjects.

The king was fond of novelty, and many were about his court who hoped to share in the profits of the voyage. The king ordered the Speedwell frigate to be fitted out at his own expence, manned, victualled, and provided with every necessary. The duke of York, and seven noblemen, joined in the purchase of a pink of one hundred and twenty tons to accompany her, which was likewise manned and victualled, and supplied with such merchandize as were thought marketable on the coasts of Tartary and Japan.

Commissions were made out to the commanders of these ships, and captain Wood was appointed to direct the expedition on board the Speedwell, and captain Flaves to bear him company, on board the Prosperous.

They sailed from the Nore on the twenty-eighth of May, 1676, with the wind at south-west, and on the fourth of June cast anchor off Lerwick, in Brassey Sound, where they took in water, and recruited their stores. They continued this voyage on the tenth, and on the fifteenth entered the polar circle, where, at this season of the year, the sun never sets. The weather was hazy, and the Speedwell broke her main-top-sail-yard, which was soon repaired.

On the twenty-eighth, they found the ice joined the land of Nova Zembla, and on the twenty-ninth was quite embayed in it. At night the Russians bore down upon the Speedwell, and cried out 'Ice upon the weather-bow'; but before the Speedwell could be brought to upon the other tack, she stuck fast upon a ledge of rocks. Guns of distress were fired, but were not heard; the fog was thick, and no land could be discerned, though close to the stern of the ship. They now expected no relief but from the interposition of Providence seconding their own endeavours. Their situation was surely dreadful, and no description could equal it. Captain Wood, in the language of the times, has given us the following full and pathetic account.

"Here we lay beating upon the rock in a most frightful manner, for the space of three or four hours, using all possible means to save the ship, but in vain; for it blew so hard, that it was wholly out of our power to carry out an anchor capable to do us any service. At length we saw land close under our stern, to the great amazement of us all, which before we could not see for the foggy weather; so I commanded the men to get out the boats before our mast came by the board, which was done. I sent the boatwain towards the shore in the pinnace, to see if there was any possibility of landing, which I much feared, because the sea ran so high. In half an hour he returned with this answer, that it was impossible to land a man, the snow being in such high cliffs that the shore was inaccessible. This was bad tidings, so that it was high time to think on the safety of our souls, and we went all together to prayers, to beseech God to have mercy on us, for now nothing but inevitable ruin appeared before our eyes. After prayers, the weather cleared up a little, and looking over the stern, I saw a small beach directly with the stern of the ship, where I thought there might be some chance of getting ashore. I therefore sent off the pinnace a second time, with some men in her to be first landed, but she durst not venture to attempt the beach. I then ordered out the long boat, with twenty-four men, to land, who attempted it, and got safe on shore. Those in the pinnace seeing that, followed, and landed their men likewise, and both vessels returned to the ship without any accident. The men on shore desired some fire-arms and ammunition, for there were many bears in sight. I therefore ordered two barrels of powder, some small arms, some provisions, with my own papers and money, to be put on board the pinnace; but as she put off from the ship's side, a sea overset her, so that all was lost, with the life of one man; and several others taken up for dead. The pinnace likewise was dashed to pieces, to our great sorrow; as by that disaster, one means of escaping from this dismal country, in case the Prosperous deserted us, was cut off. The long boat being on board,

board, and the sea running high, the boatswain and some others would compel me and the lieutenant to leave the ship, saying it was impossible for her to live long in the sea, and that they had rather be drowned than I should; but desiring me, when I came ashore, if possible, to send the boat again for them. Before we got half way to shore, the ship overfet, so making all possible haste to land the men we had on board, I went off to the ship again, to save those poor men who had been so kind to me before. With great hazard I got to the quarter of the ship, and they came down the ladder into the boat; only one man was left behind for dead, who had before been cast away in the pinnace; so I returned to the shore, though very wet and cold. We then hauled up the boat, and went up the land about a flight shot, where our men were making a fire, and a tent with canvass and oars, which we had saved for that purpose, in which we all lay that night, wet and weary. The next morning, the man we left aboard having recovered, got upon the mizen-mast, and prayed to be taken ashore, but it blew so hard, and the sea ran so high, that though he was a very skilful sailor, none would venture to bring him off.

“ The weather continuing to blow with extreme fogs, and with frost and snow, and all the ill compacted weather that could be imagined put together, we built more tents to preserve ourselves; and the ship breaking in pieces, came all ashore to the same place where we landed, which served us for shelter and firing. Besides, there came to us some hog-heads of flour and brandy in good store, which was no little comfort in our great extremity. We now lay between hope and despair, praying for fair weather, that captain Flawes might find us, which it was impossible for him ever to do while the weather continued foggy; but fearing at the same time that he might be cast away as well as we.

“ But, supposing we never were to see him again, I was resolved to try the utmost to save as many as I could in the long boat. In order thereunto, we raised her two feet, and laid a deck upon her, to keep the sea out as much as possible; and with this boat and thirty men, for she would carry no more, I intended to row, and sail to Russia; but the crew not being satisfied who should be the men, began to be very unruly, both in their mind and behaviour; every one having as much reason to save himself as another, some holding consultation to save the boat, and all to run the like fortune; but here brandy was our best friend, for it kept the men always fixed, so that in all their designs I could prevent them. Some were in the mind to go by land, but that I knew as impossible to any man, neither had we provisions, nor ammunition to defend us from the wild beasts; so the passage by land being impracticable, and no passage by sea to be attempted till forty men were destroyed, I will leave it to the consideration of any, whether we were not in a most deplorable condition, without the interposition of divine Providence.

“ The weather continued still very bad, with fogs, snow, rain, and frost, till the ninth day of our being on shore, which was the eighth day of July, when in the morning it cleared up, and to our great joy one of our people cried out, ‘ A sail,’ which proved to be captain Flawes; we set fire to our town, that he might see where we were, which he presently discovered, so came up and sent his boat to us; but before I went off, I wrote a brief relation of the intention of the voyage, with the accident that had befallen us, and put it into a glass bottle, and left it in the fortification I had there built; so by twelve o’clock we all got safe on board, but left all on shore that we had saved from the ship; for we much feared that it would prove foggy again, and that we should be driven once more on this miserable country; a country for the most part perpetually covered with snow; and what is bare being like bogs, on whose surface grows a kind of moss, bearing a blew and yellow flower, the whole product of the earth in this desolate region. Under

the surface, about two feet deep, we came to a firm body of ice, a thing never heard of before; and against the ice cliffs, which are as high as either of the forelands in Kent, the sea has washed underneath, and the arch overhanging, most fearful to behold, supports mountains of snow, which I believe hath lain there ever since the creation.”

This is captain Wood’s account of the dangers which he and his crew were exposed to. He adds, it may be affirmed with certainty, by the tide’s setting directly in upon the shore, that there is no passage to the northward. He relates one thing very remarkable, which we shall mention, though it contradicts the reports of other navigators. He says, that the sea is there salter than any where else that he had tasted, and the clearest in the world; for he could see the shells at the bottom, notwithstanding its depth, which is at least four hundred and eighty fathom.

They were now happily embarked on board the Prosperous on the ninth of July, and they steered directly for England: they arrived safe in the Thames on the twenty-third of the ensuing month, without the intervention of any remarkable accident.

The most experienced navigators in England seemed to agree, after the miscarriage of this voyage, that a passage by the north, or north-east, had no existence. We shall at present wave this disputed point. Captain Wood pronounced, from his own experience, that all the Dutch relations were forgeries, which asserted that any man had ever been under the pole, and believed verily, that if there was no land to the northward of eighty degrees, that the sea is there frozen, and always continues so. He grounded his opinion upon this remark, that if the body of ice which he saw were to be removed ten degrees further northward, many centuries would elapse before it could be melted.

The testimony of many credible persons, however, may be opposed to this assertion; some of whom have sailed beyond the eightieth degree of north latitude; and others upon evidence, whose veracity there is no reason to question.

We will give the reader the testimony of Mr. Joseph Moxon, member of the Royal Society of London, which must have considerable weight. He gives us the following relation, in a paper which he caused to be printed in the Philosophical Transactions.

“ Being about twenty years ago in Amsterdam, I went into a public-house to drink a cup of beer for my thirst; and sitting by the public fire among several people, there happened a seaman to come in, who seeing a friend of his there, who he knew went the Greenland voyages, wondered to see him, because it was not yet time for the Greenland fleet to come home, and asked him what accident had brought him home so soon? His friend (who was the steersman) answered, that their ships went out not to fish, but only to take in the lading of the fleet, to bring it to an early market. But, said he, before the fleet had caught fish enough to lade us, we, by order of the Greenland company, sailed to the north pole, and came back again. Wherefore, says Moxon, I entered into discourse with him, and seemed to question the truth of what he said; but he did assure me it was true, and that the ship was then in Amsterdam, and many of the seamen belonging to her, ready to justify the truth of it; and told me, moreover, that they had sailed two degrees beyond the north pole. I asked him if they found no land nor island about the place? He answered, ‘ No; there was a free and open sea.’ I asked him if they did not meet with a great deal of ice? He told me, ‘ No; they saw no ice about the pole.’ I asked him what weather they had there? He told me, fine warm weather, such as they had at Amsterdam in the summer time, and as hot. I should have asked him more questions, but that he was engaged in discourse with his friend, and I could not in modesty interrupt them longer. But I believe the steersman spoke truth, for he seemed a plain, honest, and unaffectatious

unaffected person, and one who could have no design upon me."

In proof of the authenticity of this relation, it has been observed, that in June, the sun being twenty-three degrees high, and having little or no depression towards the horizon, might invigorate that part of the hemisphere with more heat than he does our climate; when he is in the winter, no more than 15 degrees at the highest, and but eight hours above the horizon, in which space the earth has time to cool, and loses in the night the influence of heat which it receives in the day.

Captain Gulden made another report, upon like evidence, to King Charles the Second. The captain was in the Greenland whale trade, and spoke with two Hollanders in the North Seas, that had sailed within one degree of the pole, where they met with a hollow green sea, like that of the Bay of Biscay, and did not see any ice.

In the year 1670, an application was made to the States General, for a charter to incorporate a company of merchants to trade to Japan and China by a new passage to the north-east. The East-India Company in Holland at that time opposed it, and that so effectually, that the estates refused to grant the request of the merchants.

The voyage to Japan, by the way of Greenland, was

at that time talked of in Holland as a matter of no difficulty, and it was publicly asserted and believed, that several Dutch ships had actually made it. The verification of this fact was required of the merchants, they desired that the journals of the Greenland squadron of 1665 might be produced. There was notice taken of a ship in seven of those journals, which that year had sailed as high as latitude eighty-nine; and in three journals of the same ship agreed as to one observation taken by the master, August 1, 1655, in eighty-eight degrees 56 minutes, north latitude.

Captain Hudson's is an incontestable proof, who sailed in 1607, to the latitude of eighty-one degrees thirty minutes north, where he arrived on the sixteenth of July, the weather being then pretty warm.

Since the time of captain Wood's sailing in search of this passage, till that of Lord Mulgrave's and captain Lutwyche's voyages (an account of which will immediately follow), it does not appear, that any adventures have been made by the English, either public or private, on those discoveries.

The following journal of the voyage is collected from the best information, communicated to the author of this work. Every thing remarkable is related, and all nautical phrases and technical terms are avoided as much as possible.

AN AUTHENTIC NARRATIVE

OF THE RIGHT HONOURABLE LORD MULGRAVE'S EXPEDITION,

For the Discovery of a Passage to the NORTH POLE.

WE confess ourselves under infinite obligations to the several voyagers, who have favoured us with their proceedings and discoveries; and particularly so, to the Right Honourable Lord Mulgrave, who undertook a voyage to the north-east passage in one of his Majesty's ships, called the *Racehorse*, in company with captain Lutwyche, who commanded another, called the *Carcase*. His lordship's abilities, both as a statesman, a Lord of the Admiralty, and a seaman, are too well known to need any panegyric from our pen; and indeed, were they not so generally known, the distinguished nature of them would exceed all that we can say in their praise.

His lordship made signal to weigh on the third of June, 1773, and all things being in readiness for that purpose, the men had their bounty money in consequence of the royal proclamation for that purpose. The captain obtained leave to land some of his guns and men on shore, as his ship was judged too deep to navigate those heavy seas through which they intended to pass.

They were off Sheerness on Friday the fourth, and continued their voyage till the fifteenth, without any material occurrence; his lordship then made signal to lie to. Here they purchased some fish of some boats which came from Shetland; his Majesty's ships *Racehorse* and *Carcase* were then off *Brassay* island.

They sailed again on the seventeenth, but the day following the fog was so thick, that the hemisphere was almost totally dark. His lordship kept firing guns and beating drums during the continuance of the fog, to prevent the captain from losing company. This was found to be very necessary, as they could not see each other at a ship's length; and it was as requisite to repeat those signals, lest they should run foul of each other, as well as to prevent their parting company.

The next morning early the fog was dissipated, and

they steered to the north-east; on this day they perceived a sail to the north-east, which his lordship brought to and spoke with. The weather was hazy, and the wind variable; the captain lost his main-top-mast studding sail yard, which was very soon supplied.

They delivered out the cloathing allowed by government to the officers and men on the eighteenth, and they all received their full proportion.

They pursued their course to the eastward on the twentieth. They were now within the polar circle, and had an observation of the sun at midnight; their latitude was 66 deg. 52 min. north. Upon sounding, they found no bottom; they sounded with a line of seven hundred and eighty fathom, and with a lead of one hundred weight, to which was fastened a thermometer of Lord George Cavendish's construction. At that depth the water was eleven degrees colder than on the surface.

They observed a whale on the north-east quarter, on the twenty-first instant. The weather now set in severe, the nights were cold and the days cloudy. They observed a whaling snow with *Hamburg* colours flying, which they brought to; and as he happened to be homeward bound, a gentleman of fortune who had embarked with his lordship, with a view to prosecute the voyage, being unable to endure the sea sickness, and finding nothing but foul weather and heavy seas to gratify his curiosity, he took passage on board the *Hamburg*, in order to return home. He took leave of his friends, wished them a successful voyage, and his Majesty's ships pursued their voyage.

The weather now began to be most piercing, they had reached the 70th degree of north latitude, in a course nearly north, being only fourteen minutes to the eastward of London. To this day, which was the twenty-second, they had seen nothing remarkable,

nor

nor had any accident befallen them, which was not instantly repaired. They saw a large ship to the north-east, but did not bring her to, as they did not want any information that she could give.

The next day they heard guns fire at a distance, but saw no ship, nor any other object. There are not many whales here, and but few ships in pursuit of them; at this season they generally frequent the bays and creeks near the shore, and only break away when they are wounded or pursued.

His lordship and the captain changed their course on the twenty-fourth, to the east north-east, and served out to the ship's company plenty of mustard, pepper, and vinegar, &c. The weather continued extremely cold, and the wind variable. The vicissitudes of heat and cold are in this climate more frequent than in more southerly latitudes; it very often changes suddenly from temperate to extreme cold.

The ice likewise appears to change its place frequently in this latitude. The navigators found much wood floating about the ships, and saw great flocks of birds.

They came in sight of land on the twenty-ninth, when the ships brought to, and the commanders held a consultation about their future course. They spoke with the Marquis of Rockingham Greenlandman, the captain of which presented each of the commanders with a deer and a half, which they found well flavoured venison, though not very fat. It was an acceptable present. The captain of the Greenlandman informed our commander, that he had just come from the ice, and that the day before three whales had been crushed to pieces by its closing upon them suddenly.

At three in the morning of July the first, they made Charles's island, and at nine saw a sail to the westward whaling. On the second of July, they lay to and took the height of a mountain, which they called Mount Parnassus, and found it to be three thousand nine hundred and sixty feet high from the level of the sea; it was covered with snow, and resembled at a distance an ancient building with something like a turret at the top. The foot of this mountain, with those of the hills adjoining, have frequently a very fine appearance; and the ice and snow on their sides, resembling trees and shrubs, glisten with a brilliancy that exceeds the splendor of the brightest gems. When this happens, it generally prognosticates a storm. They shot some sea fowl here, but they had an oily taste.

On the next day they spoke with a Hollander, who foretold, that they would make no further progress this season, than a degree or two farther north. They anchored in fifteen fathom water, having doubled Cape Cold; they sent their boats ashore for water, which they found in abundance.

On the fifth, each of the ships kept firing signals. They heard a dreadful crackling at a distance, which was the dashing and grinding loose pieces of ice against each other.

The islands of ice began to appear on the sixth instant; the weather was foggy and the breezes slight; his lordship hauled up from a large body of packed ice, and the fog thickening, both ships kept firing volleys of small arms, that they might not part company. The extremes of the ice stretching from north-west to east-north-east, his lordship bore away, and at half past twelve at night lost sight of it. Early in the morning, they finding a violent surf to the south-east; tacked and stood to the westward. As the morning advanced the fog thickened, and they were obliged to fire volleys of small arms continually. At six in the morning they saw the ice stretching from east by south to north-east, and at seven they came within sight of land.

They were beset with the loose ice on the seventh, which increasing continually, gave them a great deal of trouble. They found it difficult to steer any course, for the ice came so thick upon them, as to whirl the ship about.

Both ships were entangled in the ice on the eighth, and the captain's was driven to leeward; he hoisted out her long boat to tow up with his lordship, but the boat could not live as the ice closed so fast. Orders were then given to tack and stand to the southward, but the ice prevented the ships making head; they were therefore under the necessity of applying to their ice anchors and poles, in order to warp through it. The ice began to open in the evening, and they again hoisted out their boats; with much difficulty they towed the ship round a cape of ice which projected from the main body, and at last got quite clear. The boats were hoisted on board again. In this difficult undertaking, his lordship snapt her best bower anchor, and the captain lost his starboard bumpkin and head rails.

It is very often the case, that ships beset among the ice as these were, perish, by being dashed to pieces against the solid ice, or crushed by the broken pieces which crowd upon each other, and sometimes rise so fast about the ship, as to exceed the height of her sides, and then there is no possibility of escaping. Some experienced seamen told them, that the ice sometimes rises out of the sea as high as mountains, and that several of these mountains by striking together, join and form those islands of ice that are frequently met with in the lower latitudes, the wind and tide driving them down the sea.

The loose ice is however the most dangerous. The whalers often moor their ships to the solid ice, and thence find the best fishing. In such situations it often happens, that little or no loose ice is to be seen; yet upon a change of wind, it pours upon them so suddenly, that they frequently perish in it.

These solid fields of ice, if we may so call them, are often rent asunder by the raging billows, and in breaking, they produce the most terrifying noise in nature.

The ships lost sight of each other on the ninth, but joined company the next morning. The people had an additional quantity of porter and brandy allowed them, as the weather was now piercing cold indeed. Each man was allowed daily a pint of brandy and two quarts of porter.

They perceived several whales among numberless pieces of ice on the tenth of July, but no whalers in pursuit of them. They now found it impossible to continue their course, as the ice became solid and compact. As they could not discover a passage to the North Pole in that direction, they hauled close to the wind, and steered a great number of different courses in order to follow the channels. The sailors were almost worn out with turning and winding; and though they used the greatest precaution in working through the narrows, yet they could not always avoid striking against the mountains with which they were on all sides nearly surrounded.

They sailed along the main body, having worked out of the ice on the eleventh instant. This immense quantity of ice extended to the north-east, as far as they could see from the mast head, and most probably was a continuation of that which they before engaged. The sea was now tolerably clear, and they saw the land about half past one in the morning.

On the twelfth they founded in fifteen fathom water, and found a rocky bottom. They saw several English and Dutch Greenlanders at anchor in the Norways; here they rendezvoused, not chusing to proceed further northward. His lordship made sail, and the captain followed him.

A strong easterly current set in on the thirteenth; at eight in the evening they came to with their stream anchors and haulers in forty fathoms water. They weighed again and anchored in Smearinburgh harbour, where they remained five or six days to take in fresh water.

As far as this country can be seen, it is full of mountains, precipices, and rocks. The ice appears to be generated between these hills, by the torrents that flow from the melting snow on the sides of those
towering

towering elevations. There are seven ice hills, which more particularly attract notice; they are called the Seven Icebergs, and are supposed to be the highest of the kind in that country. When the sun shines upon these mountains, and the air is clear, the prospect is inconceivably brilliant.

This harbour was first discovered by the Dutch, where they erected sheds and conveniences for boiling the fat of whales; here also they built a village, and endeavoured to establish a colony; but the first settlers all died the ensuing winter. The remains of the village, implements, &c. are still to be seen. The Russians lately attempted the same thing, but they also miscarried.

These rocks are very striking objects, and exhibit a fiery appearance before a storm. Their summits are always involved in clouds. Some of the rocks are but one stone from bottom to top, and appear like an old decayed ruin. Others consist of huge masses, differently veined, and, perhaps, if they were sawed and polished, would produce admirable marble. On the southerly and westerly sides of these rocks, grow all sorts of plants, herbs, and mosses peculiar to this country; on the northerly and easterly sides the wind strikes so cold, that it destroys every kind of vegetable. Till the middle of May, the whole country is locked up in ice; the plants are in flower in the beginning of July, and perfect their seed about the beginning of August. The dung of birds is the chief manure; they build and breed here in the summer, and in the winter take their flight to warmer climes.

Scurvy-grass and crows-foot are the most common plants in Spitsbergen; there are, besides, small house-leek, and a plant with blue leaves; an herb like stone-crop, some small snake-weed, mouse-ear, wood-strawberry, perriwinckle, and a herb peculiar to the country, which they call the rock plant.

Convenient harbour is afforded by the rocks and precipices for the birds to lay their eggs, and breed their young in safety. They are mostly water fowl, which subsist upon the food which the sea produces; though some few of them are birds of prey. They are altogether so numerous about the rocks, that they darken the air, when they rise in flocks, and make a most terrible screaming noise.

Here are a few ice birds, which are very small and beautiful. They are like turtle doves, but the plumage, when the sun shines upon it, is of a bright yellow, like the golden ring in the peacock's tail.

In this forlorn country are white bears, deer, and foxes. It is hardly to be conceived how they subsist in winter, when the whole earth is covered with snow, and the sea locked up with ice. It has been asserted, that when the sea is frozen over, they travel southerly to the warmer climates, where there is abundance of proper food for them. But another difficulty arises, when it is considered how far it is from Spitsbergen to the nearest parts of the continent; for how are they to subsist in so long a journey?

The bear is the best accommodated for this climate. He hunts for his prey, both in land and water: in summer he finds plenty of provision from the refuse of the whales, sea horses, and seals, which are thrown into the sea by the whalers, and cover the shores during the time of whaling. They likewise smell out the carcases of the dead, be they ever so deeply buried. It is still a question, how they subsisted before the whale fishery had existence, and before men found the way to this shore? As these disquisitions are beyond the reach of human finite comprehension, they only serve to raise admiring thoughts of the Deity, to whom nothing is impossible.

The bears which inhabit this country differ only in their colour from those seen in England, and, consequently, need no description. The foxes are black, and their bellies white, and differ little in shape from those with which we are acquainted.

The Dutch seamen report, that when they are hungry, they will feign themselves dead; and when the ravenous birds come to prey upon them, they rise up, and turn the tables upon them.

How the deer can survive an eight months famine, is more wonderful than all the rest. There does not appear to be any food for them, but the vegetables which the earth produces spontaneously; and these eight months there is neither plant nor shrub of any kind. There is no bush to shelter them, and they are very thinly clothed for so severe a climate. The means of their subsistence must remain among the secrets of nature, which can never be disclosed; for their winter residence cannot be traced, as no human being can live here in that season.

The sounds and bays of Spitsbergen abound with amphibious animals, which seem best adapted to endure the climate. There are sea horses and seals, of which the whalers avail themselves, when there is any deficiency in their lading, with the fat of whales.

It is not easy to say how the sea horse came by his name, for he bears no similitude to a land horse. His head is large and round, larger than that of a bull, and shaped about the ears like a pug dog. He is taper all the way down to the tail, and he is as big as a large ox. His tusks are close over his under jaw, like those of an old boar, and are from one to two feet long. His skin is thicker than that of a bull, and is covered with short mouse-coloured hair. His paws are like those of a mole, which serve him both to swim and walk with. Though he is a fierce animal, he is easily overcome on account of his unwieldy size. These creatures are always found in large numbers, and, when any are attacked, they make a common cause of it, and protect each other till the last gasp. They fight desperately, when attacked in the water, and will even attempt the boats of their pursuers, if any of them are wounded. They have been known to make holes in the bottom of the boats with their tusks, in defence of their young. They have large eyes, and two holes in the upper part of the neck, out of which they eject water as the whales do.

The seal is too well known to be described.

The sea here abounds with fish, but they seem rather designed, by Providence, for the sustenance of one another, than for the food of man, which appears to be very wisely ordered, as there are no inhabitants to eat them. However, the mackarel, of which here are no great numbers, seem wholesome, palatable, and beautiful, and appear to be of a different species to those caught on our coast. The upper part of the back is of a vivid blue; the other parts, below the belly, are like green on an azure ground. The colour is a transparent white under the belly, and the fins shine like polished silver. Fancy can hardly form any thing in nature more beautiful than their appearance, when alive in the sea. Almost all the other fish in these parts are of a disagreeable oily flavour.

The sword-fish takes his name from a broad flat bone, from two to four feet long, which projects from his nose, and tapers to a point. He is remarkable, not only from the oddity of his shape, but for his animosity to the whale. On each side of this flat bone, there are teeth, like those of a comb, at about a finger's breadth asunder. He is very strong in the water, and is furnished with a double row of fins. His length is from ten to twenty feet. War is his profession, for which he seems to be formed. When the whale and the sword-fish conflict together, the fight is dreadful; and the latter never gives over till his sword is broken, or he comes off victorious.

The whale is never known to fight but in his own defence, yet, when he is exasperated, he rages violently. Though he may be stiled the sovereign of the seas, yet, like other monarchs, he is liable to be vexed and hurt by many of his subjects. One of his most tormenting enemies is what is called the whale's louse, which fixes on the tenderest parts of the

Engraved for Moore's New & Complete Collection of Voyages & Travels.

Curious Prospect of an ICEBERG in the ISLAND of SPITSBERGEN.

the whale's body, between his fins, on his sheath, and on his lips, and eats pieces out of his flesh.

The ships were supplied with water from the rills caused by the rain, and melting of the snow; for they found no springs of fresh water in Spitzbergen. Of this water the whaling people have drank for ages, and have found no ill effects from the use of it; though some people think it unwholesome. Good fresh water is also produced from the ice taken out of the sea, and thawed.

It was remarked in this place, that the sea was uncommonly still and smooth; that it was not soon moved at the first approach of blowing weather, but, after the storm had lasted some time, the waves gradually swelled, and rose to a considerable height. These swelling waves roll before the wind, and rage in a frightful manner; yet they are not thought very dangerous.

The ice here changed its place, and they were informed, that, in some seasons, there was no ice, where, at present, they were in danger of being embayed. It does not appear, however, that any practicable navigation to the Indian ocean can ever be found in this direction; for were it certain, that the seas were always open under the pole, yet great bulwarks of ice evidently surround it. Should chance direct some fortunate adventurer to an opening at one time, he, perhaps, would be the only one; for the odds would be very much against the same opening being passable to the next who should undertake so hazardous an enterprise.

Besides the harbour of Smearingberg, there are many others about Spitzbergen, where the ships, which are employed in the whale fishery, take shelter in stormy weather; and there are many islands which serve as land-marks, by which the seamen direct their course. Many birds build in these islands, and their eggs are numerous.

This country is so cold, that the air is never free from icicles. If you look through the sun beams transversely, as you sit in the shade, myriads of shining particles are perceived; and when the sun shines hot, as it sometimes does, so as to melt the tar in the seams of ships, when they lie sheltered from the wind, these shining atoms appear to melt away, and they descend like dew.

In clear weather, which seldom lasts long in this climate, the whalers are generally successful. Night and day are here equally light. The fogs come on so suddenly, that from bright sunshine, you are soon involved in almost total obscurity.

All things being in readiness, the ships prepared to depart. His lordship made signal to weigh on the nineteenth of July; and soon after they sailed, were entangled in the ice: they continued their course along the ice, but could discover no opening. The severity of the weather increased, and an additional quantity of brandy was given to the sailors.

On the twenty-fifth they were in great danger of being inclosed in the ice. His lordship changed his course with a strong gale to the eastward.

They came in sight of Red Hill on the morning of the twenty-sixth: this is a small mount, which commands the plain, known by the name of Deer's-field, because of its fertile appearance; as it was the only spot on which they saw no cluster of snow. Muffin's island lies eastward. Here they founded, and found rocky ground, and forty-five fathom water. The captain sent out his long boat, with orders to sound along the shore, and examine the soil. Muffin's island is about a mile long, very low, and looks at a distance like a black speck. The soil is mostly sand and loose stones, and hardly a green weed is to be seen upon it. The numbers of various kinds of birds, which resort here and lay their eggs, is astonishing, insomuch that the sailors, who landed, found it difficult to walk without filling their shoes.

A droll circumstance happened to the crew of the long boat, which the captain had sent out. They

had a valiant officer at their head, whom we shall call major Sturgeon. After having founded the shores, they observed two white bears making towards them, one in the water, and the other on the ice. Major Sturgeon was always the boldest man in company, over a bottle of wine, and would as soon kill a bear as a gnat; but seeing the bears approach very fast, especially that in the water, he ordered his men to fire, while the enemy was at a distance. They all pointed their muskets, and some of them obeyed orders; but the greater part judged it safer to depend upon a reserved fire, and pretended to retreat. The major was a full fathom in the belly; he waddled after his companions, but was soon out of breath. The bear just reached the shore, and he thought of nothing but falling the first sacrifice. His hair stood upright, when he looked behind, and saw the bear, with his nose in the air, snuffing the scent. He fancied that the bear scented him, and had scarce breath enough left to call his men to halt. Thus critically situated, he dropt his gun, and, in stooping to recover it, fell into a goose nest, and had nearly smothered the dam upon her eggs. Misfortunes seldom come alone: before the major could well recover his legs, the enraged gander came flying to the assistance of his half-smothered consort, and made a dart at the major's face. The battle was now serious, and the engagement pressing; the bear was near, and the gander ready for a second attack. The men, who had not fled far, thought it high time to return to the relief of their leader. The major was overjoyed to see them; but, frightened at the bear behind him, he had forgot the gander that was over his head, which one of the men fired at and killed. The major, animated by the death of one enemy, recovered his gun, and assisted in attacking the second. The bear began to growl; the major was seized with a looseness, dropt his accoutrements, and fell back; he at last filled his breeches. The crew shot the bear, and the major now thought it high time to do something great. He saw the poor beast lying on the ground, and growling out his last; he then came with several long strides, and the fierceness of an enraged bull, and thrust his sword into the dying bear's belly; and now, said he, have not I done for the bear bravely? The sailors said, he had but half done his work, for there was another bear to kill yet. The major's situation began to be troublesome, partly on occasion of the additional contents in his breeches: he was therefore satisfied with the honour he had already acquired, and said, My lads, as I have been the death of one bear, sure six of you may kill the other. He therefore left six on shore, to kill the bear, and took four men with him, to row him on board. They killed two bears and a sea horse on this island.

On the twenty-seventh of July, the air was serene, and the weather moderate; they saw many whales and dolphins sporting in the water, and the ice appeared beautiful. They were now in latitude 80 deg. 47 min. north, and in longitude 21 deg. 10 min. east from London. They directed their course to seven islands, which they had in sight.

The weather changed the next day to piercing cold. They were now in the very place where Barentz supposed an opening would be found into the polar sea. They could only discover a continued mass of ice, except those islands just mentioned. Several bears came upon the ice, near the ships, and some of them were shot. Where no better food is to be got, the flesh of these bears are esteemed as good as beef: many of these are bigger and heavier than the largest oxen; they killed some which weighed near eight hundred weight.

As they found the ships could make no impression upon the ice, his lordship sent a party, under the command of the first lieutenant, to examine the land, which appeared like a plain at a distance, diversified with mountains and hills, and exhibited a pleasing landscape.

The weather being clear, on the thirtieth they ran close to the main body of the ice. On the thirty-first, a bear came to visit them on the ice; they saluted him with a volley of small arms, and he returned the compliment by turning his back.

They laid to among the ice on the first of August, with the loose ice driving fast to the shore. Lord Mulgrave was desirous of surveying the westernmost of the Seven Islands, from whence he hoped to judge of the possibility of proceeding farther on the discovery. With their ice anchors, they fastened their ships to the main body. The reconnoitring party consisted of the captains, the second lieutenants, one of the mathematicians, the pilots, and some chosen sailors. They sometimes sailed, and sometimes drew their boats over the ice, and with difficulty reached the shore. The first object that presented itself was a herd of deer, so very tame, that they seemed as desirous to gaze at the strangers as the strangers were to gaze at them: they came so near, that they might have been killed with the thrust of a bayonet. This is a sufficient proof that animals are not afraid of man, till they are taught the danger of approaching him by the fate of their associates. It is likewise a proof that animals are not destitute of reflexion, otherwise they could not conclude that what had happened to others, will do so to themselves if they run the same risque. Only one of these innocent animals was killed, and that was done by a sailor, while the gentlemen were upon their observations. The hills were covered with verdure, on which the deer undoubtedly fed. On this island they gathered some scurvy-grass.

The gentlemen returned to the ships, without being able satisfactorily to find out what they wanted; which was owing to the haziness of the weather on the tops of the mountains, which confined the prospect.

They discovered, too late, that by grappling the ships to the ice, they had endangered the loss of them; the loose ice closed so fast about them, that they found it absolutely impossible to get them disengaged. On the most alarming occasions, great minds are always most distinguished by their expedients. His lordship set all hands to work, to form a dock in the solid ice, large enough to moor both the ships. This arduous service was accomplished, and the ships were thus preserved from the danger of immediate destruction.

A consultation was then held about their future proceedings; they unanimously agreed that their deliverance was hopeless; that they must either provide to winter in the adjacent islands, or attempt to launch their boats into the open sea, which was at a considerable distance. The men were ordered to their quarters to refresh themselves, before any thing farther was undertaken.

The sailors never lose their courage when their commanders preserve theirs. They rose in the morning as unconcerned as if they had been sailing in the British Channel with a fine breeze.

A desperate attempt was resolved on, in order to extricate the ships, by cutting a channel to the westward into the open sea. What they had lately performed with so much spirit and alacrity, convinced them what difficulties might be overcome, if they determined to combat them. They undertook this work with amazing cheerfulness, and confidence of success. All their implements were instantly employed in facilitating this work; but, after cutting through blocks of ice of an astonishing thickness, they came to others that exceeded the power of any human strength to separate; their hopeless project was therefore laid aside, and another was adopted in its room, which, though more promising, was less laborious.

The boats of both the ships were ordered to be fitted up, on the third of August, with such coverings as were most easy to be accommodated, and of lightest conveyance; those were to be drawn over the ice, and launched in the open sea. This was determined on, in order, if possible, to attain the northernmost harbour of Spitzbergen, and they hoped to arrive there

before the departure of the last ships belonging to the European fisheries.

Whilst this expedition was preparing, another party was dispatched to the island, to take, if possible, the distance to the nearest open sea; and the people who were unemployed, amused themselves with hunting and killing bears. These creatures being attracted by the savory smell of the provisions dressed on board the ships, paid them daily visits over the ice. They killed several of these, and one of the lieutenants displayed his courage in a rencounter with a sea-horse; the lieutenant's life was in imminent danger, though at last he was victorious.

The reconnoitring party returned with the intelligence, that the nearest water was about ten leagues to the westward. The ice still surrounded both the ships, and appeared to grow more solid; those who had conceived hopes that the south-east wind would open a passage for them, were now quite dispirited; for the wind had blown from that quarter for twenty-four hours, and no favourable alteration was perceived. Notwithstanding this, the people in general appeared cheerful, and not very apprehensive of their dangerous situation.

On the fifth instant, three bears came over the ice; it is supposed they were attracted by the scent of the blubber of the sea-horse which the lieutenant killed. The men had set the blubber on fire upon the ice, and it was burning when they approached. These visitors were a she-bear and her two cubs, though the cubs had attained the size of the dam. They ran eagerly to the fire, and drew out part of the unconsumed flesh, and ate it voraciously. The ship's company threw pieces of the flesh which they had left out upon the ice, which the old bear fetched away singly, laid each lump before her cubs as she brought it, gave each of them a share, and reserved a small portion for herself. Whilst she was fetching the last piece of flesh they had to bestow, they levelled their musquets at the cubs, and killed them both; they also wounded the dam in her retreat, but not mortally. It would have drawn tears of compassion from the eyes of any but those who possessed hearts of adamant, to have observed the affectionate concern expressed by this poor beast, in the dying moments of her young. She could scarcely crawl to the place where they lay on account of the wound she had received herself, yet she carried the last lump of flesh, and tore it in pieces as she had done the others, and laid it before them. When she saw that they refused to eat, she laid her paw first upon one and then upon the other, and endeavoured to raise them up. She moaned most pitifully. When she found she could not move them, she went off, and at some distance looked back and moaned; but as they did not rise to follow her, she returned to them, and with signs of inexpressible fondness, went round them, pawing them, licking their wounds, and moaning. She found at last that they were cold and lifeless; she therefore raised her head towards the ship, and like Calabin in the tempest, growled a curse upon the murderers. The people returned the compliment with a volley of musquets; she fell between her cubs, and died licking their wounds.

It is said that the filial fondness of these animals is as remarkable as the maternal. They keep close to the old ones, and would suffer themselves to be killed rather than leave each other.

But to return to the ships. On the sixth of August, the weather was calm, but foggy, and the winds were variable; the ship inclined fast to the eastward, and they were already embayed in the middle of the Seven Islands. Another party was sent to the northernmost island, to see what discoveries could be made from the promontories there. They returned with a dismal account. They saw nothing but a vast continent of ice; and the thoughts of remaining, during the winter, in such a dreadful situation, was worse than that of perishing by instant death.

The next day the boats were brought in readiness upon the ice, fitted with weather-cloaths, thirteen inches

inches above the gunnels, in order to keep off the cold as much as possible, if they should be able to launch them into the open sea. Provisions were boiled for the intended voyage, and each man received his proportion of cloathing, provisions, and liquors.

On the eighth instant, all hands were ordered out at six in the morning, and a detachment of fifty men were appointed from each ship, to the arduous task of hauling the boats along the ice. The most gallant actions performed in war, do not so strikingly mark the true character of a sea-commander, as the readiness and alacrity with which his orders are obeyed in times of imminent danger and difficulty. Lord Mulgrave took the direction of the haulers, leaving captain Lutwyche to take care of both the ships, that if any favourable turn should happen in the disposition of the ice, he might employ the remainder of the crew to improve it.

A general order was made, previous to their departure, that no person should incumber himself with more cloaths than he wore on his back. The officers, therefore, dressed themselves in flannels, and the common men put on the cloaths which the officers had thrown off. It was droll enough to see these motley bands yoked in their new harness; and, to say the truth, there was hardly a serious face among them. The band headed by his lordship drew stoutly for the honour of their commander, and that headed by the lieutenants had their music to play to them, that they might dance it away, and keep pace with the commander in chief. All the officers were well beloved, which was proved by the steady and uniform conduct of the men in times of the greatest danger. His lordship's conduct was always calm, and his orders resolute; he was neither swayed by passion, nor disconcerted by the sudden embarrassments that often intervened.

They had only proceeded a single mile in six hours, though they exerted the utmost efforts of human labour. It was now time for them to dine, and recruit their exhausted spirits. As his lordship had laboured with them, it was also requisite that he should dine with them; and an accident happened that obliged him so to do. The cook and his master, who were bringing the commanders their dinner under covers, had made a little too free with the brandy bottle before they set out, as they feared the cold would be otherwise too much for them; and before they had got half way from the ships to the boats, the liquor began to operate. The cooks were sometimes very near boarding each other; sometimes they hauled off, sometimes they steered right a-head. At last they came to a place where the ice parted, over which they were obliged to leap; down came the master cook, with dish, meat, cover and all, and what was still worse, though it was not then thought of much value, the commodore's service of plate, which the cook carried for the officers to dine on, fell in the chasm, and instantly sunk to the bottom. The cook was brought a little to himself by this accident, and did not know whether it was most expedient to follow the plate, or to proceed to his lordship to beg mercy. He was advised to the latter by his mates, as his lordship was kind-hearted, and would never take away a man's life for a slip on the ice. Besides, they told him it was a great jump for a fat man, and that his lordship would rather lose all the plate in the great cabin than lose his cook. The cook proceeded, being comforted a little by this speech. He sent the mates on first with what remained, and to tell the story before he came. When his lordship heard the story, he judged how it was with them all. 'But, said he, Where is the cook?' 'He's crying behind, and please your lordship.' The cook made his appearance; 'Cook (said my lord) bring me your dinner; I will dine to day with my comrades.' 'My dinner! aye a pound of flesh next my heart, if your lordship likes it.' The commodore was better pleased with the promptness of the reply than with a feast upon turtle: he dismissed him with good humour, and partook with the officers in what

was left, who made up their dinners with a mess from the common men.

Soon after dinner, the pleasing intelligence was brought, that the whole body of ice had changed its situation, and was moving to the westward; that the ice was parting, and the ships were both afloat. It is not easy to conceive, much less express, the joy this news occasioned. The men shook off their harness directly, and ran to assist in working the ships, and resume their former stations.

Captain Lutwyche, during their absence, performed wonders; he was no less beloved and respected than the commander in chief. The ships were not only afloat, with their sails set, but actually cut and warped through the ice near half a mile.

This ray of hope was soon darkened; the ice suddenly assumed its former situation, and they were again closed up as fast as ever; the ships were in danger of being crushed by the closing of the channel in which they rode; they had drifted a considerable way to the eastward, the men were worn out with fatigue, and they had nothing but scenes of horror and perdition before their eyes.

The Almighty interposed in their favour in the most astonishing manner, when every hope of deliverance from their own united endeavours had deserted them. The wind blew and the ice parted, rending and cracking with a tremendous noise, surpassing that of the loudest thunder. The whole continent of ice moved together in various directions, splitting and dividing into vast bodies, and forming hills and plains of various figures and dimensions. The prospect of being once more delivered from the frozen chains of the north, made all hearts alive, and inspired the men with fresh vigour. Every soul on board laboured for life; the sails were all spread, that the ships might have the full advantage of the breeze, to force them through the channels that were already opened, and to assist them in rending the clefts that were but just cracking.

A party from both ships were dispatched to launch the boats, which was no easy task to accomplish. The ice was frozen like an island round the boats, and though it was of no great extent, yet they were hardly to be moved by the small force that could be spared to launch them. Besides this, they were at least five miles from the ships, and no channel of communication was yet opened. But the Omnipotent manifested himself also on this occasion; the island parted while the men were hauling them, and they were launched with great facility without the loss of a man.

The party with the boats rejoined them before the ships had made much more way than a mile. Several bears came posting over the ice, to be spectators of their departure, and advanced so near the ships, that they might easily have been mastered had not the men been more seriously engaged.

The ice now seemed to open as fast as it had closed before. On the tenth instant, to their great joy, Spitzbergen was seen from their mast-head. Festivity and joy took place of abstinence and gloominess; and before they arrived at Spitzbergen, there was not a sailor on board with a serious face.

As the ice no longer obstructed their course, they had now time to admire it. The various shapes in which the broken fragments appeared, were very curious and amusing. One piece described a magnificent arch, so large and completely formed, that a sloop of considerable burden might have sailed through it without lowering her mast; another represented a church, with windows, pillars, and domes; and a third, a table, with icicles hanging round it like the fringes of a damask cloth. Entertainment enough might be found here for a fertile imagination; for all that nature's art had ever produced might here be fancied.

At half past nine, in the evening of the twelfth of August, they came to anchor in their former station; where they found four Dutch Greenland-men lying in readiness to depart. These Dutchmen acquainted

lord Mulgrave that all the English fishing-ships set sail the tenth of July, which they were obliged to do by contract, in order to entitle the owner to receive the bounty-money allowed by parliament.

The greatest part of the Dutch set sail about the same time for Spitsbergen; but it is a rule with them to leave some vessels behind, to wait till the severity of the weather obliges them to depart; in order to pick up such men as may, by accident, have lost their ships upon the ice. This is a very humane institution, and deserves to be followed by every other nation, especially the English.

A tent was pitched ashore, in order to make mathematical experiments. The ovens also were taken on shore, and a large quantity of good soft bread baked for the refreshment of the men. The people were now fully employed in overhauling the rigging, tarring the ship's sides, and in preparing them for pursuing their voyage, if practicable; if not, to return home.

The enterprising spirit of the Russians manifests itself every where; perhaps the maritime powers of Europe may have reason, one day or other, to repent their emulation in contributing to aggrandize the splendor and naval power of that flourishing people. Their dominions are situated to command the trade of the universe, and they are now actually building a dock-yard for erecting ships in Kamschatka, in order to improve their discoveries from that quarter, and, if possible, to open a trade to China.

Our voyagers were told that they had attempted to settle colonies on the southermost districts of Spitsber-

gen; and those of the new settlers, who survived the rigour of the first season, were preparing to encounter that of a second. Those now sent, are said to be criminals, so that what is now done, must be by way of experiment.

The ships unmoored on the nineteenth, and on the twentieth cleared the harbour. They were again beset with ice on the twenty-second, and on the twenty-third, the captain's ship separated from his lordship. By firing repeated signals, they rejoined. On the fifth of September, the commodore sounded, and found ground at seven hundred fathoms, very soft mud. The people were employed eight hours in heaving up the lead with the captain. The ships pursued their course homeward together, with high seas and variable weather.

On the eleventh of September, a heavy storm came on, in which the ships parted company, and did not meet again till they arrived at Harwich.

As the rest of the journals of this remarkable voyage, contain only accounts of the variation of the weather, soundings, &c. which can be of no entertainment to the reader, we shall close our account of it, just remarking, that thus ended a voyage which seems to have determined the question, so much agitated, concerning the navigation to the North Pole, and seems to prove, that no passage can be found parallel in that direction.

Our next voyage will be the second of the late celebrated navigator, captain Cook, whose untimely death every true lover of his country has ample reason to deplore.

CAPTAIN COOK, IN HIS MAJESTY'S SLOOP THE RESOLUTION;

A N D B Y

CAPTAIN FURNEAUX, IN THE ADVENTURE:

Begun in the Year 1772, and concluded in the Summer of 1775.

In which are contained all the important and valuable Remarks made by Mr. FOSTER,
and other Gentlemen engaged in that Expedition to the Southern Hemisphere.

VOYAGES which have made so much noise in the world as those above alluded to, cannot be too particularly related, nor too nicely examined. Truth is most likely to be clearly ascertained, when several pens are employed in relating the same circumstances; and especially so, if the writers have no connection with each other. Two large and expensive narratives of this celebrated voyage have already made their appearance, and, like all other works submitted to the public eye, have been the subjects of much elaborate criticism. We will not pretend to say how justly the criticisms have been founded, as that is not any part of our business; there are a set of people self-appointed to this important work, so that we will rather furnish the world with another journal, communicated to the author of this work by a very intimate acquaintance, and a person of great intelligence, who sailed round the world with captain Cook, in his Majesty's ship the Resolution.

A principal advantage accruing from the following narrative, is, that the same story placed in different lights as it strikes the observer, cannot fail of being a source of fresh intelligence, or of shewing former accounts through a new medium; it is our intention to place every important incident in every view we can take of it, that our readers may be complete judges of the valuable nature of these new discoveries. The seaman will here find himself entertained with remarks peculiar to the rough element on which he has been bred and lives; and the landman will be struck with that novelty, which, of course, must be found in such an extensive voyage as this. We will, however, studiously avoid entering into tedious and uninteresting details of nautical affairs, both at sea and in harbour; such as, how often we reefed or spliced a sail in a storm; how often our vessels disobeyed their steersman, or how many times we tacked to weather a point. We shall likewise omit, as much as possible, the bearings and distances of projecting capes, hills, bays, harbours, &c. as the dull repetition of them cannot fail to tire our readers.

His present Majesty, King George the Third, being willing to obviate all the difficulties, in a matter of so much importance, as whether the unexplored part of the Southern Hemisphere is only an immense mass of water, or contains another continent; directed the following voyage to be undertaken, and committed the management and command thereof to persons in whom he placed the utmost confidence, and of whose nautical abilities he had the highest opinion. Captain Cook sailed with greater advantages in this expedition, than any of his predecessors who went out on discove-

ries; and we may venture to say, no future commander will ever have greater opportunities of pursuing a favourite line of discovery, than this able circumnavigator had. In short, he was furnished with every thing requisite for such an undertaking; he was supplied even to profusion; he had no orders to cramp him; he had assistants out of number; his stay was not even hinted at, much less was he obliged to return at any stated time, and he was left to do intirely as he pleased.

With this full and ample power and authority, captain Cook and captain Furneaux sailed from Long Reach on the tenth of May 1772; and the Resolution put into Sheerness, in order to remedy an evil which she was found subject to. They joined again in Plymouth Sound on the third of July.

On the twelfth of July, the Resolution broke from her moorings in the Sound, and was adrift together with the transport buoy to which she was fastened. All hands were on deck instantly, the cables were cleared, and the sails were spread. We passed the Adventure and came to an anchor, after escaping very apparent danger of being dashed against the rocks which are under the fort. This fortunate event was looked upon by our seamen as a favourable omen to the success of the voyage. It was, no doubt, an instance of the care of Providence, in protecting us in so critical a moment. Indeed, the whole of our voyage, as well as this circumstance, amply proved, that the divine care was absolutely necessary, in order to protect us from danger, and give us a safe return.

Both ships sailed in company on the thirteenth, and passed the Eddystone, which is a lofty and well contrived tower, and of the utmost advantage to navigation and commerce. The wind increased as we stood off shore, and the billows rolled higher and higher. Most of the seamen, both old and young, were affected by sickness.

We fell in with Cape Ortegall on the coast of Gallicia, on the twentieth. The country is hilly, and the tops of the hills are covered with wood. From the delight and fondness with which every body seemed to gaze at this land, it was easy to determine, that mankind were not designed by Providence to be amphibious animals, and of course, that our present situation was an unnatural one. The same idea seems to have occurred to Horace, when he says,

In vain did nature's wife command
Divide the waters from the land,
If daring ships and men profane
Invade th' inviolable main.

The sea now grew perfectly calm, and the prospect which surrounded us was very delightful. We were met by a small French tartan from Marseilles, freighted with flour from Ferrol and Corunna. The ship's crew begged a little fresh water, for they were quite out of that necessary article, and were obliged to subsist upon bread and a little wine. They had met several Spanish vessels, but none of them had humanity enough to supply them. Captain Cook ordered out the boat which brought their empty casks, and returned them full of fresh water. It is impossible to describe the excess of joy apparent in the countenances of these people, who were as truly thankful for this supply as mortals ever were in similar circumstances.

On the twenty-third in the afternoon, we were passed by three Spanish men of war. The sternmost of them first hoisted English colours, but hauled them down when we shewed ours; they then hoisted the Spanish ensign, and fired a gun to leeward of the Resolution. They afterwards fired a shot at the Adventure. The Spaniard put about as we kept standing on, and fired another shot just ahead of her. Both vessels brought to, and the Spaniard asked the Adventure what frigate was ahead; he was satisfied in this particular, but would not answer the same question when put to him. We were obliged to put up with this humiliating circumstance.

We anchored in Funchal road, in the island of Madeira, on the twenty-ninth of July, and the next morning saluted the garrison with eleven guns, which they returned immediately. The two commanders and some other gentlemen went ashore, and were received by the Vice Consul. We obtained leave to search the island for plants, and were supplied with every thing we wanted. It was with regret we left this place.

The only city in the island of Madeira, is Funchal, which is built round the bay, on the gentle ascent of the first hills, in form of an amphitheatre. By this means, all its buildings, whether public or private, are set off to advantage. The buildings are in general white, about two stories high, and are covered with low roofs, which give them an elegant eastern stile. There are several batteries and platforms with cannon on the sea side, and on the top of a steep black rock an old castle is situated, which commands the road. There is another castle on a neighbouring eminence. The beauty of the landscape is completed by the hills beyond the town, which are covered with plantations, vineyards, &c. and are interspersed with country houses and churches.

The internal appearance of the city of Funchal, does not answer the idea we formed of it from without. The streets are narrow, dirty, and ill paved. But few of the houses are provided with glass windows; the rest admit the light by a kind of lattice. The churches and monasteries are but ordinary buildings, and a striking want of taste is exhibited within side.

This island has seven towns. The governor is at the head of all the civil and military departments of this island of Madeira, of Porto Santo, the Salvages, and the Ilkus Desertus.

The corregidor is at the head of the law department. All causes come to him by appeal from inferior courts.

The whole regular military force of this island consists but of one hundred men; but the militia amount to three thousand, to whom there is no pay given. Yet the places communicate rank, and are therefore much sought after. The militia are only embodied once a year, and then exercised for a month.

There are about twelve hundred secular priests in this island, many of whom are employed as private tutors; for since the expulsion of the Jesuits, no regular public school is to be found on this island. The income of the bishop, dean, and chapter of Madeira, is much larger than the governor's. The four mo-

nasteries contain about seventy Franciscan friars, and the four convents about three hundred nuns.

The inhabitants of Madeira are of a tawny colour and well shaped; their feet are rather large, which may perhaps be owing to the efforts they are obliged to make in climbing the craggy mountainous parts of the country. Their eyes are dark, and their faces are oblong. The women are rather ill-favoured, and want that florid complexion, and regular set of features, by which our country women are so distinguished. Their cheek bones are prominent, and they have a very ungraceful gait; but nature has in some measure compensated for these defects, by the just proportion of their bodies; the fine form of their hands and arms, and their large lively eyes.

We left Madeira on the first of August, having got a supply of water, wine, and other necessaries. We were so much favoured by a north-east wind, that we got sight of Palma on the fourth instant, which is one of the Canary isles. These islands were known to the ancients by the name of Insulæ Fortunatæ, and were entirely forgotten in Europe, till towards the end of the fourteenth century.

We found that our stock of water would not last to the Cape of Good Hope, without putting the men to short allowance; it was therefore determined to put into St. Jago for a supply. We made the island of Bona Vita, on the morning of the ninth of August; on the next day we passed the island of Mayo, and anchored in the evening at Porto Praya, in eighteen fathoms water. Leave was granted to supply us with water. We saluted the fort with eleven guns, on a promise of its being returned with an equal number. The salute was returned only with nine, which they pretended was done by mistake; the governor made an apology to captain Cook for the omission the next day.

The island of St. Jago was discovered in 1449, and all the Cape Verd islands were discovered in that year, and that of 1460. San Jago is the greatest of them, and is about seventeen leagues in length. The capital lies in the interior parts of the country, and is the see of the bishop of all the Cape Verd islands. The island of San Jago is divided into eleven parishes, but they are thinly inhabited.

The fortifications of Porto Praya are very old and decayed; it stands on a steep rock, to which we climbed by a serpentine path. Within the walls are a small church, and a few cottages. A company of Lisbon merchants keep an agent here for the purpose of trading to all the Cape Verd islands, and they have a tolerable building at a little distance from the fort.

The inhabitants of this island are almost black, of a middle stature, and ugly, with frizzled woolly hair, and thick lips. There are very few white people among them at present. The governors and priests are taken from among the blacks in some of the islands: the women are ugly, and the children go quite naked. These people are always kept in a wretched situation, even beneath that of any community of Africa, by the despotic governors, bigoted priests, and the indolence of the Portuguese court. These people are much addicted to sloth and laziness, and they are rendered indifferent to improvement of any kind, by knowing that the attempt would only make their situation more irksome. They give themselves up to beggary, with a kind of gloomy insensibility, as this is the only state which can screen them from the rapacity of their greedy taskmasters: and as they are not benefited by their own labours, they shun it, because it only increases the treasures of others. They give themselves up to rest and sleep, which is the only method they have of solacing themselves under their wretched circumstances. Such gloomy prospects, and the difficulty of supporting a wretched existence, can be no inducements to matrimony, which must involve not only themselves, but their innocent offspring in misery irremediable. If

another circumstance is taken into consideration, that the dry soil depends, for its fertility, on the stated returns of annual rains, which should they fail, all vegetation is destroyed, and an inevitable famine is the consequence*.

Close to the west point of Porto Praya, are sunken rocks, on which the sea continually breaks. The watering place is at a well, behind the beach, at the head of the bay. The water is scarce, but tolerably good, and there is a great deal of difficulty in getting it off, on account of the great surf on the beach: we were obliged to strip, in order to wade to the boats, which were loaded with water casks, and such provisions and refreshments as could be purchased on shore. Bullocks, goats, hogs, sheep, poultry, and fruits, are here to be purchased. All the cattle are remarkably lean. Bullocks are purchased with money, but other articles may be got from the inhabitants, in exchange for old cloaths, &c.

Provisions being very scarce at Porto Praya, our stay there was very short. We contented ourselves with a few casks of water, one bullock, some lean goats, hogs, turkeys, and fowls. We likewise got some indifferent cananas, and unripe oranges. We here discovered some new kinds of insects and fish, with a few tropical plants. A species of the king's-fisher is the most remarkable bird we found here; it feeds on large land-crabs, of a blue and red colour, which live in deep holes made in the earth.

When we got clear of Porto Praya, we had a fresh gale, which blew in squalls, attended with showers of rain. On Sunday the sixteenth, in the evening, a luminous fiery meteor made its appearance; it was of a blueish colour, and oblong shape, and had a quick descending motion. After a momentary duration, it disappeared in the horizon; its course was north-west. We observed a swallow following our vessel, and making numberless circles round it, notwithstanding our distance from St. Jago was between fifty and sixty leagues. It took shelter in the evening in the carved work of the stern; the necessary manœuvres of trimming the sails, however, disturbed it from its roost on one of the gun ports. This harmless bird continued to attend the ship in her course the two following days. We observed many conitos in the sea, which shot past us with great velocity; but we could not take a single one, though we endeavoured to catch them with hooks, and strike them with harpoons. We were more successful in hooking a shark, about five feet long. On this fish we dined the next day, but found it rather difficult of digestion; though otherwise, when fried, it was tolerably good.

One of the carpenters mates fell overboard on the nineteenth, and was drowned. He was sitting in one of the scuttles, over the side from whence it is supposed he fell. All our endeavours to save him were in vain, for he was not seen till the instant he sunk under the ship's stern. He was a sober man, and a good workman; and we felt his loss very sensibly, during the remainder of the voyage. He was regretted even by his shipmates.

On the twentieth of August, the rain came down not in drops, but in streams, and at the same time the wind was squally and variable, so that the people were obliged to keep deck, and, consequently, were severely soufed. Seven puncheons of fresh water were caught in our spread awnings. A dead calm succeeded this heavy rain.

The plumage of the poor swallow was entirely soaked by the heavy rains; it was obliged to settle on the rails of the quarter deck, and suffered itself to be caught. After it was dried, we let it fly about

the steerage; it did not seem to regret its confinement, but fed upon the flies, which were very numerous there. The swallow was permitted to enjoy its liberty after dinner, and returned into the steerage and cabin in the evening. It roosted somewhere upon the outside of the ship, and the next morning returned into the cabin: after it flew out once more, we never saw it, and, it is very probable, that it took shelter in the birth of some unfeeling person, who gave it his cat for breakfast.

On the twenty-seventh instant, one of captain Furneaux's petty officers died on board the Adventure: but there was not one man sick on board the Resolution, although a great deal of rain fell, which, in such hot climates, is a great promoter of sickness. Captain Cook took every necessary precaution, by airing and drying the ship, with fires made between the decks, and by making the people air their bedding, and wash their cloaths, at every opportunity.

In our voyage we discovered a vast number of flying fishes, and we caught a bonito, which we did not find very palatable; and were lucky enough to take a dolphin, which is likewise very insipid food. It is very admirable to remark the inimitable brightness of its colours, which, as it dries, is continually changing from one rich hue to another.

On the ninth of September, we passed the line with a light air. Some of the crew, who had never crossed the line before, were here ducked by their shipmates; though they might have bought themselves off, by paying a certain forfeit of brandy. Those who underwent this submersion, were obliged to change their linen and cloaths; it therefore proved a salutary operation to them, as this cannot be done too often in warm weather. The rest of the sailors were very merry with the forfeits of some of those who did not chuse ducking.

On the fourteenth of September, a flying fish fell on the deck of the Resolution, and we caught several dolphins. We observed several aquatic birds, and, at various intervals, found the sea covered with numerous animals.

On the twenty-seventh, we discovered a sail to the west, standing after us, which shewed either Portuguese colours, or St. George's ensign. We did not chuse to wait to speak with her. The winds were variable, and we advanced but slowly, and nothing remarkable happened till the eleventh of October, when we observed an eclipse of the moon.

On Monday the twelfth, as it was calm weather, we amused ourselves with shooting sea fowl; we were accompanied by albatrosses, sheerwaters, pintadoes, and a small grey freterel, less than a pigeon. It has a grey back, and whitish belly, and has a black stroke across from the top of one wing to the other. We were sometimes visited by these birds in great flights. Several animals, of the molusca tribe, came within our reach, together with a violet-coloured shell, of a very remarkable thin texture, which is very easily broken, and seems therefore calculated to keep the open sea, and not to come near rocky places.

We saw a sail to the north-west on the seventeenth, which hoisted Dutch colours. We kept company together for two days, but the third we outailed her. On this day we had an alarm, that one of our crew was overboard; but, as we could not see any person in the water, we called over the names of the crew, and, to our happiness, found none missing. The ship's crew of the Adventure saw our consternation, and discovered a sea lion in the water, which had been the cause of it,

* Here the author begs leave to make the following remark, by way of digression, viz. That in the years 1773 and 1774, a general famine happened in the Cape Verd islands, which rose to such a height, that hundreds of poor creatures perished for want. During this distressful season, a Dutch commander put into St. Jago, and, with the true spirit of a Dutchman, took advantage of their miserable condition. He received several of the natives, with their wives and children, who sold themselves to him, in order to escape certain death, which could not be avoided, did they stay on the island. He took them in his ship to the Cape of Good Hope, and there sold them. But he it recorded, to the immortal honour of the governor of that place, when he was informed of it, he ordered the captain to redeem them at his own expence, to carry them back to their native country, and bring him a certificate from the Portuguese governor, assuring him that these orders were executed.

We saw a large whale on the nineteenth, and a fish of the shark kind, about twenty feet long, and of a whitish colour. We were now regularly supplied with four krout, as we had been some time out at sea; and this was a great means of preventing scorbutic disorders.

We outtailed the Adventure, and left her a good way behind; the captain therefore ordered the boat out, and several officers, &c. went a shooting. The passage began to appear dull and tedious, to those of us who were not used to the recluse nature of a seaman's life, when he has not seen land for some time: but the hope of making interesting discoveries brightened the gloominess of our present situation.

On the twenty-ninth of October we made the land of the Cape of Good Hope. We crowded all the sail we could, hoping to get into the bay before dark; but as we could not accomplish it, we shortened sail, and stood off and on, during the night, having thick squally weather, and showers of rain. This night produced an astonishing scene of grandeur. The whole ocean appeared to be in a blaze, as far as we could see. The summit of every breaking wave was illuminated by a light similar to that of phosphorus. Along our side, great bodies of light moved in the water, sometimes quicker, and sometimes slower, varying their courses. Their shape was sometimes clearly discovered to be that of fishes, which forced the smaller ones to hasten away from them. We procured a bucket full of this illuminated sea water, that we might discover the cause of this astonishing phenomenon. Upon the most minute inspection, we found that innumerable sparks, of a round form, moved about in the water with great brightness and velocity, and communicated to it their luminous appearance. The number of sparks seemed to decrease, after the water had been standing for a little time, but became as luminous as before, after being stirred again. We examined several of these luminous particles through an improved microscope, and found them to be globular and transparent. The water lost this appearance in about two hours time.

In the display and grandeur of this phenomenon, there was a singularity, which could not fail of giving employment to the mind, and filling it with reverential views of the Almighty's power; we were compelled to admire the Creator, even in his most minute works.

On the thirtieth, when day-light came, it brought fair weather along with it. We entered Table Bay, in company with the Adventure, and anchored in five fathoms water. The mountains at the bottom of the bay are prodigiously craggy, steep and barren. We saluted the fort, and were visited by several officers in the Dutch East-India company service. We were received with great politeness on shore, and promised all the assistance the place could afford. We learned from the governor, that about eight months before, two French ships, from the Mauritius, had discovered land, in the latitude of 48 deg. south, and in the meridian of that island: they sailed along the island forty miles, till they came to a bay, where they intended entering, but were separated in a storm, and driven off; in which storm they lost some of their boats and people, which they had sent to sound the bay. The captain, with one of the ships, soon after arrived at the Mauritius, and the captain was sent immediately home to France, with an account of the discovery. We were likewise informed by the governor, that in March last, two other French ships, from the Mauritius, touched at the Cape, in their way to the southern Pacific Ocean, when they were going to make discoveries.

We placed ourselves at Mr. Brandt's (which is the usual residence of the officers belonging to English ships), after we had visited the governor and some other principal persons of the place. Those who favour this gentleman with their company, will be sure to find an agreeable reception at his house; for he spares

neither trouble nor expence to make it so. In conjunction with Mr. Brandt, the officers concerted measures for supplying the ships with provisions and other necessaries. While the provisions, &c. were procuring, the carpenters were employed in caulking the ships' sides and decks, and the seamen overhauled the rigging.

The proper instruments were got on shore, in order to make astronomical observations; and four days after our arrival, two Dutch Indiamen came here from Holland, which had lost great numbers of men by the scurvy and other diseases. Those who remained were so ill, that they were under the necessity of being sent to the hospital. One of these ships touched at Porto Praya, and left it a month before us; nevertheless, we arrived here four days before her. The foundation of a new hospital was laid with great ceremony at the Cape, whilst we were there; the old one not being sufficient to contain the sick.

We thought of making but a short stay at the Cape, on account of the healthy condition of the crews on our arrival; but we were detained in order to collect spirits, which were scarce, and to bake fresh bread. While we staid, the crews of both ships were served every day with fresh beef or mutton, new baked bread, and as many vegetables as they could eat. The ships were fresh painted and caulked, and put in as good condition as when they left England.

This colony, and the island of St. Jago, afforded a pleasing contrast. At St. Jago we found a tropical country, capable of much improvement, but, owing to the laziness and oppression of the inhabitants, it is utterly neglected. On the other hand, here we saw a neat well-built town in the midst of a desert, where nothing but successful industry could have been the cause of its pleasing appearance. Near the water are the store-houses of the Dutch East India company; and on a gentle ascent beyond them, lie the private buildings. On the east side of the town are the fort and batteries which command the road, but are of no great strength. The principal streets in the town are broad and regular; they are likewise planted with oaks, and, through some of them, pieces of water run. All the Dutch settlements are supplied with canals, though they certainly are very prejudicial to the health of individuals.

Most of the houses are white-washed, though built of brick. They judge wisely in building them lofty and spacious, and very airy, which the hot climate absolutely requires. The church is a very plain building, and is scarcely large enough to contain the inhabitants who wish to frequent it. Though the Dutch government find the spirit of toleration so beneficial at home, they do not extend it to their colonies. The Lutherans have but very lately been permitted to build churches at Batavia and the Cape. No clergyman of that persuasion has yet been tolerated at the Cape; the chaplains of Danish and Swedish East Indiamen give the inhabitants a sermon and the sacrament once, or twice a year.

It is much to be lamented, that neither the government nor the inhabitants give themselves any trouble about the religion of their slaves, who, in general, appear to have none at all. This want of attention is very reprehensible. Some of these poor creatures are Mahometans, and they meet often in a private house, to read, or chaunt, several prayers and chapters of the Koran. They cannot partake of any other acts of worship, as they have no priest among them.

We do not mean to censure the Dutch alone in this particular, for it is very certain that the negroes who wear the French and English yoke are in the same predicament. All we mean by it is, to awaken a fellow-feeling towards this unhappy race of men: indeed, we think it a scandal to those who bear the Christian name, to withhold the necessary means of instruction from those ignorant creatures.

A spacious house is erected at the Cape, for lodging and boarding the slaves belonging to the company, who amount to several hundreds. In this building they

they are kept to work. They have likewise, as before remarked, an hospital for the sick.

On the first of November, we began our botanical excursions into the country. The ground gradually rises towards the mountains which lie at the bottom of the bay: several parts of it have some verdure, but it is intermixed with a good deal of sand. An immense variety of plants grow on the higher grounds; also a prodigious number of shrubs, as well as some few small plantations. The shrubbery is frequented by abundance of insects of every sort, together with a great variety of small birds.

The ascent to the Table mountain is very steep and difficult. We found another kind of vegetables, which spread a fine aromatic scent, growing on a drier soil. The summit of the mountain is nearly level and very barren: we found several cavities replete with rain-water, from which some plants drew their nourishment. Solitary vultures, baboons, and antelopes, are sometimes to be met with on this mountain. The view from the summit is very extensive and picturesque. From hence the bay appeared like a small pond or basin, and the ships like little boats; every other object appeared in proportion.

There are about seven hundred soldiers in this colony, four hundred of whom form the garrison of the fort, near the Cape town. There are about four thousand militia, who might be assembled in a short time, by means of signals made from alarm posts. There are at least five blacks in this colony to one white person. The slaves at the Cape are treated with great lenity, who are chiefly brought from Madagascar. A few Dutch families, with some French Protestants, but for the greatest part Germans, compose the colonies of this place. The inhabitants of the town are industrious, hospitable, and sociable; they are in general rather ignorant, having few opportunities of acquiring knowledge. There are no public schools of any consequence at the Cape; female education is very much neglected, but the young men are sometimes sent to Holland for improvement. Their conversation is uninteresting, owing to a kind of dislike to reading, and the want of public amusements: they speak the English and Portuguese languages. Though the manners of the ladies are not too much refined, nor their sentiments very delicate, yet the accomplishments of singing, dancing, and playing on the lute, when united in an agreeable person, make amends for the want of other qualities. It must however be acknowledged, that, among the principal inhabitants, there are persons of both sexes, whose extensive reading, good understanding, and prudent deportment, would render them admired and distinguished even in Europe. The inhabitants are, in general, rather affluent than otherwise, but they seldom amass such considerable sums here as at Batavia.

The country people are plain and hospitable, but the inhabitants of the remote settlements, who seldom come to town, are said to be very ignorant; which may easily be imagined, as they have none but Hottentots to converse with. The habitations of these settlers are at such a distance from each other, that all intercourse is in a great measure precluded.

There are many vineyards within the compass of a few days journey from the town, which the first colonists planted; and the ground was granted to them and their heirs. The property of the ground is now kept in the company's hands, and they only let it to the farmer for an annual rent. Corn and cattle are raised in the distant settlements; and some of the farmers have very numerous flocks, which they bring to town in large droves every year, though numbers of them are destroyed in their journey thither by lions, buffaloes, and the fatigue of travelling. Their families generally accompany the drovers in large waggons covered with leather, and drawn by oxen. They bring for sale rhinocero's and lions' skins, as well as butter and tallow. A young beginner in the farming business is entrusted with the care of four or five hundred head of sheep by the opulent, which he leads to

a distant spot, where there is good grass and water; half of the lambs fall to his share, and he soon becomes possessed of a great number of his own.

The production of this country has furnished the isles of France and Bourbon, as well as the mother country, with great plenty of corn, &c. If the settlements were not so far up the country, exportation of these articles would be made at a much easier rate.

The Dutch East India company have, in a manner, engrossed these settlements, and keep all the landed property to themselves; whereas, if they were in the hands of the commonwealth, they would, long ago, have attained to a degree of splendor, population, and opulence, which they have not yet arrived at, nor are likely to do, till they change masters.

A great variety of wines are made at the Cape, particularly Constantia. Several French plants have likewise been tried, and succeeded very well. The low sorts of wine are in very great plenty, and are sold remarkably cheap.

The ships of every nation touch at the Cape, where they are well supplied with fresh provisions. The climate of the Cape is remarkably healthy, and the inhabitants are very seldom troubled with complaints. The winters here are very mild.

The nearest Hottentot village is a hundred miles from the Cape. Towards the extremity of Africa, southwards, are several high mountains, which consist of a coarse granite, and contain no heterogeneous parts. Almost all the plantations are on a sandy soil. Some of the interior mountains contain iron and copper; specimens of which were shewn us. There are likewise hot springs in various parts of the country; and a great variety of plants that we never saw before. The tribe of animals is proportionably rich in its various productions. The extremity of Africa is inhabited by the large quadrupeds, such as the rhinoceros, the camelopard, and the elephant. The government have lately issued an order that the rhinoceros should not be entirely extirpated, as of late years they have killed great numbers of them, and they are consequently become very scarce. The sea-cow is now very scarce; the meat is here reckoned a dainty, but it tastes like coarse beef, though the fat resembles marrow. We were told that this animal could only dive thirty yards, and that it principally subsists upon vegetables.

Another huge quadruped is the wild buffaloe, which is said to have prodigious ferocity and strength. These creatures often attack the farmers on their travels, and kill many of their cattle, which they trample under their feet. They have many times tried to tame these creatures, and make them draw instead of oxen. They put a young one, about three years old, before a wagon and six oxen, but he was so strong, that they could not move him out of his place. The Cape is infested by a number of the fiercest beasts of prey, such as leopards, lions, hyænas, jackals, and several others, which feed on hares, a numerous species of antelopes, and several other wild animals. A variety of insects, and reptiles of all kinds, swarm about the Cape, and the shores abound with fish.

We finished our business at the Cape, and took leave of all the persons of distinction, as well as our friends, and the acquaintance we made there: we went on board on the twenty-second of November. On our sailing, we saluted the fort with fifteen guns, which they instantly returned. This night the sea had the same luminous appearance as before.

We directed our course to Cape Circumcision as soon as we had cleared the land; and as we were entering on another navigation, strict orders were given to prevent the waste of fresh water, as we knew not where we might meet with another place of refreshment. As we expected to come into cold weather soon, the captain ordered slops to be given to those who wanted, and supplied each man with a fear-nought jacket and trowsers.

We caught many albatrosses on the twenty-fourth instant, with a line and hook, which the ship's com-

pany relished very much. On the twenty-ninth we had a heavy storm, the sea ran high, and frequently broke over the ships. Those people who had not been used to the sea, did not know how to behave themselves in these circumstances; they were, however, amused with the daily havock made amongst the cups, saucers, &c. The decks and floors were continually wet, and the noise of the storm and its roaring waves, together with the great agitation of the vessel, made it very disagreeable. A boy in the fore part of the vessel awoke suddenly in the night, hearing a great noise of water running among the chests, and when he got out of bed, he found himself half-way up the leg in water. This alarming circumstance he directly acquainted the officers with, who encouraged the seamen with an animating gentleness: all hands worked at the pumps, but the water increased upon us. It was at last discovered, that the water came in through a scuttle in the boatswain's store-room.

This storm continued till the eighth of December, and was attended with rain and hail. We could carry no sails, as the wind blew with such violence: we were driven out of our course, and had no hopes left of reaching Cape Circumcision. We lost the greatest part of our live stock, which we brought from the Cape. Every man in the ship felt the effects of the sudden transition from warm to cold weather. An addition was made to the mens allowance of brandy, in both ships.

We had hopes, on the morning of the ninth instant, by the flattering prospect of the rising sun, that we were going to have some serene weather, but these expectations soon vanished. The barometer was very low, which foreboded an approaching storm, which happened accordingly, insomuch that we could not carry any sail.

On the eighth instant, we saw some branches of sea-wood, which favoured the hope of meeting with land, but we were disappointed. We made signal on the tenth instant, for the Adventure to make sail and lead, and saw an island of ice to the westward of us. We made signal for the Adventure to come under our stern, as the weather was hazy; this was a fortunate circumstance, for had we omitted it, we cannot tell what consequences would have ensued; for the hazy weather increased so much, that we could not see the island of ice, for which we were steering, till we were very near it. The sea broke very high against this island. Captain Furneaux imagined that this ice island was land, and hauled off from it, till he was called back by signal.

We cannot decide with precision how long this ice island was, but, in all probability, these large bodies drift but very slowly; for the winds and waves can have but little effect upon them, as the major part must be under water.

We passed another large island of ice on the eleventh of December, against which the waves dashed with amazing violence; notwithstanding its height, the sea broke sometimes entirely over it, and we frequently saw the spray arising very high above it, which had a very fine effect. It is very probable, that the sea water, which is, by this means, washed upon the ice, serves to increase the mass by congelation.

We were still surrounded by birds of the petrel genus, notwithstanding the coldness of the climate. This dismal scene, to which we were unaccustomed, was varied as well by these birds, as several whales, which made their appearance among the ice, and afforded us some idea of a southern Greenland.

Though the appearance of the ice, with the waves breaking over it, might afford a few moments pleasure to the eye, yet it could not fail filling us with horror, when we reflected on our danger; for the ship would be dashed to pieces in a moment, were she to get against the weather side of one of these islands, when the sea runs high.

On the thirteenth, a great variety of ice islands presented themselves to our view, and the number of our attendant birds decreased. As we were now

in the latitude of Cape Circumcision, according to Mr. Bouvet's discoveries, in the year 1739, yet we were ten degrees to the longitude of it; but some people on board were very eager to be first in spying land. In this field of low ice were several islands, or hills, and some on board thought they saw land over the ice; but this was only owing to the various appearance which the ice hills make, when seen in hazy weather. We had smooth water, and brought to under a point of ice: here we consulted on places of rendezvous, in case of separation, and made several regulations for the better keeping company. We then made sail along the ice.

On the fourteenth a boat was hoisted out for two gentlemen to make some observations and experiments. While they were thus engaged, the fog increased so much, that they entirely lost sight of both of the ships. Their situation was truly terrific and alarming, as they were only in a small four oared boat, in an immense ocean, surrounded with ice, utterly destitute of provisions, and far from any habitable shore. They made various efforts to be heard, and rowed about for some time, without effect; they could not see the length of their boats, nor hear any sound. They had neither mast nor sail, only two oars. They determined to lie still, as the weather was calm, and hoped that the ships would not swim out of sight. A bell sounded at a distance, which was heavenly music to their ears. They were at last taken up by the Adventure, and thus narrowly escaped those extreme dangers.

So great was the thickness of the fog sometimes, that we had the utmost difficulty to avoid running against the islands of ice, with which we were surrounded. We stood to the south on the seventeenth, when the weather was clear and serene, and saw several sorts of birds, which we were unacquainted with. The skirts of the ice seemed to be more broken than usual, and we sailed among it most part of the day; we were obliged to stand to the northward, in order to avoid it. On the eighteenth we got clear of the field of ice, but was carried among the ice islands, which it was difficult to keep clear of.

The danger to which we were now exposed, was preferable to being entangled among immense fields of ice. There were two men on board the Resolution, who had been in the Greenland trade; the one had lain nine weeks, and the other six, stuck fast in a field of ice. That which is called a field of ice is very thick, and consists but of one piece, be it ever so large. There are other pieces of great extent packed together, and in some places heaped upon each other. How long such ice may have lain here, is not easily determined. In the Greenland seas, such ice is found all the summer long, and it cannot be colder there in summer time than it is here.

Upon the supposition that this ice which we have been speaking of is generally formed in bays and rivers, we imagined that land was not far from us, and that the ice alone hindered our approaching it. We therefore determined to sail to the eastward, and afterwards to the south, and, if we met with no land or impediment, there to get behind the ice, that this matter might be put out of doubt. We found the weather much colder, and all the crew complained of it. Those jackets which were too short were lengthened with baize, and each of them had a cap made of the same stuff, which kept them as warm as the climate would admit.

Scorbutic symptoms appearing on some of the people, the surgeons gave them fresh wort every day, made from the malt we took with us for that purpose.

We stood once more to the southward on the twenty-second instant. On the twenty-third, we hoisted out a boat to make such experiments as were thought necessary. We examined several species of birds, which we had shot as they hovered round us with seeming curiosity.

On the twenty-fifth being Christmas-day we were very cheerful, and notwithstanding the surrounding rocks of ice, the sailors spent it in savage noise and drunken-

drunkenness. On the twenty-sixth, we sailed through large quantities of broken ice. We were still surrounded with islands, which in the evening appeared very beautiful, the edges being tinged by the setting sun.

On the twenty-seventh we had a dead calm, and we devoted the opportunity to shooting pètrrels and penguins. This afforded great sport, though we were unsuccessful in our chase of penguins. We were obliged to give over the pursuit, as the birds dived so frequently, and continue so long under water. We at last wounded one repeatedly, but was forced finally to kill it with a ball; its hard glossing plumage having constantly turned the shot aside. The plumage of this bird is very thick, the feathers long and narrow, and lie as close as scales. These amphibious birds are thus secured against the wet, in which they almost continually live. Nature has likewise given them a thick skin, in order to resist the perpetual winter of these inhospitable climates. The penguin we shot weighed eleven pounds and a half. The pètrrels are likewise well provided against the severity of the weather. These latter have an astonishing quantity of feathers, two feathers instead of one proceeding out of every root.

We were glad to be thus employed, or indeed to make any momentary reflections on any subject, that we might in some measure change that gloomy uniformity in which we so slowly passed our time in these desolate and unfrequented seas.

We had constant disagreeable weather, consisting of thick fogs, rain, sleet, hail, and snow; we were surrounded with innumerable quantities of ice, and were in constant danger of being split by them; add to which, we were forced to live upon salt provisions, which concurred with the weather to infect our mass of blood. Our seamen coming fresh from England did not yet mind these severities and fatigue, their spirits kept them above repining at them; but among some of us a wish prevailed to exchange our situation for a happier and more temperate one. The crew were well supplied with portable broth and sour kout, which had the desired effect in keeping them from the scurvy. The habit of body in one man was not to be relieved by these expedients, but he was cured by the constant use of fresh wort. This useful remedy ought never to be forgotten in ships bound on long voyages, or the encomiums on the efficacy of malt cannot be exaggerated; great care must also be taken to prevent its becoming damp and mouldy, for if it is suffered to do so, its salutary qualities will become impaired in a long voyage.

On the twenty-ninth, the commanders came to a resolution, provided they met with no impediment, to run as far west as Cape Circumcision, since the sea seemed to be pretty clear of ice, and the distance not more than eighty leagues. We steered for an island of ice this day, intending to take some on board, and convert it into fresh water. On this island we saw a great number of penguins. The sight of these birds is said to be a sure indication of the vicinity of land. This may hold good where there are no ice islands, but not so when there are any, for there they find a resting place. We will not determine whether there are any females among them at so great a distance from land, or whether they go on shore to breed.

On the thirty-first we stood for this island again, but could not take up any of the loose ice, for the wind increased so considerably, as to make it dangerous for the ships to remain among the ice; besides which, we discovered an immense field of ice to the north, extending further than the eye could reach. We had no time to deliberate, as we were not above two or three miles from it.

On the first of January 1773, the gale abated, but there fell a good deal of snow and sleet, which froze on the rigging of the ships. The wind continued moderate the next day, and we were favoured with a sight of the moon, whose face we had not seen since we left the Cape of Good Hope. Several observations

were made of the sun and moon. We were now nearly in the longitude assigned by M. Bouvet to Cape Circumcision; but as the weather was very clear at this time, inasmuch that we could see at least fifteen leagues distance from us, it is most probable that what he took for land was no more than mountains of ice, surrounded by loose or packed ice, the appearances of which are so deceptive.

From all the observations we could make, we think it highly probable that there is no land under the meridian between the latitude of 55 and 59 degrees. We directed our course to the east south-east, that we might get more to the south. We had a fresh gale and a thick fog, a good deal of snow and sleet, which froze on the rigging, and every rope was covered with fine transparent ice. This was even pleasing enough to look at, but made us imagine it was colder than it really was, for the weather was much milder than it had been for many days past, and there was not so much ice in the sea. One inconvenience attended us, which was, that the men found it very difficult to handle the rigging.

On Friday the eighth of January we passed more ice islands, which became very familiar to us. In the evening we came to one which had a vast quantity of loose ice about it, and, as the weather was moderate, we brought to, and sent the boats out to take up as much as they could. Large piles of it were packed upon the quarter-deck, and put into casks, from which, after it was melted, we got water enough for thirty days. A very little salt water adhered to the ice, and the water which this produced was very fresh and good. Excepting the melting and taking away the ice, this is a most expeditious method of supplying ships with water. We observed here several white whales, of an immense size. In two days afterwards we took in more ice, as did the Adventure. Some persons on board, who were ignorant of natural philosophy, were very much afraid that the unmelted ice, which was kept in casks, when the weather altered, would dissolve and burst the casks in which it was packed, thinking that, in its melted state it would take up more room than in its frozen one. In order to undeceive them, Captain Cook placed a little pot of stamped ice in a temperate cabin, which, as it gradually dissolved, took up much less space than before. This was a convincing argument, and their fears of this sort subsided.

As we had now several fine days, we had frequent opportunities of making observations, and trying experiments, which were very serviceable to us on many accounts. The people likewise took the opportunity of washing their cloaths in fresh water, which is very necessary in long voyages. We took in some more on the sixteenth, for these purposes.

We crossed the antarctic circle on the seventeenth of January, before noon; and advanced into the southern frigid zone, which to all former navigators had remained impenetrable. We could see several leagues around us, as the weather was tolerably clear. In the afternoon we saw the whole sea covered with ice, from south-east to south-west. We saw a new species of the pètrrel, of a brown colour, with a white belly and rump, and a large white spot on the wings; we saw great flights of them, but never any of them fell into the ships. We called it the Antarctic pètrrel, as such numbers of them were seen hereabouts.

In the afternoon we saw thirty-eight ice islands, large and small. This immense field was composed of different kinds of ice; such as field-ice, as so called by the Greenlandmen, and packed ice. Here we saw several whales playing about the ice, and still large flocks of pètrrels.

We did not think it prudent to persevere in a southern direction, as that kind of summer which this part of the world produces was now half spent; and it would have taken up much time to have gone round the ice, supposing it practicable; we therefore resolved to go directly in search of the land lately discovered by the French.

In the evening of the nineteenth we saw a bird, which in Captain Cook's former voyage was called the Port Egmont hen; which is so called, because there are great numbers of them to be seen at Port Egmont in Falkland islands. They are about the size of a large crow, short and thick, of a chocolate colour, with a white speck under each wing. Those birds are said never to go far from land; and we were induced from this circumstance to hope that land was near, but we were disappointed; the ice islands had probably brought this bird hither.

We saw white albatrosses on the twenty-first, with black tipped wings. On the twenty-ninth several porpusses passed us with amazing swiftness; they had a large white spot on their sides, which came almost up to their backs. They went at least three times as fast as our vessels, and we went at the rate of seven knots and a half an hour.

On the thirty-first we passed a large ice island, which at the time of our sailing by was tumbling to pieces. The explosion equalled that of a cannon; we saw, on the first of February, large quantities of sea-weed floating by the ships. Captain Furneaux acquainted Captain Cook, that he had seen a number of divers, which very much resembled those in the English seas, and likewise a large bed of floating rock-weed. These were certain signs of the vicinity of land; but we could not tell whether it was to the east or west.

We imagined that no land of any extent lay to the west, because the sea ran so high from the north-east, north north-west, and west; we therefore steered to the east, lay to in the night, and resumed our course in the morning. We saw two or three egg birds, and passed several pieces of rock-weed, but no other signs of land. We steered northward; and made signal for the Adventure to follow, as she was rather thrown astern by her movement to the eastward. We could not find land in that direction, and we again steered southward. There was an exceeding thick fog on the eighth, on which we lost sight of the Adventure. We fired several signals, but were not answered; on which account we had too much reason to think that a separation had taken place, though we could not well tell what had been the cause of it. Captain Cook had directed Captain Furneaux, in case of a separation, to cruize three days in that place he last saw the Resolution. Captain Cook accordingly made short boards, and fired half hour guns till the afternoon of the seventh, when the weather cleared up, and the Adventure was not to be seen in the limits of that horizon. We were obliged to lie to till the tenth, and notwithstanding we kept firing guns, and burning false fires all night, we neither saw nor heard any thing of the Adventure, and were obliged to make sail without her, which was but a dismal prospect, for we were now exposed to the danger of the frozen climate without the company of our fellow-voyagers, which before had relieved our spirits, when we considered that we were not entirely alone in case we lost our own vessel. The crew universally regretted the loss of the Adventure; and they seldom looked around the ocean without expressing some concern that we were alone on this unexplored expanse.

We had an opportunity of seeing what we had never observed before, viz. the aurora australis, which made a very grand and luminous appearance.

Nothing material happened to us, but various changes of the weather and climate, till the twenty-fifth of March, when land was seen from the mast-head, which greatly exhilarated the spirits of our sailors. We steered in for the land with all the sail we could carry, and had the advantage of good weather and a fresh gale. The captain mistook the bay before us for Dusky Bay, the islands that lay at the mouth of it having deceived him.

We proceeded for Dusky Bay, in New Zealand, but with much caution as we advanced nearer the land. We passed several islands, &c. and two leagues up the bay an officer was sent out to look for anchorage, which he found, and signified it by signal. Here

we anchored in fifty fathoms water, and very near the shore. This joyful circumstance happened on the twenty-sixth of March, after we had been one hundred and seventeen days at sea, and sailed three thousand six hundred and sixty leagues, without so much as once seeing land. It might be supposed, from the length of time we had been at sea, that the people would have been generally affected by the scurvy; but the contrary happened, owing to the precautions we used. We had much reason to be thankful to the Divine Providence, that no untoward accident had befallen us, and that our crew were in good health.

The country appeared beautiful and pleasing. The islands we passed, before our entrance into Dusky Bay, were shaded with evergreen, and covered with woods; the various shades of autumnal yellow, intermixed with the evergreens, exhibited a delightful contrast. The rocky shores were enlivened with flocks of aquatic birds, and the whole country resounded with the wild notes of the feathered songsters. As soon as we anchored we caught great numbers of fish, which eagerly took the bait laid for them. Our first meal upon fish here was looked upon as the most delightful we had ever made. Captain Cook did not like the place in which we anchored, and sent lieutenant Pickersgill in search of a better, which he soon found. The captain liked it, and called it Pickersgill harbour.

We entered Pickersgill harbour on the twenty-seventh of March, by a channel which was scarcely twice the width of the ship. Here we determined to stay some time, and examine it thoroughly, as no one had ever entered it before, or landed on any of the southern parts of this country.

This was a most admirable situation for wood and water. Our yards were locked in the branches of trees, and near our stern ran a delightful stream of fresh water. We made preparations on shore for making all necessary observations, and perform necessary repairs, &c. &c.

The live cattle we had left, which consisted of a few sheep and goats, would not taste the grass which grew on the shore; nor were they very fond of the leaves of tender plants which grew here. When we examined these poor creatures, we found their teeth loose, and they had other symptoms of an inveterate scurvy.

We had not hitherto seen any appearance of inhabitants; but on the twenty-eighth some of the officers went on a shooting party in a small boat, and discovering them, returned to acquaint captain Cook therewith. Very shortly a canoe came filled with them, within musket shot of the ship. They stood looking at us for some time, and then returned; we could not prevail upon them to come any nearer, notwithstanding we shewed them every token of peace and friendship. Captain Cook, with several officers and gentlemen, went in search of them the same day. We found the canoe hauled upon the shore, where were several huts, with fire-places and fishing-nets, but the people had probably retired into the woods. We made but a short stay, and left in the canoe some medals, looking-glasses, &c. not chusing to search any further, or enforce an interview which they wished to avoid; we returned accordingly to the ship.

Two parties went out the next day, but returned without finding any thing worth noticing. The first of April we went to see if any thing we had left in the canoe remained there. It did not appear that any body had been there, and there were none of the things meddled with.

The next day we again went on shore to search for natural productions. We killed three seals, and found many ducks, wood hens, and wild fowl, several of which we killed. Another party went ashore the same day, and took with them a black dog we had brought from the Cape, who ran into the woods at the first musquet they fired, and would not return. Both parties came back to the ship in the evening.

We

We made a shooting party on the sixth of April, and found a capacious cove, where we shot several ducks; on which account we called it Duck Cove. We had an interview with one man and two women, as we returned in the evening, who were natives, and the first that discovered themselves; and had not the man halloed to us, we should have passed without seeing them. The man stood upon the point of a rock, with a club in his hand, and the women were behind him with spears. As we approached, the man discovered great signs of fear, but stood firm; nor would he move to take up some things that were thrown to him. His fears were all dissipated by Captain Cook's going up to embrace him; the captain gave him such things as he had about him. The officers and seamen followed the captain, and talked some time with them; though we could not understand them. In this conversation, the youngest of the women bore the greatest share. A droll fellow of a sailor remarked, that the women did not want tongue in any part of the world. We were obliged to leave them on the approach of night; but before we parted Mrs. Talkative gave us a dance.

On the seventh instant we made them another visit, and presented them with several things; but they beheld every thing with indifference, but hatchets and spike nails. We now saw all the man's family, as we supposed, which consisted of two wives, the young woman we mentioned before, a boy about fourteen years old, and three small children. Excepting one woman (who had a large wen upon her upper lip), they were well favoured; on account of her disagreeable appearance, she seemed to be neglected by the man. We were conducted to their habitation, which consisted of two mean huts, situated near the skirts of a wood. Their canoe lay in a small creek, near the huts, and was just large enough to transport the whole family from place to place. A gentleman of our party made sketches of them, which occasioned their calling him Toe-Toe; which, it seems, is a word which signifies marking or painting. On taking leave, the man presented captain Cook with some trifles, and a piece of cloth of their own manufacture; and pointed to a boat cloak, which he wished to have. The hint was taken, and one was ordered to be made for him of red baize.

We paid the natives another visit on the ninth instant, and signified an approach by halloing to them; but they neither met us on shore, nor answered us as usual; the reason of which was, that their time was fully occupied in dressing themselves to receive us. They had their hair combed and oiled, stuck with white feathers, and tied upon the crowns of their heads, and had bunches of feathers stuck in their ears. We were received by them with great courtesy in their dress. The man was so well pleased with the present of the cloak, that he took his patta-patoo from his side, and gave it to captain Cook. We continued here a little time, and took leave, spending the rest of the day in surveying the bay.

On the twelfth instant this family paid us a visit in their canoe, but proceeded with caution as they approached the ship. We could not by any means persuade them to come on board, but put ashore in a little creek near us, and sat themselves down near enough to speak to us. Captain Cook ordered the bagpipes to play, and the drum to beat; the latter only they regarded. They conversed very familiarly (though not well understood) with such officers and seamen as went to them, and paid a much greater regard to some than to others; we supposed that they took such for women. One of the females shewed a remarkable fondness for one man in particular, until she found out his sex; after which she would not let him approach her. We cannot tell whether she had before taken him for a female, or whether, in discovering himself, he had taken some liberties with her.

In the evening of Monday, the twelfth instant, the natives of Dusky Bay took up their quarters very near our watering-place, which was a clear proof that

they placed a great deal of confidence in us. We passed two or three days in examining the bay and making necessary experiments and observations. We likewise shot great quantities of wild fowl.

On the nineteenth of April the man and his daughter before-mentioned ventured on board our ship, while the rest of the family were fishing in the canoe. Before the man would come into the ship, he struck the side of it with a green branch, and muttered some words, which we took for a prayer; after which he threw away the branch and came on board.

We were at breakfast, but could not prevail on them to partake with us. They viewed every part of the cabin with apparent curiosity and surprise; but we could not fix the man's attention to any one thing for a moment. All we shewed him seemed beyond his comprehension, and the works of nature and art were alike regarded. The strength and number of our decks and other parts of the ship seemed to strike him with surprise. The man was still better pleased with hatchets and spike-nails than any thing our ship produced; when he had once got possession of these, he would not quit them.

Captain Cook and three other gentlemen left the ship as soon as they could disengage themselves from the visitors, whom they left in the gun-room, and went out in two boats to examine the head of the bay; at which place they took up their night's lodging; the next day they continued their observations; and fired at some ducks. Upon the repeat of the gun, the natives, who had not discovered themselves before, set up a most hideous roar in different places. The gentlemen halloed in their turn, and retreated to their boats. The natives did not follow them, neither indeed could they, because a branch of the river separated them, but still made a great noise. As they continued shooting and making their observations, they frequently heard the natives in the woods. A man and woman appeared at last on the banks of the river, waving something in their hands as a token of friendship. The gentlemen could not get near them, and the natives retreated into the woods. Two others appeared; but as the gentlemen advanced, they retreated likewise, and the woods afforded them thick cover.

Captain Cook and his party passed the next night in the same place, and after breakfast embarked to return on board; but saw two men on the opposite shore, who halloed to them, and they were induced to row over to them. Captain Cook with two other gentlemen landed unarmed, and advanced all together, but the natives retreated, nor would they stand still till captain Cook went up alone. It was with some difficulty that he prevailed on one of them to lay down his spear; at last he did it, and met the captain with a gross plant in his hand, giving captain Cook one end to hold whilst he himself held the other. In this position they stood while the native made a speech, which the captain did not understand, but returned some sort of answer; they then saluted each other, and the native took his coat from his back, and put it on the captain. The captain presented each of them with a hatchet and a knife, having nothing else with him. They invited the gentlemen to their habitation, and wanted them to eat, but the tide prevented their accepting of this invitation. More people appeared in the skirts of the woods, but did not approach any nearer. The two natives accompanied the gentlemen to their boats, but seemed very much agitated at the appearances of the musquets, which they looked upon as instruments of death, on account of the slaughter they had observed among the fowls. It was necessary to watch them, for they laid their hands on every thing except the musquets. They assisted the seamen in launching the boat.

It did not appear that they had any boats or canoes with them, but used two or three logs of wood tied together, which answered the same purposes; for the navigation of the river, on the banks of which they

lived,

lived, was not very difficult, and swarmed with fish and fowl. We apprehend that all the natives of this bay did not exceed more than three families.

This party took leave of the man about noon; and in the evening returned to the ship, when they found that the visitors had staid on board till noon; that he and his family remained near them till that day, and went into the woods, after which they were never seen; this appears rather extraordinary, as they never went away without some present.

Several parties were made in order to catch seals, which were very useful for food, for oil, and their skins were cured for rigging. The flesh of them is nearly as good as beef-steaks, and their entrails are equal to those of a hog. We likewise took the summit of the mountains in this bay, and made other remarks.

On the twenty-fourth instant captain Cook took five geese and a gander, which were all that remained of those brought from the cape of Good Hope, and carried them to a cove, which on this account he called goose-cove; this was a convenient place, for they were not likely to be disturbed by the inhabitants, there was plenty of food for them, and they were likely here to breed and spread the country with their species.

We had now several days fair weather, which gave us a fine opportunity of making necessary preparations for departure. On the twenty-seventh we found an arm of the sea more convenient than that by which we entered the bay; we shot several ducks, and were much pleased with the day's expedition.

All we now waited for was wind to carry us out of harbour by the new passage we had discovered. The tents and all other articles were got on board. The rubbish we had made on shore, which consisted chiefly of pieces of wood, &c. we set on fire, in order to dry the ground, which being done, Captain Cook sowed the spot with various sorts of garden seeds. This was the best place we could find to place them in.

We made several efforts to sail, but the wind proving contrary we made but little way, and were obliged to anchor on the first of May on the north side of Long Island. Here we found two huts with fire places, which appeared to be lately inhabited.

Captain Cook was detained on board by a cold, and sent a party to explore an arm of the sea which turns in to the east. This party found a good anchoring place, with plenty of wild fowl, fish, and fresh water. We made several shooting parties when the wind would not permit us to sail.

Before we leave Dusky Bay, we think it necessary to give our readers some description of it.

There are two entrances to this Bay, which are by no means dangerous; and there are numerous anchoring places, which are at once safe and commodious; at Cascade Cove, so called on account of the magnificent cascade near it, is room for a fleet of ships, and a very good passage in and out. The country is very mountainous, and the prospect is rude and craggy. The land bordering on the sea-coast, and all its lands, are covered with wood. There are trees of various kinds which are common in other countries, the timber of which is remarkably fine. Here are likewise a great number of aromatic plants, and the woods are so over-run with supple jacks, that it is difficult to make way through them. The soil is undoubtedly composed of decayed vegetables, which make a deep black mould; it is very loose, and sinks at every step. This may be the reason why there are so many large trees blown down as we meet with in the woods. Except flax and hemp, there is a very little herbage. The Bay abounds with fish, which we caught in great numbers. Seals are the only amphibious animals to be found here, but there are great numbers of them. Various kinds of ducks are to be found here, as well as all other wild fowl. Here is likewise a bird which we called the wattle bird, because it has two wattles under its beak like

those of a dunghill cock. Its bill is short and thick, its feathers are dark, and is about the size of an English black-bird.

We called this bird the poy-bird, on account of two little tufts of curled hair which hang under its throat, called its poies, which is the Otaheitan word for ear-rings. The feathers of this bird are of a fine mazaine blue, except those of his neck, which are of a silver grey. The sweetness of its note is equal to the beauty of its plumage; its flesh is likewise luxurious food, though it is a great pity to kill them.

The small black sand flies are here very numerous and troublesome; they cause a swelling and intolerable itching wherever they bite. Another evil attending this bay is the almost continual rains that fall, but happily our people felt no ill effects from them. The place must certainly be healthful, as those of our crew, who were in any degree indisposed when we came in, recovered speedily.

The inhabitants of Dusky Bay are the same with those in other parts of New Zealand; they speak the same language, and adopt the same customs. It is not easy to divine what could induce these few families to separate themselves from the society of the rest of their fellow-creatures. It seems probable that there are people scattered all over this southern island, by our meeting with inhabitants in this place. They appear to lead a wandering life, and don't seem to be in perfect amity with each other.

On the eleventh of May we again made sail, but met with more hinderances. We observed on a sudden a whitish spot on the sea, out of which a column arose which looked like a glass tube. It appeared that another of the same sort came down from the clouds to meet this, and they made a coalition and formed what is called a water-spout; several others were formed in the same manner soon after. As we were not very well acquainted with the nature and causes of these spouts, we were very curious in examining them. Their base was a broad spot, which looked bright and yellowish when the sun shone upon it; this appeared when the sea was violently agitated, and vapours rose in a spiral form. The columns were like a cylinder, and moved forward on the surface of the sea, and frequently appeared crossing each other, they at last broke one after another, this was owing to the clouds not following them with equal rapidity. The sea appeared more and more covered with short broken waves as the clouds came nearer to us; the wind veered about, and did not fix in any one point. Within two hundred fathoms of us, we saw a spot in the sea in violent agitation; the water ascended in a spiral form towards the clouds; the clouds looked black and lowering, and some hail-stones fell on board. A cloud gradually tapered into a long slender tube directly over the agitated spot, and seemed descending to meet the rising spiral, and soon united with it. The last water-spout broke like others, no explosion was heard, but a flash of lightning attended this disjunction.

The oldest mariners on board had never been so near water-spouts before, they were therefore very much alarmed. Had we been drawn into the vortex, it was generally believed that our masts and yards must have gone to wreck. From the first appearance, to the last dissolution, was three quarters of an hour.

On May the eighteenth, at five o'clock in the morning, we opened Queen Charlotte's Sound, and saw three flashes arising from a strong hold of the natives. We imagined them to be signals of the Europeans, and probably of our old friends in the Adventure; when we fired some guns, we were answered, and in a short time saw the Adventure at anchor. We were saluted by Captain Furneaux with thirteen guns, which we very cheerfully returned; none can describe the joy we felt at this most happy meeting.

As it must be agreeable to our readers, who undoubtedly highly interest themselves in all the attendant

pendant circumstances of this voyage, we will proceed to give some account of the accidents which befel the Adventure after our separation.

Captain Furneaux says, that he was prevented from gaining the place where they parted company till the third day, by a very high wind; and when he did gain, he cruised about for three days, according to agreement, and continually fired signals, but was obliged at last to seek for winter quarters. She continued her course to the northward after losing our company, and experienced very heavy gales. The Captain thought it advisable to descend into the latitude of Diemen's Land, in the extremity of New Holland. He fell in with the south-west part of this coast, on the ninth of March; and on the eleventh in the afternoon, after having run along the southern extremity, he came to an anchor in a place which he called Adventure Bay. Large broken masses of black and brown rocks compose the southern extremities of this coast. There were several sandy hillocks covered with trees round the bay. They also saw a lake with fresh water, in which there were great quantities of water-fowl. Captain Furneaux here took in a supply of fresh water, and collected several curious animals; they did not see any inhabitants, and departed in three days.

They sailed out of Adventure Bay on the fifteenth, and stood to the northward. The shore consisted of sandy hills, and they met with several islands. They called one place the Bay of Fires, because they saw several fires there, which probably had been lighted by the natives. They ran a great deal of danger from numerous shoals; and still seeing land about eight leagues to the northward, they concluded that New Holland and Diemen's Land were connected. They directed their course to the rendezvous at New Zealand.

The Adventure continued fifteen days at sea after leaving this coast, and on the third of April made the coast near Rock's Point, on the southern island; and on the seventh instant they anchored at Ship Cove, in Queen Charlotte's Sound.

They made the same establishments on shore here, as the Resolution did at Dusky Bay. Their astronomer fixed his observatory on the strong hold of the natives. The inhabitants, which were numerous, had begun an intercourse with them, and were very friendly; they frequently came on board, ate of their provisions, and were particularly fond of biscuit and pease soup. They very gladly exchanged their weapons, tools, and cloathing, for nails, hatchets, and cloth.

Several of the crew, who were at work on shore on the eleventh of May, very sensibly felt the shock of an earthquake, which was not perceived by those who remained on board. It is very probable, from this circumstance, that there are volcanos in New Zealand, as these phænomena generally go together.

The Adventure's company began to despair of ever meeting us again just when we arrived, and captain Furneaux was preparing to take up his winter-quarters here. But captain Cook was not willing to pass so much time in criminal inactivity, and therefore ordered out his men to assist the crew of the Adventure in preparing her for sea, as that had been already done to the Resolution. He was induced to this, more especially, because he knew there were refreshments to be had at the Society Isles.

Upon examination, the productions of these forests were very similar to those of Dusky Bay; but the season and climate was much more favourable to botanical researches. Several species of plants were still in flower, which we had not seen before, also several sorts of birds. Here were, likewise, several antiscorbutic plants, which gave this place great advantage over others. Great quantities of scurvygrass and wild celery were gathered, which were daily boiled with pease soup for dinner, and with oatmeal for breakfast. Here we found likewise great plenty of the spruce and tea-tree, which afforded us much refreshment.

We visited the fortification of the natives, where the observatory was fixed. It is only accessible in one place, and there by a narrow, difficult path, being situated on a steep rock. The natives huts stood promiscuously within an inclosure of pallisadoes; they consisted only of a roof, and had no walls. The crew of the Adventure said that they found those habitations very full of vermin particularly, from which it is natural to conjecture that they had been lately occupied. Perhaps this is only an occasional residence, when they find themselves in any danger; Captain Furneaux had planted, before our arrival, a great quantity of garden-seeds, which grew very well, and produced us plenty of sallad and European greens.

We went over to Long island on the twenty-second of May, which consists of one long ridge; the top is nearly level, and the sides are steep. We sowed some European garden-seeds upon some spots which we cleared for that purpose. Here we found various kinds of stone and pebbles.

We did not see any natives, since our arrival in this harbour, till the morning of the twenty-third instant, when two small canoes came rowing to us, in which were five men. They resembled the people of Dusky Bay, but were much more familiar, and did not appear concerned at seeing us, which probably was owing to their having before visited the crew of the Adventure. They sat down to dinner very freely and socially, and coveted nothing we had to give so much as hatchets and nails. Some of our crew made use of their canoes to fet themselves ashore; on which the natives complained to the captain, for they plainly saw his authority. They seemed highly delighted when their canoes were restored to them.

This party returned on board the next morning, and brought with them a woman and some children. Captains Cook and Furneaux, accompanied by some gentlemen, went, after breakfast, to view West Bay, which was so called in captain Cook's first voyage. As we were going, we met a double canoe, in which were thirteen people, who wanted to scrape acquaintance with captain Cook, and enquired for Tupaya, the native of Otaheite, who accompanied captain Cook in his former voyage, and lived to visit this country. They appeared very much concerned when they heard he was dead.

We were under great apprehensions for a party of our gentlemen who went out fishing, and did not return till the third day, when they were almost spent with hunger and fatigue.

We passed several days in making researches, and seeking plants and birds. On the twenty-second we received another visit from the family which had been with us before, who came for no other purpose than partaking of our food, and to get some more of our iron work. We wanted to know their names, but it was a long time before we could make them understand us; at last we found that the oldest was called Towahanga, and the others Kotugha-a, Koghoaa, Khoaa, Kollakh, and Taupuaperua. The last was a boy about twelve years of age, and was very lively and intelligent. The latter dined with us very voraciously, and was very fond of the crust of a pie made of wild-fowl. He did not much relish some Madeira wine which the captain gave him, but was very fond of some sweet Cape wine, which elevated his spirits, and his tongue was perpetually going. He very much wanted the captain's boat cloak, and seemed much hurt at the refusal. He wanted the empty bottle and table-cloth, which being likewise refused, he was exceedingly angry, and at last grew so fullen that he would not speak a word.

On the twenty-ninth instant a great number of natives surrounded us in canoes, who brought goods to exchange, for which they got very good returns, owing to the eagerness with which our sailors outbid each other, all of them being desirous of having some of the productions of this country. There were many women among them, whose lips were of a blackish hue,

hue, and their cheeks were painted with a lively red. They had large knees, and slender bandy legs, which is owing to their want of exercise, and sitting so much in their canoes cross legged. Their skins were of a clear brown colour, their faces round, their hair black, and had lively eyes, which had not much expression.

These ladies were very agreeable to our crews, who had had no intercourse with women since our departure from England; and they even found out that chastity was not a distinguishing part of their character. The men had the absolute command of their persons in every respect; and the women could not gratify the inclinations of the seamen without their concurrence. Their consent was easily purchased; a spike nail, or an old shirt was a sufficient bribe: the lady was then left to make her Adonis happy, and to exact from him another present for herself. We cannot help saying, to the credit of some of the women, and to the discredit of their men, that this prostitution was submitted to with reluctance by several of them; but they were terrified into compliance by the menaces and authority of the men.

The New Zealanders, encouraged by the gain of this disgraceful commerce, went through both the ships, offering their daughters and sisters to the promiscuous embraces of every one: indeed the married women seemed to be totally exempted from this way of purchasing iron, tools, &c. which could not be had at an easier rate than their daughters and sisters prostitution.

It seems to be an established custom in New Zealand, for a girl to favour a number of men without an infringement on her character; but after she marries, the strictest conjugal fidelity is expected from her. So far our sailors did not injure their moral characters, though we wish they could have set them a better example; but it is in vain to sigh in this respect, as we fear British tars will never become examples of piety or virtue.

Sketches were taken, by an eminent draughtsman, of the most characteristic of their faces. Several of the old men, in particular, had very expressive countenances, and some of the young ones looked very savage, owing to their bushy hair hanging over their faces. Their dress is much the same as described in our copper-plates for captain Cook's first voyage.

They began to pilfer after they had been a few hours on board, and some of them were discovered in taking away some handkerchiefs, several knives, a large four-hour glass, and a lamp. These malefactors were turned out, and never suffered to come on board again. They could not well put up with this humiliating circumstance, and would very gladly have been revenged.

They all went on shore in the evening, and made some temporary huts there opposite to the ships. Here they made fires, and prepared their suppers, which consisted of fresh fish, which they had caught in their canoes with great dexterity.

On the thirtieth instant we went over to Long island, to collect some hay which the crews had cut, and to bring some greens on board. In this trip we found several new plants, and shot some small birds, which we had never seen before. Leave was given, in the afternoon of this day, to some of the sailors to go on shore, where they again purchased the embraces of the ladies. These fellows must be very keen indeed, or they would have been disgusted with their uncleanness. They had a disagreeable smell, which might be perceived at a considerable distance; and their clothes, as well as their hair, swarmed with vermin to a very great degree: These they occasionally cracked between their teeth. It is really wonderful how people, who had received a civilized education, and who never before had seen such nastiness, could gratify the animal appetite with such loathsome creatures.

While this fallacious party were on shore, a young woman stole one of the sailors jackets, and gave it to

a young man of her own nation. Upon the sailor's taking it from the possessor, he received several blows on his face with the young fellow's fist. At first the sailor took this in joke, but when he found him in earnest, he gave him a hearty English drubbing, and made him cry for quarters.

Captain Cook was very humanely employed in sowing all sorts of vegetables that he thought would grow in this country; such as potatoes, corn, beans, peas, &c. and this in several spots, which he had cleared for this purpose.

We received a visit, on the first of June, from several natives whom we had not seen before, who brought some new articles of commerce. We purchased some dogs of them. Some of these people were oddly marked in their faces, by spiral lines being deeply cut in them. These marks were very regular on the face of a middle-aged man, named Tringho Waya, who seemed to have some authority over the people. These people seemed to understand the notion of traffic, and did not like we should make hard bargains. Some of them gave us a dance on the quarter-deck. They parted with their upper garments, and stood in a row. One of them sung some words, and alternately made many frantic gestures. They sung the chorus of the song all together. The words appeared to have some metre, but we could not tell whether they had rhimes. Music accompanied this song and dance, but it was not very harmonious.

We set on shore, at a place called Cannibal cove, a boar, two sows, and a male and female goat, which were left to range in the woods at their pleasure. This we did, in hopes that these new colonists would remain unmolested by the inhabitants, and that future ages would benefit by a race of such useful animals.

We sent some boats to Long island on the third of June, to bring away the remainder of the hay. One of the boats was chased by a large double canoe, which contained above fifty men. Prudence dictated their escape by sailing; for though the people might have no hostile intention, this was a necessary caution.

On the fourth of June, being his Majesty's birthday, we hoisted our colours, and prepared to pass the day with the usual festivities. The first family of natives who had taken up their residence near the shore, and were now become quite familiar to us, came on board very early, and breakfasted with us. Soon afterwards, a large double canoe approached, well manned. The canoe contained about thirty men, and came within a musket shot. Our friends on board told us very earnestly that they were enemies. Among these new visitors, one stood at the head of the canoe, and another at the stern, while the rest kept their seats. One of them held a green plant, of the New Zealand flag, in his hand, and spoke a few words. The other made a long harangue, in solemn and well articulated sound. When he had finished this speech, he was invited on board the ship. He at first appeared dubious, but he at last ventured aboard, and was soon followed by the rest, who eagerly traded with our crew. They directly saluted the natives on board, by an application of their noses, and paid the same compliment to the gentlemen on the quarter-deck. We found the visitor's name to be Teiratu. They all enquired for Tupaya, and were much concerned at hearing of his death.

These people were taller than any we had hitherto seen in New Zealand, and their dress and ornaments bespoke them a superior race than the inhabitants of Queen Charlotte's Sound, though they bore a perfect resemblance to them in their uncleanness. Their tools were made with great attention, and elegantly carved; we likewise obtained some musical instruments from them.

These visitors made but a short stay with us, as it blew fresh; they all embarked for the Motre-Aro. About noon captain Cook and several other gentlemen followed them, who were received with every mark of friendship. The captain distributed several presents among them, among which were a great number

number of brass medals inscribed with the King's title on one side, and the ship which undertook this voyage on the other. Teiratu appeared to be the chief among these people, by the great degree of respect paid him. Captain Cook conducted Teiratu to the garden he had planted, and obtained a promise from him that he would not suffer it to be destroyed. He seemed very much pleased with the potatoes.

We sailed from this place early in the morning of the seventh of June, in company with the Adventure, but had frequent hindrances from contrary winds. On the twenty-second of July we were in latitude 32 deg. 30 min. longitude 133 deg. 40 min. west. And now the weather was so warm, that we were obliged to put on lighter clothes. We did not see a single bird this day, which was rather remarkable, as not one day had hitherto passed since we left the land without seeing several.

Captain Cook having heard that the crew of the Adventure were sickly, went on board the twenty-ninth of July, when he found the cook dead; and twenty men ill with the scurvy and flux. Only three men were on the sick list on board the Resolution, which was certainly owing to the Captain's absolutely enforcing the eating celery and scurvy-grass with the food, though at first the crew did not like it. The people were now convinced that this diet prevented their sickness, and were even afterwards ready to gather vegetables and eat them, without being ordered.

All hopes of discovering a continent now vanished, as we had got to the northward of Captain Carteret's tracts, and we only expected to see islands till our return to the south. Every circumstance considered, we were induced to believe that there is no southern continent between New Zealand and America; it is very certain that this passage did not produce any sure signs of one.

On the sixth of August Captain Furneaux came on board the Resolution to dinner, and reported, that his people were much better, that the flux had quite left them, and that the scurvy was at a stand. The scorbutic people had been well supplied with cyder, which in a great measure contributed to this happy change.

Land appeared to the south on the eleventh instant at day-break, which we judged to be one of those islands discovered by Mons. Bougainville. We called it Resolution Island, it lies in the latitude of 17 deg. 24 min. longitude 141 deg. 39 min. west. We did not stay to examine it, as it did not appear large enough to supply our wants, we therefore determined to make the best of our way to Otaheite, where we were sure of a plentiful supply of refreshments. In the evening we saw land again, which in all probability was another of Mons. Bougainville's discoveries. This we called Doubtful Island.

On the morning of the twelfth instant at day-break we discovered land at about two miles ahead of us, so that we were advised of our danger but just in time. This was another small half drowned island. The sea broke against it in a dreadful surf. This island is in latitude 17 deg. 5 min. longitude 143 deg. 16 min. west. We called it Furneaux Island.

On the seventeenth of August we saw another of these islands in latitude 17 deg. 4. min. longitude 144 deg. 30 min. west. It is with very great propriety that Mons. Bougainville calls these low overflowed islands the Dangerous Archipelago. We were under the necessity of proceeding with the utmost caution, especially in the night, as we were surrounded by them, which the smoothness of the sea sufficiently indicated. On the fourteenth we found ourselves clear of these islands, and steered our course for Otaheite.

We saw Ofnaburg Island (which was discovered by captain Wallis) on the fifteenth, at five in the morning, and acquainted captain Furneaux that it was our intention to put into Oati-piha bay, near the south end of Otaheite, and get what refreshments

we could in that part of the island, before we went to Matavai.

The next day we were within a league of the reef. On account of the breeze failing us, we hoisted out our boats to tow the ships off, but they could not keep us from being carried too near the reef. Many inhabitants came on board from different parts, who brought fruits, &c. to exchange; they most of them knew captain Cook again, and enquired for Mr. Banks and others, but none of them asked for Tupaya. Our situation became still more dangerous as the calm continued. On sending to examine the western point of the reef, in order to get round that way into the bay, we found that there was not sufficient depth of water. Both ships were carried with great impetuosity towards the reef, and all the horrors of shipwreck now stared us in the face. The breakers were not two cables length from us, and we could find no bottom to anchor. The Resolution came at three fathoms water, and struck at every fall of the sea, but the Adventure brought up under our bow without striking. The dreadful surf which broke under our stern threatened our shipwreck every moment. At length we found ground a little without the bason, and got the ship afloat by cutting away the bower anchor, and the tide ceased to act in the same direction. We happily towed off the Resolution, and all the boats were ordered to assist the Adventure. We happily got once more safe at sea, after narrowly escaping a shipwreck. A number of the natives were on board the ships while we were in this perilous situation, but were totally insensible of any danger, even while we were striking, and when they parted with us they seemed quite unconcerned.

We anchored in Oati-piha bay on the seventeenth instant, very near the shore, and were visited by a great number of the natives, who brought roots, fruit, &c. Presents were made to their chiefs of shirts, axes, and other articles, in return for which they promised hogs, fowls, &c. but we believe they never intended to keep their promise.

Captains Cook and Furneaux landed in the afternoon to sound the disposition of the natives, and to view the watering place. The natives behaved with great civility, and we had a very convenient supply of water.

We recovered the Resolution's bower anchor, which we were obliged to leave; but the Adventure lost three in the time of our extremity, which were never recovered. We were still supplied with fruit and roots, but not in large quantities. A party of men were trading on shore, under the protection of a guard. We could not get any hogs from the natives, though plenty were said to be seen about their habitations, they all said they belonged to Waheatow, their chief, whom we had not seen.

A man who pretended to be a chief came on board with several of his friends, to whom presents were made, but he was detected in handing several things over the quarter gallery; and as complaints of the same nature were alledged against those on the deck, the captain took the liberty to turn them all out of the ship. The captain was so exasperated at the conduct of the pretended chief, that he fired two musquets over his head, which terrified him so much, that he quitted his canoe and took to the water. On sending a boat to take up the canoe, the people from the shore pelted the boat with stones. The captain went himself in another boat to protect her, he likewise ordered a cannon loaded with ball to be fired along the coast, which terrified them sufficiently, and he brought away the canoes without any opposition. They soon became friends again, and the canoes were returned.

Two or three people began to enquire after Tupaya, but they were soon satisfied when they heard the cause of his death. Several people asked for Mr. Banks, and other people who were at Otaheite with captain Cook before. We were informed by these people,

people, that there had been a battle fought between the two kingdoms, that Toutaha, the regent of the greater peninsula, was slain, and that Otoo reigned in his stead. In this battle Tubourai, Tamaide, and several of our old friends fell. A peace was now fully established.

On the nineteenth instant the two commanders made an excursion along the coast, and were entertained by a chief (whom they met) with some excellent fish, &c. to whom in return they made several presents. On the twentieth one of the natives stole a gun from the people on shore. Some of the natives pursued him of their own accord, who knocked him down and brought back the musquet. We imagine that fear operated more with them in this business than any other motive.

A chief came to visit us on the twenty-first instant, who brought in a present of fruit, which proved to be some cocoa nuts that we had drawn the water from and thrown overboard. He had so artfully tied them, up that we did not soon discover the deceit. He did not betray the least emotion when we told him of it, and opened two or three of them himself, as if he knew nothing of the matter; he then pretended to be satisfied that it was really so, and went on shore, from whence he sent some bananoes and plantains.

We were informed that Weheatow was come into the neighbourhood; and wished to see captain Cook, who accordingly went in company with captain Furneaux and some gentlemen; they were likewise attended by some natives. About a mile from the landing place they met the chief, advancing to meet them with a numerous train. When the prince perceived the company, he halted. He knew captain Cook very well, as they had seen each other several times in 1769. He went at that time by the name of Terrace, and took his father's name at his death.

We found him sitting on a stool; and as soon as the usual salutation was over, he seated captain Cook on the same stool with himself; the rest sat on the ground. He enquired after several who had been on the former voyage, and seemed sorry when we told him we must sail the next day, offering the captain that if he would stay he should have hogs in plenty. Captain Cook made him many presents, and staid with him the whole morning. This party returned on board of ship to dinner, and made this chief another visit in the afternoon, made him more presents, and he gave us two hogs. At the different trading places some others were got, so that a meal's fresh pork served for the crews of both ships.

We put to sea early in the morning of the twenty-fourth, and were accompanied by several canoes, who brought cargoes of fruit for sale; neither did they return till they had disposed of them. The sick people on board the Adventure got much relief from these fruits. We left a lieutenant on shore, in order to bring some hogs, which they promised to send by him. He returned on the twenty-fifth, and brought eight pigs with him.

We arrived at Matavai bay in the evening of the twenty-fifth, and our decks were crowded with natives before we could get to anchor, almost all of them were acquainted with captain Cook. Otoo their king and a great crowd were got together on the shore. Captain Cook was going on shore to pay him a visit, but was told that he was gone to Oparee in a fright; which seemed very extraordinary to the captain, as all others were much pleased to see him. Maritata, a chief, was on board, and advised the captain to defer his visit till next morning.

The captain set out on the twenty-sixth for Oparee, after having given directions to fetch tents for the reception of the sick, &c. Captain Furneaux, Maritata and his wife, and some others, went with the captain. They were conducted to Otoo as soon as they were landed, who sat on the ground under a shady tree, with a great number of people around him. Captain Cook made him several presents, after the usual compliments had passed, being very well

persuaded that it was much to his interest to establish a friendship with this man. His attendants also had presents made to them; they offered cloth in return, which was refused, being told that what was given was merely out of friendship.

Otoo inquired for all the gentlemen who had been there before, as well as for Tupaya, and promised to send some hogs on board; but was very backward in saying he would come on board himself, being, as he said, much afraid of the great guns. He was certainly the most timid prince, as all his actions demonstrated. He was a personable well made man, six feet high, and about thirty years of age. His father and all his subjects were uncovered before him, that is, their heads and shoulders were made bare.

The king Otoo came on the twenty-seventh to pay us a visit, attended by a numerous train; he sent before him two large fish, a hog, some fruits, and a large quantity of cloth. After much persuasion he came on board himself, accompanied by his sisters, a younger brother, &c. with many attendants, who all received presents; and when they had breakfasted, carried them home to Oparee. Upon landing, an old lady, the mother of Toutaha, met captain Cook, seized him by both hands, and, weeping bitterly, told him that her son and his friend Toutaha was dead. Had not the king taken her from captain Cook, he must have joined her lamentations. It was with a good deal of difficulty that the captain prevailed on the king to let him see her again, when he made her some presents.

Captain Furneaux gave the king a male and female goat, which we hope will multiply. A lieutenant was sent to Attahourou on the twenty-eighth, to purchase hogs. The king, with his sister and some attendants, paid us another visit soon after sun-rise, and brought with them a hog, some fruit, and some more cloth. They likewise went on board the Adventure, and made captain Furneaux the same presents. Soon after they returned, and brought captain Furneaux with them. Captain Cook made them a good return for the presents they brought, and dressed out the king's sister to the greatest advantage.

The king was carried again to Oparee, when his Otaheitan majesty thought proper to depart, and was entertained as he went with bagpipes and the seamen dancing. Some of his people danced also in imitation of the seamen, and performed their parts tolerably well.

Toutaha's mother again presented herself to captain Cook; but could not look upon him without shedding many tears. The next day the king promised to visit us again, but said we must first wait upon him. The lieutenant whom we sent for hogs returned only with a promise of having some, if he would go back in a few days.

On the twenty-ninth instant the commanders took a trip to Oparee, early in the morning, attended by some officers and gentlemen, and made the king such presents as he had not before seen. One of them was a broad sword; at the sight of which he was very much intimidated, and desired it might be taken out of his sight. With a vast deal of argument he was prevailed upon to suffer it to be put on his side, where it remained a very short time.

We received an invitation to the theatre, where we were entertained with a dramatic piece, consisting of comedy and dance. The subject we could not find out; though we heard frequent mention of captain Cook's name during the performance. The performers were one woman, which was no less a personage than the king's sister, and five men, and their music consisted of only three drums. The whole entertainment was well conducted, and lasted about two hours. When this diversion was over, the king desired us to depart, and loaded us with fruit and fish. The king sent more fruit and fish the next morning.

In the evening of the thirtieth we were alarmed with the cry of murder from the shore. A boat was immediately

mediately armed, and sent on shore, to bring off any of our people who might be found there without orders, and to discover the occasion of the disturbance. The boat soon returned, with a seaman and three marines; others were taken, who belonged to the Adventure, and even put under close confinement till the morning, when they were severely punished according to their demerits. The people would not confess any thing, and it did not appear that any material injury had been done. The disturbance might be occasioned by the fellows making too free with the women: notwithstanding this, the alarm was so great, that the natives fled from their habitations in the night; and the inhabitants of the whole coast were terrified. The king himself had fled a great way from the place of his abode; and when captain Cook saw him, he complained to him of the disturbance.

Captain Cook presented the king with three Cape sheep, as it was his last visit. With this present he was very well pleased, though he had not much reason to be so, as they were all weathers; this he was made acquainted with. The king's fears were now dissipated, and he presented us with three hogs, one of which was very small, which we took notice of. Soon after a person came to the king, and seemed to speak very peremptorily about the hogs, and we thought he was angry with him for giving us so many, and more so when he took the little pig away with him; but we were much mistaken, for soon after we were gone, another hog was brought to us, larger than the other two. The king seemed much affected when captain Cook told him he should leave the island the next day. They embraced each other several times, and departed.

On the first of September we determined to depart, as the sick were nearly recovered, the necessary repairs of the ship were completed, and plenty of water provided. Most of the day was employed in unmooring the ships; and in the afternoon the lieutenant returned, who had been sent for the hogs promised. With him came Pottatou (the chief of the district of Attahounou), with his wife, to pay captain Cook a visit, and made him a present of two hogs and some fish. The lieutenant got likewise two more hogs. As the wind was westerly, we were obliged to dismiss our friends sooner than they wished; but they were very well satisfied with the reception they met with.

A young man, named Poreo, came on board some hours before we got under sail, and desired to go with us, to which we consented; and at the same time he asked for an ax and a spike nail for his father, who came with him on board. They were accordingly given him, and they parted with great indifference, which seemed to indicate that they had deceived us, and no such consanguinity subsisted. Presently a canoe, conducted by two men, came along-side, and demanded Poreo in the name of Otoo. We informed them that we would part with him if they would return the hatchet and spike nail, but they said they were ashore; so the young gentleman sailed along with us, though he wept when he saw the land at our stern.

On the second instant we steered our course for the island of Hualheine, and the Resolution anchored in twenty-four fathoms water on the third instant, but the Adventure got ashore on the north side of the channel, but she was happily got off again without receiving any damage. The natives received us with the utmost cordiality, several of whom came on board before our commanders went on shore. Some presents were distributed amongst them, which were gratefully returned by a plentiful supply of hogs, fowls, fruit, &c. Here we had a fine prospect of being plentifully supplied with fresh pork and fowls, which was to us very pleasing.

Two trading parties were sent ashore on the fourth instant, which were very well conducted. Captain Cook was informed that Oree was still alive, and waited to see him. The commanders, with Mr. Foster, went to the place appointed for the interview,

accompanied by one of the natives. The boat was landed before the chief's house, and we were desired to remain in it till the necessary ceremony was gone through. There stood close to the shore five young plantain trees, which are their emblems of peace; these were, with some ceremony, brought on board separately. The first three were each accompanied by a young pig, whose ears were ornamented with coconut fibres; the fourth plantain tree was accompanied by a dog. All these had particular names and meanings, which we could not understand. The chief had carefully preserved a piece of pewter, with an inscription on it, which captain Cook had presented him with in 1769, together with a piece of counterfeit English coin, which, with a few beads, were all in the same bag the captain made for them; these the chief sent on board. This part of the ceremony being over, we were desired by our guide to decorate three young plantain trees with nails, looking-glasses, beads, medals, &c. With these in our hands we landed, and were conducted through the multitude. We were directed to sit down a few paces before the chief, and the plantains were laid one by one before him. We were told that one was for God, another for the king, and the third for friendship. This being done, the king came to captain Cook, fell on his neck, and kissed him. A great effusion of tears fell down the venerable cheeks of this old man; and if ever tears spoke the language of the heart, surely these did. Presents were made to all his attendants and friends. Captain Cook regarded him as a father, and therefore presented him with the most valuable articles he had. He gave the captain a hog, and a good deal of cloth, with the promise that all his wants should be supplied.

Soon after we returned on board, fourteen hogs were sent us, with fowls and fruit in abundance. In the morning of the fifth instant we were visited by this good old man, who brought a hog and some fruit; indeed he sent the captain every day ready dressed fruit and roots in great plenty. This morning the lieutenant went on shore in search of more hogs, and returned in the evening with twenty-eight; and about seventy more were purchased on shore.

On Monday the sixth of September the trading party went on shore as usual; it only consisted of three people. Captain Cook went on shore after breakfast, and learnt that one of the inhabitants had been very insolent and troublesome. This man was shewn to the captain, equipped in his war habit, and he had a club in each hand. The captain took these from him, as he perceived him bent on mischief, broke them before his face, and obliged him to retire. The captain being informed that this man was a chief, became a little suspicious of him, and sent for a guard.

Much about this time a gentleman had gone out botanizing alone; two men assaulted him, and stripped him of every thing but his trowsers; luckily they did him no harm, though they struck him several times with his own hanger. They made off when they had done this, and another of the natives brought a piece of cloth to cover him. This gentleman presently appeared at the trading place, where a number of the natives were assembled, who all fled at seeing him. Captain Cook persuaded some of them to return, assuring them that none should suffer who were innocent.

When the king heard this complaint, he and his companions wept bitterly; and as soon as his grief was asswaged, he made a long harangue to the people, telling them the baseness of such actions, when the captain and his crew had always behaved so well to them. He then took a particular account of the things the gentleman had lost, and promised they should be returned, if it was in his power to find them. After this he desired captain Cook to follow him to the boat, but the people being apprehensive of his safety, used every argument to dissuade him from it. It is impossible to describe the grief they expressed in the intreaties they used; every face was bedewed with

with tears, and every mouth was filled with the most dissuasive arguments. Oree was deaf to them all, and insisted on going with the captain; when they both were in the boat, he desired it might be put off. The only person who did not oppose his going, was his sister, and she shewed a magnanimity of spirit equal to her brother.

We proceeded in search of the robbers, as far as it was convenient by water, and then landed. The chief led the way, travelled several miles, and enquired after them of all he saw. We then went into a cottage, and had some refreshment. The king wanted to proceed farther, and was with great difficulty dissuaded from it by captain Cook. When we returned to the boat, we were met by the king's sister, who had travelled over land to that place, accompanied by several other persons. The king insisted on going into the boat with us, as well as his sister. We returned to the ship, and the king made a very hearty dinner; though his sister, according to custom, ate nothing. We made them suitable presents for the confidence they had placed in us, and set them ashore amidst the acclamations of multitudes.

Peace was now perfectly re-established, provisions poured in from all quarters, the gentleman's hanger and coat were returned, and thus ended these troublesome transactions.

We went to take our leave of Oree while the ships were unmooring, and presented him with things both valuable and useful. We left him a copper-plate, with this inscription. "Anchored here, his Britannic Majesty's ships Resolution and Adventure, September 1773." After we had traded for such things as we wanted, we took our leave, which was a very affectionate one. On returning to the ships, they were crowded, as on our arrival, with canoes filled with hogs, fowls, &c. Soon after we were on board, the king came, and informed us that the robbers were taken, and desired us to go on shore, that we might behold their exemplary punishment. This we should have been glad to have done, as so much pains had been taken to discover them; but it was out of our power, as the Adventure was out of harbour, and we were under sail. The good old king staid with us till we were near two miles out at sea, and then, after taking another affectionate leave, parted. During our stay here, we procured upwards of three hundred hogs, besides fowls and fruit in great abundance.

During our stay at this island, captain Furneaux engaged a young man, named Omai, a native of Ulitea, who had been dispossessed of his property by the people of Bolabola, to accompany him on his voyage. This young man has a good understanding, honest principles, and a natural good behaviour. But his history is so well known in England, that we will not enlarge upon it.

On Wednesday the eighth instant we entered the harbour of Ohamaneno; the natives crowded about us with hogs and fruit as soon as we were anchored. We refused the hogs, as we had already more than we could manage; but several of the principal people obliged us to take them whether we would or no.

We made a visit on the ninth instant to Oreo, who is the chief of this part of the island of Ulitea. He expressed great satisfaction on seeing captain Cook again, and desired him to exchange names with him, which the latter agreed to: this is a distinguishing mark of friendship. Here we traded as usual, but the balance of trade was much in our favour.

On the tenth the chief entertained us with a comedy; a very entertaining part of which was a theft, committed, with amazing dexterity, by a man and his accomplice. Before the thief has time to carry off the prize, he is discovered, and a scuffle ensues: The discoverers are vanquished, and the thieves go off in triumph. We returned to dinner after the play was over, and as we were walking on shore in the evening, one of the natives informed us that there were nine uninhabited islands to the westward.

Oreo and his son paid us a visit early in the morning of the eleventh of September, and brought, as usual, hogs and fruit with them. We dressed the youth in a shirt, and some other articles, of which he was not a little proud. After staying some hours, they went ashore, and so did captain Cook soon after, but to another part of the shore. When the chief heard he was landed, he went of his own accord and put a hog and some fruit in the boat, and returned without saying any thing of it to any other person. He afterwards came with some friends to dinner.

Po-oorau, who is the most eminent chief of the island, made us a visit after dinner. He was introduced by Oreo, and brought a present with him; for which he received a handsome return. We promised to visit both the chiefs the next morning; which we accordingly did, in company with several gentlemen. Another play was acted, and two very pretty young women performed; otherwise this piece was not so entertaining as the one we saw before.

On the fourteenth instant we sent on shore for a supply of bananoes and plantains, for sea store. Oreo and some friends paid us a pretty early visit, when we informed him, that we would dine with him on shore, and desired he would let us have two pigs for dinner, dressed in their fashion. We found the floor of the chief's house strewn thick with leaves; and we were soon seated round them. Soon after the pigs came tumbling over our heads upon the leaves; and they were both so hot as scarcely to be touched. The table was ornamented with hot bread-fruit and plantains; we had likewise a quantity of cocoa-nuts to drink. We never saw victuals dressed cleaner nor better in our lives, and it had a most exquisite flavour, much superior to victuals dressed in our mode; how they contrived it we cannot tell, but though one of these hogs weighed fifty pounds at least, it was well done in every part, and not too much done in any. Oreo and his son, with some male friends, dined with us. We had a great number of attendants and people who came to see us thus dine in public, to whom pieces of pork were handed. The chief did not refuse his glass of Madeira whenever it came to his turn, and we never at this, or any other time, saw him affected by it. The boat's crew took the remainder when we had dined. In the afternoon we were again entertained with a play.

On the fifteenth we had a sufficient proof of the timorous disposition of these people. We rather wondered that none of them came to the ships as usual. We were afraid that as two men of the Adventure's crew staid out all night contrary to orders, that the natives had stripped them, or done them some other injury, and were afraid we should revenge their conduct. We went ashore, and found the neighbourhood nearly deserted. Presently the two men made their appearance, and reported that they had been very civilly treated. We could get no account of the cause of their flight, and could only learn from a few persons who ventured near us, that several were killed and wounded, and pointed to their bodies where the balls of the guns went in and out. Captain Cook was very uneasy at this relation, fearing for the safety of the people gone to Otaha. In order to get the best information, the captain determined to go to the chief himself, whom, after much searching for, he found seated under the shade of a house, with a great many people round him. There was a great lamentation as soon as captain Cook approached, the chief and all his company bursting into tears. After all this piece of work, it was found that the cause of their alarm was on account of our boats being absent, supposing that the people in them had deserted us, and that we should adopt violent methods to recover them. They were satisfied when captain Cook assured them there was no cause for alarm, and that the boats would certainly return.

On the morning of the sixteenth we paid the chief a visit, who was in his own house in perfect tranquillity. At this time Poreo left us, having contracted

tracted a friendship with a young woman. He had a powder-horn in his keeping, which he restored to one of the ship's company before he went away.

The party we had sent to Otaha returned this day well laden with plantains, who informed us, that they were very hospitably received. We determined to put to sea on the seventeenth, having a good supply of all kinds of refreshments. Before we sailed, Oreo and his son paid us a visit. Several canoes filled with fruit and hogs surrounded us; the latter we could receive no more of, as our decks were so crowded with them we could hardly move; in both ships we had about three hundred and fifty. Oreo and his friends frequently pressed us to tell them when we should return; they did not leave us till we were under sail.

Captain Cook took a young man on board named Occidee, a native of Rolabola, and a near relation of the chief of that island.

We must remark, that great injustice has been done the women of the Society Isles and Otaheite, by such people as have represented them as a race of prostitutes. This is not the case with the higher or middling class, it being as difficult to obtain the least favours from them as from the ladies of any other country. We should think it very hard if the English ladies were condemned in the lump, from the conduct of those who are to be found in Covent-garden and Drury-lane.

It was now our intention to get into the latitude of the islands of Middleburg and Amsterdam; we proceeded by night with great caution, for fear of meeting with land. We saw land on the twenty-third instant, which proved to be two small islands covered with wood; but there were no signs of inhabitants. More islands had a connection together, and we called them Hervey's islands.

We saw Middleburg on the first of October, which, however, we did not touch at, as we could not find safe anchorage; and steered our course for Amsterdam, which was then in view. The shores of Middleburg now bore a different appearance, and two canoes with inhabitants came along-side of us. We therefore anchored in twenty-five fathom water, under the island. We were now visited by great numbers of the inhabitants, and a trade was immediately opened. Among these was a chief named Tioony, who received presents from captain Cook.

A party went on shore, accompanied by Tioony, and were received by multitudes of people, with loud acclamations. Those people seemed more willing to supply us with various articles, than to receive ours in return, and they thronged about us so much, that it was with the greatest difficulty we could land. We were at length conducted to the chief's house, which is very pleasantly situated. We ordered the bagpipes to play, and the women danced and sung both gracefully and harmoniously. We returned on board to dinner, the chief bearing us company. We went on shore again after dinner, and desired to see the country, which they very readily shewed us. The plantations were inclosed with neat fences, and laid out with great judgment; they consisted of various fruit trees, roots, &c. The only domestic animals we saw were hogs and fowls, which they did not like to part with.

Every person was very much pleased with this delightful country and the reception they met with, and regretted that the season of the year, and other circumstances, would not permit our longer stay. We took leave of the chief, and departed for Amsterdam.

Before we were got more than half way to Amsterdam we were met by three canoes, who made several attempts to come on board, but without effect, as the rope we gave them broke, and we did not chuse to shorten sail for them. They likewise were unsuccessful in boarding the Adventure. This whole island appeared covered with plantations, and we saw the natives on the shore displaying flags, which we imagined were emblems of peace.

Several canoes met us, and without any ceremony came on board, as we entered the west side of the island, and invited us on shore. We anchored in eighteen fathoms water, in Van Dienien's road. The seamen were now so eager in purchasing curiosities by bartering away their cloaths, that captain Cook found it absolutely necessary to prohibit any further commerce of this sort. The natives now brought us fowls, pigs, barances, and cocoa nuts, for which we gave them nails and old rags.

A trading party was now settled, and our commanders went on shore in company with Otago, who had attached himself to captain Cook, before the ships came to anchor; Otago was a chief; the captain and he exchanged names. We were received on shore with every demonstration of friendship. Presents were made to the principals among them, and we desired to see the country; we were immediately conducted along a lane, at one end of which we found a place of worship, built on a mount about eighteen feet high; the building was oblong, and inclosed by a stone parapet. Every one seated himself on the green as soon as we came before the place. Three elderly men, whom we took for priests, came and muttered some religious ceremony, and then sat down with us.

We then viewed the premises, to which they did not shew the least reluctance. The house was built like other dwelling-houses; round it was a fine gravel walk, and the ascent to it was easy. In the centre of the floor, which was laid with fine gravel, was an oblong square of blue pebbles. An image roughly carved in wood stood in one corner of the building. This image they handled very roughly, which convinced us that they did not worship it as a divinity. We made an offering at the altar, consisting of medals, nails, &c. which Otago thought proper to take up and put in his pocket. At last we found out that this was a burial place, of which there are several in this island.

The country hereabouts is surprisngly fertile and well cultivated; we might easily have imagined ourselves in the most pleasant situation that Europe could afford. There are various delightful walks, and not an inch of uncultivated ground is to be seen; in these transporting places we met great numbers of people going and coming to and from the ships with fruits, &c. We soon after saw another of these burial places much larger than the former one, and some additional ceremonies were observed on our approach.

We returned to dinner in company with Otago and another person, whom we understood to be a king, or some great man, for Otago would not presume to eat at the same table with him; after dinner this stranger returned on shore, and Otago finished his meal very heartily. In return for his entertainment, we were presented with a hog and some fruit.

We were conducted to a pool of fresh water, though we did not enquire for any. It is very probable that this was the washing-place for the king and his nobles, mentioned by Tasman. We were afterwards shewn a boat-house, where was a large double canoe not yet launched, which belonged to the old chief who had been on board with Otago.

The botanizing and shooting parties were all well entertained by the natives, and the trading party made many advantageous bargains.

On the fifth of October we sent the pinnace on shore to trade as usual, and we were soon informed that the natives grew very troublesome, which obliged us to send a guard. The commanders afterwards went again on shore, making presents, and receiving others in return. We were by this time pretty well supplied with refreshments, and the sailors had now leave to purchase any curiosities they had a fancy to, which opportunity they embraced with great eagerness; indeed they became quite the ridicule of the natives, who jeeringly offered them sticks and stones in exchange for goods, and a saucy boy took a piece of human dung on a stick and offered it for sale.

A fellow found means this day to get into the master's cabin, out of which he stole several locks, and other articles, with which he was making off in his canoe; on being pursued by one of our boats, he left the canoe and took to the water; but our people could not lay hold of him, as he dived very well. Several other daring thefts were committed. One man stole a seaman's jacket, and he would not part with it till he was fired at and pursued.

When we were about to depart, Otago was very importunate with captain Cook to return to this island, and promised us every supply we could desire. He likewise wanted the Captain to bring him a suit of cloaths like his own, meaning his uniform. This man was very faithful and serviceable to us, during our stay. We unfortunately lost an anchor at this place by the breaking of the coasting cable, which had been chafed by the rocks. We got at this island about three hundred fowls, one hundred and fifty hogs, and as many cocoa-nuts and bananas as we could store.

Large flocks of sea fowls attended us when we left the torrid zone. We had an opportunity of observing how carefully nature has allotted to each animal its proper place of abode, for on the twelfth we saw an albatross. Among the rest of the inhabitants of the temperate zone, these birds never dare to cross the tropic, but roam from thence as far as the polar circle.

On the morning of the twenty-first instant we discovered land, and stood in shore till we were abreast of Table Cape and Portland Island, which is joined to it by a ledge of rocks; we were gazed at by the natives as we passed, but none of them ventured to come off in their canoes. We advanced to the Black Cape on the twenty-second, and now several inhabitants took courage and boarded us, among whom was a chief; he was clothed elegantly, and his hair was dressed in the high fashion of the country. We entertained him in the cabin, and his companions sold us some fish. These people were very fond of nails, and the chief received them with much greater eagerness than when the captain gave him hogs, fowls, seeds, and roots. We obtained from him a promise not to kill any, and if he keeps his word, there are enough to stock the whole island; the present consisted of two fows, two boars, four hens, and two cocks; we likewise gave him several useful seeds, and instructed him in the manner of setting them. These people very well remembered the Endeavour having been on their coast.

The Adventure was now a good way to leeward, and as we were obliged to tack, she was consequently separated from us; we were joined by her on the twenty-fourth. The wind was now very high, so that we could carry hardly any sail; we endeavoured to make Cape Palliser, but we had such a hard gale for two days, that drove us off the land just as we were in sight of port. This was very mortifying; but two favourable circumstances attended it, for we were in no danger of a lee-shore, and it was fair over head.

In the evening of the twenty-fifth we endeavoured to find the Adventure, which the storm had separated, but without effect, the weather being so hazy, that we could not see a mile round us. On the twenty-eighth we saw the Adventure about five miles to leeward, and we kept company with her till the night of the twenty-ninth, when she disappeared, nor did we see her at day light. Charlotte Sound was the appointed place of rendezvous; and as we had separated from the Adventure, we were obliged to make for it, otherwise captain Cook would have fought a supply of wood and water further south. We stood to the eastward, in hopes of meeting with the Adventure.

On the second instant the morning was very clear, and we kept a sharp look-out for the Adventure; but as we could not see her, we judged she was got into the sound. We accordingly made for the shore of

Eakeinomauwe. In doing which we discovered an inlet, which the captain had never observed before, on the east side of cape Teerawhitte. We anchored in twelve fathoms water, at the entrance of this inlet; and several of the inhabitants came on board, who were extravagantly fond of nails. We ran up into Ship Cove on the third of November, where we expected to see the Adventure, but were disappointed.

Here we were obliged to unbind the sails, which had been very much damaged in the late storms. Several people came on board, who remembered the Endeavour when on this coast, particularly an old man called Goubiah. The empty casks were ordered on shore, and the necessary repairs both to them and the ships were ordered to be made. We were unsuccessful in our fishing parties, but were well supplied by the natives with that useful article. On opening the bread casks, we found a great deal of it damaged; that which remained good we baked over again, in order to preserve it.

On the fifth of November one of the natives took an opportunity of stealing one of the seamen's bag of cloaths, which with some difficulty we recovered. This made our people more cautious in future. We found one of the fows which captain Furneaux put on shore, and were informed that the boar and other fow were taken to another part, but not killed. We were mortified very much when we heard that old Goubiah had killed the two goats which captain Cook put on shore, and were concerned to think that our endeavours to stock this country with useful animals were likely to be rendered fruitless, by those very people for whose benefit they were designed.

Nature had amazingly assisted our intentions in the gardens, every thing was in a flourishing state except the potatoes, which were most of them dug up. We put on shore another boar and fow, with two cocks and four hens. We purchased a large quantity of fish from the natives, who were very much inclined to theft; we detected them picking our pockets very frequently. Several strangers came to visit us in five canoes, they took up their quarters in a cave near us, and decamped the next morning with six of our small water casks. All the people whom we found on our arrival likewise went with them. Some of them returned in a day or two, and supplied us with fish.

We made a party on the fifteenth instant to the summit of one of the hills, in order to look for the Adventure, but were disappointed, and were totally at a loss to know what was become of her. When we returned, the natives were collected round our boat, to whom we made some presents, and went on board. We were very well supplied with fish during our stay here.

On the twenty-second we took one boar and three fows, together with some cocks and hens, into the woods, where we left them with provision sufficient for ten or twelve days, with hopes that the natives would not discover them till they had bred.

Some of our officers having visited the dwelling-places of several of the natives, found some human bones, from which the flesh appeared to be lately taken. On the twenty-third some of our officers being on shore saw the head and bowels of a youth, lately killed, lying on the beach; his heart was stuck on a fork, and fixed on the head of one of the largest canoes. The head was bought, and brought on board by one of the gentlemen, where one of the natives broiled and eat it before the whole ship's company, and it made several of them sick. Ocdidee, whom we had brought with us, expressed his horror at this transaction in terms which it is impossible for us to describe. It is certain that the New Zealanders are cannibals, which this circumstance fully proves; but from all we could learn, they only eat the flesh of those slain in battle. This youth had fallen in a skirmish with some of the natives, as well as several others; but how many, or what was the cause of the quarrel, we could not learn.

Our crew had for three months past lived almost wholly on fresh provisions and vegetables, and we had, at this time, neither a scorbutic nor sick person on board.

Before we quitted this place, we left a memorandum, setting forth the day of our departure, what course we intended steering, &c. and buried it in a bottle, where it must have been discovered, did captain Furneaux tack at this place, though we did not place any great expectation in such an event. We sailed from this place on the twenty-fifth of November, and sought the Adventure in several harbours, but without effect. All hopes of seeing her again were now vanished, and we set about our intended discoveries by ourselves. The ship's company were perfectly satisfied with captain Cook's care and conduct, and did not express any uneasiness at our being unattended.

We steered to the south on the twenty-sixth instant; and on Monday the sixth of December found ourselves antipodes to our London friends. We were then in south latitude 50 deg. 17 min. and east longitude 179 deg. 40 min. We met with several flights of our old companions, albatrosses, petrels, &c. We sailed through large quantities of loose ice on the fourteenth, and discovered many ice islands. We were soon embayed by the ice, and were obliged to stretch to the north-west; we were now in much danger, owing to the ice islands and the fog. We attempted to take some of the ice on board, but without effect; but on the seventeenth we succeeded, and got on board as much as we could manage.

On Tuesday the twenty-first instant we came the second time within the antarctic circle; and on a sudden got amongst a great quantity of loose ice, and a cluster of ice islands, which it was very difficult to steer clear of, as the fog was so thick. On the twenty-fourth instant they increased so fast upon us, that we could see near an hundred round us, besides an astonishing quantity of small pieces. Here we spent the twenty-fifth, being Christmas-day, in much the same manner as we did the preceding one.

We steered north-west on the second of January, in order to explore great part of the sea between us and our track to the south; but were obliged to steer north-easterly the next day, and could not accomplish our design. Many of the people were attacked with slight fevers while we were in these high latitudes, but happily they were cured in a few days.

If we take every circumstance into consideration, it is not very probable that there is any extensive land in our track from Otaheite, which was about two hundred leagues; and that any lay to the west is still less probable; we therefore steered north-east. There was no sign of land; and therefore on the eleventh instant we altered our course, and steered south-east. On the twenty-fifth we found ourselves in a pleasant climate, and no ice in view; on the twenty-sixth came a third time within the antarctic circle.

On Sunday the thirtieth we saw a very extensive field of ice, and within the field we distinctly enumerated ninety-seven ice hills of various sizes; it is probable that such mountains of ice were never seen in the Greenland seas. On this account, the attempt to get farther to the south, though not absolutely impossible, was yet both rash and dangerous. The majority of us were of opinion that this ice extended to the pole, as it might possibly join some land to which it has been contiguous since the earliest times. Should there be land to the south behind this ice, it certainly can afford no better retreat for man, beast, or birds, than the ice itself, with which it must certainly be covered. As we could not go any farther to the south, we thought it advisable to tack and stand back to the north. Happily for us we tacked in good time, for we had no sooner done it than a very thick fog came on; which would have been highly dangerous, had it come on when we fell in with the ice.

On the first of February we were able to take in some more ice, which, though it was cold work to

collect, served us for present consumption when melted. Our commander was now well satisfied that no continent was to be found in this ocean, but that which is totally inaccessible; he therefore determined to pass the ensuing winter within the tropic, if he met with no other object worth pursuing. It was determined to steer for the land discovered by Juan Fernandez, or, in failure of this pursuit, to search for Easter Island or Davis's Land, which we knew very little about. The sailors, and all on board acceded to these designs, and were happy at the thoughts of getting into a warmer climate. We had continual gales from the eighth to the twelfth instant, when it fell a dead calm: The weather varied every day considerably till the twenty-fifth, when captain Cook was persuaded that the discovery of Juan Fernandez, if any such was ever made, could be nothing but a small island, not worth notice.

On the twenty-fifth, captain Cook was taken so ill as to be obliged to keep his bed, and recovered very slowly. It is something very extraordinary, that when he could eat nothing else he had a mind to a dog of Mr. Foster's, which was killed, and he relished both the flesh and the broth made of it. This seems very odd kind of food for a sick man; and, in the opinion of many people, would create much greater sickness than it was likely to be any means of removing.

On the eleventh of March land was seen from the mast-head, which proved to be Easter Island; and on the thirteenth came to an anchor in thirty-six fathoms water, before the sandy beach. One of the natives came on board the ship, where he staid two nights. He measured the length of the ship, and called the number by the same names as the Otaheiteans do; but otherwise we could not understand his language. A party of us went ashore on the fourteenth, and found a great number of the natives assembled, who were pacifically inclined, and seemed desirous to see us. We made signs for something to eat, after we had distributed some trinkets among them; they brought us some sugar-canes, potatoes, and plantains.

We very soon found out that these gentlemen were as expert thieves as any before met with; we could scarce keep any thing in our pockets, and it was with some difficulty that we could keep our hats upon our heads. These people seemed to understand the use of a musket, and to be very much afraid of it.

Here were several plantations of potatoes, sugar-canes, and plantains; but otherwise the country appeared barren and without wood. We found a well of brackish water, and saw some fowls. As the natives did not seem unwilling to part with these articles, and as we were in want of them, we determined to stay a few days. A trade was accordingly opened with the natives, and we got on board a few casks of water.

A party of officers and men were sent up the country in order to examine it; and captain Cook remained on shore among the natives. An advantageous trade for potatoes was opened, but soon put a stop to by the owners of the spot from whence they were dug. It seems that they had stolen these potatoes; for they all ran away at his approach. From this circumstance it is pretty evident that they are not more strictly honest among themselves than to strangers.

The reconnoitring party, above mentioned, were followed by a crowd of natives; and before they had proceeded far, they were met by a middle-aged man, with his face painted. He had a spear in his hand, and walked along with him, keeping his countrymen at a distance, that our people might receive no molestation from them. This man was punctured from head to foot. This party found the greatest part of the island barren; though in many places there were plantations of the roots before mentioned. They met with the ruins of three platforms of stone work. On each of these platforms had stood four very large statues, made of stone, but they were now fallen to the ground, and much defaced. These statues were
fifteen

fifteen feet long, and six feet broad across the shoulders. On the head of each statue was a round red stone, of considerable magnitude.

They travelled on, and found in some places a poor sort of iron ore, and afterwards came to a fruitful part of the island, on which were several plantations. They could get no good water in their journey; but they were obliged to drink what they could get, on account of the extremity of their thirst. They found the natives so addicted to theft, that they were obliged to fire some small shot at a man, who took from them their bag of provisions and implements. The shot hit this fellow in the back, on which he dropped the bag and fell; but he soon afterwards got up and walked off. Some delay was occasioned by this affair. The man before mentioned ran round them and repeated several words, which they could not understand; and afterwards they were very good friends together, no one attempting to steal any thing more,

A number of the natives were assembled together on a hill at some distance, with spears in their hands, but dispersed at the desire of their countrymen. There appeared to be a chief amongst them, which wore a better cloth than the rest. He had a fine open countenance, and was very well made. His face was painted, and his body punctured.

They met with some pretty fresh water towards the eastern end of this island, but it was rendered dirty by a custom which the inhabitants have of washing themselves in it as soon as they have drank. Let the company be ever so large, the first that gets to the well jumps into the middle of it, drinks his fill, and washes himself all over; the next does the same, and so on till all of them have drank and washed.

Great numbers of the gigantic statues, before described, are to be seen on this part of the island; one of which they measured, and found it to be twenty-seven feet long, and eight feet broad across the shoulders. One of these figures, of an astonishing height, being standing, it afforded shade for the whole party to dine under, which consisted of thirty persons. Many gained the summit of a hill, but could not see any bay or creek, nor discover any signs of fresh water. They returned to the ship in the evening.

No shrubs worth mentioning were found in this excursion, neither did they see an animal of any sort, and but very few birds. They could not discover any thing in the whole island to induce ships, in the utmost distress, to touch at it; we therefore sailed from hence on the sixteenth.

We steered for the Marquesas islands, intending to make some stay there if nothing material intervened. On the sixth of April we discovered an island, when we were in latitude 9 deg. 20 min. and longitude 138 deg. 14 min.; we were about nine leagues distance from it. We soon discovered another, more extensive than the former, and presently afterwards a third and a fourth; these were the Marquesas discovered in 1595 by Mendana.

After various unsuccessful trials to come to an anchor, we came at last before Mendana's port, and anchored in thirty-four fathoms water, at the entrance of the bay. Several canoes appeared, filled with natives, but it was with some difficulty they were persuaded to come along-side; they were at last induced by some spike nails and a hatchet. From these people we got some fish and fruit.

Great numbers of them came along-side next morning, and brought with them one pig, some bread-fruit and plantains, for which they received nails, &c. We often detected them in keeping our goods, and making no return; which practice was not put a stop to till captain Cook fired a musket-ball over the head of one man, who had repeatedly served us so. We wanted to get farther into the bay, and accordingly fought after a convenient place to moor the ship in. When captain Cook saw there were too many natives on board, he desired that they might be well looked after, or they would certainly commit many

thefts. Before the captain was well got into the boat, he was told that a canoe, with some men in her, were making off with one of the iron stanchions from the opposite gangway. The captain immediately ordered them to fire over the canoe, but not to kill any body. There was such a noise on board, that his orders were not distinctly heard, and the poor thief was killed at the third shot. The rest that were in the canoe leaped overboard, but got in again just as captain Cook came up to them, and threw overboard the stanchion. One of the men sat laughing as he laded the blood and water out of the boat, but the other looked very serious and dejected. We afterwards had reason to think that the father of the latter had been shot.

The natives retired with great precipitation at this unhappy accident; but their fears were in some measure allayed by the captain's following them into the bay, and making them presents. We found fresh water ashore, which we very much wanted. One would have imagined that the fatality attending one poor fellow's thieving, would have discouraged them from making any more attempts of the like nature; but no sooner was our kedge anchor out, but two men came from the shore, wanting to take away the buoy, not knowing what was fastened to it. Lest they should take away the buoy, a shot was fired, which fell short of them: of this they took not the least notice; but when another was fired, which went over their heads, they instantly let go the buoy, and returned to the shore. This last shot had a good effect; for by this they saw that they were not safe at any distance, and they were ever afterwards much terrified at the sight of the musket.

They still continued to practice their art of thieving; but it was judged better to be put up with, as we did not intend making a long stay here. A man who had the appearance of a chief came off to us with a pig upon his shoulder; he was presented with a hatchet in return, and afterwards great numbers of the natives came along-side, and carried on some traffic.

Another party of men were sent ashore, when matters were thus re-established. The natives received us civilly, and we got a supply of water, as well as some hogs and fruit. On the ninth instant another party went ashore, and were met by a chief of some consequence, attended by several of the natives. Presents were made to him; but we could not prevail on him to return with us to dinner.

In the afternoon another party was made to the southern cove, which came to the house that belonged to the man we had killed. His son inherited his substance, which consisted of five or six pigs; but he fled at our approach. We should have been glad to have seen him, as we wanted to convince him that we bore the nation no ill-will, though we killed his father, and to have made him some presents by way of a small compensation. We collected a good many pigs and other refreshments this day, and returned on board in the evening.

We obtained several pigs from the different canoes that came along-side of us on the tenth instant; and by this time we had a sufficient number to afford the crews a fresh meal. A party was made on this day, which was successful in the purchase of several more pigs, and a large quantity of fruit.

We had now a fine prospect of getting a supply of all manner of refreshments; but our expectations were frustrated, by some of our crew having been on shore, and selling them such articles as they had never before seen, which made the natives despise the hatchets and nails, which before they so much prized. As this was the case, and we had much need of refreshment, having been a long time at sea, it was determined to remove our quarters, and make sail for Otaheite, hoping to fall in with some of those islands discovered by the Dutch and other navigators.

On the seventeenth of April we saw land, which proved to be a string of low islands connected together. A boat was sent out to examine the foundings of these islands.

islands. The inhabitants appeared along the coast with long spears and clubs. The master of the boat came back, and reported that there was no anchorage in the creek which he had been sent up; but as it was not necessary that we should anchor in that place particularly, and as the inhabitants had shewn some tokens of friendship, two armed boats were sent on shore to have an interview with them. They landed without any opposition: a little while after, a large party of the natives joined those who were collected near the shore, when captain Cook kept close in with the shore, in order to support them in case of an attack, which fortunately did not happen.

The armed boats returned to the ship, and the lieutenant who commanded them, informed captain Cook, that he saw many more inhabitants armed with spears in the skirts of the woods, and that the natives received the presents he made them in a very cool and indifferent manner, which were sufficient proofs to him that they were looked upon as intruders. The lieutenant likewise said, that he was glad to embark and return, when the natives received their reinforcement; that some people wished the boat to stay, and others assisted in pushing her off. He said they saw plenty of dogs, five of which he brought on board with him, but saw no fruit, except cocoa-nuts.

This island is called Tiookea; commodore Byron discovered it. It is situated in south latitude 14 deg. 27 min. 30 sec. and west longitude 144 deg. 56 min. it is of an oval form, and about ten leagues in circumference. The inhabitants are hardy and robust, and of a much darker colour than those of the higher isles. They seem indebted to the sea entirely for their subsistence.

We went to another island on the eighteenth instant, which proved to be just such another as we had left, and must be the same to which commodore Ripon gave the name of St. George's island.

We left this island without landing upon it, and discovered land to the westward on the nineteenth. We bore down to it, and discovered some inhabitants on shore, who appeared much like those of Tiookea. In the whole we saw four islands, which captain Cook called Palliser's islands, in honour of Sir Hugh Palliser, at that time Comptroller of the navy, and who has since been the topic of much conversation.

When we were clear of these islands we made for Otaheite, the wind much in our favour. The high land of Otaheite was made on the twenty-first. We steered for Point Venus, and made it by the evening, and anchored in seven fathoms water in Matavai bay. The inhabitants were much rejoiced at our return.

A place was pitched upon for making astronomical observations, tents were erected, and a guard sent on shore to protect them. We had no sick on board, owing to the care of the commander and the surgeon, and the refreshments got at the Marquesas. On the twenty-third our old friends the natives brought us a plentiful supply of fruit and fish. We were honoured with a visit on the twenty-fourth from Otoo, and several chiefs his attendants, who brought with them a large present of hogs and fruit, which made them remarkably welcome. Captain Cook paid the king every mark of respect; and both he and his attendants were highly satisfied with their visit.

They renewed their visit on the twenty-fifth, though there was a great storm of thunder, lightning, and rain. Fortunately for us, we had collected a quantity of red parrot feathers when we were at Amsterdam. These the people were very anxious to obtain, and brought us large presents for these valuable commodities. These feathers were now become of as much importance to us as the natives, for our stock in trade was nearly exhausted; so that we should have found it very difficult to have obtained refreshments, had it not been for the plumage of these poor parrots.

The face of this country was now entirely changed. We found at Oparee and Matavai a great number of canoes building, with houses of every kind. Those people, who had not a place to shelter them eight months

ago, now dwelt in splendid habitations; plenty was visible in every part, and the breed of hogs considerably increased. Here we determined to stay, and make the necessary repairs, as well as obtain the desired refreshments.

Captain Cook, and a party of officers and gentlemen went to Oparee on the twenty-sixth, to pay Otoo a visit by appointment. They observed a large number of canoes in motion as they drew near the shore; but when they arrived at Oparee, they were surprised at seeing upwards of three hundred ranged along the shore, manned and armed, as well as a great number of armed men upon the shore. Various conjectures arose in the minds of our people on this occasion; notwithstanding they went into the midst of them. A chief, whose name was Tee, and uncle to the king, met our party, which was soon after met by Towha, who received us very civilly. Tee took captain Cook by one hand, and Towha by the other, and dragged him through the crowd. One party wanted him to remain with Towha, and the other to go to Otoo. It was with great difficulty we could get disengaged from them, and return to our boat.

We reviewed this warlike fleet when we were in our boats. There were a hundred and sixty large double canoes, which were the vessels of war, armed, manned, and equipped. The chiefs were dressed in a large quantity of cloth, breast-plates, helmets, and turbans. This dress was more calculated for show than use. The whole made a very grand appearance, for their vessels were decorated with flags and streamers, and they did every thing to set themselves off to the best advantage. This appeared very extraordinary to us, who never thought of seeing such a sight in these seas. The heads of the vessels lay to the shore, and their sterns to the sea; they were all ranged along side each other, and the admiral's ship was in the midst of them. Attendant upon the warlike ships were an hundred and seventy smaller canoes, rigged with masts and sails, and a little house upon each of them, which the ships of war had not. We imagined that these latter were designed for victuallers, transports, &c. to the grand fleets, for the ships of war had no provision on board. We computed that in the whole there were upwards of seven thousand men on board, and this was the lowest calculation.

Captain Cook made several efforts to see the admiral, but without effect. Had he seen him, he would have obtained information of the destination of this fleet, and for what purpose it was thus assembled. After some difficulty, we had an interview with Otoo, who was afraid we should revenge a theft one of the natives had committed; but his fears were banished when he found captain Cook was not angry.

Towha sent a present on board the next day, consisting of some fruit and two large hogs; his servants who brought them were directed not to receive any presents in return. The king and Towha were afterwards invited to dinner by captain Cook, together with Tee and Tarevato, the king's younger brothers. The admiral had never seen a ship before, and expressed a great deal of surprise and astonishment at the novelty of the sight. Towha put a hog on board after dinner and departed, without receiving any thing in return, and very soon after the king and his attendants went away likewise. Great respect was paid to Towha by Otoo, from whom we understood that he was jealous of him. These chiefs both solicited captain Cook to assist them in their warlike designs against Tiarabou; but we heard no more of it afterwards, as they had no encouragement from our commander.

The king of Tiarabou, named Wahea-toua, sent us a hog the next day, and desired in return a few red feathers, which were sent him accordingly. On the twenty-ninth we were again visited by Otoo, Towha, and several grandes of this place, who received presents in return for their late civilities.

On this day one of the natives was detected in stealing a water-cask; he was immediately put in irons, and Otoo and the other chiefs saw him in that situation, to whom his crime was made known. The king earnestly desired that he might be set at liberty, which was refused, as our people were punished for the smallest fault, of which they were found guilty by the natives, and it was very proper that he should be punished in the same manner. The man was ordered on shore, and in presence of the inhabitants received twenty-four lashes with the cat and nine tails. The king and his sister begged hard that his punishment might be remitted; but captain Cook expostulated with them on the nature of the man's crime, that we never took any thing from them either clandestinely or openly, without paying for it, and that this slip would be attended with several good consequences. All this they attentively heard, and only begged that the fellow might not be killed. He received his punishment with great firmness, and after it was over Towha harangued the people for near half an hour; and from what we could learn of his speech, it contained the substance of what captain Cook had before said, dissuading them from any future conduct that might be reprehensible, and enforcing the justice of the late punishment. This chief appeared to us to be a great orator. The king said never a word.

When this harangue was over, captain Cook ordered the marines to go through their exercise, and to fire in volleys loaded with ball. The men were very quiet in their manœuvres, and the natives were in the utmost amazement; whether they were more pleased or frightened we cannot pretend to say, however they all retired.

On the thirtieth we saw ten of the war canoes go through their exercise, which they performed with great expertness. They were all in their warlike dress, and the moment the canoes touched the ground, the rowers leaped out and dragged the canoe upon the dry land. They were so alert in this, that in five minutes time after they put on shore you could not tell what before went forward. Each man took his paddle with him out of the canoe.

We were presented on the first of May with a large supply of provisions, sent by different chiefs; we received another visit from them, and went on shore to see them in return. On examining the state of our bread, we found a good deal of it totally useless; we separated the good from the bad, and had the whole opened and aired. On the fifth of May the botanist made several considerable discoveries.

We obtained leave from Otoo on the seventh instant to cut down some trees for fuel, promising that we would not cut down any fruit trees. The whole royal family visited us this afternoon, and brought captain Cook a complete morning dress, which curiosity the captain very much valued. In return he gave them what they desired, and this was not a little.

An interruption was put to our friendly connections, by a transaction which happened during the night of the seventh and eighth instant. One of the centinels on shore had either slept or quitted his post, and one of the natives stole his musquet. News was brought to captain Cook that Otoo was frightened, and desired him to go to the king. The captain accordingly went on shore, and was informed of the whole by the serjeant, who had the command of the men. Most of the natives fled, and they were all alarmed. We endeavoured to allay the fears of the people, but desired the musquet might be returned. We could not find the king, who avoided an interview as much as we sought it. Tee advised us to return on board, which we accordingly did, and sent Ocdidee to persuade Otoo that his fears were groundless, and to desire that he would cause the musquet to be returned.

Very soon after this messenger was dispatched, we discerned six large canoes coming towards us, and we

were informed that they were laden with baggage, hogs, fruit, &c. We came to a resolution to intercept them, and fitted out two boats accordingly. At some distance from the rest of the canoes, one appeared coming near the ship, in which were two or three women captain Cook knew. This people informed us, that they were going on board the ship with presents, and that Otoo was then in the tents. On receiving this agreeable intelligence, the order for intercepting the other canoes was contradicted, in hopes that they might be induced to come on board, as well as the one we left near the ship. We therefore rowed ashore, in order to speak with the king; but when we arrived there, no person could inform us where he was, and they said he had not been there. The canoes now made off with great precipitancy, together with that we left near the ship. We were not a little mortified at being then outwitted by them, and fitted out another boat to intercept them; we took five out of the six, but one of them got away. Their design was clearly proved to deceive us, and they accordingly sent the first canoe to amuse us, while the rest escaped.

We thought the musquet irrecoverably lost; but, contrary to our expectations, it was brought us in the evening of the eighth instant. Whether this was done by the king's order, or not, we could not learn. They were rewarded for their trouble, and we made no more inquiry about it. Several people wanted this reward who were not at all intitled to it, and some of them acted the farce very well. Soon afterwards we had an interview with the king, and friendship was re-established on its former footing; this was a fortunate circumstance for us, for during the interval we obtained no supply of any kind of refreshment. Matters being now perfectly accommodated, we went to see the place where they built their canoes, and afterwards returned on board, accompanied by Tee.

On the tenth instant the king desired to see some of our great guns fired, which we gratified him in; but it certainly gave him more pain than pleasure. We made up for this by exhibiting some fire-works in the evening, with which he was very much pleased.

We received a large supply of refreshments on the eleventh instant. Towha sent us a great deal of them, and ordered his servants to accept of nothing in return. By these servants he sent a message to captain Cook, desiring his company on shore, as he was ill, and could not wait upon him on board of ship. Towha lived at Atahourou, which was at a considerable distance, and it did not suit the captain to take so long a journey; he therefore sent Ocdidee with a present to Towha, suitable to that sent lately to the captain. It was now resolved to leave Otaheite in a few days, as the necessary repairs were completed; all things were ordered to be got ready, that the natives might see our intentions.

An old woman named Oberea paid us a visit on the twelfth of May. She was thought to be queen of the island when the Dolphin was ashore in 1767. Captain Cook had not seen her since 1769. She made herself welcome, by making us a present of fruit and hogs. Just after she came on board, the king, with several attendants, came likewise with a plentiful share of provisions. Captain Cook made them liberal returns, and entertained them with fire-works at night.

We have just now mentioned that Ocdidee went to Towha at Atahourou, and he was not returned on the thirteenth; various conjectures were made concerning him. That we might know what was become of him, a party went down to Oparee in the evening, and in their way were met by Towha and Ocdidee. Towha had gotten thus far, being determined to see the captain before he sailed, notwithstanding he had a violent swelling in his feet and legs.

When Ocdidee found we were ready to depart, and heard that we did not intend coming back, he seemed desirous of remaining here. He was informed that

that he was at liberty to stay here, to be set on shore at Ulitea, or to accompany us to England. If he had chosen the latter, captain Cook promised to be a father to him, and to take all necessary care of him. He embraced the captain, and wept much, saying his friends persuaded him to stay there. The captain desired to go on shore, consult his friends, and return the next day. All the ship's crew were fond of him, and wanted him very much to go to England, telling him he would be extremely rich if he went there, and that he would see many very fine things. The only thing that seemed prevalent with this youth, was the prospect of returning; but the captain thought proper to undeceive him, as that was not likely to be the case.

Several applications were made to captain Cook, to take some of the natives, who were willing to live and die in England; and many of the gentlemen on board solicited some of them as servants, but the captain refused them all, thinking himself strongly bound to see them taken care of afterwards.

Ocdidee formed a resolution of remaining at Otaheite; but he was prevailed upon by a gentleman on board to sail with us to Ulitea. We were visited by a number of our friends on the fourteenth, among whom was Tauka, Potatou, &c. Tauka was placed on the quarter-deck in a chair; he brought his wife with him, and was very well pleased with the articles presented him.

When these visitors were gone, we saw several war canoes; and as we wanted to take a particular view of them, we made a party, and reached the canoes before they landed. They formed themselves into divisions before they reached the place where they intended to land. In each division the canoes were lashed close along-side each other; they then paddled in for the shore as fast as they could, and very judiciously formed and closed a line along the shore. A man stood with a wand in the fore part of the middlemost vessel, and encouraged the rowers, as well as directed them when to row, and when to stop. It is very plain, by the alertness with which they performed this service, that they were not strangers to the business.

This fleet was equipped in the same manner as the other, which we before described. It consisted of forty sail, and belonged to the district of Tettaha, and came to Oparee that their king might review them. The small canoes that attended this fleet, had on their fore part a place covered with leaves, where they told us they laid dead their upon.

The king, Otoo, ordered some of these troops to perform their exercise on shore. Two parties began with clubs; but this part of the exercise was finished almost as soon as begun. They afterwards exhibited, with great alertness, the various modes of fighting in single combat. The combatants had no superfluous dress on. When their exercise was over, they returned to their boats and departed; not in the order they came in, but rowed away promiscuously.

We then went to one of the dock-yards, where some canoes were nearly ready for launching. Otoo begged of captain Cook a rope and grappling, which the captain gave him, likewise an English pendant and jack, desiring that the canoe might be called the Britannia; which request was readily granted, and she was named accordingly. Otoo made us a present of a fine turtle and a large hog, which were put privately into our boat. The king and Tee dined with us, and afterwards took a most affectionate farewell, using many intreaties for us to return. The ship got under sail, and Otoo remained along-side of us for some time. We finally took our leave, by saluting him with three guns.

One of our gunner's mates had concerted a plan for remaining at this isle, as he liked the treatment we received so well. He could not well execute this design whilst we lay in the bay; but as soon as the boats were in, and our sails set, he threw himself overboard, being a good swimmer: but we were too quick for

him, and hoisted out a boat before he got clear off, and took him up. We observed a canoe coming from the shore, which was desigued to take him up. As soon as this was done, we steered for Huahine.

As many improvements had been made on this island since we last left it, we will just make some remarks upon them before we leave it entirely. That such a number of large canoes and houses should be built in so short a space of time, would have been incredible to us if we had not seen it. These works must have been greatly accelerated by the iron and other tools left here by ships touching at this place, and they had no want of workmen. Another thing that excited our wonder, was the number of hogs every where visible; they certainly must have concealed the major part of them before. We cannot tell how it is, but this we are very certain of, that we got as many as we could consume during our stay, and took several away with us.

Otoo must have had some judicious sensible men about him, who have a considerable share in the government. Every one seems to have contributed his time and talents to the improvement of this rising state. In this state, as well as others, there are divisions; otherwise the king would not have told us that Touka and Potatou were not his friends. It is possible he was jealous of them, on account of their great power, as they were two leading chiefs; at all times, and on every occasion, he appeared to covet their interest.

We were informed, that an expedition against Eimeo was to take place five days after our departure; and we had reason to believe, that Touka and Potatou raised the greatest number of men and vessels. In this expedition they were to be assisted by Waheatoua, king of Tiarabou. They seemed to wish us gone before the engagement took place, otherwise we should gladly have been spectators, as there must have been much novelty in such a fight. Otoo and the chiefs ceased to solicit our assistance for some days before we failed. We conjectured that this was owing to the knowledge of its being in our power to give victory to which side we pleased; and very probably they thought we would run away with the spoils. Be this as it may, they certainly wished us to be gone.

The people of Otaheite discover a remarkable fondness for red feathers, which they esteem as much as we do jewels. They use them, when tied in bunches, as symbols of the divinities in all their religious ceremonies. They often held these branches between their fore finger and thumb, and repeat their prayers, which we could not understand.

When captain Furneaux was last here, he gave the king two goats; and the end for which they were put on shore, seemed very likely to be answered. Two female kids had been produced from the she-goat, which were nearly fit for propagation, and the old ewe was again in the thriving way; and what with the ensuing produce, and the expected fruitfulness of the young kids, the ram would find pretty good employment, and they will soon have a sufficient number to stock the country, and spare some for their neighbours. The natives appeared to be very fond of these animals; and it was a proof that the poor creatures themselves liked their situation, as they were in excellent condition.

Our intentions respecting the sheep did not answer so well, for we were informed that they were all dead but one. However we stocked their country with cats, not less than twenty having been left behind us.

We made the island of Huahine, and anchored in Owharre harbour on the fifteenth of May. Oree, the chief, and several of the inhabitants paid us visits, bringing presents with them. Captain Cook returned Oree's visit the next day, and gave him some red feathers, which he held in his hand, and muttered a prayer. The chief sent us two hogs on board, and both himself and his friends came to dinner with us. The chief asked for axes and nails, which were accordingly

cordingly given him, and he distributed them as he pleased; but gave the largest share to a youth, who appeared to be his grandson.

As a servant of Mr. Foster's was walking along the shore by himself, he was beset by several stout fellows, who would have stripped him, had not some of our people arrived to his assistance. One of the men made off with a hatchet.

On the seventeenth we found Oree and a great number of the principal people assembled in a house, consulting together. We heard the late robbery mentioned by them several times. The chief assured captain Cook, that neither himself nor his friends had any hand in the robbery, and desired him to kill with the guns those that had. - We could not learn where the men were gone, and took no more notice of the affair.

A dramatic entertainment was exhibited in the evening. The subject of the piece was that of a girl running away with us from Otaheite. This was not entirely feigned, for a girl had taken her passage with us from Ulietea, and was at this time present, when they represented her own adventures. She could hardly refrain from tears while the play was acting; and it was with much difficulty we persuaded her to stay out the entertainment. At the conclusion of the piece, the girl's return to her friends was represented; but the reception she met with was not very favourable. It is very probable that this representation was designed to deter others from going away with us.

Ocdidee had informed Oree, that we had fired some great guns, with shot, at Otaheite; in consequence of which Oree came on board to dinner on the eighteenth, and afterwards desired he might see the same sight. His request was complied with.

A party of the petty officers obtained leave from captain Cook, on this day, to amuse themselves in the country. They took with them some hatchets, nails, &c. in two bags, which were carried by two natives, who went to shew the way. These fellows made off with the trust reposed in them, and used much art to effect their escape. The party had two muskets with them, and after it had rained some time, the natives pointed out some birds for them to shoot. One of the guns went off, and the other missed fire several times; they therefore took this opportunity to run away, as they thought themselves perfectly secure, and none of the party thought of pursuing them.

Another party, of three gentlemen, went on shore on the twentieth, upon whom the natives fell, and stripped them of all they had. When this came to captain Cook's ears, he took the boat's crew with him on shore, entering a large house, where were two chiefs; he took possession of them, and all their effects, and remained there till he heard that the gentlemen had got safe on board, and had all their effects returned. Ocdidee informed us, that Oree was so much affected at the relation of this, that he wept much.

On the twenty-first we saw several canoes steering for Ulietea, and we were informed they were going to visit their brethren in the neighbouring islands. It seems these people have customs among them peculiar to themselves, and assist each other when necessity requires; we may call them the Free Masons of Huahine.

Oree sent a message to captain Cook by Ocdidee, desiring he would come on shore, and bring twenty-two men with him, in order to search for, and chastise the robbers. Ocdidee brought twenty-two pieces of leaves to assist his memory, which is a very common custom among them. This method appeared very extraordinary, and our commanders went on shore for better information. Oree informed him, that a set of fellows had formed themselves into a party, determining to rob all they met; that they were now assembled and armed for that purpose. These people Oree wanted us to attack. Captain

Cook told him they would fly to the mountains, but he assured us to the contrary; desired we would fight them, and destroy both them and their habitations, only sparing the canoes. This appeared an extraordinary request; but captain Cook was resolved to go, lest these fellows should make more head, and become formidable, likewise to prevent the report from gaining ground in Ulietea, where we intended going, and associations might there be formed in like manner.

We landed on the twenty-first. Our party consisted of forty-eight men, including officers. The chief joined us, and we marched in good order in search of these fellows. The party increased as we proceeded; and Ocdidee told us that several of the banditti themselves had joined us, wanting to decoy us into a place where they might attack us with advantage. As we could place no confidence in any other person, we took his advice, and proceeded with caution. We marched several miles, when captain Cook declared he would proceed no further; we were then informed that the men had fled to the mountains. At this time we were about to cross a deep valley, with steep rocks on each side, where our retreat might have been rendered difficult, by a few men assaulting us with stones. Ocdidee persisted in his opinion; and we marched back in the same order as we came. As we went along, we observed several people coming down the sides of the hills with clubs, &c. which they immediately hid when they found we saw them. This was some confirmation of Ocdidee's suspicions; but we could not persuade ourselves that the chief had any such intention, whatever might be the designs of his people.

We wanted some refreshments, which were immediately brought us. The people were much alarmed, though no cause had been given them. When we arrived at the landing-place, we fired several volleys, to convince the natives that we could support a continual fire; after this we all returned on board, and the chief came and dined with us. After dinner we received a great number of hogs, and a good deal of fruit, which were sent as peace-offerings. The expedition had one good effect at least; the people were convinced that muskets were more terrible things than they at first imagined.

We were promised a larger supply of hogs and fruit the next day; but the chief was not so good as his word. We went ashore in the afternoon, and found the chief sitting down to dinner. The people about him immediately began chewing the pepper root; a cup of the juice was presented to captain Cook, but he did not like the method of brewing it. Ocdidee was not so nice, and immediately swallowed what the captain refused.

The chief washed his mouth with cocoa-nut water after he had taken the juice of the pepper root, and ate a large quantity of plantain, repe, and mahee, and finished his dinner by eating and drinking a composition of plantains, bread-fruit, mahee, &c. of the consistence of a custard; of this he took about three pints. He dined in the open air, at the outside of his house, and during dinner time a play was performing within the house.

We put to sea on the twenty-third instant. The chief and captain Cook took an affectionate leave of each other. When Oree heard that we never intended coming there any more, he said, Let your sons come, we will treat them well. We did not get a sufficient supply of hogs at this island, though they did not appear to be scarce; but we obtained more fruit than we well knew what to do with.

Our stock in trade was nearly exhausted. We found it necessary to set the smiths to work, in making different sorts of iron tools, that an influence might be kept up at the other islands, and to enable us to procure refreshments.

On the twenty-third instant we anchored in Ulietea, and was visited by Oree the chief, who brought with him a handsome present. A party of us went ashore

to make the chief a present, and as we entered his house we were met by five old women, who lamented very bitterly, and cut their faces in a shocking manner. This was not the worst part of the story, for we were obliged to submit to their amiable embraces, and get ourselves covered with blood. After this ceremony was over, they washed themselves, and appeared as cheerful as any other person.

On the twenty-seventh instant the chief paid us a visit, in company with his wife, son and daughter, and brought with them a very handsome present of all kinds of refreshments. We accompanied them on shore after dinner, and were entertained with a play, which concluded with the representation of a woman in labour, performed by a set of brawny fellows; the child that was brought forth was at least six feet high. As soon as the child was delivered, they pressed his nose, which seemed to indicate that they really take this method with all their children, which occasions that flatness which their noses generally have.

On the twenty-ninth several things were stolen out of our boats, which lay at the buoy; but on application to the chief, we had them all returned, except an iron tiller, and in lieu of that they brought us two large hogs.

A party of us set out for Ocdidee's estate on the thirtieth instant, accompanied by the chief and his family. When we arrived there, we found that Ocdidee could not command any thing, though he had promised us hogs and fruit in abundance; they were now in possession of his brother. We had here an opportunity of seeing them kill and dress a pig, which was done in the following manner: three men first strangled the hog; the hog was laid on his back, two men laid a stick across his throat, pressing at each end, the third man stuffed up his fundament with grass, and held his hind legs. The hog was kept in this position for ten minutes, before he was dead. An oven, which was close by, was heated. They laid the hog on the fire as soon as he was dead, and singed off his hair; he was then carried to the sea-side and washed. The carcase was then laid on clean green leaves, that it might be opened. They first took out the lard, and laid it on a green leaf, the entrails were then taken out and carried away in a basket; the blood was put into a large leaf. The hog was then washed quite clean, and several hot stones were put into his body; the hog was then placed in the oven on his belly, the lard and fat were put in a vessel, with two or three hot stones, and placed along-side the hog; the blood was tied up in a leaf, with a hot stone, and put into the oven; they covered the whole with leaves, on which were placed the remainder of the hot stones; they afterwards threw a great deal of rubbish in, and covered the whole with earth. A table was spread with green leaves, while the hog was baking, which took up a little more than two hours. We sat down at one end of the table; and the natives, who dined with us, at the other; the fat and blood were placed before them, and the hog before us. We thought the pork exceeding good indeed, and every part of it was well done. The natives chiefly dined of the fat and blood, and said it was very good victuals. The whole of this cookery was conducted with remarkable cleanliness.

This estate of Ocdidee was small, but very pleasant; and the houses formed a pretty village. After we had dined, we returned to the ship. In our way we saw four wooden images, each two feet long. They stood on a shelf, had a large piece of cloth round the middle, a turban on their heads, stuck with cocks feathers. They told us these were their servants gods.

On the thirty-first of May, the people hearing that we intended sailing, brought abundance of fruit on board, which continued on the first of June. We were informed that two ships had arrived at Huahine. The person who brought the information described the persons of captain Furneaux and Mr. Banks so well, that we had no doubt of the truth of the assertion; we therefore thought of sending a boat over there, but a man came on board, and declared the

whole to be a lye. We could not confront the fellow who brought the intelligence, for he was gone away, and the danger of sending the boat was put a stop to.

On Saturday the fourth of June the chief and his family came on board to take leave, bringing a handsome present with them. These people denied that there were any ships at Huahine. We were very much importuned to return to this place; when we told them we could not, their grief was bitter, and we believed it to be real. They desired captain Cook to acquaint them with his burial place, and said they would be buried with him. A strong proof of affection and attachment.

We left Ocdidee here, as we could not promise that more ships would be sent from England to those islands; he left us with infinite regret. Ocdidee did not leave us till we were out of the harbour, and staid to fire some guns, it being his Majesty's birth-day. This youth was of a gentle, docile, humane disposition, and would have been a better specimen of the natives than Omiah.

Whoever visits these isles, should have a good supply of axes, hatchets, nails, cloth, chissels, red feathers, knives, beads, scissars, looking-glasses, &c. as these and such like articles will always be valuable here; and if they wish for any connexions with the fair sex, they must not omit bringing a number of shirts, of which they are very fond. The ladies of Otaheite pretty well stripped their lovers of shirts.

The day after we left Ulietea we saw land, which proved to be a low island discovered by captain Wallis, and called by him Howe Island. We saw land again on the sixteenth, which we called Palmerston Island, in honour of lord Palmerston, one of the lords of the Admiralty. On the twentieth we discovered land again, and inhabitants appearing upon the shore; we equipped two boats, and as we approached, the inhabitants retired into the woods. When we landed, we took post on a high rock, to prevent a surprise, and the botanising party began collecting plants, with which the country seemed covered. Captain Cook took two men with him and entered the woods, but on hearing the inhabitants approach they returned. We made every friendly sign in our power, but were answered by menaces; and one of the natives threw a stone, which struck one of our party. Two musquets were fired indiscriminately, and they all retreated into the woods.

We embarked, and proceeded along the coast till we came to a place where four canoes lay. In order to prevent being surpris'd, and to secure a retreat, the men were drawn up upon a rock, from whence they had a view of the heights. Captain Cook and only four gentlemen with him went to look at the canoes. Very soon after the natives rushed out of the wood upon us, and we endeavoured to no purpose to bring them to a parly; they threw their darts, and appeared very ferocious. We discharged some musquets in the air, but this did not intimidate them, for they still threw darts and stones. Captain Cook's musquet missed fire, otherwise he would certainly have killed the ring-leader of them. The men drawn upon the rock fired at some who appeared on the heights, which rather allayed the ardour of our antagonists, and we had an opportunity to join the marines. We do not think any of the natives were hurt, but they all retreated into the woods; and seeing we could make nothing of them, we returned to the ship.

Captain Cook named this place Savage Island, from the conduct and aspect of the islanders; its situation is south latitude 19 deg. 1 min. west longitude 169 deg. 37 min. its form is circular, and is about eleven leagues in circumference. The country appears entirely covered with trees and shrubs. Nothing but coral rocks were to be seen along the shores. The inhabitants do not appear to be very numerous; they go intirely naked, except round the waist, and seem stout well made men. Some of them had their thighs, breast, and faces painted black.

We steered for Rotterdam, and as we drew near it several canoes laden with fruit came along side of us, but we did not shorten sail. The people on board them wanted us much to go towards their coast, telling us, as well as they were able, we might safely anchor there. They inquired for captain Cook by name. We came to anchor on the north side of the island on the twenty-sixth instant. The inhabitants brought to us great quantities of yams and haddocks, for which we gave them old rags and nails. A party of us went ashore to look for water, and were civilly received by the natives. We got some water, but it was rather brackish. We got a plentiful supply of fruit and oats, as well as water, but happened to leave the surgeon on shore. He got a canoe to bring him off; but just as he was getting into it, one of the natives snatched away his musquet and ran off with it, after which no person would bring him on board. He certainly would have been stripped, had he not presented a tooth-pick case to them, which they took for a little gun. When captain Cook heard of this transaction, he went ashore; but the natives fled at his approach. We did wrong in not taking any steps for the recovery of the gun, as it encouraged the inhabitants to make more depredations. A boat was sent ashore on the twenty-eighth for some water, when the people behaved in a rude and daring manner; it was with difficulty they got their water-casks filled, and into the boats again. The lieutenant who commanded this party had his gun snatched from him, and most of the people had something or other taken away from them. This was the effect of ill timed levity. Captain Cook landed soon after, and resolved to have the gun restored. All the marines were ordered ashore armed. As the botanising party were in the country, three guns were fired from the ship to alarm them, as we did not know how the natives might behave to them. The natives knew well enough what we intended, and brought the musquet long before the marines got ashore. When the lieutenant and the marines arrived, they all fled; captain Cook seized two double canoes in the cove, and threw a few small shot into a fellow's legs, who made some resistance. We very soon obtained the other musquet, and then the canoes were restored.

When we returned to the cove, the people wanted to persuade us that the man captain Cook fired at was dead, which we thought very improbable. Captain Cook desired a man to restore a cooper's adze which had been stolen that morning, and he went away, as we thought, to fetch it; but we were mistaken, for he soon returned with the wounded man stretched out on a board apparently dead. The surgeon was sent to dress his wounds, which in his opinion were but slight, and of no consequence. Captain Cook still insisted upon the adze, and with a great deal of difficulty obtained it. An old woman presented a young girl to captain Cook, giving him to understand that she was at his service. The girl was artful enough, and wanted to bargain for a shirt and a spike nail, neither of which the captain had with him. He was then given to understand that he might retire with her upon credit, which he refused. The old procurefs then abused him, saying he were insensible to her charms; the girl was very pretty, and wanted to go aboard a ship with the captain; but he would not take her, as he had given orders no women should be admitted there.

We sailed on the twenty-ninth, and a great many canoes came up with us, loaded with fruit, &c. which were exchanged for the usual commodities. The passion of our people for curiosities was as great as ever, and they were stripped of most of the cloths the ladies of Otaheite had left them. We stretched out for Amattafoa on the thirtieth, and several canoes came to us from all parts with the common articles; out of one of them we got two pigs, which in this part of the world are a scarce commodity.

We discovered land on Friday the first of July, the master and the boat were sent into the sound to find anchorage; four or five people were discovered on the shore, who retreated as the boat advanced, and they all fled to the woods when the boat landed. The master returned, and brought word there were no foundings without the reef; that he rowed in for the shore, intending to speak to the people, who were about twenty in number, armed with clubs and spears; but they all returned into the woods on his approach. He left some trifles upon the rocks, which they certainly found, for several people were seen at the place soon afterwards. The number of inhabitants on this island are supposed to be very few, and it is very probable that the few who are there only came to catch turtles, of which there are a great number here. This island is situated south latitude 19 deg. 48 min. west longitude 178 deg. 2 min. We called it Turtle Island.

After a good deal of stormy weather we discovered an island, called by the natives Ambrym, on the twenty-first of July. We discovered a creek as we drew nearer the shore, which had the appearance of a good harbour; many people were assembled, who invited us on shore, but we did not chuse to go, as they were armed with bows and arrows. We sent out two armed boats to discover a port about a league more to the south, where we anchored in eleven fathoms water. Several of the natives came off to us, but acted with great caution; at last they trusted themselves alongside, and exchanged arrows for pieces of cloth. The arrows were pointed with bone, and dipped in a green gummy substance, which we imagined to be poisonous. Presents were made to two men who ventured on board, and others came at night for the same purpose, but they were not admitted.

On the morning of the twenty-second instant several natives came round us; some swam, and others came in canoes. We prevailed on one man with some difficulty to come on board, and he was followed by more than we wished. Various articles were given to four of them, which were taken into the cabin; these they shewed to others in the canoes, who were very well pleased with their reception. We were all put in confusion by an accident which happened while these were in the cabin. One of the natives who had been refused admittance into one of our boats bent his bow at the boat-keeper, to shoot a poisoned arrow at him; he was prevented by some of his countrymen, and captain Cook was acquainted with it. Captain Cook went on deck, and saw a man struggling with him, who had leaped out of the cabin window for this purpose. The fellow again pointed his arrow at the boat-keeper; and on captain Cook's calling out, he pointed the arrow at the captain, who instantly fired a musquet at him. This staggered him for a little while, but he again pointed his arrow; a second shot obliged him to desist. Several began to shoot arrows on the other side; but they were all sent off in the utmost confusion, by a four pound shot being discharged over their heads. They all to a man leaped overboard. We permitted them to come and take away their canoes, and some again came alongside the ship. We heard the beating of drums on shore as soon as the four pounder was fired, which we took for the signal for the country to assemble under arms. However, we determined to go on shore and seek for wood and some refreshments, which we were very much in want of.

We landed in the face of five hundred men, armed with bows, arrows, spears, and clubs, but they made no opposition. Captain Cook advanced alone, with nothing but a green branch in his hand; on seeing this, a person who seemed to be a chief gave his bow and arrows to another, and came to meet him in the water, took the captain by the hand, and led him up to the crowd. The marines were at this time drawn up on the beach. Captain Cook distributed several presents

prefents among them. We made signs that we wanted wood, for we could not understand a word of their language, and in return they made signs for us to cut down the trees. They brought a small pig for a peace-offering, and we were induced to hope that we should get some more, but we were disappointed; we only got a small quantity of water, and about half a dozen cocoa nuts. They parted with their arrows, but we could not get any bows from them without a good deal of difficulty; they did not seem to set any value upon any thing we presented them with; nor did they like that we should proceed farther than the beach, and seemed desirous that we should return on board. We cut some wood down and sent it on board, and afterwards returned ourselves. They all departed to different parts of the country.

In the afternoon we observed a man bringing along the buoy, which had been taken from the kedge anchor; but he immediately delivered it, when we sent on shore for it. This was the only thing they ever attempted taking from us. Captain Cook and Mr. Foster went to examine some of their houses, which bore a resemblance to those in the other isles. They saw a great many fine yams, and several pigs and fowls. They called this island Mallicolæ, another near it Apee, and a third Paoom.

We went in search of fresh water, but it was not attended with success. The curiosity of these people was very soon satisfied, for none of them came on board the ship. When they saw us under sail, they came off to us in a number of canoes, and gave us many surprising and astonishing proofs of their extreme honesty, which appeared very much in their favour, as we had lately been among a most thievish race.

The people of this island are very ugly and ill proportioned, dark coloured, and of a diminutive size; their heads are long, their faces flat, and their features very much resemble those of a baboon; their beards are strong and bushy, and of a dark colour. The men go quite naked, except a wrapper round their waist. The women we saw were as ugly as the men; their faces, heads, and shoulders were painted red. Some of them had a bag over their shoulders, in which they carried their children, and they wear a sort of red petticoat. We saw but few of them, as they generally kept at a distance when we were on shore. They wear bracelets and ear-rings made of tortoise shell; they wear hogs tuks bent circular round the right wrist, and rings made of shells. They run a piece of white stone an inch and a half long through the bridge of their noses, which are pierced for that purpose. They sprinkle water over the head, and present a green branch as tokens of friendship. Their weapons are bows, arrows, clubs, and spears.

These people seem to be very different from all we have met with, and speak quite a different language; when they express their approbation, it is by hissing like a goose. Their country must be fertile, but the fruits are not remarkably good. We left them a dog and a bitch, as they have none on the island; they appeared very fond of them, and undoubtedly will take care of them. The harbour is a good one, and we named it Port Sandwich.

As we continued our course, we discovered several small islands on the twenty-fourth of July, and came very near one, which is about four leagues in circumference, and has three high peaked hills upon it. We called this Threehill Island. We then passed a group of small islands, which we named Shepherd's Islands, in honour of Dr. Shepherd of Cambridge. We saw people on every one of these islands, but there were no soundings near them at one hundred and eighty fathoms. We found the southern lands to consist of one large island, the extremities of which we could not see. On the north side of this extensive island we saw three or four smaller ones, one of these we called Montague, another Hinchinbrook, and the largest Sandwich, in honour of the earl of

Sandwich, now first lord of the Admiralty. Several people came down to the side as we passed Montague Island, and appeared to invite us on shore. We saw some likewise on Sandwich Island, the surface of which appeared very delightful, being agreeably diversified with woods and lawns. As we could not approach it where we were, we steered more to the west, as there appeared to be a bay run up that quarter which sheltered from the winds. But as this was not so much our object as to discover the southern extremity of the Archipelago, we steered east south-east, which was the direction of Sandwich Island.

We gained the north-west side of the island on the first of August, and saw several inhabitants, who invited us on shore by various signs; here we should have anchored, but the wind obliged us to alter our design. Besides, we wanted to explore the lands to the south-east, we therefore ranged along the coast. As we continued our course, we saw a light ahead; and as it was now near the evening, we did not chuse to proceed any farther, but stood off and on all night. When the sun rose next morning, we saw nothing of it, nor any land but the coast we were upon.

We sent a boat on shore on the third instant to get some wood if possible, as we were very much in want of that article, but they could not land, on account of a high surf of the sea; they saw no people on that part of the isle.

We anchored in seventeen fathoms water under the north-west side of the head of the land, where several people appeared on the shore, some endeavouring to swim off to us; but they all retired when they saw our boat approach towards them. A party went out armed on the fourteenth instant to find a proper landing place, where we could get a supply of wood and water. We did not like the first place we came to, but had an opportunity of giving the inhabitants some medals, &c. with which they seemed pleased, and directed us to a bay where we might get better landing. As we went along the shore, their numbers increased prodigiously. We tried several places to land, but did not like the situation of them. At length we came to a fine sandy beach, where captain Cook stepped out without wetting a foot; he took but one man with him out of the boat, and landed in the face of a large number of people, with only a green branch in his hand. The inhabitants received our commander with great politeness. One of them, who appeared to be a chief, made the natives form a semicircle round the head of the boat, and chastised such as attempted to prevent it. Captain Cook gave this man several articles, and by signs signified his want of fresh water, a little was presently brought in a bamboo; and when the captain made signs for something to eat, they brought him yams and cocoa nuts. Their behaviour was in every respect agreeable, otherwise we did not much like their appearance, as they were armed with bows, arrows, clubs and spears, and darts. We therefore kept a good look out, and watched the motions of the chief, who wanted us to haul the boat on shore. He seemed to hold a conference with some of the people, and renewed his signs for hauling the boat on shore. One circumstance appeared rather suspicious, for he refused some spike nails that we offered him. Captain Cook immediately returned to the boat, making signs to them that he was about to return. They then attempted by force to detain us. Very unfortunately the gang-board happened to be laid out for the captain to return into the boat; this the natives unhooked from the boat's stern as we were putting off; then they hooked it to the head of the boat, and attempted hauling her on shore; some of them took the oars out of our peoples hands. They in some measure desisted, on captain Cook's presenting a musquet to them; but went on again, seeming determined to detain us. The chief was at the head of this party, and a great number stood behind with their weapons ready to support him. Our own safety was now become very necessary, for signs and threats

had no effect. The captain determined to make the chief alone suffer, but unfortunately his piece did not go off. The party were then ordered to fire on them, as they began throwing darts and arrows at us. They were thrown into confusion by the first fire, and they were with difficulty driven off the beach by the sound. After this they continued to throw stones from behind trees, and sometimes a dart or two. Four of them appeared to lay dead on the shore, but two of them moved off afterwards; had our pieces gone off regularly, we should have done much more execution among them; but happily for them, poor wretches! most of our guns missed fire. One of our people was slightly wounded with an arrow, and another with a dart.

We anchored near the landing place as soon as the party returned on board. The people displayed two oars, which they had taken from us in the late skirmish. We thought they wanted to give us our oars, and took it for some token of submission. But that they might see what effect our great guns had, we fired a pound shot, which fell short of them, and terrified them so much, that we saw no more of them. They went away, and left the oars among the bushes.

As this place did not seem capable of supplying our wants in a peaceable manner, we set our sails and went out of the bay. If it was not in our power to find a more convenient place to the south, we could at any time return hither.

The people of this island are of a middle size, regular features, and pretty well made; they are different from those of the island of Mallicollæ, as well in their persons as their language. Their colour is naturally dark, but they paint their faces red. The women were rather ugly, they wear a kind of petticoat; the men go quite naked, except a belt and wrapper round their waist. Their houses are covered with thatch, but we saw no canoes among them.

We steered to the south, and discovered an island, near which we anchored on the fifth instant, in four fathoms water. The boats were sent out to find a better place. Many of the natives came in parties to the sea side, whilst we were busily employed in anchoring, &c. and though they appeared rather afraid of us, by degrees they waxed bolder. They were all armed with bows, arrows, and spears. Several of them came in canoes under our stern, where they behaved in an insolent manner; they attempted to take away our flag from the staff, and wanted to knock the rings off the rudder; and we had no sooner thrown the buoys of the anchors out, but they got hold of them. We fired a few musquets in the air, which they took no notice of, but were much alarmed on our firing a four pounder; they all instantly quitted their canoes. They got again into their canoes when they found themselves unhurt, flourished their weapons, and gave us some halloos; they went again to the buoys, but some musquet shot soon dispersed them.

Soon afterwards an old man, who seemed to be amicably disposed, came several times in a canoe between us and the shore, and brought off cocoa nuts, yams, &c. and exchanged them for some of our commodities. We landed in the evening with a party of men well armed, and the natives made no opposition, though there were a great number of them armed with spears, &c. We distributed some plants among them, and filled two casks with fresh water; we likewise got plenty of cocoa nuts, but we could not prevail on them to part with their weapons, which they held constantly in a posture of defence. We thought little was wanting to set them upon us; but we reembarked very soon, and most probably disconcerted their scheme.

We brought the ship as near the landing-place as possible, that we might overawe the natives, and obtain a supply of wood and water, which we very much wanted. The natives continued assembling themselves to the amount of some thousands, all well armed. Several canoes came off to us, bringing us

cocoa nuts, plantains, &c. and did not want any thing in return, though we took care they should always have something; their principal intention seemed to be the getting us ashore. The old man before mentioned came off to us several times; and we made him understand, as well as we could, that the inhabitants must part with their weapons, and we would establish a friendly intercourse with them. He made this request known to his countrymen, for we saw him frequently in conversation with them, and he never afterwards appeared with any of the like armour. A canoe soon came under the stern of our ship, and one of the men behaved very outrageously, brandishing his club and striking the sides of the ship with it; at last he offered to exchange it for a string of beads, which he no sooner got in possession of, but he made off with it without delivering the club. We were not sorry for this, as we wished for an opportunity of shewing the people on shore what effects our fire arms would have upon them. Accordingly we complimented this man with the contents of a piece loaded with small shot, and when they got about musquet shot off, we fired some musquetoes and small pieces at them, which made them take to the water. This seemed to have no effect on the people ashore, but they rather made a joke of it.

Our artillery was now placed in such a manner as to command the whole harbour. A party of seamen and marines were embarked in three boats, and we went towards the shore, where the natives were drawn up, in two divisions, near the landing-place. A space was left between these two divisions, where were laid a few plantains, two or three roots, and a yam. Four reeds were stuck upright in the sand, where they remained some days after. We were invited on shore, but we did not like to be taken in any trap they might have laid for us. We made signs for the divisions to retire back, but they paid no regard to our request. They were joined by several others; and all, except two or three, were well armed. From all these circumstances we concluded that they meant to attack us as soon as we got on shore; but this we wished to avoid, as many of their deaths would have been inevitable, and we could not expect to come off without some damage. We thought it therefore better to frighten them into a more gentle behaviour, and ordered a musket to be fired over the party on our right, which had the desired effect for about a minute, but they soon returned to their daring behaviour; one of the men shewed us his backside in defiance. The ship was then ordered, by signal, to fire two or three great guns, which presently dispersed them; we then landed, and made a present to an old friend, who stood his ground. The natives, some of them, returned, and appeared more friendly; many came without their weapons, but the greater number with them. We wanted them to lay them down, and they desired we would lay ours down first. They climbed several trees, and threw us down some cocoa-nuts. These people seemed to have no notion of traffic, and did not desire any thing in return, but we always took care they should have some compensation; they seemed very much afraid to touch any thing that belonged to us.

We found the old man's name to be Paowang. Him we took with us to the woods, and made him understand we wanted to cut down some trees, to which he readily consented, provided we would not cut any fruit-trees. Thus far matters went on pretty well; we returned to dinner, they all dispersed, and we did not hear that any one was hurt by our fire. We made a fishing party in the afternoon, and caught a large quantity of mullet and other fish. Our old friend Paowang made us a present of a pig, which was the only one we got at this place. This man, and about twenty of the natives, made their appearance on the shore.

On this island there was a volcano, which, during the night, emitted vast quantities of fire and smoke, attended

attended with a violent rumbling noise; this was increased by a heavy shower of rain, which fell at this time. The ship was loaded with the ashes, which was very troublesome; and much affected our eyes.

On Sunday the seventh instant the natives began to assemble again with weapons in their hands, but not in such numbers as they did before; notwithstanding this we landed, in order to get water and cut wood. The old people among the islanders appeared much more friendly than the young ones; the latter were very insolent, and obliged us to stand to our arms. A lieutenant, who commanded the party, was obliged to fire at one of them, and wounded him with a swan-shot; after that the other behaved better.

We were now on a tolerable footing with those who lived in the neighbourhood; and only those now made their appearance. Some of our people had left an ax on the beach, or in the woods, which Paowang returned us. A serjeant's guard was now thought sufficient for the protection of the wood and water parties. Some of our people were invited to go home with the natives, provided they would strip themselves naked, as they were.

Captain Cook went on shore on the ninth instant, and was received courteously by the natives, though they were armed. He prevailed on a young man, named Wha-a-gou, to accompany him on board, to whom he shewed the ship; but nothing in it seemed to engage his attention. He called the goats, dogs, and cats, by the same name that signifies hogs. He seemed more fond of a dog and bitch than of any other animal; and we presented him with one of each. Some of this young man's friends were probably doubtful of his safety, and therefore followed him in a canoe; but on his speaking to them out of the cabin window, they went on shore, and soon returned with a cock, some cocoa-nuts, and a sugar-cane. He drank a glass of wine, but did not like our salt pork. He was afterwards conducted ashore, and loaded with presents.

Captain Cook went with him ashore, and some of his friends took the captain by the hand, and, as he understood, wanted to conduct him to their habitations; but on their way they made a sudden stop, and seemed unwilling that he should proceed, and seemed jealous of our going up the country. While we were here, Paowang brought us a present of fruit and roots, at least he headed a party of twenty men who brought them, though they might all have been carried by two; perhaps this was done that the present might appear the greater. This was done in return for something we had given him in the morning.

Wha-a-gou and his friends were still for detaining us, and seemed to wait with impatience for something to give us in return for the dogs he had received; but we desired to depart, as the night approached, and they complied with our solicitations. We learnt that the proper name of this island is Tanna, and that which we last touched at is called Erromango.

The people of the island of Tanna gave us to understand, that circumcision is practised among them, and that they eat human flesh. This conversation they began of their own accord, and asked us if we did the same. If it is true that they are Cannibals (and we have no reason to doubt it, though we did not actually see them eat any human flesh) it sets aside that assertion, that none can be Cannibals who have any thing else to eat, for here was plenty of fowls, pork, roots, and fruit.

As one of the men was employed on the ninth instant taking in ballast, he scalded his finger in taking up a stone out of some water. We afterwards found some hot springs at the foot of the cliff.

We took courage, and proceeded a little farther into the country, and met with civil treatment from the natives, who were now pretty well reconciled to us. On the eleventh instant, during the night, the volcano was very troublesome, and threw out great quantities of fire and smoke, with a most tremendous noise; and sometimes we saw great stones thrown into the

air. In several parts of the harbour we found places from whence a sulphurous smell issued; the ground about these places was very hot. As the botanizing party was out, they happened to meet with Paowang's house; most of the articles he had received from us, were hanging about the bushes and trees near his house.

The volcano was unusually furious on the twelfth instant, and we were very much troubled with the ashes. The natives played us a trick this day. They pretended to be unwilling we should go far up the country by ourselves, and offered their services to conduct us to the mouth of the volcano, which offer we very readily embraced; instead of shewing us the way to the place, we found ourselves near the harbour before we discovered the trick.

Paowang came on board the ship on the thirteenth instant, and we shewed him every part of it, and almost every article in it, hoping he might see something or other that he liked, and a traffic for such articles might be carried on; but he beheld every thing with the greatest indifference, except a wooden sand-box, which he took some notice of. We endeavoured, on the fourteenth, to get a near view of the volcano, and went by the way of one of those to the smoking places which we mentioned before. Near this place was a fig-tree, which seemed to like its situation. We proceeded through the country up a hill entirely covered with plants, shrubs, and trees, in so much that the fruit-trees were nearly choked up. They use much the same tools for clearing a piece of ground for a plantation here as they do at the Society Isles; it must nevertheless be a work of great time and labour. We came to a plantation where we saw a man at work, who undertook to be our guide. We had not gone far before we came to a place where two roads joined, in one of which stood a man with a sling and a stone, which he would not lay down till a musquet was pointed at him; he seemed however determined to defend the road in which he stood, and partly gained his point, for our guide led us the other way. We were now joined by some others, who wanted to conduct us down to the harbour, and our guide refused to go any further with us. Upon our attempting going alone, several people collected together to oppose it; but when they found us returning, they suffered us to pass unmolested, regaling us by the way with variety of fruits.

A party of us walked into the country in the evening, and were very civilly treated by the natives. We came to a village of about twenty houses, which are built like the roof of one of our thatched houses, with the walls taken away, and open at both ends. In one of these we understood lay a dead corpse; this hut was separated from the others by a reed fence. At one end of the hut hung a basket, with a piece of roasted yam and some leaves quite fresh. The man shewed an unwillingness to let us look into the basket, and absolutely opposed our going into the hut. The man who served as our guide had two or three locks of human hair tied with a string round his neck. We wanted him to part it, but he would not; at the same time informing us, that it was the hair of the person who lay in the hut.

One of the botanical party shot a pigeon on the fifteenth, in the craw of which was found a wild nutmeg. He endeavoured, without effect, to find the tree. In most of the sugar plantations of this island deep holes are dug, which, on inquiry, we found were designed to catch rats, with which they are much troubled.

We found on the sixteenth instant that our tiller was damaged, and we had never a spare one on board. We knew of but one tree in the neighbourhood that would do for the purpose. The carpenter was sent ashore to look at it, with a party of men, who were directed to cut it down after they had obtained the consent of the natives. They did not make any objection, and the men went to work accordingly. It took a good deal of time to cut it down, as the tree

was large; and before they had finished their work, word was brought to the captain that Paowang was not pleased. Paowang was sent for, and our necessity was explained to him. We made him a present of a dog and a piece of cloth, and both Paowang and those that were with him unanimously expressed their consent. We thus obtained our point, and were afterwards conducted to a man whom they called the king of the island; his name was Geogy; he had a cheerful open countenance, though he was old, and wore round his waist a broad red and white chequered belt. He had a son with him, who could not be less than fifty years old.

Old Geogy and his son dined with us on board the ship on the seventeenth instant, and viewed every part of the vessel with a great deal of astonishment. They ate plentifully of a pudding made with plantains, but did not like our salt beef and pork. They were conducted ashore in the afternoon, after being presented with a hatchet, some medals, and a spike nail.

We prepared for sailing on the nineteenth, as the tiller was finished, but the wind being rather unfavourable, the guard and a party of men were sent ashore as usual. Several natives were assembled round the landing-place, among whom various articles were distributed. One of the centinels presented his piece at a man, who he said pointed an arrow at him; and notwithstanding he received orders to the contrary, fired at, and killed him. Captain Cook was exasperated at this rascally conduct, for all the poor fellow meant, was, to shew that he was armed as well as we. The natives were terribly frightened at this circumstance, and came immediately with abundance of cocoa-nuts, &c. which they laid down at our feet.

We got out of the harbour on the twentieth of August, and as we sailed we heard a noise in the woods, not unlike psalm-singing. It was now too late to inquire into the cause; but very probably the natives were performing some religious acts.

The natives of Tanna were always jealous of our proceeding into the country beyond certain limits: they might be apprehensive of an invasion, and that we meant to take their country from them. All we can say, is, that none of our conduct justified such a conclusion, as we always paid for what we had, and would not take even their wood and water without leave. We caught a large quantity of fish at this place, and were tolerably well supplied by the natives with fruit and roots; and should certainly have obtained more refreshments, had we had any thing on board that suited their taste. Our cloth was of no use to people who go naked, and they had no knowledge of the utility of iron.

This island produces abundance of plantains, cocoa-nuts, bread-fruit, yams, a kind of potatoe, a fruit like a nectarine, wild figs, sugar-cane, and a fruit not unlike an orange, but which is never eaten. We saw here a few fowls, and a great number of hogs, but they did not fall to our lot; and we did not observe any other domestic animals. We saw some beautiful small birds, such as we had never before seen. Our botanists found many curious trees and plants.

The inhabitants of Tanna appear to subsist chiefly on the production of the land, and are not much indebted to the sea; though there are plenty of fish on the coast. We did not see them catch any fish, but by striking them with darts; and they were surprized at our method of taking them. These people bear but very little resemblance to, and have no affinity either to the inhabitants of Erromango or those of Mallicollo. It did not appear to us, that the geographical knowledge of these people extended beyond the limits of their own horizon. They are rather slender made, of the middle size; they have agreeable countenances, and good features, and are very active and nimble, like the other inhabitants of the tropic. Their females are put to all the laborious work; and the men walk unconcerned by their side, when the women are loaded with heavy burdens, besides a child

at the back. Perhaps they think that their trouble in defending them is sufficient. We often saw large parties of women carrying various kinds of articles, and a party of men to protect them, armed with clubs and spears. Though the women of Tanna are not very handsome, they certainly are beautiful enough for the men, who put them to all kinds of drudgery. Though both men and women are dark coloured, they are not black, nor do they bear any resemblance to negroes. Some of them paint their faces and bodies with red, and others with black. The women wear a petticoat made with leaves, and the men nothing but a belt and wrapper. Bracelets, ear-rings, and amulets, are indiscriminately worn by both sexes.

The people here seem to know how to make matting pretty well; they likewise manufacture a kind of cloth out of the bark of a tree. Their arms and canoes are very clumsy. They are pretty good marksmen, and throw their darts at fish and birds with great exactness.

A gentleman on board favoured the author of these sheets with the following remark, which, as it is characteristic of these people, we will subjoin in his own words.

“ I must confess, says he, I have often been led to think the feats, which Homer represents his heroes as performing with their spears, favour too much of the marvellous to be admitted into an heroic poem; I mean, when confined within the straits of Aristotle; nay even so great an advocate for him as Mr. Pope, acknowledges them to be surprizing. But since I have seen what these people can do with their wooden spears, and they badly pointed, and not of a very hard nature, I have not the least exception to any one passage in that great poet on this account. But if I see fewer exceptions, I can find infinitely more beauties in him; as he has, I think, scarce an action, circumstance, or description of any kind whatsoever, relating to a spear, which I have not seen and recognized among these people; as their whirling motion and whistling noise as they fly, their quivering motion as they stick in the ground when they fall, their meditating their aim when they are going to throw, and their shaking them in their hands as they go along, &c. &c.”

As to their government, religion, or cookery, we can say nothing about them, as we had no opportunities of making any observations. The old men were frequently respected and obeyed; but we heard none of them called chief.

As the Resolution was the first ship that ever entered this harbour, we called it Port Resolution. It is situated in latitude 19 deg. 32 min. 25½ sec. south, and in longitude 169 deg. 44 min. 35 sec. east.

We ran to the eastward, in order to examine the island of Irromanga, after we had again put to sea; we came near it in the evening, and found it to be about twelve leagues from Tanna. It did not appear so large as Tanna, but its mountains seemed equally high. We shaped our course along the south-west shore of Tanna, and were on the lee side of Irromanga on the morning of the twenty-second of August. Our commander determined to explore the western coasts of this group of islands, which, as they were the westernmost hitherto known in the South Pacific Ocean, captain Cook called the New Hebrides. He certainly had a right to call them so, as there were ten large islands, and several smaller ones, which had never been discovered by any former navigators. The southern shores of sand, in this island, appeared very beautiful, and its forests appeared very rich and copious. We saw a harbour formed by four small islands, which appeared both safe and commodious.

On the twenty-third we came in sight of the islands of Pa-oom, Apee and Ambrym, and stood along the south-west side of Mallicollo, and we were agreeably surprized with the beauty of its forests, out of which we saw smoke ascend in various places, which proved that they must be inhabited. We saw a fine beach, with

with a spacious bay, and the circumjacent land appeared very fertile and populous. We observed several natives on the shore; and two canoes put off to us, but could not overtake us, as we sailed too fast for them.

On the morning of the twenty-fourth we were a good way advanced in Bougainville's passage; the land on the north side appeared very high, mountainous, and extensive. Indeed we had now such fine weather, that every object appeared beautiful and delightful.

We saw land to the northward, that appears to be the same called by captain Quiros, Terra Austral del Espiritu Santo, which he supposed to form part of a continent. We saw the appearance of a bay, which he called St. Philip and St. Jago; but we did not stop to examine it. As it was St. Bartholomew's day when we saw several isles near the great land, we called them Bartholomew Islands.

We kept along the eastern shore of Terra del Spiritu Santo, and discovered some more islands, which were not seen by Bougainville; they had all the appearance of fertility and populousness. On the morning of the twenty-fifth we came abreast of the northernmost islands, and observed that the large land extended no further to the northward. The islands we saw formed a low flat point, and were very long and narrow. We saw no cocoa-nut trees among their forests. These formed a beautiful prospect as we passed their northern extremity. We opened a spacious bay to the westward of Terra del Espiritu Santo, which was about five leagues wide, and its depth was in proportion to its width. The bay terminates at the end of about seven leagues. All the land about it had the appearance of fertility, and being well peopled. We saw several natives towards the western shore, and observed a canoe, like those at Mallicolo. We invited those on board, who were in her, but they would not come near the ship. We endeavoured to come to an anchor, but on sounding found no bottom. On the twenty-sixth we sent two boats to the beach, which runs along the bottom of the bay, to endeavour to find anchorage. While they were gone, three canoes, with triangular sails, put off from the shore, in each of which were four or five men, to whom we called as soon as they were within hearing. These people were of the same colour as the inhabitants of Mallicolo, but were more stoutly formed and taller; their beards were frizzled, and their hair woolly. Some of them wore a white shell tied on their forehead, and others a bunch of feathers on the top of their heads. They wore bracelets on their arms, and a belt round their waists. They had prongs with them, which looked like instruments to catch fish, other than which they had no arms. They approached so near us, that we had an opportunity of giving them some Otaheite cloth, medals, and nails. By the eagerness with which they seized the nails, we imagined that Quiros might have left them some when he was here. To the rope by which we lowered down the nails to them, they fastened a branch of the pepper plant, as an emblem of friendship, but they had nothing else with them. We wanted to converse with each other, but could not understand their language. We could not learn the name of the country, and therefore called it as Quiros had done before us. The party in the boat returned, without giving us any satisfactory account, and we went gradually out of the bay.

Next to New Zealand, this was the largest land we had seen, and, in appearance, is one of the finest in the world. The botanists would here have had an ample harvest, as its productions must have been very copious, and the country must have been very rich in vegetable productions. We caught a shark this afternoon, which afforded us a fresh meal.

We had an opportunity of examining this coast, as the wind prevented our sailing fast. We observed many fish swimming along the shore, and caught a dolphin. We saw several fires in the night, made by the natives, probably to clear the ground for plantations.

On the fourth of September we saw land at about six leagues distance, but we could not tell whether it was a group of islands, or one connected land. The coast seemed to terminate to the south-east in a high promontory, which we called Cape Colnett, after the name of a midshipman on board, who first discovered this land. We saw two or three canoes under sail, and we thought they had been coming to us; but they struck their sails a little before sunset, and we saw no more of them.

On the fifth instant we sent out two armed boats to find the channel, and saw several canoes near us. When we hoisted out our boats, they were pretty near us; but when they saw us they returned, and the boats followed them. We stood in with the ship, as the boats made a signal for a channel. The people in the boats reported that there was good anchorage, and the people were very civil and obliging. The boat's crew gave the natives medals, and they gave fish in return. We anchored in five fathoms water, the bottom a fine sand mixed with mud, and we were very well sheltered from the wind and sea.

A great number of natives surrounded us before we had well got to anchor, without any sort of weapons, who were soon prevailed upon to come near enough to receive presents. The fish they gave us in return, stunk very bad. An intercourse was established between us, and several of them came on board the ships. Some of them dined with us, but they would not eat our salt beef, pork, or pea-soup; we happened to have some yams left, which they were very fond of. These people were quite naked, except the belt and wrapper, which they used as the inhabitants of the other islands. They viewed the ship with very particular attention. They had no knowledge of our dogs, cats, goats, &c. not having even a name for them, but were very fond of pieces of red cloth and spike nails.

After dinner, a party of us went ashore with two armed boats, and landed amidst a great number of people, who were induced by curiosity alone to come and see us; they had not so much as a stick in their hands, and received us with great courtesy. They expressed a natural surprise at seeing such people as we were. Presents were made to such, as a man, who had attached himself to captain Cook, pointed at; but he would not suffer the captain to give the women who stood behind any beads or medals. We saw a chief, whose name was Teabooma, who called for silence soon after we came ashore. Every person instantly obeyed him, and listened with extraordinary attention. When he had finished, another spoke, who was likewise particularly attended to. These harangues were composed of short sentences, and a nod of approbation was given by the auditors. We were certainly the subject of their speeches, but we could not understand them. We inquired by signs for fresh water, and they pointed to different places where we might find some. The ground we passed, in order to get at the water, was beautifully cultivated, laid out in several plantations, and well watered. We came to a little straggling village, where we were shewn fresh water. We saw several cocoa nut trees, but they had not much fruit on them; and heard the crowing of cocks, but saw none. We saw some roots baking on a fire, in an earthen jar which appeared to be of their own manufacture. Mr. Foster shot a duck as it flew over our heads, and explained to the man, who attached himself to the captain, how it was killed. He desired to have the duck, and afterwards informed his countrymen of the manner in which it was killed. We had little else to expect from these people but good nature, and the privilege of visiting their country without molestation, as it was easy to see these were all they could bestow. Though this did not satisfy our demands, it gave us much ease and satisfaction, for they certainly excelled all the natives we hitherto met with in civility and respect.

On the morning of the sixth instant great numbers of the natives came to visit us, some swam, and others came in canoes; our ship was quite full of them. Only one of them, the man before alluded to, brought some fruit and roots; the others brought clubs, spears, &c. which they readily exchanged for nails, pieces of cloth, and other articles. Teabooma came with them, but went out of the ship imperceptibly, and by that means lost the present captain Cook designed him.

We found near our watering place a great deal of fire wood; but we were not in want of this article. Simon Monk, our butcher, fell down the hatchway on the evening of this day, and died on the morning of the seventh; he was very well respected on board the ship.

We made a party to take a view of the country on the seventh instant, and were accompanied by the natives, who undertook to be our guides. From the summit of one of the hills we saw the sea in two places, by which we could discover the breadth of this country, which is not more than ten leagues. A large valley lay between the advanced hills, and a serpentine river ran through it, and on the banks of the hills were several villages. The valley appeared remarkably beautiful, and the villages, interspersed with woods, very much improved the scene. The other parts were rocky and barren, not unlike New Holland. We returned by a different road to that we came by, and went through some of the plantations in the plains, which were laid out with great judgment, and were well cultivated. All the nations in these seas recruit their land by letting it lay some years contracted; but they do not seem to have any idea of manuring it. We rewarded our guides, and returned on board.

A gentleman being ashore in the afternoon, observed one of the natives stick a fish, which bore much resemblance to a sun fish; he purchased it of him, and brought it on board. It was ordered for supper, as we had no suspicion that it was poisonous; very providentially the time the draughtsman took up in drawing and describing this fish made it too late for us to have it dressed. Captain Cook and the two Mess. Fosters only tasted the liver and row, and in the middle of the night they found themselves seized with a kind of weakness and stupor, which affected the whole frame. An emetic and sweat were immediately taken by these gentlemen, which proved very beneficial. When they rose in the morning, they found one of the pigs, who eat the entrails, dead; and when the natives came on board and saw the fish hang up, they expressed their abhorrence of it, signifying that it was not wholesome food. It is rather remarkable that they did not do this when the fish was to be sold, nor after it was purchased.

We received a present of a few yams and sugar-canes on the eighth from Teabooma, the chief, and in return sent him a red and white dog and bitch. The chief would not believe for a long time that this present was intended for him; but when he found that it really was so, he was almost transported with joy.

A reconnoitring party had been sent out, and they returned on the evening of the eleventh, giving the following intelligence. That they had a view of the coast from our observation the morning they set out, and found that there was no passage for the ship to the west. They went to Ralabea from thence, accompanied by two of the natives; but the expedition was fruitless, as they stayed there only one night; they saw a great number of turtles as they went down to the isle, but could not stick any, as the wind and sea were violent. The cutter suddenly filled with water, and they were obliged to throw several things overboard, to prevent her being lost, and stop the leak. They met with a fishing canoe, from which they got as much fish as they could eat. Teabi, the chief of the island of Ralabea, received them courteously, and the people came in great numbers to see them. That our people might not be too much

crowded by numbers, they drew a line, and desired none of them would pass it; which restriction the natives observed. One of them was in possession of a few cocoa nuts, which one of our men wanted to purchase, but he was unwilling to part with them, and walked off; the man who wanted them followed him. When the native saw him following him, he sat down and made a circle round him, desiring the man not to come within that line; so that the tables were thus turned upon himself.

On the twelfth instant the carpenter was ordered to repair the cutter. Captain Cook wanted to stock the country with hogs as well as dogs, the former being more useful of the two; and wished to see the chief, to present him with a boar and a sow. The inhabitants informed us, that he lived at some distance, but they would send for him; but as he did not come as soon as we expected him, captain Cook determined to give them to the first man of consequence he met with. They were offered to a grave old man, but he refused them, and made signs for us to take them into the boat again; but on our refusing to comply, they appeared to hold a consultation what was to be done; one of them advised us to carry them to the chief, and we were accordingly conducted to a house where eight or ten middle aged persons were seated in a circle. Captain Cook was desired to sit down, after he and his pigs had been formally introduced. The captain explained to them the nature of the pigs, that they would multiply, and enhanced their value as much as possible, that they might take the more care of them. In return for this present, we had six yams brought us, after which we went on board.

We went on shore again in the afternoon, and caused an inscription to be cut on a tree near the watering-place, shewing the ship's name, date, &c. as we were the first discoverers of this country; after which we took leave of our friends, and returned on board.

The inhabitants of this country are strong, robust, and active; not at all addicted to theft, and very friendly and courteous. They have better features than the natives of Tanna, and are a much stouter race, and had a good deal of the appearance of negroes. Their hair is very rough, and it frequently wants scratching; for which they have a well contrived instrument which they always wear in their hair on one side of the head; they generally wear their beards short. They are much subject to swelled and ulcerated legs and feet, as also to a swelling of the scrotum. When they go out in their canoes and unemployed, they generally wear a coarse kind of matting of their own manufacture; the men of note generally wear a large stiff black cap. The women wear a short petticoat made of the leaves of the plantain tree; these are dyed black, and ornamented on the right side with some pearl oyster shells. Both sexes are ornamented with ear-rings, neck-laces, and amulets, as well as bracelets. Various parts of their bodies are punctured. They appear to be a race of men between the inhabitants of the Friendly Isles and those of Tanna, and they bear some resemblance to the New Zealanders; their language appears to be collected from these three countries. They certainly excel all others in honesty and a friendly disposition. It is very certain that they are sometimes engaged in war, notwithstanding they are so peaceably disposed, otherwise they would not be so well provided as they are with weapons of various sorts. They seem very dextrous in striking large fish with a dart. They build their houses circular, into which they enter by a very small door; the roof is lofty, and brought to a point at the top; the side walls are about five feet and a half high, and in some houses there are two floors laid on above the others; on the floors mats are spread for the principal people to sleep on. We found two fire-places in most of the houses, where fires continually burn, but the houses are very smoaky and hot, as they have no chimney nor other vent for the

the smoke but the door; to people like ourselves, this was very disagreeable. Perhaps this is one cause why the natives are so chilly, as they always appeared to be when out of doors and unemployed.

Many of the houses are ornamented with carved work; there are no partitions in them, consequently cannot have much retirement; in the earthen vessels before mentioned they bake their roots and fish, they always cook their victuals in the open air on the outside of the house. Water seems to be their only liquor, and their chief subsistence is on fish and roots and the bark of a certain tree, which they roast before they chew it; it has a sweet, insipid taste. None of their trees seem very fruitful.

The island seems pretty well peopled, considering nature has been rather scanty in her bounty to them. The botanical party had a good deal of employment here. We could not obtain the name of the whole island, only of certain districts. Some of the gentlemen saw one of their burial places, where the remains of a chief was deposited who was slain in battle, all round his grave were spears, darts, &c. stuck upright. Their canoes are very clumsy and heavy. The women here, as well as at Tanna, are very chaste, and we believe none of the sailors obtained any favour from them.

We continued our course, but nothing worthy of observation happened till the twenty-seventh of September, when we saw the skirts of an island covered with trees resembling pines, and we called it the Island of Pines on that account. We were now surrounded with dangers, on account of the many breakers about us; Providence interposed in our favour: we should have quitted this dangerous coast, but our captain was determined to see what these trees were which so much resembled pines, as the discovery might be very useful to future navigators.

On the twenty-ninth we anchored in thirty-nine fathoms water, and sent a party on shore, accompanied by the botanists, who found the trees to be of the spruce pines, very proper for spars, of which we were very much in want; the carpenter and his crew were afterwards sent to cut down what was wanting. Besides the pines that grew on this island, there were several other trees, shrubs, and plants, which fully employed our botanists, and we called it Botany Isle. We saw several pigeons, doves, water-snakes, and hawks here, and there were several signs of people having lately been here. Some pines on this island measured twenty inches in diameter, were about seventy feet long, and would have served very well for a foremast, had we wanted one. It is very reasonable to suppose that larger trees than these are to be found on the main island, as trees of such a size are found on so small a spot as this; the whole island does not exceed three quarters of a mile in circumference.

The purpose being answered for which we stopped here, we endeavoured to get to the southward of the shoals and breakers, which were in great abundance. We stretched to south-east with our starboard tacks on board, and by noon of the first of October got out of sight of land.

We were in want of several necessary stores, and necessity obliged us to leave a coast that we had discovered, but not explored. We called it New Caledonia; probably it is the largest island in the Pacific Ocean, except New Zealand. The extent is from latitude 19 deg. 37 min. to 22 deg. 30 min. south, and from longitude 163 deg. 37 min. to 167 deg. 14 min. east. The breadth is not considerable, but it is about eighty-seven leagues long. The country is filled with hills, valleys, and rivers; some of the hills are barren, and others are covered with wood. Most, if not every part of the coasts appear, to be inhabited.

We continued our course to New Zealand, and discovered land on the tenth of October. It is situated in latitude 29 deg. 2 min. 30 sec. south, and longitude 168 deg. 16 min. east. Captain Cook called it Norfolk Island, in honour of the Howard family, who have the title of duke of Norfolk. We an-

chored here in seventy-two fathoms water. A party of us went on shore, and found it uninhabited; we were certainly the first people who ever set foot upon it. The flax plant abounds here very much, as well as several other trees that grew at New Zealand. The spruce pine is here to be found in great abundance, the trees are tall, straight, and thick; the soil of this island seems very rich and deep, and is almost wholly covered with plants. We found here many sea and land fowl, likewise fresh water, and cabbage trees, which are not only wholesome, but very pleasant and agreeable to the taste. We caught here some excellent fish, which served for a luxurious entertainment.

We sailed from Norfolk Island on the eleventh instant, and found the coast bounded by rocky cliffs and banks of coral sand. We intended refreshing ourselves, and repairing the ship in Queen Charlotte's Sound. We saw Mount Egmont on the seventeenth, which is perpetually covered with mud; and on the eighteenth anchored before Ship Cove, as the wind and tide would not permit us to get in. Captain Cook went on shore as soon as we arrived here, and looked for the bottle with the memorandum he left when he was last here, but it was taken away by some person or other. We caught a few fish this afternoon, and shot some birds. We got the ship into the cove next morning, and began our repairs of the rigging, &c. on shore, and obtained plenty of vegetables for the subsistence of the men. From some circumstances, such as the cutting down some trees with saws and axes, we had no doubt but the Adventure had been here since we left this place.

We found our gardens at Montuara almost in a state of nature, no cultivation or care having been bestowed on them by the inhabitants. The soil in which they grew seemed suitable to them, for many of them were in a flourishing condition. As we had not hitherto seen any of the natives, we made a fire on the land, hoping this would induce them to come down to us.

We saw two canoes coming down the sound on the twenty-fourth, which retired behind the point when they saw the ship. We fired some musquets at some birds, the report of which brought them near the shore; when we landed, and came near their habitations, they all fled into the woods, except three men who maintained their ground. These men knew us when we approached them, their fears subsided, those who had fled returned, and were very happy to see us, which they expressed by jumping and dancing round us. We saw some women at a distance, but the men would not suffer them to approach us. We obtained from them a large quantity of fish which they had just caught, and gave them in return hatchets and knives. We asked them on what account they were afraid of us, and likewise what was become of some of our old acquaintance? we got no satisfactory answers to those questions, but they talked much about killing. The next morning they brought us a large quantity of fish, and had in return a good deal of Otaheitan cloth.

We were informed by the people, on the twenty-sixth, that a ship, like ours, had lately been lost in the Strait: That some of the men got on shore at Vanna Aroa, near Terrawhitte, on the other side of the Strait; that the natives stole their cloaths, for which some of them were shot, but that the natives got the better of them when they could fire no longer, and not only killed them, but ate them. One of the men said it was twenty or thirty days ago, but another said it was two moons since, and described, as well as he could, in what manner the ship was beat to pieces. On the next day they told the same story to others, which made the captain, and indeed all of us, very uneasy about the Adventure; but when the captain inquired himself into the truth of the report, the very people who had raised it, as flatly and plainly denied it.

We went again on shore on the twenty-eighth, but found no appearance of the hogs or fowls we left behind. We obtained some fish from the natives, and made them presents in return. As we came back, some of the party thought they heard a pig squeak in the woods. We shot this day a good many wild fowl and small birds.

A large black boar was seen on the the thirty-first by the botanising party, which must be the same that captain Furneaux left behind him. We were not without hopes that this island will be stocked with those useful animals. Lieutenant Pickersgill was told the same story by one of the natives, of a ship being lost, but he earnestly declared, though many people were killed, it was not done by them.

We obtained a seasonable and plentiful supply of fish from our old friends on the fifth of November. A party of us embarked, in order to find the termination of the sound, and, if possible, to discover whether there was any passage by sea that way. We were met by some fishermen, who agreed in declaring that there was no passage to sea by the head of the sound; and soon after we were informed by others, that there was such a passage to the east; we therefore continued our course that way. We found a large settlement of the natives at a place called Kotieghenooce, and we were received with great civility both by them and their chief, who had been on board our ship. These people encouraged us in the pursuit of the object we had in view, and we therefore proceeded down this arm of the sea; we at last found it to open into the strait by a channel about a mile wide. A little within the entrance of it we found thirteen fathoms water; but from its situation it seemed necessary to have a trading wind either to go in or out of this channel; but as we determined to return on board that night, we had not time to make the necessary observations. We saw a strong hold built on an elevation on the north side, which we omitted visiting, though the inhabitants made many signs for us to come on shore. We reached the ship about ten o'clock at night, and brought home a few fish and small birds.

An old man, named Peder, made captain Cook a present of a staff of honour, such as the chiefs carry; and in return the captain dressed him up in a suit of old cloaths, which made him very happy. We inquired of this man if the Adventure had been there, and he gave us to understand that she was there a little time after we departed, and staid about twenty days, and that she did not meet with any accident upon the coast. This made us easy respecting her, but we feared that the described catastrophe might have happened to some strangers.

On the sixth instant we were accompanied by Peder to dinner, who ate heartily of every thing set before him, and drank more wine than any body else, without being at all intoxicated. On the eighth we put a boar, a sow, and two pigs on shore near Cannibal Cove, so that this country must be stocked with these useful animals, if the natives do not take more pains to destroy them than we have to supply them. On this day we found a hen's egg, newly laid, so that we had sufficient reason to believe that the cocks and hens still existed.

We had a large supply of fish on the ninth instant, and in return we gave old Peder an empty oil jar, which made him very happy. We went on shore in the afternoon into one of the coves, where we found two families employed in different manners; some were making mats, others were sleeping; some roasting fish and roots, and one girl was employed in heating stones, which she took out of the fire as soon as they were hot, and gave them to an old woman who sat in the hut. The old woman placed them one upon another, laid over them some green cellery, and over that a coarse mat; she then squatted on them all, and sat very close; very probably this was designed as a cure for some disorder, for she seemed very sickly. We sailed from this place on the tenth of November, and steered for the west entrance of the Straits of

Maghellan; the coasting this we thought would be an advantage to navigation and geography, as the world has not much acquaintance with that shore. We lost our main top-gallant mast on the twenty-seventh instant, nothing else being worth mentioning between these dates. We made the land of Terra del Fuego, near the west entrance to the Straits of Maghellan, on the seventeenth of December, nothing particular intervening worth notice. We now had entirely left the Southern Pacific Ocean; and we trust the world will give us some credit for having explored it tolerably well.

We ranged along this coast, and passed several capes, to which various names were given; and on the twentieth of December anchored on the east side of the land, that divided the two arms, in twenty-five fathoms water. We discovered a more convenient situation on the twenty-first instant, and the ship was removed there. We then went to work to clear a place to cut wood, fill water, and set up a tent for the reception of a guard, if it was found necessary. A place was, with some difficulty, pitched upon for fixing the astronomical instruments, &c.

Two parties went out on the twenty-second; one to examine and draw a sketch of the channel on the other side of the island, and the other to survey the northern parts of the sound. In our way we discovered a hut, and some other signs of inhabitants. We went over to the part that we judged to be the main land of Terra del Fuego, and found a fine harbour, surrounded by high rocks, and ornamented with many beautiful streams of water.

Captain Cook called this harbour the Devil's Bason; it is divided into two parts, and the communication between them is by a narrow channel. The inner bason is very secure, but intolerably gloomy; it is shaded from the sun, even when in its meridian splendour, by the vast height of the rock. The outer bason is much more pleasant than the other, and is equally safe and commodious. We found other harbours to the westward, which we had not time to look into. We found wood for fuel, and fresh water in or near them all. The whole country is a barren rock, except the fire wood which grows here, and seems to afford no other vegetation of any kind. The sea coast is composed of a great number of large and small islands. We found several huts on one of them, which had lately been inhabited; we likewise had an opportunity of loading a boat with wild celery. We shot but few fowls in this expedition. The other party found two commodious harbours; and we both returned on board in the evening. This day we had the misfortune to lose one of our mariners, who fell over the head and was drowned.

On the twenty-fourth we had an opportunity of shooting as many geese as served for a Christmas meal for our men, which was very acceptable to them, and much more agreeable than salt beef or pork. On this day a number of the natives in Nine Sound came along-side of the ship; these people seemed acquainted with the Europeans, and had some knives amongst them. On Christmas-day we had another visit from them, and they appeared to be the same that Monsieur Bougainville calls Pecharas. They are a diminutive, beardless, ordinary people; they go almost naked, being only slightly covered with a seal skin, or two or three of these joined together, so as to make a cloak that reached to their knees; the majority of them had but one skin, which scarcely covered their shoulders, and all their lower parts were quite naked. The women are clothed like the men, but cover their private parts with the flap of a seal skin; we could not see much of them, as they and their children remained in the canoes. They are inured from their infancy to cold and hardships, for we saw two young children at the breast entirely naked. They had with them harpoons made of bone, and bows and arrows; with the harpoons we imagined they killed fish. Their cloaths smelt intolerably of train oil, and they were very much delighted with presents of knives, medals, &c.

&c. Their canoes were made of bark, and in each of them was a fire. They carry in their canoes large seal hides, which may serve for covering in bad weather.

We celebrated Christmas-day very cheerfully, and had for our repast roast and boiled geese, goose-pie, &c. we had likewise some madeira wine left, which was not worse for keeping. We were visited again by some of the natives on the twenty-sixth instant, and as it was very cold, we gave them some baize and old canvas for covering. A party of us went on shore on the twenty-seventh, and were successful in shooting geese, &c. We called this place Christmas Sound, from the festival we celebrated here. We obtained here, as before remarked, great plenty of wild fowl, and some few fish. We found some good muscles here, which were agreeable to the taste, though not very large, and great plenty of wild celery. We believe, from some circumstances, that the inhabitants do not live here all the winter, but retire to parts where the weather is less severe. These people are certainly the most wretched of all the nations we have seen. They live in an hospitable climate, and do not seem to have sagacity enough to provide themselves with the comforts of life, particularly in the article of clothing. Our botanists found many unknown plants here.

We sailed from this place on the twenty-eighth of December 1774, and on the twenty-ninth we passed Cape Horn, and entered the Southern Atlantic Ocean. A party was sent into Success Bay, in order to discover if any traces of the Adventure had been seen there; but they returned without finding any. Our ship's name, &c. was written on a card, and nailed to a tree which stood near the place where it was likely the Adventure would water, should she be behind us and put into this place.

The natives received this party with civility. They were clothed with seals skins, and had bracelets on their arms, and appeared to be of the same race as those seen in Christmas Sound. The party reported that the bay was full of whales and seals. As we had now explored the south coast of Terra del Fuego, we determined to do the same by Staten Land, which is but very little known. We bore up for the east end of Staten Land on the morning of the thirty-first, and we now and then only got sight of the coast, as the weather was hazy. We perceived several islands as we advanced to the east. We were abreast of the most eastern isle at eight o'clock in the morning, when we waited some time for clear weather; but as it did not clear up as we wished, we hauled round to the east end of the island for the sake of anchorage, if we wanted it. As we continued our course, we saw on this island a great number of seals and birds, which was a great temptation to our people, who wanted some fresh provisions; accordingly we anchored about four leagues from the east end of Staten Land, and about one mile from the nearest shore. The island shaded us from the north wind, and Staten Land from the south.

On the afternoon of the thirty-first a large party of us landed, some of us designing to kill fish or birds, and others to kill seals. The island was so stocked with the latter, that one would have thought he had been transported into Essex, or any other county where cows and calves are in abundance, as they made such a continual bleating. When we came to examine them, we found them different from seals, though they resembled them in shape and motion. The male bears a great resemblance to the lion, on which account we called them so; we also found of the same kind as the New Zealand seals, which we called sea bears. We shot some of the large ones, not thinking it safe to approach near them; though in general they were tame enough to suffer us to knock them down with our sticks. Our party returned in the evening, sufficiently laden with provisions of one kind or other.

A party was sent out on the first of January 1775, to look for a good harbour, as this place promised to

afford some tolerable refreshments. Another party went to bring on shore the beasts we killed the day before; the old lions and bears were good for nothing but their blubber, or fat, which we made oil with, but the flesh of the young ones we liked very well. The party returned from Staten Land, where they found a good port, situated three leagues to the westward of Cape St. John. The harbour is almost two miles long, and near one broad; the bottom is of mud and sand, and there are from ten to fifty fathoms water. There are several streams of fresh water in it, and good wood for fuel. The air was quite darkened with sea gulls, which rose up when disturbed by our people, and almost suffocated them with their dung, which they seemed to emit by way of defence. It answered their purpose tolerably well, for it stunk so intolerably that our people could hardly endure it.

This was called New Year's harbour, from the day on which it was discovered, and is certainly a very convenient one for shipping.

Before we leave this place, we will give a more particular description of the animals, &c. found upon it. The largest sea lion we saw was about fourteen feet long, and about eight or ten in circumference; the back of the head, the neck, and shoulders, are covered with long hair, like those of the lion, the other parts of the body with short hair, like that of a horse; both the long and the short hair are of a dark brown colour. The female is of a light dun colour, and about half the size of the male; they live in herds near the sea shore. We saw a male with twenty or thirty females about him, and he seemed very desirous of keeping them all to himself, beating off all other males who attempted coming near them. The sea bears are smaller than the lions; all the hairs that grow upon them are of an equal length, and much finer than those of the sea lion. They permitted us to come very near them. It was rather dangerous to go between them and the sea, for if they happened to take fright at any thing, they would come down in vast numbers towards the sea, and run over you, at least before you could get out of their way. This place abounds with penguins, which is an amphibious bird. They are not very good eating, but they served us instead of better. Here are great numbers of shags, which are very good eating; we killed abundance of them. We saw a few geese, which are of the same species as those in Christmas Sound; here are also some ducks. We saw several oceanic birds, and some land birds.

Two new species of birds were discovered here by our naturalists. The plumage of one of them is as white as milk, and about the size of a pigeon; these feed along the shore, and have a very bad smell. The other new sort is somewhat like a curlew, and about the size of a heron. The plumage of it is variegated, but is chiefly of a light green. There are also sea pies on this coast. All the animals on this island live in perfect harmony together; and we saw them have such an easy communication with each other, as cattle and poultry in a farm-yard, no one attempting to disturb the general tranquillity.

On the third of January, 1775, we left the land, with a view of discovering the gulph of St. Sebastian, if such a coast subsisted, in which that gulph lies. We made several tacks between the third and the sixteenth, and came into the latitude that Mr. Dalrymple fixes for the coast he says he discovered, but we did not see it. A person saw an island from the mast-head, whose name was Willis, and we called the island after his name. This is a high rock, of no great extent; it is situated in latitude 54 deg. fourth, longitude 38 deg. 23 min. west.

We made sail in for the land on the seventeenth, and steered along the shore at the distance of four or five miles. A party went out to reconnoitre the bay before we entered with the ship, but we could not find a bottom with our line, which was only thirty-four fathoms. As it did not seem probable, from the appearance of this country, that we should be benefited

sited by the discovery, we were not particular in examining the places, as it was determined not to bring the ship in. We took possession of the place in the King's name, fired some small arms, and we displayed our colours.

On all sides of the bay were very high perpendicular ice cliffs, and very frequently large pieces would break off and fall into the sea. The same horrible appearance subsisted in the interior parts of the country. The vallies lay covered with snow, and the rocks reached the clouds; there were neither trees nor shrubs of any size. We saw several seals and sea bears, but they were not so large as those on Staten Land; it is very probable that they were chiefly females, for there were many cubs on the shores. We likewise saw several flocks of larger penguins than we had ever before seen; one was brought on board which weighed thirty-nine pounds. Here were several albatrosses, gulls, Port Egmont hens, terns, divers, shags, the new white birds, and another bird like some we saw at the Cape of Good Hope, which we found very palatable indeed.

We did not meet with any land quadrupeds, nor any vegetation, but a coarse kind of grass. The rocks appeared to contain iron ore. We returned on ship-board with an acceptable present to our sailors, which consisted of seals and penguins; we were now most heartily tired of salt provisions, and any fresh food went down with much satisfaction.

This place, which we called Popopin Bay, is situated in latitude 54 deg. 5 min. south, and longitude 37 deg. 18 min. west. A projecting point was discovered on the eighteenth, which terminated in a round hillock; this we called Cape Charlotte, in honour of her most gracious Majesty the Queen, whose birthday we were now celebrating. To the westward of Cape Charlotte lies a bay, which we called Royal bay, and the west part of it we called Cape George. These Capes, viz. George and Charlotte, lie six leagues from each other.

We saw a new land on the nineteenth, which appeared at first in a single hill, like a sugar-loaf; but afterwards more detached pieces were visible. We saw an island, which we called Cooper's Island, and another which we called Pickersgill Island. On the twentieth instant we discovered that the land, which we had all along taken for a considerable continent, was no other than a large island, of seventy leagues in circumference. This island, though situated between the latitude of 54 and 55 deg. was, in the very midst of summer, almost wholly covered with deep frozen snow. On this island, in winter time, much ice must be found, which breaks off in the spring, and is dispersed over the sea; but as there are such quantities of ice in those seas, it is impossible that it can all come from this island; it is therefore a necessary consequence, that the ice is formed in the sea, or that there is an extensive continent near this latitude; but if the continent that is supposed to exist, is like the island we just discovered, it is not worth going in quest of.

In honour of his Majesty King George the Third, we called this island Georgia. We saw neither river nor stream of fresh water on the whole coast, but it seems to abound with bays and harbours, which are rendered inaccessible by the vast quantities of ice. After we saw this land, we did not doubt about the existence of Cape Circumcision, we therefore steered for the land we saw on the nineteenth, but we met with a heavy storm, which was succeeded by a thick fog. By the twenty-third we had surrounded this new land, which we found to be no more than a few detached rocks, which were the receptacles for birds. These rocks were named Clerke's Rocks, after the lieutenant of that name, who first saw them.

On the twenty-seventh of January we found ourselves in latitude 60 deg. south, and we did not intend going farther, unless we had good expectation of meeting with land. From all circumstances, we think we may safely pronounce, that the extensive coast, said

to be discovered by Dalrymple, and laid down in his chart of the ocean between Africa and America, does not exist, any more than the gulph of St. Sebastian.

We saw an ice island on the twenty-eighth, and several large and small pieces of floating ice, and in the afternoon fell in with a large number of ice islands; the weather was hazy, and we found it dangerous sailing among them. These islands appeared to be of various extent, but of equal height; some of them were nearly three miles in circumference.

On the thirty-first we discovered land ahead, at the distance of three or four miles; the weather soon cleared up, and we had a tolerable view of it. This proved to be three rocky islets, which were very high; one of them terminated in a lofty peak, like a sugar-loaf, and we called it Freezeland Peak, after the man who first discovered it. It is situated in latitude 59 deg. south, longitude 27 deg. west. An elevated coast appeared behind the peak, which we called Cape Bristol, in honour of the earl who bears that title. Another elevated coast appeared in sight at noon, in latitude 59 deg. 13 min. 30 sec. south, longitude 27 deg. 45 min. west. This we called the Southern Thule, because it is the most southern land that ever yet was discovered; it is wholly covered with snow, and its surface appears exceeding high. Between the Thule and Cape Bristol, it is very probable there is a deep bay, which we called Foster's Bay, after Mr. Foster, who sailed with us on botanical researches. As we could not weather the Thule, we bore to the northward, and we were soon left to the mercy of a violent swell, which sat right upon the shore. The weather had been hazy, but it cleared up, when we saw Cape Bristol terminating in a point to the north, and we could not see any land beyond it; we were thus providentially relieved from being carried on this most horrible coast.

We saw a high promontory on the first of February 1775, which we called Cape Montagu; it is situated in latitude 58 deg. 27 min. south, longitude 26 deg. 44 min. west. We thought this new coast and Cape Bristol were connected, as we saw land from space to space between them. Prudence prevented our going near the coast, we therefore could not determine this with accuracy.

On the second instant a new land appeared, about ten leagues distance, but we soon lost sight of it, and steered for the land we saw the day before, but we could not weather it; it appeared to be an island of about eight or ten leagues in circumference. A full stop was put to our further discovery of this land, by a thick fog, which made it unsafe to stand in for the shore. We named this supposed island, Saunders's Island, in honour of Sir Charles Saunders, an admiral of the British fleet. It is situated in latitude 57 deg. 49 min. south, longitude 26 deg. 44 min. west. We saw another land on the fourth and fifth instant, which we could not explore, and called it Sandwich Land.

From a multitude of circumstances, we are inclined to believe that there is a larger or smaller tract of land near the pole, which is the source of a great deal of the ice found in this sea; and as we always found ice to the north in this ocean, it is very probable that the land extends farthest to the north, opposite the Southern Atlantic and Indian Oceans. If ice may be formed without the existence of any land, it will necessarily follow, that the cold round the pole ought to be every where nearly equal, and that we ought to see ice every where under the same parallel; but this was not the case. We may very safely determine, that the lands which lie to the south will never be explored, for the danger is so very great in exploring these unknown seas, that every one but an enterprising commander will be deterred from such attempts.

On the sixth of February we had a very heavy fall of snow; the quantity that lodged in our sails was immense, and we were much indebted to a storm which arose, and cleared us of it. All the space between the sixth and twenty-third of February was employed

ployed in looking for Cape Circumcision, but without effect. It is most likely that the ice islands deceived Monsieur Bouvet, as they very frequently did us.

By this time we had traversed the Southern Ocean, in such a manner as to have no doubt in determining that there is no continent, unless it is near the pole, and out of the reach of navigation. We made many new discoveries, and ascertained the exact situation of several old ones. Thus was the end of our voyage fully answered, the southern hemisphere sufficiently explored, and the necessity of the search after a southern continent put an end to.

It is not denied (but we are rather of opinion that the conjecture is reasonable) that there is land near the pole, and it is probable that we may have seen a part of it.

As the formation of ice islands has not been fully investigated, we will offer some hints and observations respecting them. We do not think, as some others do, that they are formed by the freezing of the water at the mouths of great cataraets or large rivers, which, when accumulated, break off, owing to their ponderous weight; because we never found any of the ice, which we took up, in the least connected or incorporated with earth, which must necessarily adhere to it, were this conjecture true. Furthermore, we are not certain whether there are any rivers in these countries, as we saw neither rivers nor streams of fresh water there. The ice islands, at least, in those parts, must be formed from snow and sleet consolidated, which gathers by degrees, and are drifted from the mountains. In the winter, the seas or the ice cliffs must fill up the bays, if they are ever so large. The continual fall of snow occasions the accumulation of these cliffs, till they can support their weight no longer, and large pieces break off from these ice islands. We are inclined to believe, that these ice cliffs, where they are sheltered from the violence of the winds, extend a great way into the sea.

We should have proceeded to farther discoveries, but our commander thought it cruel to detain the people, who sailed with him, any longer without the necessary refreshments, especially as their behaviour merited every indulgence, as neither officers or men ever once repined at any hardship, nor expressed any uneasiness, or additional fear of danger, on account of our separation from the Adventure. It was now high time to think of returning home; had we continued longer, we should have been in great danger of the scurvy breaking out amongst us, and we do not know any good purpose further discoveries would have answered; we therefore steered for the Cape of Good Hope, intending to look for the isles of Denia and Marseveen.

On the thirteenth of March we were near the parallel, where the isles of Denia and Marseveen are said to lie; but we saw no traces of them, and had not time to discover whether they existed or not. We had nothing but stale and salt provisions on board, and every one heartily desired to get into port; we therefore steered for the Cape of Good Hope.

Pursuant to the instructions given to Captain Cook before he sailed, he demanded of the officers all the log books and journals, which he sealed up, enjoining both them and the whole crew not to divulge any of the transactions which happened to them, or where they had been, till they obtained leave to that effect. In the evening of the seventeenth we saw land, with a great fire upon it; we likewise saw two sail of ships, one of which bore Dutch colours. On the eighteenth a boat was hoisted out, and sent on board one of the ships, which was about two leagues from us; we did not regard the distance, as we were by this time very impatient for news.

She proved to be a Dutch East Indiaman from Bengal. The captain offered us arrack, sugar, and whatever he could spare. An English seaman, on board this ship, told one of our men that the Adventure arrived at the Cape of Good Hope about twelve months ago, and related, that part of the crew had been mur-

dered and eaten by the people of New Zealand. We afterwards saw an English East Indiaman, who confirmed the news of the Adventure; on board this ship captain Cook put a letter, directed for the secretary of the Admiralty. The captain of this ship furnished us with some fresh provisions, tea, &c. which to us were very acceptable; we likewise got from him some old newspapers, which were entertaining to people who had been so long from home. We parted company in the afternoon, and were very much pleased with the polite behaviour and generosity of the captain.

We anchored in Table Bay on Tuesday the twenty-first instant, where we found several Dutch and French ships, and one English East Indiaman, by whom we sent several papers to the Admiralty. We acquainted the Governor with our arrival, and requested the necessary stores and refreshments, which he very readily and obligingly granted. The garrison was saluted with thirteen guns, and they immediately returned the compliment. Captain Cook here received a letter that captain Furneaux had left for him.

We will entertain our numerous readers with a narrative of captain Furneaux's proceedings in the Adventure, when we have safely brought back the Resolution to England.

We were very politely received at the Cape by the Governor and other principal officers, who contributed all in their power to make our visit agreeable; this proved a real repose after the dangers and difficulties of so long a voyage. As it is the custom at the Cape, all our principal officers took apartments on shore, where we provided a quantity of fresh baked bread, meat, and greens, for the people on board; but of our whole crew, there were not more than three men who were obliged to go on shore on account of their health.

We erected a tent on shore, and began our necessary repairs; great part of our rigging was replaced, though at an exorbitant rate. It is not very wonderful that our rigging and sails should be worn out, as we had not sailed less than twenty thousand leagues, which is about equal to three times the circumference of the earth, and which it is very probable no ship ever sailed before in the same time. Owing to the great care of our officers, and the good properties of the ship, we neither sprung nor broke a mast or shroud during the whole voyage.

On the twenty-sixth of April we took leave of the Governor, having got on board all necessary stores, and a fresh supply of water and provisions; we weighed and put to sea in company with the Spanish frigate Juno. When we were got under sail, we saluted the garrison with thirteen guns, and they fired an equal number. We were saluted by the Spanish frigate and a Danish Indiaman as we passed them, and we returned each salute with an equal number of guns; afterwards we steered for St Helena.

We saw the island of St. Helena on the twenty-fifth of May, and anchored before the town. The Castle and the Dutton East Indiaman saluted us, and we returned the compliment. We were received with the utmost politeness by the Governor and principal gentlemen of the place. A new church has been built at St. Helena within these five years, and there are other new buildings begun. They have finished a commodious landing-place for boats, and made several other improvements. Here we got our empty water-casks filled, and purchased a considerable quantity of fresh beef.

We departed from St. Helena on the twenty-first of May, and received the usual salute of thirteen guns, which we returned. We made the Island of Ascension on the twenty-eighth instant, and anchored in Cross Bay, about half a mile from the shore. Here we remained till the thirty-first, but obtained only twenty-four turtles notwithstanding we had several parties out; indeed it was rather too late in the season to expect any more; those we caught were very large, weighing between four and five hundred pounds each. This island is about ten miles long, and about six broad; its surface is very barren, and scarcely pro-

duces any vegetation; it is very probable, from the general appearance of the island, that at some time, of which we have no account, it has been destroyed by a volcano.

On the island of Ascension, turtle may be caught from January to June. They always come on shore to lay their eggs in the night, when they are caught by people who are placed there to watch; as soon as they catch them, they turn them upon their backs, in which position they lay on the beach till the next day, when the people take them away. It is very certain that they come to this island merely for the purpose of laying their eggs, as we found none but females; and none of those we caught, had any food in their stomachs.

We left the island of Ascension on the thirty-first, and steered for the island of Fernando de Noronha, on the coast of Brazil. In our passage for this place, we had very good weather, and fine moon-light nights, which afforded us many opportunities of making lunar observations. We made the island on the ninth of June, and it appeared like detached hills; the largest of which very much resembled the steeple of a church. As we approached the isle, we found the sea broke in a violent surf on some sunken rocks, which lay about a league from the shore. We hoisted our colours, and bore up round the north end of the isle. There is a strong fort on the island, so situated as to command all the anchoring and landing places. After we had sufficiently explored this coast, we stood away to the northward, and on the eleventh instant crossed the equator.

We made the island of Fayal on the thirteenth, and on the fourteenth anchored in the bay of Fayal, about half a mile from the shore. We came here on purpose to make observations, by which we could judge of the longitude of these islands. We accordingly sent to the English consul, and notified our arrival to the governor, begging his permission to make the observations on shore for the above purpose. This was readily granted, and the English consul behaved in a very hospitable manner to us. We staid here but a short time, in which the crew were supplied with plenty of fresh beef. This island produces abundance of wheat and Indian corn, with which some other isles are supplied. Villa de Huta is the chief town on the island; it is situated close to the edge of the sea at the bottom of the bay, there is a castle at each end of the town, and a stone wall all along the shore. These works are not kept in much repair, though they considerably increase the prospect of the city, which has a beautiful appearance from the road. The monasteries, churches, and Jesuits college, are the principal buildings. One thing makes rather a disagreeable appearance, at least to an Englishman, in this place, all the windows of the private dwelling-houses are latticed, and there is no glass to be seen but in the windows of the public buildings. In this small city are three convents of men, and two of women, eight churches, and one Jesuits college; thus, like all other Portuguese towns, is over-run with religious buildings. The Jesuits college has been suffered to go to decay since the expulsion of that order.

There is not wine enough raised on this island for its own consumption, but the wine which bears the name of this place is brought to de Houta, from Pico, and from thence exported.

The east end of the island, in the bay of Fayal, is of a semicircular form, two miles broad, and three quarters of a mile wide. The bottom is sandy, and there is depth of water from twenty to six fathoms.

We left the bay on the nineteenth, and steered for St. George's Island, and afterwards proceeded as expeditiously as possible for England. We anchored at Spithead on the thirtieth of July.

The whole time of our absence from England was three years and eighteen days, and owing to the good hand of providence, which smiled upon our attempt, and seconded our endeavours, notwithstanding the

various changes of climate) and they were as various as any man could experience) we lost only one man by sickness, and three by other accidents. The circumstance of keeping the ship's company in health, by means of the greatest care and attention, will make this voyage remarkable in the opinion of every humane person; and we trust that the purposes for which we were sent into the southern hemisphere were both diligently and sufficiently pursued.

We think that by this time our readers wish to be informed of the circumstances that happened to captain Furneaux in the Adventure, after he separated from the Resolution. The author of these sheets acknowledges his obligations to an officer on board for favouring him and the public with an account of their proceedings. He is the more indebted to him for this narrative, as a large history of this famous voyage, (sold at an enormous expence) is published without this necessary information.

Captain Furneaux made the coast of New Zealand, after a passage of fourteen days, from Amsterdam; they had a very heavy storm that blew us off the coast for three days successively, which split several of their sails, and parted us from the Resolution.

They got near the shore on the fourth of November 1773, and several of the natives brought them fish and fruit, which they readily exchanged for Otaheite cloth, nails, &c. On Friday, the fifth, they were again driven from the shore by a heavy gale of wind, which lasted two days, accompanied by a good deal of sleet, so that their bedding was wet, and several of the people complained of colds.

They came abreast of Talago bay on the ninth, and at eleven in the forenoon anchored in twelve fathom water. Though little was to be expected here, by the account given by captain Cook in his former voyage, yet the ship was hardly moored when great numbers of the natives came alongside in their canoes. But our journalist has left us to guess whether they came to trade, or only to gratify their own curiosity. It was at an island in this bay where the Endeavour's people observed the largest canoe they met with during their whole voyage. It was, according to account, no less than sixty-eight feet and a half long, five broad, and three feet six inches high; it had a sharp bottom, consisting of three trunks of trees hollowed, of which that in the middle was the longest; the side planks were sixty-two feet long in one piece, and were ornamented with carvings not unlike fillagree work, in spirals of very curious workmanship, the extremities whereof were closed with a figure that formed the head of the vessel, in which were two monstrous eyes of mother of pearl, and a large shaped tongue, and as it descended it still retained the figure of a monster, with hands and feet carved upon it very neatly, and painted red. It had also a high peaked stern wrought in fillagree, and adorned with feathers, from the top of which two long streamers depended, made of feathers, which almost reached the water. From this description we might be tempted to suppose these canoes to be the vessels, and this to be the great country lying to the south, of which Quiros received Intelligence at Taumai; and where Toabia said they ate men, and had such large ships that the English ship was small in comparison. Be this as it may, our voyagers shortened their stay in this harbour, being impatient to continue their voyage, and, if possible, join the Resolution.

The boats were manned on the tenth of November, and sent on shore for a supply of wood and water; and a guard of marines were ordered to accompany them, in order to protect them from insult. All the remaining part of the crew were employed in stopping leaks and repairing the rigging, which was now in a most ruinous condition. Having got on board a small supply, the weather being tolerable and the wind fair, on the eleventh instant they hoisted in the boats, unmoored, weighed, and put to sea. They had hard gales and squally weather with rain on the twelfth. At eight in the morning they bore up,

up, but could make no way, so were again obliged to run into Talago bay. At noon they came to, moored, and hoisted out the boats to increase their supply of wood and water. The thirteenth they were employed as before. On the fourteenth the surf rose so high, that they could not make the land. The fifteenth was employed in getting on board more wood and water; and on the sixteenth, at three in the morning, they unmoored, and before six got under Tay, and came to sea. From this time to the twenty-eighth nothing but tempestuous weather, in which their rigging was almost all blown to pieces, and the men quite worn down with fatigue. On the twenty-ninth the water they had obtained was nearly expended, and they were reduced to the scanty allowance of a quart a man per diem.

The weather became more moderate on the thirtieth, when they made Cook's Straights, and at three in the afternoon cast anchor in Charlotte Sound.

As soon as they came to anchor, they made inquiry whether any instructions had been left for them by the Resolution; and upon examination a letter was found, importing that the Resolution had set sail six days before.

The tents were carried on shore on the first of December, the sick landed, the armourer's forge put up, and, in short, every preparation made to refit the ship, and to recover the numerous sick. Here the natives came on board with great familiarity, brought fish, and what else they had to sell, and seemed to behave with great civility and traffic honestly; but this behaviour was but of short continuance.

A party of them came down on the night of the thirteenth, and robbed the astronomer's tent of every thing they could carry away. This they did so quietly, that they were not so much as heard, or suspected, till the astronomer, getting up to make an observation, missed his instruments, and charged the sentinel with the robbery. This brought on a pretty severe altercation, during which they spied an Indian creeping from the tent, and Mr. Bailey fired at, and wounded him; but, notwithstanding, he made shift to run into the woods and escape. The report of the gun had alarmed his companions, who likewise, instead of taking to their canoe, fled into the woods, leaving the boat with most of the things that had been stolen in it aground upon the beach. This it is more than probable laid the foundation of that dreadful catastrophe which soon after happened.

When they were preparing for their departure on the seventeenth, the largest cutter manned with seven seamen, under the command of Mr. John Roe, the first mate, accompanied by Mr. Woodhouse, midshipman, and James Tobias Swilley, the carpenter's servant, were sent up the sound to Grass Cove, to gather greens and wild celery. The tents were struck at two in the afternoon, every thing got on board, and the ship made ready for sailing the next day. Night coming on, and no cutter appearing, the captain and others began to express great uneasiness, fearing some treachery from the savages. They sat up the whole night in expectation of their arrival, but to no purpose. At day-break the captain ordered the long boat to be hoisted out, and double manned, with Mr. Burney, second lieutenant, Mr. Freeman, master, the corporal of the marines with five private men, all well armed, with plenty of ammunition, two wall-pieces, and three days provisions. Thus equipped, about nine in the morning they left the ship, and rowed and sailed for East Bay, keeping close in shore, and examining every creek they passed, to find the cutter: they continued their search till two in the afternoon, when they put into a small cove to dress dinner.

While dinner was getting ready, a company of the natives were observed seemingly very busy on the opposite shore, upon which they left their dinner and rowed precipitately to the place where the savages were assembled. Upon their approach, the natives immediately fled; they followed them closely to a

little town, which they found deserted; but while they were employed in searching their huts, the natives returned, and made a shew of resistance, but some trifling presents being made their chiefs, they were very soon appeased. However, on their return to the boat, the savages again followed them, and some of them threw stones. After dinner they renewed their search, and at proper intervals kept firing their wall-pieces as signals to the cutter, if any of the people should happen to be within hearing.

They opened a small bay about five in the afternoon, where they saw a large double canoe, and a body of natives hauling her upon the beach. They quickened their course to come up with them, but the savages instantly fled on seeing them approach, which made them suspect that some mischief had been done. On landing, the first thing they saw in the canoe was one of the cutters row-lock boards and a pair of shoes tied up together. On advancing farther up the beach, they found several of their peoples baskets, and saw one of their dogs eating a piece of broiled flesh, which upon examining they suspected to be human, and having found in one of the baskets a hand, which they knew to be the left hand of Thomas Hill, by the letters T. H. being marked on it; they were no longer in suspense about the event. They pursued the natives as far as was practicable, but without success. On their return they destroyed the canoe, and continued their search. At half after six in the evening they opened Grass Cove, where they saw a great many natives assembled in the beach, and six or seven canoes floating in the surf; they stood in shore, and as soon as the savages saw them they retreated to a rising hill close by the water side. The lieutenant being doubtful whether their retreat proceeded from fear, or a desire to decoy them into an ambuscade, determined not to be surprised, and therefore running close in shore, ordered the grappling to be dropt near enough to reach them with the guns; but at too great a distance to be under any apprehension from their treachery. In this position they began to engage, taking aim, and determining to kill as many of them as their guns would reach. It was some time before they dislodged them; but at length many of them being wounded, and some killed, they began to disperse. The lieutenant improved their panic, and, supported by the officers and marines, leapt on shore and pursued the fugitives.

They had not advanced far from the water side before they beheld the most horrible sight that ever was seen by any European; the heads, hearts, livers, and lights of three or four of their people broiling on the fire, and their bowels lying at the distance of about six yards from the fire, with several of their hands and limbs in a mangled condition, some broiled and some raw; but no other parts of their bodies, which gave cause to suspect that the cannibals had feasted and eaten all the rest. They observed a large body of them assembled on a hill about two miles distance, but night coming on they durst not advance to attack them; neither was it thought safe to quit the shore, to take account of the number killed, their body being but small, and the savages numerous and fierce. They were armed with long lances and weapons not unlike a serjeant's halbert in shape, made of hard wood, and mounted with bone instead of iron. They could discover nothing belonging to the cutter but one of the oars which was broken and stuck in the sand, and the fastenings of the natives canoes tied to it. It was suspected that the dead bodies of their people had been divided among the different parties of savages that had been concerned in the massacre; and it was not improbable that the party that was seen at a distance were feasting upon some of the others, as those on the shore had been upon what were found, before they were disturbed by the crew of the long boat; be that as it may, they could discover no traces of more than four of their bodies, nor could they tell where the natives had concealed the cutter.

It was now near night, and the lieutenant not thinking

thinking it safe to trust the crew in the dark in an open boat, within reach of such cruel barbarians, ordered the canoes to be broken up and destroyed, and carefully collecting the remains of their mangled companions, they made the best of their way from this polluted place, not without a few execrations upon the inhabitants, and got on board the ship before midnight. The remains of the bodies brought on board were examined by the surgeon, but he could not make out to whom they belonged, so they were decently laid together, and with the usual solemnity observed on board ships committed to the sea.

It was the twenty-second of December before the Adventure got clear of land; and then the cloaths and effects of the ten men who were murdered and eaten were sold before the mast, according to the old sea custom. Nothing material happened till the first of January 1774, when strong gales and rainy weather came on, and by reason of the seas' running so high they were obliged to lie to. Towards night the violence of the gale abated, and the wind being at

west, and their course south south-east, they made sail and proceeded very fast on their voyage. Between this date and the fifteenth of July nothing remarkable happened, except their stopping at the cape of Good Hope, where captain Furneaux left captain Cook a letter. To the great joy of all the sailors, they anchored at Spithead on the fifteenth of July 1774, after having been absent two years.

From a review of the whole, the reader will judge how much the world has lost by the death of that able circumnavigator captain Cook. Upon the comparison of the course the Resolution steered, and the valuable discoveries she made, with that pursued by the Adventure after she parted company, the contrast will be sufficiently striking, and the necessity of any further remarks entirely superseded.

That our account of this Voyage may be rendered as complete as possible, we shall add a new and correct table of the language used throughout the Society Isles, which was noted on the spot with great care and exactness.

A brief Table of the Language used by the Inhabitants of the Society Isles; to which is affixed their meaning in English.

Engraved for Moore's New & Complete Collection of Voyages & Travels.

The GRAND SEIGNIOR in an elegant Turkish Habes, making a public appearance before his palace.

A N A C C U R A T E A C C O U N T
O F
T U R K E Y in E U R O P E ;

Extracted from the most celebrated Voyagers and Travellers to those Parts.

In order that our useful and entertaining Work may be rendered entirely free from any material Omission, and fully answer the Title, viz. A NEW AND COMPLETE COLLECTION OF VOYAGES AND TRAVELS, we shall in this and the following Sheets, give a full Account of those Places on our Globe, which have been either omitted, or slightly touched upon in the former Part of this Work.

TURKEY in Europe contains several provinces, which we shall particularly describe. The ancient Thraë or Romania, is the first province. The chief town of this province is Constantinople; the metropolis of the Turkish empire, and has the finest port and harbour in Europe. This city was built by the emperor Constantine in the fourth century, who removed the seat of the empire from Rome to this city. The situation of it is 29 deg. 15 min. east long. and in 41 deg. 30 min. north lat. Two sides of it are washed by the sea, and as it rises gradually from the shore almost in the form of an amphitheatre, it affords the finest prospect in the world from the harbour, from whence are seen a great multitude of magnificent temples, mosques, the seraglio, gardens, and several groves of beautiful evergreens. The city is surrounded by a wall of about twelve miles in circumference, and the suburbs are very extensive. The streets of the town are narrow; the houses are low, and built with timber, which occasions almost a general conflagration when a fire happens; several hundreds, and sometimes several thousand houses being destroyed before the fire is extinguished.

The seraglio or palace is a fine building, and contains a great number of apartments richly furnished. Fifty porters keep guard at a principal gate of the palace, who wear high stiffened caps; and as many more keep guard at the second gate, but all of them without any other arms than a little staff. The Janissaries seldom carry any arms when they are not upon duty, and laugh at the Franks for wearing swords about the streets.

The mint for coining money is in the first court of the palace; and in the same court is an hospital, into which some people make interest to be admitted, that they may have the liberty of drinking wine, which is not denied to the sick, though it is prohibited to men in health.

The Divan, or supreme court of judicature, is in the second court, where all the people are allowed to come, as well as to the first. The Treasury is also here, round which there runs a piazza; and in the middle of the court are fountains with trees planted about them. The seraglio contains a vast number of inhabitants; it may rather be called a city than a palace; but notwithstanding this, there is a most profound silence constantly observed, for most people here learn to talk by their fingers.

Ambassadors with their retinues, when they come to an audience, are allowed to pass beyond the second court; but other than these, no strangers are admitted. The ambassadors are conducted to the hall where the imperial throne is erected, being almost covered with jewels.

That the dignity, importance, and sacredness of the Grand Signor may be preserved, he very seldom

shows himself to the people more than once a year; and then he appears in great pomp and magnificence.

Seven of the royal mosques and temples are exceedingly magnificent, and are surrounded with spacious areas, at a distance from houses and other buildings that may hinder the prospect of them. These, as well as the rest, have hospitals belonging to them, and are endowed with schools; but the only ornaments in them are branches for candles, ivory balls and large crystal globes; no paintings or drapery are suffered in any of them. The Turks have broken down or defaced the cherubims and paintings, with which some of them were formerly adorned. The floors are covered with carpets, and there is a marble pulpit in every one of them, from whence the molla's sometimes preach to the people.

Public inns are not here used, as at other places, for the reception of travellers or merchants, but there are buildings erected on purpose for their entertainment, where there are warehouses for their goods, and other conveniences, for which they pay reasonably, and are provided with food gratis. In the market for their cattle, slaves of all ages and sexes are sold, and these are generally Christians; but where any of the girls have a good share of beauty that may recommend them to men of figure, they are kept in handsome lodgings by their masters, and provided with good cloaths and whatever else may recommend them to their purchasers. The Turkish gentlemen employ old women to examine into the state of their virginity; which if found uncontaminated, insures them a good price.

The second city of the province of Romania, and indeed of the empire itself, is Adrianople, which is about eight miles in circumference, and was rebuilt by the emperor Adrian after it had been destroyed by an earthquake. The Grand Signor has here another seraglio, equal in beauty, though not in extent, with that of Constantinople. Here are also several grand mosques; but the houses are meanly built, as in the metropolis.

Philippopoli is the next considerable town in Romania, which received its name from king Philip, the father of Alexander the Great. This city is inhabited chiefly by Christians of the Greek communion, and is the see of one of their archbishops; they shew a chapel here, in which they say St. Paul preached to the Philippians.

Gallipoli is another town in this province; it contains about ten thousand Turks and four thousand Christians, and was the first town the Turks possessed themselves of in Europe.

Between Constantinople and Gallipoli, Heraclea stood, which was once a great flourishing city, but there now remains little more of it than the ruins. Rodosto stands about seven miles from it, which is a place of considerable trade.

Macedonia is the next province of Turkey in Europe, and contains the following principal towns, viz. Cantessa, Philippi, Amphipolis, and Janiza.

The province of Albania contains Scodra, Aleffio, Dulcigno, Durazzo, and Ragusa.

The provinces of Theffaly and Epirus contain the following principal towns, viz. Lariffa (of which the reader may see a beautiful prospect in the annexed print), Theffalonica, Pharra, Janna; besides the mountains of Olympus, Chimæra, Butrinto, Larta, and Actium.

The province of Attica contains Setines, the ancient Athens, which was once a powerful republic, the seat of learning, wit and eloquence; and all arts and sciences were brought to greater perfection here than in any other part of the world, at the time when this city was in its flourishing state. It is now a poor despicable place: the inhabitants are still esteemed a polite ingenious people; their number is about ten thousand, of which three fourths are Christians of the Greek church.

The habit of the modern Athenians is a black vest, with a loose coat over it, lined with furs, and their cap resembles the crown of a hat; on their legs they wear easy black boots, which fit in wrinkles, but never wear any shoes or slippers. The women wear coloured gowns, usually red and blue, which reach down to their feet, and over them a short vest of silk, but never appear abroad without a veil; their hair is plaited and hangs down low on their backs. There are many churches and oratories in Athens, and the province of Attica contains the ruins of Eleufis, the city of Megara, which was once the capital of a considerable territory, Delphos, Mount Parnassus, Lepanto, Livadia, Thebes, Marathon, Aulis, Plataea, and the Morea, called Peloponnesus by the ancients.

Peloponnesus obtains its name from Pelops, the son of Tantalus, who led a colony hither. The name of Morea is obtained from Morus a mulberry tree; either because it seems to resemble a mulberry leaf, or because the soil produces abundance of those trees.

The Morea is a peninsula situated in the Mediterranean sea, is about one hundred and eighty miles long, and one hundred and thirty broad.

The chief towns are Napoli de Romania, Argos, Corinth, Sicyon, Nemæa, Lacedæmon, Sparta, Malvaria, Megalopolis, Belvidere, Modon, Coron, Arcadia, and Olympia.

The province of Bulgaria contains the following principal towns, viz. Sophia, Silliftria, and Nicopolis.

The province of Servia contains the towns of Belgrade, Semendria, Widin, Niffa, and Scopja.

The province of Bosnia is but a small one; the principal town is Bosnia Seraio.

The province of Dalmatia contains the towns of Trebigna, Narenza, and Antivari.

The Turkish provinces situated north of the Danube and Euxine Sea are, Bessarabia, Moldavia, and Walachia, Crim, Little and Budzaick Tartary.

Walachia is situated to the south of Moldavia, is of a triangular form, and consequently its breadth unequal, but its length is two hundred and fifty miles. The air is temperate, and soil fruitful; cattle abound, and wood is scarce. The whole is well watered; the established religion is that of the Greek church, and the common people are extremely ignorant. The waywode, prince, despot, or hespodar of Walachia, is a vassal of the Ottoman porte, paying a yearly tribute and furnishing a body of troops in time of war. The principal places are Terves, the capital, on the river Jalonitz, sixty miles north of the Danube, which has a tolerable trade, with some fortifications; and Buckereft, a strong town and archbishop's see, forty miles north of the Danube, which has some trade, is the residence of the waywode.

Moldavia takes its name from the Moldau, which runs through it. It is situated to the east of Transylvania; it is about two hundred and forty miles long, but the breadth varies considerably. It is in general a barren spot, and the inhabitants are a mixture of

various neighbouring nations. The principal places are Jassy, the capital, and residence of the waywode, which is situated on the Pruth, eighty miles north-west of Bauder; and Choczim, a strong town on the Dinefter, near the borders of Podolia.

The most material parts of Tartary have already been delineated, and the different tribes of Tartars described. Those in Europe remain to be mentioned, but these are few in proportion to the others, and being almost perpetually in motion, it is hard to speak of them locally. We shall however mention

Bessarabia, or Budziack, which borders on the Black Sea. The inhabitants are called White Hordes; they rove from place to place, live on the flesh of horses, oxen, cheefe, milk, particularly that of mares, &c. The chief place is Beuder, which in the Turkish language, signifies a strong pass. It was here that Charles XII. of Sweden resided after his defeat at Pultowa.

Ockzakow is inhabited only near the sea and along the banks of the rivers; and the country between the Don and Nieper is possessed by the Nogay Tartars, who are dependent partly on the cham of the Crim, partly on Russia. Their food is horse flesh, and their religion Mahometanism, but their hospitality far exceeds that of the most civilized Christians.

Having thus given a view of Turkey and Europe, nothing remains respecting the description of that quarter of the globe, but that we give our readers an account of Iceland, which is an European island, and situated in the Atlantic ocean, between 63 and 68 deg. north latitude, and 10 and 26 deg. west longitude. It is about four hundred miles long, and one hundred and fifty broad. For two months together the sun never sets; and in the winter it never rises for the same space, at least not entirely. The greater part of the island is mountainous, stony, and barren; but in some places there are excellent pastures, and the grass has a fine smell. The ice, which gets loose from the more northern country, in May brings with it a large quantity of wood, and several animals, such as foxes, wolves, and bears.

Large and small rivers, that flow from the mountains, besides rivulets and large lakes, all of which abound with excellent fish, well water this country. There are no forests in any part of the island; but this defect is in a great measure compensated by large quantities of fine timber, that come floating ashore on different parts of the sea-coast.

The mountains, several of which are exceedingly lofty, and always covered with ice and snow, are the most remarkable phenomena for which this island is distinguished. In the vallies between them the inhabitants live, and in those near the coast are plains covered with verdure. But notwithstanding the amazing coldness of this island, earthquakes and volcanos have been more known here than in many countries in much warmer climates. The former have several times laid the country desolate, particularly in 1734, 1752, and 1755, when fiery eruptions broke out of the earth. Many of the snowy mountains have also gradually become volcanos. The most famous of these burning mountains is that called Hecla, which is seated in the southernmost part of the island, not far from the sea. It has frequently sent forth flames, and a torrent of burning matter, whence the inhabitants formerly imagined that it was the place where the souls of the damned were tormented. Its eruptions have been very frequent, especially in 1693, when they were most dreadful, and occasioned terrible devastations, the ashes being thrown all round the island to the distance of more than 100 miles; but since that time Hecla has been free from eruptions. It takes up four hours to ascend from the foot of this mountain to its summit; and on the north-west side is a large chasm, reaching from the top almost to the bottom. It is remarkable that while flames and ignited matter issued from this chasm, the huge masses of ice and snow, with which the other side of the mountain was covered, were not melted, though the heat on that side was so intense,

intense, as to calcine large stones and other substances.

Other eruptions have broken out, though those of Hecla are stopped. The huge mountain of Crabla, on the 17th of May 1724, began to eject, in a terrible manner, smok, fire, cinders, and stones, which were followed by a fiery stream, like melted metal. The lava continued to move slowly on for about eight or nine miles, as far as the lake of Mynat into which it discharged itself, but did not cease till the end of September 1729, when the eruptions of the mountain subsided. They were, however, soon followed by the eruption of three of the adjacent mountains. Indeed it is a common observation among the inhabitants, that when the ice and snow are so accumulated on one of the mountains that formerly ejected fire, as to stop the clefts and chafms, which were the spiracles whence proceeded smok and flame, a new eruption is not far distant. Thus, in 1756, a mountain, named Cotligian, which had twice before cast forth fire and smok, again began to flame.

In this country stones of various colours are found, but no marble. It likewise produces a kind of crystal, a large quantity of pumice-stones, and, near the volcanos, two sorts of agate. It is also certainly rich in minerals, though there are no mines worked in the country. The people find, even above ground, large lumps of silver, copper, and iron ore, so rich, that they are melted by a common wood fire, and the metal made into various utensils. But the principal metal of this island is sulphur, great quantities of which were formerly exported to Copenhagen and other countries; but at present that branch of trade has entirely ceased.

The inhabitants of Iceland, are naturally well made, and possess a considerable share of bodily strength; though they seldom live to a very old age. In general, they are sober, honest, docile and industrious; but, like all others who dwell in cold countries, they are fond of drinking spirituous liquors, though few are so circumstanced as to procure any considerable quantity. They are subject to various disorders, particularly the rheumatism, fevers, asthma, and consumption; but the leprosy, or rather a kind of scurvy, is the prevailing disease. Their chief employment is fishing, to which they bring up their children as soon as they have strength enough to row a boat. The dress both of the men and women is much the same as that worn by the Norwegians. The men, in fishing, wear a garment of sheeps-skin over their cloaths, and this they frequently soften by rubbing it over with fish liver.

The buildings in this island nearly resemble those of Norway; with this difference, that as they are not so well supplied with timber, they make more use of stones, turf, and mud walls. The better sort possess tolerable houses, well furnished. Their roofs are either boarded or thatched, and their walls are comfortably thick and warm.

The inhabitants of Iceland are remarkably ingenious and docile. The country not only affords a great number of able boat-carpenters and handicraftsmen, but has likewise produced many men of distinguished learning. As there are no public schools in the country, the children are taught to read, and instructed in the articles of religion at home, by their own parents, or by the ministers of the different parishes, in the course of their visitations. They do not reckon time by the clock or hour; but take their observations from the sun, stars, or tide, and parcel out the day

into different divisions, each of which has its own appellation; such as midnight, twilight, broad-day, forenoon, noon, afternoon, evening, mid-evening, &c.

The Icelanders were originally a colony from Norway, they still speak the old Norwegian dialect, though they have adopted a great number of words from the Scots, with whom they heretofore maintained a considerable traffick. The Lutheran doctrine is the only religion here tolerated. The country is divided into two bishopricks; namely, the see of Skalholt for the south, and that of Hoalum for the north.

The revenue of each bishop amounts to about two thousand rix dollars; from which, however, he must maintain the rector and corrector, the minister of the cathedral church, and a certain number of scholars. At the time of the Reformation, great part of the church revenues was secularized, and now belong to the king of Denmark. The clergy here have no tythes; but some small dues are paid to them either in merchandize or money. The churches are in general low, and but indifferently decorated; nevertheless they are clean, decent, and commodious.

The people of this island are ruled by a governor called Staffsamptmand, or rather by his deputy the Amptmand; the former is generally chosen by the king from the Danish nobility, and resides at Copenhagen; but the latter always lives in Iceland, at the king's palace of Resstedt, on a salary of four hundred rix-dollars. His majesty likewise appoints a receiver, who collects all the taxes and revenues, and transmits them to the treasury. Besides the steward, there are Syffelmen, who farm the king's taxes in certain districts, and act as justices of the peace, each within his own province. The king's revenues arise from taxes and dues, an annual sum paid by the company of merchants, secularized abbey-lands, and other royal demesnes farmed out to the natives.

All the law contests in religious affairs, or concerning freehold property, are determined by the Norwegian laws; but in every dispute relative to meum and tuum, the old Iceland laws take place. There are two judges called Langmænd, who preside over the southern and northern divisions, and sometimes deputies are allowed. Actions are first brought in the court of Syffelman, from whence they may be evoked to higher courts; and if the cause be of great consequence, the last resource is the supreme court at Copenhagen. In spiritual cases the deputy-governor sits as judge, with the deans and clergy as his assessors. There is no other legal method of punishing men with death than beheading or hanging: the women, condemned to die, are sewed in a sack and drowned.

The commerce of this island consists of dried fish, salted meat, butter, tallow, train-oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, eider-down, feathers, timber, fishing lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, silk, all which they export and import, and a few other necessaries; as well as superfluities, for the better sort.

The Danes engross the whole trade of this island, for they are allowed an extensive charter. This company maintains factories at all the harbours in the island, where they exchange the foreign goods for the merchandize of the country; and as the balance is in favour of the Icelanders, they pay the overplus in Danish money, which is the only current coin in this island. The weights and measures here are nearly the same with those used in Denmark.

We shall now present our Readers with an Account of SOUTH AMERICA, extracted from the best and most approved modern Travellers and Historiographers; for though some Parts of it have already been slightly mentioned, we think this Part of the World of so much Consequence, that a complete View must be very acceptable to the numerous Subscribers to this Work; a Work in which we have taken the greatest Pains to please, and we are happy to find our Labours are crowned with the desired Success.

S O U T H A M E R I C A .

THE possessions of the Spaniards in South America, are Terra Firma, Peru, Chili, and La Plata, and the island of Cuba, part of Hispaniola, Porto Rico, Trinidad, Margareta, and several smaller islands.

New Mexico is about two thousand miles long and fifteen broad, and as the Spaniards bound it by a Terra Incognita on the north, they will most probably, at some future period, lay claim to the country as far as the Arctic Pole. New Mexico is divided into two provinces, that of New Mexico Proper, and California, which is contiguous to it. The capital of New Mexico is Santa Fe, and is considerable for its silver mines. Old Mexico, commonly called New Spain, is about two thousand miles long and six hundred broad; it contains three audiences, viz. Galicia, Old Mexico Proper, and Guadalajarra; the latter is the most northerly division of Old Mexico.

Mexico is the most capital province of America, it is situated in 103 deg. of west long. and 20 deg. of north lat. It stands upon an island in a lake which lies in the middle of a valley, surrounded by mountains at about ten miles distance. The town is about six miles round, is of a square form, and has a magnificent area in the middle of it, in which all the streets center; part of it is built in a morass, and is very subject to floods, as abundance of rivers discharge themselves into the lakes from the adjacent mountains. The hazard and inconveniences of the city have been so great, that it has frequently been the subject of debate, whether or not they should totally abandon the city, and build another on better ground; but as a vast expence would attend it, and the situation of the present city is cool and comfortable, and also naturally very strong, they have abandoned this project.

The Emperors palaces and their temples are the only public buildings we have any description of. The palace where Montezuma the last Emperor resided, opened with thirty gates into as many different streets. The principal front making one side of a great square. This building was erected with polished jasper, and over each gate in a large shield were the arms of Montezuma. The palace consisted of several square courts, extensive enough to contain three thousand of his women and their attendants.

When Hernando Cortez came here, the palace assigned to him was very large, and contained commodious rooms and apartments for five hundred Spaniards, and for several thousand of his Indian allies; the whole was surrounded with a thick stone wall, and flanked with stately towers. Formerly there were several canals with bridges over them, and several thousand boats plied upon the water to bring in provisions, &c. There were also two large aqueducts which Montezuma made at a considerable expence. This Emperor had likewise several pleasure houses in and about the city; in one of which were large galleries supported by pillars of jasper, in which were kept every species of land fowls and birds that Mexico produced. The sea fowls were preserved and fed in reservoirs of salt water, and those that were bred in lakes and rivers, in others of fresh water; these creatures

were so numerous, that they required three hundred men to look after them. Another part was appropriated to wild beasts, another to dwarfs, monsters, fools and naturals of the human species, which were kept for the diversion of the court.

The armouries were well stocked with all manner of Indian weapons of war, and all the palaces had elegant gardens laid out in shady walks, beds of fragrant and medicinal herbs and parterres of beautiful flowers with magnificent summer houses, bagnios, arbors, and fountains, that in those days might have vied with any thing of that kind in Europe.

When the Spaniards first came here, they were very much surprized at an edifice called the House of Sorrow, to which the Emperor used to retire on the death of his near relations, or on any public or private calamity. It inspired all those who approached it with gloomy melancholy thoughts, the ceiling and side were black, and there was only light enough admitted to discover the dismal obscurity. It is said that Montezuma used here to converse with the devil; but it is imagined, that we may either believe or disbelieve this part of the story.

The principal of the Mexican temples were dedicated to Vitzlipuyli, the God of war; which stood in a spacious square, was built with stone, and the front of it adorned, or rather deformed, with the skulls of men who had been sacrificed. The altar on which they offered human sacrifices was erected within the temple; every part of the building both within and without bore strong marks of magnificence and splendor. There were eight of these temples of equal wealth and grandeur, besides two thousand small ones dedicated to as many different deities, every street had its tutelar god; and every distress or calamity its particular altar, to which recourse was had for a remedy in their several complaints.

The face of the country is mountainous, and abounds on all sides with beautiful groves and woods; between the hills, rich vallies are interspersed of considerable extent. The mountains on the west side of Mexico are most of them volcanos, from whence vast quantities of fire and smoke are emitted.

The seas of Mexico are either the gulph of Mexico, and the north sea on the north-east, or the Pacific Ocean on the south-west. Here are a variety of rivers, capes, bays, and lakes.

The year is divided into the wet and dry seasons. The rainy season begins the latter end of May, when the sun is in the northern signs: the fair season is when the sun is at the greatest distance from them. The air of Mexico is very hot and unhealthy, though it is very much cooled by the situation in which the city stands.

The productions of Mexico are cotton, cedar trees, logwood, mangrove trees, cabbage tree, calabash, chocolate nut, and the venella, as well as many other fruits. They have several species of animals peculiar to this part of the world, such as the peccary, a little black short legged animal, that bears some resemblance to a hog, but his navel grows on his back. The warree resembles the former, but is something less.

A VIEW OF THE PEARL-FISHERY.

The opossum is remarkable for a false belly, where it preserves its young ones, when danger is near. The moor deer, which resembles the red deer, is almost as large as an ox. The guanoe is of the shape of a lizard, but as big as a man's leg. The flying squirrel has a small body, and a loose skin, which he extends like wings. The sloth is about the size of a spaniel dog, and feeds on the leaves of trees; but he is so many days getting down one tree and up another, that he will grow lean on the journey; no blows will make him mend his pace, and he will be eight or nine minutes in moving one of his legs. The armadillo is so named from his shell resembling armour, in which he can enclose himself. The pacoen resembles a badger. The tiger cat is certainly a smaller species of the tiger. They have likewise great variety of fish and fowls, as well as abundance of reptiles and insects.

The trade of Mexico is very extensive, for they trade with the Philippine islands near the coast of China, through the South Sea or Pacific Ocean; with Peru and Chili, through the same sea; and with Old Spain and the Spanish islands, through the North Sea and Atlantic Ocean. There is very little traffick carried on by sea on the coast of Mexico, as all goods are carried from Acapulca to the city of Mexico by mules and pack horses, and from thence to Vera Cruz on the North Sea in like manner, in order to be shipped for Europe.

There are a great variety of inhabitants in the province of Mexico: with the original Indians, the Spaniards and other Europeans have intermixed. It seems there is a wide difference between the temper and genius of the Mexicans at the time the Spaniards first came among them, and what they are at this day. They were then a very ingenious, inoffensive, and hospitable people, but they are now much degenerated in every respect.

The Indians who at present retain their liberty, and are not subject to the Spaniards, we are informed by Dampier, are a very humane, brave, generous, and active people, and are uncontaminated with the fordid vices of those who live in towns, and are corrupted by the Europeans. They spend great part of their time in hunting, shooting, and fishing. Every man builds his own house, and makes his own arms, tools, and implements of husbandry. They cultivate but little ground, and plant just enough Indian corn to supply the necessities of the family. The women spin and weave their cotton and linen; they do the household business, and carry the baggage upon a march; they are never known to murmur or repine, but do every thing forced upon them with cheerfulness and alacrity.

Their principal food is Indian corn ground into flour, of which they make their cakes; they likewise eat fruit, roots, sometimes fish, wild hogs, and venison. They go out in hunting parties a week or fortnight for food, and some women go with them to carry roasted plantanes, &c. They have a variety of diversions among them, and they rejoice in a particular manner at the commencement of a new age. [Vide our plate annexed.]

The mines of Mexico are in the rocky barren parts of the country; great part of the gold is found in the sands of their rivulets. Many thousand negroes are employed annually, in the fair season, to take up and wash the sand till they have separated the gold from it.

The mines of silver are usually found in barren rocks and mountains, though they are sometimes met with in plain fields. The fixed mine is said to resemble the branches and ramifications of trees and plants; and where they find one, they usually meet with a great many in the same place. The Indians know how to purify silver by fire, and to separate it from lead and other metals, before the Spaniards came amongst them, but they knew nothing of the art of refining it by quicksilver.

Any person who discovers a mine of silver in this

country, is at liberty to work it, paying the king's tenth of the produce, and he is assigned by the king's officers sixty yards round about the place to chuse to dig. All the silver dug in the mines of Mexico or New Spain, is brought to the king's exchequer, except what is concealed, and there it is coined into marks and pieces of eight.

There are several quarries of jasper, porphyry, and all kinds of excellent marble in Mexico; and it is said, that before the conquest of it, they used to build their palaces and temples with it.

The pearl fishery is here very extensive, multitudes of Indians and other slaves have been destroyed by the Spaniards in this part of the world, in fishing up the oysters that contain them. These slaves were forced to dive into six, nine, and even twelve fathoms water, in search of these oysters, which are fastened to rocks and gravel in the sea, and they continued above a quarter of an hour under water, being directed in such a manner as might best enable them to hold their breath. [Vide the annexed plate on this subject.]

The Spaniards have not many regular forces in Mexico; and it seems very likely that a powerful expedition to this coast, would, under the blessing of Providence, be attended with success. Britain might in that respect pay herself for the losses she has sustained in North America, by making conquests of so valuable a nature in the southern parts of it.

We will now give some account of the grand revolution in Mexico, in the year 1518 and 19. Fernando Cortez had the command of about seven hundred men, in order to invade the empire of Mexico: he arrived at the mouth of the river Tobasco, in the bay of Campeachy, in March, where the natives made a shew of opposing his landing, till he fired some great guns at them, with which they were so much terrified, that they abandoned the shore; and he landed without opposition, and marched to the city of Tobasco, which he found fortified with a kind of wooden wall, formed with the bodies of trees, fixed like palisadoes, through the intervals whereof they shot their arrows; but his men no sooner came up to the walls, and fired their musquets through the palisades, than the enemy retired to a large square in the middle of the town, where they shewed some intention to defend themselves; but upon the approach of the Spaniards, they retired from thence also, and fled to their friends in the woods. It is said, that only two of the natives were killed at this onset.

The day after the taking of Tobasco, the Mexicans assembled an army of forty thousand men, with which they attacked the Spaniards, and the battle seemed doubtful, till Cortez sallied out of a wood and charged them in the flank with horse; by which he obtained another compleat victory. The Indians are represented in this battle as a formidable enemy, and to have attacked the Spaniards with such bravery, that they were scarcely able with their fire-arms to repulse them; but this is undoubtedly related to magnify the victory.

The day after the battle, the prince of Tobasco sent a solemn embassy to Cortez, imploring peace, attended with a present of such fruits and provisions as his country afforded, together with jewels, plumes, and painted cotton, linen, and whatever he thought most acceptable to the conquerors. The ambassadors approached Cortez as they used to do their gods, with golden pans or censers, in which they burnt aromatic gums and other incense. The prince afterwards came in person and made his submission, bringing with him twenty beautiful Indian virgins, which he made Cortez a present of; and one of these, whom the general afterwards caused to be baptized by the name of Donna Maria, served him, during the whole expedition, in the double capacity of concubine and interpreter; she was a native of Mexico, of ready wit, and understood the customs and language of the country remarkably well.

When the prince of Tobasco came to make his sub-

mission, Cortez let him know that he came from a powerful prince, and that his principal view was to make them all happy in this world and the next, by making them subjects of the same sovereign, and converting them to the true religion. To which the affrighted prince replied, that he and his people should think themselves happy in obeying a king, whose power and greatness appeared with such advantage in the value of his subjects; but as to the point of religion, they gave little hopes of their conversion.

A peace was concluded with the natives of Tobasco, and Cortez sailed to the westward, till he arrived at the port of St. John de Uloa. When the Spaniards were coming into this port, two canoes full of Indians came into the fleet, and addressed the general in a submissive manner.

On Easter day, 1519, ambassadors arrived from the emperor Montezuma, and were splendidly entertained by Cortez, after which he acquainted them that he was come from Don Carlos king of Spain, the greatest monarch of the East, to propose matters of the greatest importance to their emperor, and therefore he desired an audience of him. To which the Mexicans answered, they had brought the general a present, and had orders to give him and his people a hospitable reception, but that their sovereign never admitted foreigners into his presence. Whereupon the ambassadors desired time to acquaint their emperor with his demand; which being agreed to, Cortez entertained the Mexicans by exercising his soldiers before them, and making several discharges of his canon and small arms, at which he perceived they were exceedingly astonished. Another rich present some time after arrived from the emperor, but with an intimation that he could not admit the Spaniards into his presence. To which Cortez replied, that he must deliver his message to the emperor in person, and therefore was determined to continue his march to the city of Mexico.

The general foresaw that the Mexicans would not be able to prevent his approaching Mexico, especially as he was joined about this time by a prince of the country, named Zempoala, who offered to enter into an alliance with Cortez against Montezuma, whom he represented as a cruel oppressive tyrant.

The prince furnished him with four hundred men to carry his baggage, and others to draw his artillery, there being no beasts in the country fit to draw carriages. The general continuing his march by the sea coast to Vera Cruz, was joined there by above thirty princes from the mountains, who reinforced his troops with a hundred thousand men; and some parties of Europeans hearing of the success of Cortez, voluntarily followed him hither and joined his troops. The general now became so confident of success, that he burnt all his ships; and having fortified Vera Cruz, in which he left a small garrison, he began his march directly for the city of Mexico, being joined by the Tlascalans, sovereign of a country of considerable extent, who offered to become subjects of the king of Spain; at which Montezuma was so alarmed, that he offered to pay the Spaniards an annual tribute, amounting to one half of his revenues; and when he found it in vain to oppose the general's march, he thought fit to give him an invitation to his capital; but Cortez being determined to have the plunder of the capital city, pretended that the Mexicans were not sincere in their invitation, but had entered into a conspiracy to surprize the Spaniards, when they had drawn them into an ambuscade, and massacre them; and therefore immediately began hostilities, and cut in pieces some thousands of Montezuma's subjects.

The Spaniards continuing their march, were attended by several other princes and lords of the country, who complained of the intolerable oppressions of Montezuma, telling Cortez, that they looked upon him as their deliverer sent from heaven, to restrain and punish the injustice and cruelty of tyranny; to whom he promised his protection; and drawing near Mexico, in order to strike the greater terror into the natives, he

ordered his artillery and small arms to be discharged, and caused several Indians to be shot that approached too near his quarters, while he lay encamped at Amemecca, on the borders of the Mexican lake.

It was at this place that Cacumatzin, the nephew of the emperor, attended by the Mexican nobility, came to the general and bid him welcome, assuring him, that he would meet with a very kind and honourable reception from the emperor; but intimated, that there had lately been a great scarcity of provisions in the city, and intreated he would defer his entrance till they could give him better accommodations. But the general was determined to advance, and they seemed to acquiesce.

Cortez arrived at Itztaepalapa, which is near the city of Mexico, where he was received with all imaginable honours by the neighbouring princes, who presented him with a great variety of plumes and fruit, and with plates of gold to a considerable value. The general staid here one night, and on the 19th of November, 1519, approached the city, and was met by four thousand of the nobility and great officers of state, who, after having paid the compliments, advanced before them to the gates of Mexico, and then made a lane for the army to march through; the rest of the people appeared at the windows and battlements on the top of the houses, which were crowded with them; but they were not suffered to stand in the streets, that the march of the Spaniards and their auxiliaries might not be hindered.

At this time the army consisted of four hundred and fifty Spaniards and six thousand Tlascalans and Indians, who had no sooner entered the streets of Mexico, but they were met by two hundred noblemen of the emperor's household, clothed in one livery, with large plumes of feathers on their heads, all of the same fashion and colour; after meeting and complimenting the general, these fell back also, and made a lane for the Spaniards. Another body then came, who made a much more splendid appearance, and in the midst of them was the emperor Montezuma, carried in a chair of beaten gold, on the shoulders of his favourite courtiers; four more of them sustained a canopy over his head, the whole adorned with beautiful feathers, through which the glittering gold appeared; he was preceded by three officers with rods of gold, the harbingers of the emperor's approach, on whose appearance the people prostrated themselves, never daring to look up.

When the emperor drew near, Cortez dismounted, and the Mexican monarch alighted from his chair, and carpets were spread in the streets for him to tread on. He advanced with a slow solemn pace, leaning on the arms of two princes his relations, and was met by Cortez, who bowed most reverently, which Montezuma answered by touching the ground with his hand, and afterwards raising it to his lips, which was the first time this haughty emperor ever condescended so much, for he would scarce bend a knee to his gods. The conference between the emperor and the general was short: the Spaniards were afterwards conducted to the place assigned for them, which was large enough to contain all the Europeans and their auxiliaries. To this place the emperor came the same evening, and was received by Cortez in the principal square. Montezuma entered the room of state; and having seated himself, ordered a chair for Cortez, and a signal was made for the courtiers to retire to the wall; the Spanish officer did the same, and Cortez began a speech by his interpreters, but Montezuma prevented him, and said as follows:

"Illustrious and valiant stranger, before you can close the important message which the great monarch you came from has given you in command, it is necessary some allowance be made for what fame has reported of us on either side. You may have been informed by some, that I am one of the immortal gods; that my wealth is immensely great, and my palaces covered with gold: and on the other hand, you may have heard that I am tyrannical, proud, and cruel. But
both

both the one and the other have equally imposed upon you : you see I am a mortal of the same species with other men ; and though my riches are considerable, my vassals make them much more than they are, and you find that the walls of my palaces are nothing more than plain lime and stone. In like manner, no doubt, has the severity of my government been magnified : but suspend your judgment of the whole, till you have had an opportunity of informing yourself concerning it ; and you will find that what my rebellious subjects call oppression, is nothing more than the necessary execution of justice.

“ After the same manner, have your actions been represented to us ; some speak of you as gods, affirming, that the wild beasts obey you ; that you grasp the thunder in your hands, and command the elements : while others assure me, that you are wicked, revengeful, proud, and transported with an insatiable thirst after the gold our country produces.

“ I am sensible you are of the same composition and form as other men, and distinguished from us only by accidents, which the difference of country occasions.

“ These beasts (horses) that obey you, are probably a large species of deer that you have tamed, and bred up in such imperfect knowledge as may be attained by such animals : your arms are made of a metal indeed unknown to us ; and the fire you discharge from them, with such an astonishing sound, may be some secret taught by your magicians. As to your actions, my ambassadors and servants inform me that you are pious, courteous, and governed by reason ; that you bear hardships with patience and cheerfulness, and are rather liberal than covetous ; so that we must, on both sides, lay aside our prejudices and prepossessions, and rely only on what our eyes and experience teach us. Nor need you take any pains to persuade us, that the great prince you serve is descended from our ancestor Quezalcoal, lord of the seven caves of Navatlaques, and king of the seven nations that gave beginning to the Mexican empire. We know that he departed from this land to conquer new regions in the East, promising to return again and reform our government and manners : and because you came from the east, and your actions manifest that you are descended from this our illustrious progenitor, we have already determined to pay you all imaginable honours.”

To this harangue Cortez answered, “ That it was true, various were the reports they had heard ; some endeavoured to defame and asperse him, while others adored him as a god. But the Spaniards, who were endowed with a penetrating spirit, easily saw through the different colours of discourse, and the deceit of the heart ; that they neither gave credit to his rebellious subjects, or those that flattered him ; but came into his presence, assured that he was a great prince, and a friend to reason ; but very well satisfied, however, that he was mortal, as they themselves were. That the beasts which obeyed him were not deer, but fierce and generous animals, inclined to war, and seemed to aspire with ambition after the same glory their masters did.

“ Their fire arms were indeed the effect of human industry, and owed nothing to the skill of the magicians, whose arts are abominated by the Spaniards.

“ That he came ambassador from the most potent monarch under the sun, to desire his friendship and alliance, that there might be a communication and intercourse between their respective dominions, and by that means the Christians might have an opportunity of convincing them of their errors. And though, according to their own traditions, he might claim a more absolute power over this part of the world, their king only desired to make use of his authority to instruct them in matters infinitely to their advantage ; to shew the Mexicans they lived in darkness and error, adoring insensible blocks of wood, the works of mens hands and fancies. Whereas there was but one God, the eternal cause of all things, without beginning or ending, whose infinite power created out of nothing the wonderful fabric of the heavens, the sun which

gives them light, the earth that sustained them, and the first man from whom they all proceed. And this God they were all under an equal obligation to acknowledge and adore ; an obligation inspired on their souls, and of which even the Mexicans could not be wholly ignorant, though they dishonoured that almighty Being, by worshipping devils and impure spirits, creatures of the same God, who for their ingratitude and rebellion were doomed to subterraneous fires ; of which their volcanoes had an imperfect resemblance ; that these infernal spirits, whose malice and envy rendered them most inveterate enemies of mankind, endeavoured their perdition, by causing themselves to be adored in their abominable idols. That it was their voice they sometimes heard in the answers of their oracles, and their illusions that imposed on their reason ; that these mysteries could not be explained at a single interview ; but the king, whose superiority they acknowledged, admonished them to hear those fathers, whose business it was to preach the heavenly doctrine. This was the first and principal thing the king his master commanded him to insist upon, as the most likely means of establishing a lasting amity ; that being united in principles of religion, their alliance might become indissoluble.”

Montezuma said in reply, “ That he accepted the alliance proposed by the king of Spain, the descendant of his great ancestor Quezalcoal ; but as to the overture that had been made concerning religion, he held that all gods were good ; and the god of the Spaniards might be what they represented, but he saw no reason to withdraw that veneration the Mexicans paid to theirs ; and having made Cortez a present of gold, jewels, and other valuable curiosities, and distributed more among his officers, Montezuma returned to his palace.”

Cortez, attended by some of his officers and soldiers, went the next day to the emperor's palace, and was admitted to an audience ; and here again Cortez entertained Montezuma upon the subject of religion ; he endeavoured to give him an high opinion of the rites and ceremonies of the Christians ; exclaimed against human sacrifices, and how unnatural it was to devour their own species thus sacrificed. It is said that Cortez prevailed so far with the emperor, as to induce him to banish human flesh from his own table, though he durst not prohibit his subjects eating it, or his priest the continuing to offer such sacrifices. On the contrary, he maintained, that it was no cruelty to offer to his gods prisoners already condemned to die, though Cortez and father Olmedo the priest frequently endeavoured to convince him of the barbarity of the practice, and of the excellency of the Christian religion. That he still insisted, that his gods were as good in his country as the god of the Christians was in theirs ; nor could he dissemble his resentment, when he was pressed so closely on this subject.

Various authors relate, that many occurrences happened, which have all of them an air of improbability ; we will therefore omit them, and bring the account of this revolution to a close as soon as possible.

The general found, that the Mexicans were not to be amused with insidious proposals, that his provisions were nearly spent, that it would be impracticable to make his retreat from the city in the day-time ; he therefore determined to attempt it in a dark night, and take away the emperor and his two sons with him, as he had made them his prisoners. Having divided the treasure which he had plundered the city of amongst his soldiers (and they were pretty well laden with it) he set out ; but had not advanced more than a mile upon the causeway, before he found himself attacked by the Mexicans, who had broken down the bridges, and cut the causeway through in many places ; Cortez foresaw this, and had provided a portable bridge to pass the breaches, which was of considerable service to him ; but the Mexicans found means to destroy this bridge before they had all passed over, and their rear guard, consisting of about two hundred and fifty Spaniards, and one thousand Tlascalans, were cut in pieces ; they

lost also their artillery, prisoners, baggage, and treasure, with forty six horses. However, the general, with the best part of his forces, broke through the Indians, and escaped on the other side the lake. Some impute this loss to the avarice of his soldiers, who were so loaded with gold and silver, that they could scarce make use of their arms. It is said that Montezuma and his two sons were slain amongst the Spaniards.

The Spaniards having halted some time to refresh themselves, and take care of their wounded men, continued their march towards Tlascalala, the country of their allies and confederates, but they had not advanced far before they were again attacked by the Mexicans at a time when they were so fatigued and harassed, that had not Cortez taken possession of a temple, surrounded by a wall of vast extent, that very fortunately lay in his way, he would have found it difficult to have repulsed the enemy. But the Mexicans, finding they could make no impression on the Spaniards as they lay intrenched within those walls, thought fit to sound a retreat. Cortez marched again at midnight with great silence, in hopes to have got the start of the enemy so far, that he should have reached the Tlascalalan territories before they could have overtaken him; but when he arrived at the top of a very high mountain, he discovered the whole force of the Mexicans, consisting of two hundred thousand men drawn up in battle array, in the valley of Otumba, to intercept his passage to Tlascalala.

In this difficult situation Cortez made this short speech, "We must either conquer or die," and finding an uncommon ardour in his soldiers to engage, he immediately led them on. It is said the battle was for some time bloody and obstinate; and that Cortez, apprehending his men would be wearied out by the continual supplies of fresh forces which the Mexicans poured in upon them, gave a surprising turn to the battle by attacking the imperial standard, carried by the Mexican general, who was surrounded by the nobility; for having routed them, killed the general, and taken the standard, the rest of their troops turned their backs and fled, and were pursued with incredible slaughter by the Tlascalalans, as well as by the Spaniards, who made themselves ample amends with the spoils of the enemy, for the treasure they lost on retiring from the city.

Cortez now found it necessary to cultivate a good understanding with the princes of the country, and to take their troops into his service, and made himself master of such parts as might be of most advantage to him in reducing Mexico; and as he could not approach it by land, but at the caufeways, he built thirteen brigantines and sloops, whereby he became master of the navigation of the lake; and then attacked the town by water, as well as on the land side, having a reinforcement of Spaniards, his whole number amounting to about a thousand, and two hundred thousand Tlascalalans, and other Indian allies.

On the 13th of August, 1521, Cortez took the city of Mexico by storm, one hundred thousand Mexicans perishing in defence of the city, and all the neighbouring princes submitted to the conquerors.

Terra Firma is a Spanish settlement, and is situated between 50 and 82 deg. of west longitude, and between the equator and 12 deg. of north latitude, bounded by the Atlantic Ocean on the north; by the same sea, and the Dutch settlement of Surinam on the east; by Amazonia on the south; and by the Pacific Ocean, and the province of Veragua on the west; the country is mountainous, but the coast is flat and low.

There are nine provinces in Terra Firma, the first of which is Darien, or Terra Firma Proper, which is about three hundred miles long, and sixty broad. This province is the richest and the most important of any other. Its situation, both in the north and south seas, and on the confines of North and South America, and the gold sands and pearls with which this province, and the adjacent seas are replenished, render it almost invaluable. The rivers, bays, and capes are numerous, and produce variety of articles.

Panama is the principal town of Terra Firma, it stands in the most capacious bay of the South Sea, and is built with brick and stone, being surrounded by a stone wall, fortified with bastions and other works planted with cannon, both towards the sea and land. It lies in the form of a half moon upon the bay, affording a most beautiful prospect; all the best houses and public buildings appearing above the walls. There are no large woods or marshes near Panama, but a fine dry land not subject to fogs. The island of Perica, at three miles distance, is the port of Panama; for the water is so shallow near the town, that large vessels cannot come up to it.

Panama contains upwards of six thousand houses, eight parish churches, besides the cathedral, and several monasteries, &c. It is a bishop's see, is suffragan to the archbishop of Lima in Peru, the seat of the governor, and of the courts of justice of the province. The treasures of gold and silver, and the rich merchandizes of Peru, which are lodged in the magazine of this town till they are sent to Europe, render this place very considerable.

Porto Bello is a fair and commodious harbour, affording good anchorage and shelter for ships; having a narrow entrance, and spreading wide within the entrance; is secured by a fort on the left hand, and by a blockhouse on the other opposite to it. At the bottom of the harbour lies the town, bending with the shore like a half moon; in the middle of which, upon the sea, is another small flat; and at the west end of the town, upon an eminence, lies another strong fort, yet commanded by a neighbouring hill, and in all these forts there are usually about three hundred men in garrison. The town lies open towards the country, without walls or works; and at the east end is a large stable for the king's mules. The governor's house stands upon an eminence, near the great fort at the west end of the town.

The majority of the inhabitants are Indians, Mulattoes, and negroes; very few Spaniards chuse to reside in it, as the place is very unhealthy.

Venta de Cruz is a place of considerable merchandize, as it is the market place for goods brought from Panama, in order to be sent to Europe.

Cheapo is but a small inconsiderable town.

Nata abounds with cattle, hogs, and poultry, with which they supply the market of Panama.

Conception has nothing remarkable in it worthy our notice.

Santa Maria is considerable on account of the gold found in the neighbourhood, but it does not seem to be a place of any great strength, the country about it is low and woody.

Scuchadero is esteemed a healthful place, on which account the Spaniards resort hither with their slaves, to the gold rivulets, at the proper seasons.

New Edinburgh is situated in a most excellent harbour, capable of containing five hundred sail of shipping, untouched from any wind that can blow. The land about is very rich and plentiful, and in the neighbourhood of many gold rivulets. Here the Scots arrived in November, 1699.

These are the most considerable places in the province of Darien; the inhabitants of which very much resemble those in the eastern provinces of Mexico.

The province of Carthagena is about three hundred miles long, and two hundred broad, and contains four principal towns. Carthagena, the capital city (which is one of the best and securest harbours in Spanish America), Madre de Popa, Cenu, and Tolu.

St. Martha province is about three hundred miles long, and two hundred broad; the country is mountainous, and the land in general lies very high. The principal towns in this province are St. Martha, Ramada, Baranca, Ciudad de los Reys, and Tamalameque.

The province of Rio de la Hacha is but small, and is frequently reckoned a part of that of St. Martha. It produces corn and cattle, and has a pearl fishery upon

upon the coast. The principal towns are Rio de la Hacha, and Rancheria.

Venezuela province is about four hundred miles long, and three hundred broad, and is the most northerly province of South America. The principal towns are Venezuela, Caracas, Gibraltar, St. Jago de Leon, New Segovia, Tucuyo, Trugillo, Laguna, and Maricapane.

The province of New Andalusia is five hundred miles long, and two hundred and fifty broad. The principal towns are Comana, Verina, and St. Thomas.

The province of Caribbiana extends twelve hundred miles and upwards along the Atlantic Ocean. Several European powers have settlements on or near the coasts of this country, particularly the Spaniards, French, and Dutch. The chief Dutch settlement is that of Surinam; and the chief French settlement is that of Cayenne.

The persons of the Caribbees resemble the more northern neighbours of Terra Firma in size and features, and in most other respects resemble the general inhabitants of America, of which see our description under that head.

The province of New Granada is about six hundred miles long, and three hundred broad. The principal towns are Santa-fe de Ragota, Tocama, Pampeluna, Velez, Trinidad, Palma, Tunia, and St. John de Lanos.

The province of Popayan is about four hundred miles long, and three hundred broad. A chain of barren mountains, almost impassable, runs through the country, some of which are volcanoes, and in one of them the load-stone is found. The land is low and flat towards the shores, on which there is found a good deal of gold dust. The principal towns are Popayan, Agreda, and Madrigal.

The islands on the coast of Terra Firma in the South Sea, are Gorgona and Gallo. In the North Sea, Trinity, Tobago, Margaretta, Salt-Tortuga, Orchilla, Roca, Aves, Bonayre, Curassow, and Aruba.

After the conquest of Mexico, all that part of Terra Firma, which lies between the province of Darien and the river Oronoque, was subdued by private adventurers at their own charges: every one begged a certain extent of country of the court of Spain, and used the natives as they thought proper, which was not in general with great humanity.

The province of Carthagena was begged of the court of Spain by Don Peter de Heredia, who enslaved the natives, and made settlements here in 1532.

New Granada was penetrated into by Gonzalo Ximenes de Querada, and George Federman the Dutchman, about the year 1535. These led the way to the reduction of the other provinces, which were severally invaded and subdued by different adventurers.

The Pope gave the Spaniards a right to all the countries west of the Atlantic Ocean; but other powers, especially the English, have repeatedly contested their right; and many engagements have consequently ensued, which the History of England will furnish several instances of.

Peru was so called from a Spaniard who arrived here, asking one of the natives what that country was called: the Indian answered Peru, or Beru, which signifies, What do you say? The Spaniard thought the native understood him right, and concluded that Peru was the name of the country, and it is so called to this day.

Peru is near two thousand miles long, and about two hundred broad, except in the south, where it is five hundred broad. It is generally divided into three branches; the Lanas or lardy plains which lie along the coast, the Scirras or hills situate a little further within land, and the mountains of the Andes, beyond both which is esteemed the highest land in the world. It never rains on the west side of the mountains, called the Scirras, unless within two or three degrees of the equinoctial. The Andes and Scirras

run parallel to each other, at least a thousand leagues; Peru has generally a high bold shore.

The Pacific Ocean borders on Peru: it is so called, because the weather on shore is very serene and mild.

Peru is divided into three audiences, viz. Quito, Lima, and Los Chareos.

The city of Quito is rich and populous, built after the Spanish manner, with a great square in the middle, and large spacious streets running from it on every side, and a canal runs through the middle of it, over which there are several bridges. It is the seat of the governor and of the courts of justice, a university, and a bishop's see, suffragan to the archbishop of Lima. They have a good trade in woollen cloths, sugar, salt, and cattle; but their greatest riches proceed from the gold that is found in their rivers.

In one of the mountains near the town is a volcano, whose eruptions have more than once threatened the ruin of it.

The other towns in this audience are, St. Jago de Puerto, Viejo, Guiaquil, Tombes, Thorne, Cambay, Loxa, Zamora, St. Michael's and Payta.

The audience of Lima is about eight hundred miles long and four hundred broad. Lima is the capital of the audience and of the whole kingdom of Peru, and lies in a spacious and fruitful plain. It is built like other Spanish cities. On the side of the square are the archbishop's and viceroy's palaces, the treasury, the town-hall, the armory or public magazine, and a college of the jesuits. Besides the cathedral, there are a great many parochial and conventual churches, an university, abundance of monasteries and nunneries of every order, and five or six large hospitals. The whole city is about four miles long and two broad; the air is pretty healthy: the city is well supplied with provisions, and is very wealthy; it is well watered with canals that are supplied from the river. The outsides of the houses make but a mean appearance, being built with bricks dried in the sun; many of them have only clay walls, and scarce any of them are more than one story high; the roofs are exceeding light, covered with reeds and mats, and sometimes only a cloth, for which they give two very good reasons, one is, that they are subject to earthquakes, and the other, that the sun does not heat these roofs as it does tile or slate; and they have no great occasion to provide against wet or stormy weather, for it never rains on this coast, and they are never disturbed by storms and tempests, but enjoy constant serene weather, and the heats are much abated by the sea and land breezes.

But this great city has its disadvantages. The earthquakes, they are so subject to, must naturally cast a damp upon all their enjoyments, especially when great part of the town has been several times laid in ruins by them, particularly in the years 1586, and 1687, in the last of which years, the sea ebbed so far from the shore, that there was no water to be seen; and after the sea had disappeared a considerable time, it returned in rolling mountains of water, which carried the ships in the harbour of Callao, the port of Lima, a league up into the country, overflowed the town of Callao, though situated on a hill, together with the forts, and drowned both men and cattle for fifty leagues along the shore.

Another earthquake happened at Lima on the seventeenth of October, 1746, between ten and eleven at night, by which seventy four churches, fourteen monasteries, fifteen hospitals, several magnificent palaces, and upwards of a thousand private houses were destroyed, and fifteen hundred people perished in the ruins, with a prodigious treasure, which lay ready to be sent to Europe; and at the same time Callao, the port town of Lima, about five or six miles distant from it, was swallowed up by the sea, and a great many ships in the harbour were carried some leagues over the dry land; nothing was to be seen of this fine port, where about seven thousand people were swal-

lowed up by the sea; two hundred of the inhabitants only escaping.

During the reigns of the Incas, Cusco was the metropolis of Peru: it is built upon the side of a hill in the midst of a spacious plain, surrounded by mountains, from whence there fall rivers which water the country, and altogether afford a most agreeable prospect from the town, which overlooks the vale. The climate is very temperate and healthful. The chief streets of the old town pointed to the four winds, and the houses were well built with stone.

The present city of Cusco, built by the Spaniards, consists of large squares with their piazzas, from whence the principal streets run in direct lines. Besides the cathedral, there are several parochial and conventual churches, monasteries, nunneries and hospitals. The bishop of Cusco is suffragan to the archbishop of Lima, which the Spaniards have thought proper since their conquest to make the capital of Peru.

The third audience of Peru is Los Charcos, which is about seven hundred miles square, the principal towns are Potofi, Porca, La Plata, Santa Cruz, La Paz, Chinquita, Tiagunaco, Arica, and Hillo.

The Peruvians are of the usual stature of the Europeans; their complexion is a deep copper colour, their hair and eyes are black. The principal ornaments of the ancient Peruvians were rings and jewels in their ears, which they stretched to a monstrous size, and occasioned the Spaniards to give some of them the appellation of the people with great ears. It is related, that they were without religion or government; that they neither built houses nor cultivated the soil, but dwelt in caves, and subsisted on roots, herbs, and the fruits of the earth; enjoyed their women in common, and did not understand what property meant; but that their father, the Sun, from whom the Incas or sovereigns of Peru descended, sent a son and a daughter from heaven, to instruct them in the worship of himself (the Sun), and to polish and reform the natives, and that this happened about five hundred years before the Spaniards arrived; but what the state of the country was then, is very uncertain, since those people had no way of recording past transactions. The Spaniards, however, acknowledge, that they found the Peruvians a polite ingenious people, that they exceeded most nations in the world in quickness of wit and strength of judgment. They were very defective in the liberal arts, but had some notion of astronomy.

There are much the same vegetables, animals, and minerals in Peru as in Mexico.

With respect to the revolutions of Peru, Vasco Nunez de Balboa, who first discovered the South Sea or Pacific Ocean, in 1513, being constituted viceroy of all the lands he should reduce to the obedience of Spain, came on the coast of Peru, having got intelligence of the vast riches contained in it, and was preparing to take possession of it; when Pedrarias, governor of Terra Firma, under pretence that Vasco was about to render himself independent of his sovereign, caused him to be put to death, that he might reap the advantage of the discovery; and accordingly he employed several skillful pilots to pursue the same tract Vasco had pointed out, in order to plant colonies in Peru; but these adventurers, discouraged by the winds, which are always contrary to those who would sail near the coast from Panama to the southward, represented the project as impracticable; and Pedrarias being informed that there was plenty of gold-dust to be found in the province of Nicaragua, adjoining to that of Terra Firma on the north, he dropped his design of invading Peru, and gave leave to three enterprising gentlemen to try their fortunes on that side at their own expence; their names were Pizarro, Almagro, and De Luque. Pizarro was to command the first embarkation, Almagro was from time to time to send recruits, and De Luque was to remain at Panama, and lay in ammunition and provisions for the support of the enterprize.

Pizarro met with great difficulties in his first attempt, from cross winds and currents, and the incessant rains that fell near the equator, insomuch that all his men, except fourteen, forsook him, and returned to Panama; but Almagro soon joined him with some recruits; and these two enterprising men determined to continue their course to the southward, and having crossed the bay of Panama, went ashore, expecting to have found a passage to Peru by land, but they found the country so encumbered with wood, &c. that they returned on board, and set sail to the southward.

The city of Tumbez was the first considerable town they visited. Pizarro sent one of his officers to the prince thereof, to let him know they came as friends, and desired to traffick with his people; and the prince, in return, sent him all manner of refreshments. The officer who was sent, was a man of a very extraordinary stature, and clothed in shining armour; in order to give the Indians an higher opinion of those strangers. The prince shewed him the palace, and temple of Tumbez; and the officer observed, that all the vessels and utensils were gold, some of which he was presented with in lieu of the presents Pizarro made them; there is very little doubt but that Pizarro would upon this intelligence have plundered them of a great deal more, had he had a sufficient force to support him in such an attempt, but he thought it prudent at present to return to Panama for a reinforcement, and therefore parted apparently in a friendly manner.

In the year 1527, he returned to Panama, bringing some of the Peruvians with him, as well as a specimen of the treasures and animals he met with. Thus encouraged, a number of volunteers wanted to enter into his service, but they were refused by the governor, till the emperor's pleasure should be known. Pizarro went to Spain, and procured the emperor's commission, with a grant of the twentieth part of the revenues and profits of all the countries they should conquer. Having finished this business to his satisfaction, he returned to Panama, attended by his brothers, Ferdinand, John and Gonzalo.

In the year 1530, he embarked again on board three ships at Panama, taking with him one hundred and twenty-five soldiers, thirty-seven horses, and a proper quantity of arms, ammunition and stores; but meeting with contrary winds, he was obliged to land a hundred leagues to the northward of Tumbez; and as he thought himself strong enough to drive the naked Indians before him, he fell upon them, plundered their towns, made many of them prisoners, without the least provocation, upon which the rest fled from the sea coasts up into the country, and Pizarro was afterwards so distressed for want of provisions, and lost so many men by sickness, &c. that he too late perceived his error in not courting the friendship of the natives, being then in no condition to make the conquest of Peru. He therefore sent the treasure he had plundered the Indians of, back to Panama, and raised more recruits. He afterwards with much difficulty marched to Tumbez, where he fortunately found the inhabitants engaged in a civil war, one part of them adhering to Huascar their lawful prince, and the other to Atabalpa, the bastard son of the preceding one.

Pizarro was reinforced by Almagro and a good number of troops; they advanced through the valley of Tumbez, and met with some opposition from the Peruvians, who by this time looked upon the Spaniards as their enemies; but they were put into such disorder by the horse and artillery, and such a slaughter ensued, that they were forced to abandon the town, castle, and whole valley of Tumbez, leaving behind them all the gold and silver plate, emeralds, pearls, and other rich spoils which lay in heaps in the temple of the sun, and in the inca's palace, being so vast a treasure that the Spaniards could scarce believe their eyes, when they found themselves so suddenly possessed of it. And such was the consternation of Atabalpa, and his whole court, when the fugitives related what slaughter the thunderer's ordnance made
among

Gonzalo Pizarro
BEHEADED
at Cuzco.

among them, and how impossible it was to escape the Spanish horses, to which animals their fears had added wings, that they concluded, if the Spaniards were not gods, as they at first conjectured, they were certainly devils, and that it was not possible for any human force to defend the country against them.

Pizarro, receiving this agreeable intelligence, resolved to take advantage of their dismay, and marched immediately to find out Atabilpa, while he remained under that delusion; but he found it necessary to defer his march till he had erected a slight fortress on the sea coast (to which he gave the name of St. Michael), for receiving the recruits he expected, and to serve him for a place of retreat, in case of any unforeseen accident. This was the first Spanish colony planted in Peru, and here the first Christian church was erected in 1531. We wish the establishment did a little more credit to the Christian name, and that it had not owed its rise to such base means.

Pizarro gave out, that he was come in the name of the great king of Spain, to relieve the oppressed, and do justice to those who were injured; which he soon found had the desired effect, for the emperor Huascar having been deposed and imprisoned by the bastard Atabilpa, and all his friends and faithful subjects that adhered to him being cruelly oppressed, they immediately sent an embassy to Pizarro, to desire that he would assist them in delivering their prince from his captivity, and restore him to the throne of his ancestors; to whom Pizarro returned a favourable answer.

Atabilpa, who was scarce settled on his usurped throne, apprehending that he should be driven from it, if the Spaniards joined the other party, endeavoured by all possible means to gain the favour of Pizarro, sending a messenger to excuse the hostilities his forces had committed on his landing, and not only promised what satisfaction he should demand, but assured him, that he was ready to obey the commands of that great prince from whom he came.

Atabilpa agreeing to a conference with the Spaniards, in the fields of Caxamalca, Pizarro directed father Vincent, a Spanish friar, to insist, that both the emperor and his subjects should immediately profess themselves Christians; and while the emperor was desiring the friar to inform him what he meant by this extraordinary demand, Pizarro and his Spaniards fell upon the Indians, and made a signal for the great guns to fire among the thickest of them, and his horse to attack and trample them under their feet, while Pizarro, at the head of his infantry, marched up to the golden chair, or throne, on which Atabilpa was carried, and made him prisoner. It is said, that the poor Indians, when they saw what the Christians chiefly aimed at, threw themselves between the Spaniards and their prince, to prevent his being taken; but not a man of them offered to lift up a weapon to defend himself, their emperor having commanded the contrary. The people were therefore slaughtered like so many sheep by Pizarro, who made his way through them, pulled the emperor from his chair with his own hands, and took him prisoner, in which action he received a slight wound from one of his own soldiers, who struck at Atabilpa, and Pizarro was the only Spaniard that was hurt, though five thousand Peruvians were killed this day with their arms in their hands. They afterwards murdered Atabilpa, though he paid an immense sum for his liberty.

Pizarro arrived at Cusco in the month of October, 1552, the people having abandoned the city, and carried off the greatest part of their treasure, but still the Spaniards found so much left as to be very much amazed at the quantity.

Pizarro got his grant confirmed of the country from the equinoctial, two hundred leagues to the southward of it; and to Almagro was allotted Chili, which lies to the south of Peru; thither he marched from Cusco, at the head of five hundred Spaniards and fifteen hundred Indians. Almagro advanced as far as the province of Charcos, without meeting with

any thing to obstruct his designs, but had some smart rencounters with the natives in the southerly parts, which they reduced to subjection. After this, Almagro returned to take possession of his authority at Cusco.

Various quarrels afterwards took place between the Spanish commanders, who were jealous of each other; but as this will not be very entertaining to our readers, having given a full history of the Spaniards possessing themselves of this wealthy country, we will conclude our account, by saying, that Almagro was beheaded through the treachery of Pizarro, and his death was soon revenged, for Pizarro was assassinated at noon day, in his palace at Lima, in the year 1541. There were some more insurrections after this, but they were all suppressed about the year 1554, and the Spaniards have from that day to this remained masters of this country.

The Spanish province of Chili is about two thousand miles long, and six hundred broad; it is usually thrown into two divisions, viz. Chili Proper, and Cuito. The principal towns are St. Jago, Coquimillo Imperial, Osorno, Castro, Guafca, Anglo, Arauco, Mendoza, and St. John de Frontera.

The people of Chili do not live in towns, but every tribe extends itself on the bank of some river; their houses are very slightly built with wood, and they can remove at pleasure, which they frequently do for the convenience of pasture, and as the season of the year requires. They esteem it a sort of imprisonment to stay in one place, and therefore they have no gardens, plantations, or furniture to stop their progress.

The Chilierians are of a middle size, and strong limbed; of a tawny complexion, and have long black hair; their features are tolerably good, they have very fine teeth, and are remarkably active, but have in general a dejected countenance.

Patagonia is sometimes described as a province of Chili: it is divided into two parts by the streights of Maghellan, and is the most southern province of South America.

It is a mountainous country, and is generally covered with snow; great part of it is a desert, and produces very few vegetables.

There are no towns of any note, or any remarkable productions in Patagonia, and therefore proceed to

Paragua, or La Plata, which is divided into six provinces, viz. La Plata Proper, whereof Buenos Ayres is the principal town: there are five churches in it besides the cathedral, and several convents and nunneries, and it has a castle regularly fortified for its defence. It has a great market, where all the merchandize of Europe and America is sold and exchanged, as well as a considerable number of negroes. Santa Fe and Assumption are likewise in the province of La Plata Proper.

The next province is Tuccuman, the principal towns of which are St. Jago and Cordova.

The next province is Uragua, and the principal towns of it are Purification, and La Capia.

The next province is Parana, the principal towns of which are Itopia, and St. Ignatio.

The next province is Guayra, and the principal towns are Guayra, and St. Xavier.

The last province is Paragua Proper; as we have no account of this province, it is probably a desert on the side of Amazonia.

The river of Plata rises near the town of La Plata, in Peru, and falls into the river Paragua. This river obtained its name, because it rises near the town of La Plata, and because the plate is sometimes brought down this stream from Peru to Buenos Ayres.

Amazonia is in general a flat country, abounding with rivers, woods, and lakes. The mornings are generally fair, and the heavy rains seldom fall till three or four in the afternoon. All the trees here are evergreens, and they have fruits, flowers, and herbage, all the year round. The natives are of the ordinary stature; but as to the nation of Amazons, which were

were said to give name to the country, they are no where to be found, any more than the giants and cannibals, the first adventurers mentioned.

Brazil consists of fifteen provinces, which are Paria, Marignan, Siara, Petagues, Rio Grande, Payrabee, Tamara, Pernambuco, Seregippi, Bahia, Itheos, Porte Seguro, Spirito Sancto, Rio Janeiro, St. Vincent, and Del Rey. The coast from north to south is washed by the Atlantic Ocean, in which are several good harbours.

A considerable traffick is carried on by the Europeans with the Brazils, particularly in the province of Bahia several merchants reside, as it is a place of great trade. They are chiefly Portuguese, and are said to be very rich.

We will say no more about the Brazils, as they have been frequently mentioned in the former part of our work. We will therefore finish our account of America, by giving a description of the Spanish islands in that part of the world.

The island of Cuba is the largest Spanish island in the American seas; it is about eight hundred miles long, and two hundred broad. It is divided by a chain of hills that run from east to west, through the middle of it, from whence descend some small streams, but there is hardly a navigable river in the island. St. Jago is the capital town, which has a commodious

port, and is strongly fortified. The Havanna is a secure and spacious harbour, but of difficult access. There are likewise several smaller harbours and towns. The island of Cuba was first discovered by Columbus.

Hispaniola is a large island, being six hundred miles long, and two hundred broad; it is at present divided between the Spaniards and French. A chain of mountains run through the middle of it, from whence gold dust was formerly washed down, but that treasure is now exhausted. Domingo is situated in the south-east coast of the island. This island was also first discovered by Columbus in 1492.

Porto Rico is about one hundred and twenty miles long, and sixty broad, it consists of little fruitful hills and vallies. It was discovered by Columbus in his second voyage.

The Virgin Islands are very small, which are situated on the east side of Porto Rico.

Trinidad is about ninety miles long and sixty broad; it is an unhealthy place, but the soil is fruitful, producing sugar, tobacco, indigo, ginger, and corn.

The island of Margareta is about fifty miles long and twenty-four broad; there is very little wood or water in this island, and its productions are of very little consequence.

BRITISH WEST-INDIA ISLANDS.

THE British islands in the West-Indies are of the utmost importance to our dominions; they are almost necessary for the existence of our commerce, and much more so for their flourishing condition; an account of these islands must therefore be very acceptable.

Jamaica is situated in the American sea, between 76 and 79 deg. west longitude, and 17 and 18 deg. north latitude. The form of it is nearly oval, being one hundred and forty miles long, and sixty broad. The blue mountains run the whole length of the island from east to west; and though these hills are rocky, they are nevertheless covered with very fine timber. On the south side of the island lie most of the plain and level grounds, which after the rainy seasons are very green and pleasant.

There are several rivers in this island, but none of them are navigable; and fresh water is very scarce at Jamaica. They make salt in ponds, into which the salt water runs.

As this island is several degrees within the Tropic, the trade-wind is continually there; which on the south side of the island is called the sea breeze. It comes about eight o'clock in the morning, and increases till twelve in the day; it then decreases with the sun, and at four o'clock entirely subsides. The land breeze begins about eight in the evening, blowing four leagues into the sea, and continues till twelve at night; it then decreases till four, and there is no more of it.

Earthquakes are very common in Jamaica; the inhabitants expect one every year, and some of them think they follow their great rains. Thunder is heard almost every day in the mountains. Lightning generally precedes thunder, as elsewhere. Frost or snow are never seen in this warm climate; but it sometimes hails, and the drops are remarkably large. The dews in this island are very great, insomuch that the water drops from the leaves of the trees as if it had rained; these dews are very serviceable to the vegetation of the island. The rains are more or less violent in different places.

The island of Jamaica is divided into fourteen parishes, but there are only four towns of any consequence, which are,

St. Jago de la Vega, or Spanish Town. It contains about a thousand houses, and is the capital of the island. The Governor resides here, and here the courts of justice are held. This town is pleasantly situated in a fine plain on the river Cobre, which falls into a bay of the sea, that forms the harbour of Port Royal. When the island was in the possession of the Spaniards, this town was considerably larger than it is at present.

Kingston is situated on the north side of the bay of Port Royal, and is become a place of consequence since the repeated misfortunes of the town of Port Royal. It is now very populous, and a great trade is here carried on.

Port Passage obtained its name from being the greatest thoroughfare in the island. The town is not very large, but chiefly consists of houses of entertainment.

Port Royal was destroyed by an earthquake in 1692. It was afterwards rebuilt, and destroyed by fire in 1702, and again destroyed by an inundation of the sea in 1722.

The island of Jamaica produces sugar-canes, cocoa-nuts, oranges, lemons, citrons, palms, cocoa trees, cotton, tobacco, indigo, salt, ginger, cod pepper, guaiacum, china root, sarsaparilla, Cassia fistula, tamarinds, venellas, gums and roots, &c.

The trade of Jamaica is so well known to the people of this country, that we need not particularly describe it.

On the plains there are a great plenty of cattle, but fresh beef is ready to corrupt in four or five hours after it is killed. The butchers kill their meat just before day-break, and by six o'clock in the morning the market for fresh meat is all over. The inhabitants subsist in a great measure upon turtle, and drink a great deal of Madeira wine; but the most usual liquor is punch.

Jamaica is a royal government. The governor and council

NATIVES of the CARIBEE ISLANDS
feasting on Human-Flesh.

council are appointed by the king, and the representatives are chosen by the freemen; these assemblies make laws, but they must receive their confirmation in England.

Columbus discovered this island in 1493, and the Spaniards possessed it till the year 1656, when the admirals Pen and Venables made a descent on Jamaica, and reduced the whole island, and the conquest was confirmed to Great Britain by a subsequent treaty.

Next to that of Jamaica, Barbadoes is the most valuable British American island; it is situated in 59 deg. west longitude, and 13 deg. north latitude. It is of a triangular form, and about seventy miles in circumference; the country is in general, plain and level, there are very few hills, and very little wood grows on this island. They have made plantations for sugar where the wood was first planted; they have a few streams, but no river in this island, but their well water is very good. There is no secure harbour in the island; the best is, that of Bridge Town, but that will not secure the shipping from hurricanes, which generally happen the latter end of the summer, but not so often here as in the Caribbee islands.

The weather is in general serene and fine; when the sun is vertical, their rains happen. The produce and manufactures of Barbadoes are principally rum, cotton, sugar, indigo, ginger, and pimento. Their fruits are oranges, citrons, limes, pomegranates, guavas, pine apples, plantains, cocoa nuts, Indian figs, melons, prickly pears, and other garden stuff.

James, earl of Carlisle, had a grant made to him of this island, in the first year of the reign of King Charles I; several gentlemen purchased plantations of him, and endeavoured to raise tobacco on them, but that attempt did not succeed; they then tried cotton and indigo, which brought them a considerable profit.

In the year 1647, colonel Modiford, colonel Drax, and colonel Walrond, with several of the cavaliers, finding they could not live under Oliver Cromwell, whose usurped authority was become very burdensome to all ranks of people, and particularly to those who adhered to the unfortunate monarch, whom Cromwell caused to be beheaded. These gentlemen prudently transported themselves to Barbadoes, and planted a great deal of sugar. Colonel Drax soon raised an estate of about eight thousand per annum by his sugar works; and having amassed this respectable fortune, married the earl of Carlisle's daughter, who was then proprietor of this island.

The island of Barbadoes was at that time divided into four circuits and eleven parishes, each parish being authorized to send two members to the house of representatives.

The horses and other cattle used on this island, are imported from the northern colonies; but there are not many employed on the island, as there is but little fodder for them.

It has been formerly calculated that the number of white people on this island amounted to forty thousand, but at present we believe that not above half that number are resident here; notwithstanding this, their negro slaves amount to upwards of one hundred thousand men, women, and children.

Their military force, which is composed of militia, consists of two thousand five hundred horse, and three thousand foot; those are officered by people of the first consequence in the island.

Barbadoes, as well as Jamaica, is a royal government; the king of Great Britain appoints the governor and council, and the assembly of estates are elected by the freemen, which is not unlike a British house of commons.

Many Irish families are resident on this island, as well as on that of Jamaica. The people here are all subject to contagious distempers, not unlike the plague, they have been likewise very much oppressed by some of their governors, which is a political disorder, almost as grievous as the other.

The island of Antigua is situated in 61 deg. west longitude, and 17 deg. north latitude; its form is

circular, and it is about sixty miles in circumference. St. John's and Falmouth are the principal towns. St. John's lies on the north west part of the island; and Falmouth on a bay on the south side of the island.

They raise a considerable quantity of sugar on the island of Antigua, but fresh water is very scarce, which, together with the unhealthiness of the climate, renders the situation not very desirable; they have no water here but what they save in cisterns and reservoirs in the time of the rains, or what they bring from the other islands. Antigua is said to contain about ten thousand white inhabitants, and about thirty thousand negroes.

The English governor of the Caribbee islands usually resides here. It is well known that the original natives of these Caribbee islands are cannibals, and that their greatest entertainment is feasting upon human flesh. [See an annexed plate upon this subject.]

The white inhabitants of Antigua have, till very lately, been in great danger of a general massacre by their negroes; an alarming plot of this nature being happily discovered before it was put into execution.

The island of Tobago is situated in 61 deg. west longitude, and 11 deg. 15 min. north latitude. It is one of the Caribbee islands, in the American ocean, situated twenty miles north-east of the island of Trinity, and one hundred and twenty south of the island of Barbadoes; it is fifty-two miles long, and twelve broad. It was formerly planted by the English, who were driven from it by the Caribbee Indians on the neighbouring continent. It was seized by the French some time since, but it was at length ceded to England by the peace of 1763.

The inhabitants of Barbadoes frequently visit this island for wood, which it produces in abundance.

Tobago is a desirable and fruitful island, and capable of producing a good deal of sugar, and every thing else that the best of the Caribbee islands produce.

St. Christopher's and St. Kitts' is situated west longitude 64. 10, north latitude 17. 30, and twenty leagues west of Antigua. It is one of the Caribbee islands, to which the celebrated Christopher Columbus gave his Christian name. It is about twenty miles long, and seven broad, and has a high mountain in the middle of it, from whence some rivulets run down. There are some hot springs in this island. St. Christopher's is said to contain about six thousand white inhabitants, and eighteen thousand negroes.

St. Christopher's chiefly produces sugar, cotton, ginger, and indigo, with the tropical fruits.

The island of Nevis is situated west longitude 62. 5, north latitude 17. 32. It is one of the Caribbee islands in the American ocean, and is divided from the east end of St. Christopher's by a narrow channel. It is about six leagues in circumference, and produces a good deal of sugar in proportion to its dimensions, which are very small. Nevis is said to contain about three thousand white inhabitants, and nine thousand negroes.

The island of Montserrat is situated west longitude 62. 10, latitude 15. 55. It is one of the smallest Caribbee islands in the Atlantic ocean. It contains about four thousand white inhabitants, and about twelve thousand negroes.

Montserrat was so named by the Spaniards, from a mountain in it, which resembles that of Montserrat in Catalonia.

The island of St. Lucia is also one of the Caribbee islands. It is about twenty-two miles long and eleven broad; some part of it is hilly, but in general the soil is rich, well watered with rivulets, and furnished with timber. It has several good bays and commodious harbours.

This island has lately been taken from the French, by the gallant conduct of Admiral Barrington.

St. Vincent is one of the Caribbee islands, situated in the Atlantic, or American ocean, seventy-five miles west of Barbadoes. This island was ceded to the English by the French in 1763; but since the commencement of the present war, it has again fallen into their hands, as well as Granada, Dominica, &c.

We will close this description with lieutenant-general Matthews's account of the Caribbee islands, who was lately a governor of them.

“ St. Christopher's was formerly jointly possessed by the English and French, but by the treaty of peace made at Utrecht, in 1713, the whole island was yielded to the English. It is about twenty-two miles long, and its greatest breadth is not above seven miles. The middle part is so full of hills, that there are but twenty-four thousand acres of land fit for sugar. They make, one year with another, ten thousand hogheads of sugar. Nevis is about twenty-four miles in circumference, Montserrat about eighteen, and Antigua about forty-five. They compute at Antigua seventy thousand acres of land in all; and they make, one year with another, sixteen thousand hogheads of sugar, six thousand at Nevis, and two thousand five hundred at Montserrat.

“ The militia is regulated thus; in these islands a regiment of foot containing about seven or eight hundred men; a troop of horse, of two hundred and twenty men, and another of about one hundred and twenty dragoons. There are several forts, but that called Sarpries on Brimstone Hill, at St. Christopher's, is now finished, and said to be impregnable. It is well provided with cistern water, and has a large well dug in it. There is a regiment of foot on those islands, viz. five companies at Antigua, two at St. Christopher's, two at Nevis, and one at Montserrat. The fortifications of Monk's Hill, at Antigua, are now finished, and the governor-general of the Caribbees resides in this island, because it is by nature and art the strongest of all the islands, though it is not very healthful, and they had lately scarce any fresh water, but what they saved during the rains. But I am assured they have now discovered fresh water in several parts of the island.

“ Great disputes have happened between the British sugar islands and the northern colonies, which were at length brought before the parliament of England. The sugar colonies complained, that the northern colonies supplied the French, Dutch, and other foreign islands with cattle, timber, and provisions of all kinds, without which those islands could not well subsist; and that they took sugar, rum, and other produce of the French, &c. in return, in consequence whereof the English islands lost their trade, and could not dispose of their sugar and rum, the northern colonies being supplied by the French, &c. with these articles. To this the northern colonies answered, that the British sugar colonies could not take off half their produce, and it would be hard to restrain them from selling their produce to foreigners, when the English islands could not take off their goods; but at length the sugar islands obtained an act of parliament, requiring that all foreign sugars and rum, carried from any foreign plantation to the northern colonies, should be charged with an extraordinary duty. But this does not do the British sugar islands much service; the northern colonies having such an extensive coast, that it is impossible to hinder smugglers running the goods of foreigners in upon them.

“ Another dispute happened in parliament, concerning the state of the fortifications in the British plantations; but when it was proposed, that a committee should be appointed to take the security of the plantations into their consideration, it passed in the negative, to which several noble lords dissented, for the following reasons:

I.

“ Because we apprehend, that the power proposed to be given to the committee, was not only expedient but absolutely necessary, since by the account given by several lords who attended the committee (and contradicted by none) it appeared to the house, that from the information of merchants of undoubted credit, Jamaica, Barbadoes, and the Leeward islands, were in so defenceless and miserable a condition, that they

might be taken in twenty-four hours; and we conceive, that such imminent danger of these valuable possessions required an immediate examination, in order to discover the causes and nature of their danger, and to apply proper and adequate remedies.

II.

“ Because we conceive that the chief reason urged in the debate against this enquiry, is the strongest argument imaginable for it, viz. that it might discover the weakness of those islands, in the present critical juncture of affairs, and invite our enemies to invade them: whereas we think that this critical juncture calls upon us to put our possessions in a state of defence and security at all events; and since we cannot suppose, that their present defenceless condition is unknown to those powers who are most likely to take the advantage of it; we apprehend it to be both prudent and necessary, that those powers should at the same time know, that the care and attention of this house was employed for providing for their security. We conceive likewise, that such an argument may tend to debar a house of parliament from looking into any of our affairs, either foreign or domestic. If in any transaction at any time, there shall appear to have been a weak, treacherous, or negligent management, the directors will never fail to lay hold of that argument, to stop any parliamentary enquiry; and the fear of national weakness may be urged, only to prevent the detection of a ministerial negligence.

III.

“ Because we have found by experience, that we can never be too attentive to the preservation of the possessions and dependencies of this kingdom, since treaties alone will not bind those powers, who, from the proximity of their situations, from favourable opportunities, or other inducements, may be tempted to attack or invade them. But the interposition of a British Parliament will be more expected, and more effectual, than the occasional expedients of fluctuating and variable negotiations, which in former times, have often been more adapted to the present necessities of the minister, than the real honour and lasting security of the nation.

IV.

“ Because, we apprehend the debarring this house from any enquiry into the conduct of ministers for the time past, or from giving their advice in matters of great concern to the public, for the time to come, tends to destroy the very being of this house, and of consequence the whole frame of our constitution. And how melancholy a view must it be to all his Majesty's subjects, to see the private property of so many particulars, and so advantageous a trade to the whole, refused to be brought under the inspection of this house; and yet (as far as it appears to us) totally neglected by the administration! And we are the more surprised to find this backwardness with regard to the interest of our colonies, since we are persuaded that the balance of trade is at present against us, in most parts of the world, and only compensated in some degree by what we gain by our West-India trade. Neither can we allow, that they ought to be left to look after themselves, since they have a right to claim even more than the protection of their mother country, by the great wealth they annually transmit to it, and the great duties they pay to the increase of the public funds and the civil list. And we are fully convinced, that if this beneficial trade should once be lost, it will be irrecoverably lost, to the infinite damage of this kingdom; for though the islands should be restored to us afterwards, the utensils and stock of negroes being carried away, it would take up a long tract of time, and would be a very great expence to the public to re-instate them in their present condition. We rather think it impracticable to restore them; though we can by no means suppose it difficult, by timely precaution, to prevent their destruction.”

LUCAYO'S; Or, BAHAMA ISLANDS.

THE Lucayo's or Bahama islands are situated between 73 and 81 deg. of west longitude, and between 21 and 27 deg. north latitude.

These islands amount to upwards of forty in number. The island of Providence is possessed and fortified by the English. Some writers say, that there are near an hundred of these islands, but then they call every rock that makes but a small appearance above the water one of them.

The island of Providence is situated in 78 deg. west longitude, and 25 deg. north latitude; it is about twenty-five miles long, and nine miles broad. In the neighbourhood of Providence there are several more of the Bahama islands planted by the English, but they are not capable of making any defence when an enemy approaches them; on this account, the English planters retire to Providence with their effects, when any alarm of danger is spread.

The island of Bahama, from whence the rest derive their name, is about sixty miles long and twelve broad.

The largest and most northerly of the islands is Lucayo, which lies to the east of Bahama Proper, is about eighty miles in length, and twenty in breadth, but there are not more inhabitants upon this island than upon the rest.

Christopher Columbus first discovered these islands on the eleventh of October, 1492. The first island he made was Guanahani, or Cat Island, to which he gave the name of St. Salvador, in memory of his remarkable deliverance from the mutinous designs of his crew, who, looking upon themselves as lost in a boundless ocean, had formed a conspiracy to throw him overboard, for engaging them in such an enterprise; very fortunately for Columbus, they were diverted from their intention, by his discovering light on shore the very night they designed to attack him.

When they landed on this island, they found it well planted, but in general flat and low; the natives were of a middle stature and of an olive complexion; their bodies were naked, but some of them were painted

red, their eyes and hair were black, their chief ornaments were thin gold plates made in the form of a crescent, which hung over the upper lip, and their arms were spears pointed with the bones of fishes.

Columbus found them very inoffensive and hospitable; they brought the Spaniards such provisions as the country afforded; cotton and parrots were the only articles they had to exchange for the European goods, and small cur dogs were the only four-footed animals they found on these islands.

The Spaniards gained intelligence, that they had their gold from the south, they therefore for the present left these islands, and sailed for Cuba and Hispaniola; but afterwards discovering that there were Pearl fisheries in these seas, and perceiving that the inhabitants of the Bahama islands were exceeding good divers, they employed them in diving for pearl oysters, and they very cruelly obliged them to continue under water till their strength was quite exhausted; they added to this unnatural cruelty several oppressions, insomuch, that in a very few years they destroyed all the Indians in the Bahama islands; at length there was not a man left upon them, and for many years they remained destitute of inhabitants, only they were sometimes visited by the Spaniards from Cuba and Hispaniola, in order to collect such fruits and provisions as this island produced.

The island of Providence, and the neighbouring ones, soon afterwards became the refuge of Buccaneers and privateers, till they were captured by the English, under captain William Style, in the year 1667, who was driven in here by stress of weather; it was afterwards taken from us by the French and Spaniards; but as they soon quitted the island, the English who escaped returned, and being reinforced from England, Providence became a royal government.

Turk's island is a very small one, and lies in 70 deg. west longitude, and 21 deg. north latitude.

Our ships, in their return from Jamaica, pass through these islands, which form what is called the windward passage; and, as there are many rocks and shelves in it, is rather dangerous.

NEW FOUNDLAND.

THIS island is situated between 55 and 60 degrees of west longitude, and between 47 and 52 deg. of north latitude. It is upward of three hundred and fifty miles in length, and two hundred in breadth.

In the winter season this country is very cold, as it is generally covered with snow to a great depth one half of the year, and in the summer season it is extremely hot.

The country is mountainous, and the hills are very well clothed with pine and fir trees, but very little corn or grass grows here. The principal productions of this country are, the cod-fish, which are taken in great numbers on the sand-banks near the coast; several hundred ships are annually laden therewith, and here are several very commodious harbours to cure them in.

The principal sand bank, where they take the fish, lies about twenty leagues from the southern promon-

tory of the island, and is about a hundred leagues long and twenty-five broad; as long as the sun continues in the northern signs, the fishing season lasts.

The French had once some settlements here, but the property of the island was yielded to the English by the treaty of Utrecht, only the French are allowed the liberty of curing their fish on the northern coast of the island; but it is so cold and uncomfortable a country, that there are not above four or five hundred English families who remain here all the year, except in the fortifications; but in the fishing season there are upwards of ten thousand people resident there.

There are but few native Indians on the island; but in the winter, the Indians of New Britain pass the straits of Bellisle, and come over to hunt here.

The English had no clergymen among them till very lately; but now the Society for the propagation of the Gospel send a missionary thither, who usually resides

resides at Bonavista, but is a kind of itinerant preacher, visiting Trinity harbour, Placentia, and other settlements, as he has opportunity.

There is plenty of venison, fish, and fowl in this island, but very little fruit, corn, or cattle; the inhabitants receive most of their provisions, as well as cloathing and furniture, annually from England, on the return of the fishing ships.

The town and fortifications of St. John's, is situated in 65 deg. west longitude, and 47 deg. north latitude; this town was taken from the French by the English, in the year 1758, who have still the possession of it, and have both peopled and fortified it.

The port town of Placentia is situated in 52 deg. west longitude, and 41 deg. north latitude; it stands on a bay on the south-east part of this island, forty miles west of St. John's.

The garrisons of St. John's and Placentia, is sometimes greater than at other times, as the exigency of affairs requires, or as soldiers can be spared from the other parts of America.

Newfoundland was first discovered by the English in the reign of Henry VII. and several voyages were made thither in the preceding reigns, by many adventurers, and some were sent by the authority of the different monarchs. The Portuguese and the French traded thither for furs, and fished on the coast, but were expelled from thence by the English; but king Charles II. who in all his transactions was too complaisant to the French, and too negligent of the interests of his subjects, abandoning himself to luxury, ease, and effeminacy, suffered the French to settle in Placentia. Several rencounters between the English and French took place during the reign of William III. who restored the dignity and importance of the British empire to its former splendor and magnificence.

In Queen Ann's reign, the French took the town of St. John's, the capital of Newfoundland, but were not able to conquer the fort. At the peace of Utrecht in 1713, the French were obliged to yield up the whole island of Newfoundland to the subjection of the British crown. But, like all other treaties where the French are concerned, this has frequently been

invaded; instances of French perfidy we see daily; nothing but the cannon's mouth can make them at all faithful to any moral or political obligation; yet we trust, we shall yet live to see the pride and haughtiness of those insidious people sufficiently humbled, and Great Britain be once more triumphant over all her foes, and be the glory of the whole earth.

THE CONCLUSION.

Thus have we traced the various climes, and followed the voyagers and travellers through all the habitable parts of the known world; the ancient as well as the modern discoveries, are here amply and fully remarked upon, the difficulties they have undergone, the dangers to which they have been subject and have surmounted, as well as the various revolutions of empires and states which have been occasioned thereby.

We trust that our numerous readers will be fully satisfied with the pains we have taken to entertain and please them, and presume that our design will be fully answered, as no work of this kind is so well calculated for the purpose; none already exists where there is such a variety of useful and entertaining matter comprised in so small a compass.

The natives of our happy island may sit at home and peruse the various pages of this work, where they will reap all the benefit of useful instruction, and be entertained with the most interesting narratives and adventures, without being exposed to the smallest degree of that hazard and difficulty which the navigators or travellers have run. The elegant copper-plates and whole sheet maps, charts, &c. exhibited in this work, will give a striking idea of the countries, habits, and manners of the various inhabitants, for in them the sum of the whole is in a great measure brought to view; all that narrative can relate, or representation can describe, the one to inform the mind, and the other to please the fancy, at once form this complete, useful, and entertaining production, worthy the patronage the public have already given it, and laying claim to their future support.

F I N I S.

New Books lately Printed for and Sold by ALEXANDER HOGG, No. 16, Pater-noster Row, London.

The NEW COMPLETE DICTIONARY of ARTS and SCIENCES; Or, AN UNIVERSAL SYSTEM of USEFUL KNOWLEDGE.

Containing a full Explanation of every Art and Science, whether Liberal or Mechanical, in which the Difficulties attending a thorough Knowledge of them are clearly pointed out, and such Directions given as cannot fail of making their Acquisition easy and familiar to every Capacity. The Whole upon an improved Plan.

By the Rev. ERASMUS MIDDLETON, and OTHERS.

* * To prevent any other Publication being offered by mistake, the Public are desired to order "MIDDLETON'S NEW
"DICTIONARY of ARTS and SCIENCES."

†† This *Dictionary of Arts and Sciences* is held in universal Estimation, and the elegant Copper-Plates are entirely New, and executed by the most capital Artists. Upon the whole, this Work is pronounced, by the best Judges, to be the most complete Publication extant; and although the Expence is so exceedingly moderate, yet it comprehends the Substance of, and is much more preferable, in many Respects, to similar Works of ten or twelve Guineas Price. In 2 Volumes, neatly bound in Calf and Lettered, Price only 2l. 10s. or bound in one Volume, 2l. 6s.

‡‡ To accommodate such as are not inclined to purchase the above Work complete at once, Persons may take it in by one or two Numbers at a Time, including all the elegant Copper-plates, the Whole being published in only 80 Numbers, at 6d each.

THE MALEFACTOR'S REGISTER; Or, The New Newgate and Tyburn Calendar.

Containing the authentic Lives, Trials, Accounts of Executions, and Dying Speeches, of the most notorious Violators of the Laws of their Country; who have suffered Death and other exemplary Punishments, in *England, Scotland, and Ireland*, from the Year 1700 to the present Time.

This Work comprehends all the most material Passages in the *Sessions-paper* for a long Series of Years, and compleat Narratives of all the capital Trials for *Bigamy, Burglary, Felony, Forgery, Highway-Robbery, High Treason, Murder, Petit-Treason, Piracy, Rapes, Riots, Street-Robbery, Unnatural Crimes*, and various other Offences. To which will be added, a correct List of all the capital Convictions, at the Old Bailey, &c. since the Commencement of the present Century.

* * That the Public may not have any old Publications offered instead of this NEW and COMPLETE WORK, they are particularly requested to order the MALEFACTOR'S REGISTER; Or, NEW NEWGATE and TYBURN CALENDAR, Dedicated to Sir JOHN FIELDING, and printed for ALEXANDER HOGG.

In 5 large Volumes, in Octavo, Price neatly bound and lettered, only 1l. 10s.

* * This New Work being divided into 50 Numbers, those who wish to take it in Weekly or Monthly, may be supplied with one or two Numbers at a Time, price only 6d each, containing all the beautiful Copper-plates, one at least in each Number.

* * Divide the Volumes between the Signatures 7 M and 7 N.—And a Mistake having happened in P. 724, the Book-binder is desired to cancel that Leaf, a Duplicate of which is to be cut off from the second Volume Title.—The List of Subscribers and Catalogue of Books, to be placed at the End.

N. B. The Book-binder is particularly requested to beat this Work before the Copper-plates are placed, in order to prevent the Letter Press from setting off, and thereby spoiling the Engravings.
